

**CENTRAL MAUI LANDFILL
STATE LAND USE COMMISSION
FY2014 ANNUAL REPORT
SP86-359**

Part 1: Project Summary

Landfill Gas

Landfill gas wells were monitored by the County and reports submitted to the Dept. of Health, Clean Air Branch. Landfill gas emissions are collected and piped to the flare installed near Phase IV of the Central Maui Landfill. The flare is routinely maintained with notifications sent to the Dept. of Health when it is shut down for maintenance.

Gulch Crossing

The crossing was re-graded and slopes armored in September 2013 for a total cost of \$94,616.71. The crossing has performed well during subsequent storm events with no overflows. Banks have re-vegetated and the roadway surface has remained hardened.

Co-composting and Fats, Oil & Grease (FOG)

The \$3M co-composting contract for biosolids and greenwaste continued with fats, oil, and grease collection subcontracted to Pacific Biodiesel for processing off-island.

Part 2: Project Compliance

Condition 1: That the adjacent Kalialinui Gulch shall not be disturbed by the activities of the sanitary landfill with the exception of drainage from storm generated runoff.

Report: The Gulch was cleared of any remaining litter due to landfill operations when Phases I and II were closed in 2006. No further landfill activity directly abuts the Gulch. The fenced and paved perimeter road buffers the closed landfill from the Gulch.

Condition 2: That appropriate monitoring of the quality of water to be discharged into Kalialinui Gulch from drainage basins shall be undertaken to assure that toxic wastes are not part of the discharge.

Report: Any stormwater discharged into Kalialinui Gulch is tested for parameters listed in the NPDES permit. Two detention ponds have had adequate storage capacity to hold run-off from both the composting facility and closed landfill during storm events.

Condition 3: That in the preparation of the sanitary landfill, the landfill floor shall be further compacted and be made relatively impervious to water in order to contain leachate. Proper disposal methods of leachates shall be installed within the landfill.

Report: A riser and perforated pipes were placed at a low point in the landfill floor after waste excavation to locate the original leachate collection pipe. Leachate has not been observed, due to the dryness and depth of waste, low rainfall, and warm temperatures.

Condition 4: That a traffic assessment shall be developed to determine the impact on Pulehu Road once the sanitary landfill is operating. This assessment shall be completed no later than one year after said landfill is in operation. Findings of the assessment shall be submitted to the County of Maui's Department of Planning for review.

Report: This was completed by R. M. Towill as part of their original design work.

Condition 5: That the Applicant shall stop work on the sanitary landfill and immediately contact the Department of Land and Natural Resources, Historic Sites Division, in the event that any previously unidentified historic, archaeological or cultural sites are encountered.

Report: No previously unidentified historic, archaeological, or cultural sites were found.

Condition 6: That appropriate internal vehicle circulation patterns shall be designed so as to not cause confusion and congestion within the sanitary landfill.

Report: Phases I and II are closed to all traffic except for monitoring and maintenance. Traffic to the composting and fats, oil, and grease (FOG) collection tanks goes through the Phase IV landfill entrance, across the Gulch, and directly to the composting site and FOG collection tanks. Traffic includes green waste disposers, sludge trucks, fats, oil, and grease trucks, and compost customers.

Condition 7: That full compliance with the requirements of the State's Department of Health for sanitary landfill operation shall be rendered.

Report: Phases I and II were closed according to Dept. of Health regulations.

Condition 8: That appropriate rules shall be established to prohibit scavenging within the sanitary landfill.

Report: Phases I and II are closed to the public and capped according to regulations.

Condition 9: That appropriate mitigative measures to control excessive dust generation shall be implemented.

Report: Phases I and II are covered with drought-resistant grass and has paved roads.

Condition 10: That provisions shall be enacted to ensure emergency access to the sanitary landfill in case of fire or any other disaster.

Central Maui Landfill FY2014 LUC Annual Report for SP86-359
Page 3

Report: The Fire Dept. on Dairy Road has keys to the landfill in case of a problem.

Condition 11: That warning signs shall be clearly posted near all entry points of the landfill to indicate any blasting activity on the adjacent rock quarry.

Report: There is no public entrance to Phases I and II. Blasting is done well beyond the landfill as quarrying activity has moved well beyond the area adjacent to the landfill.

Condition 12: That full compliance with any other applicable government requirements shall be met.

Report: NSPS regulations are followed for landfill gas measurement and reporting.

Condition 13: Petitioner will submit to the Commission a letter from Ameron HC&D requesting an amendment to the Special Permit issued under docket No. SP77-271 to delete a portion of land consisting of the Property, currently approved for quarrying purposes, for the establishment of the Project, pursuant to Section 205-6, Hawaii Revised Statutes.

Report: This was done at that time.

Condition 14: Permitted activities shall include the processing of special waste into marketable materials, such as biodiesel and compost, as an additional use under the special use permit.

Report: For FY2014 County contractor Maui EKO Systems received 24,206.59 tons of biosolids and related materials such as grit and lift station pumpings; approximately 19,000 tons of green waste, pallets, and wood chips were received. A total of 13,108 units of compost were sold (units include categories of bulk, cubic yards and 40 quart bags). Their sub-contractor, Pacific Biodiesel, received 5,457.89 tons of commercial fats, oil, and grease (FOG). In FY 2013 biodiesel production was transferred from the Maui plant to the Big Island plant. FOG is screened and dewatered before transport to the Big Island plant for processing into bunker fuel or biodiesel.

Condition 15: That the Applicant shall satisfy the County of Maui Department of Water Supply standards for fire protection.

Report: There are two fire hoses connected to the on-site water tank which meets the County standards for fire protection at the compost facility.

Condition 16: That security safety measures including, but not limited to, the methanol tanks, onsite catalyst, and lab container shall be implemented due to the type of products used and produced onsite.

Central Maui Landfill FY2014 LUC Annual Report for SP86-359
Page 4

Report: As biodiesel production has been discontinued, the only materials stored on-site at Pacific Biodiesel are the fats, oil, and grease prepared for transport to the Big Island plant.

Condition 17: That a combustible liquid tank permit shall be acquired and maintained, as necessary.

Report: Permits issued by the County Fire Prevention Bureau have been renewed.

Condition 18: That the Applicant shall timely provide without any prior notice, annual reports to the Commission and the County of Maui Department of Planning in connection with the status of the uses approved under the special use permit and the Applicant's progress in complying with the conditions imposed herein. The annual report shall be submitted in a form prescribed by the Executive Officer of the Commission.

Report: Filing of this FY 2014 annual report complies with this condition.
