Appendix C

Cultural Impact Assessment for the Kaua‘i Community College Redesignation to Urban District Project
Prepared by Cultural Surveys Hawai‘i, Inc.
April 2012
Prefatory Remarks on Language and Style

A Note about Hawaiian and other non-English Words:

Cultural Surveys Hawai‘i (CSH) recognizes that the Hawaiian language is an official language of the State of Hawai‘i. Hawaiian Language is important to daily life, and using it is essential to conveying a sense of place and identity. As such, CSH does not follow the conventional use of italics to identify and highlight Hawaiian words. However, other non-English words in this report are still presented in italics unless citing from a previous document that does not italicize them. CSH parenthetically translates or defines in the text the non-English words at first mention, and the commonly-used non-English words and their translations are also listed in the Glossary (Appendix A) for reference. However, translations of Hawaiian and other non-English words for plants and animals mentioned by community participants are referenced separately (see explanation below).

A Note about Plant and Animal Names:

When community participants mention specific plants and animals by Hawaiian, other non-English, or common names, CSH provides their possible scientific names (Genus and species) in the Common and Scientific Names of Plants and Animals Mentioned by Community Participants (Appendix B). CSH derives these possible names from authoritative sources, but since the community participants only name the organisms and do not taxonomically identify them, CSH cannot positively ascertain their scientific identifications. CSH does not attempt in this report to verify the possible scientific names of plants and animals in previously published documents; however, citations of previously published works that include both common and scientific names of plants and animals appear as in the original texts.

## Management Summary

### Reference

Cultural Impact Assessment (CIA) for the Kaua`i Community College (KCC) Redesignation to Urban District Project, Nāwiliwili, Niumalu, and Ha`ikū Ahupua`a, Lihu`e District, Kaua`i Island, TMK: [4]-3-4-007-001, [4]-3-4-007-002, [4]-3-4-007-003, and [4]-3-4-007-006 (Fa’anunu, Magat, and Hammatt 2012)

### Date

April 2012

### Project Number

CSH (Cultural Surveys Hawai`i) Job Code: NIUMALU 2

### Agencies

State of Hawai`i Department of Health/Office of Environmental Quality Control (DOH/OEQC)

### Project Location

This study is located in the ahupua`a (Land division usually extending from the uplands to the sea in the district of Lihu`e, on the island of Kaua`i. The TMK parcels for the proposed site are: [4]-3-4-007-001, [4]-3-4-007-002, [4]-3-4-007-003, and [4]-3-4-007-006

### Land Jurisdiction

Public, University of Hawai`i

### Project Description

The University of Hawai`i Community Colleges (UHCC) proposes to amend the State Land Use District Boundary to re-designate the entire 199-acre KCC campus from its existing land use classification of Agricultural District to Urban District. The Project consists of the re-designation of land, as well as the construction of new buildings, additions to buildings, and new parking. A Special Permit was granted by the State Land Use Commission in 1973 for construction of the college campus within an approximately 99-acre parcel situated within TMK [4]-3-4-07-003. Most of the additional approximately 100 acres (within TMK [4]-3-4-07-01, .002 and .006) are undeveloped, except for two Hawaiian Language Immersion schools, Pūnana Leo o Kaua`i Pre-School and Kawaikini New Century Public Charter School

### Project Acreage

Approximately 199 acres

### Area of Potential Effect (APE) and Survey Acreage

For the purposes of this CIA, the APE is defined as the 199-acre Project area. While this investigation focuses on the Project APE, the study area also includes the three ahupua`a of Nāwiliwili, Niumalu, and Ha`ikū

### Document Purpose

The Project requires compliance with the State of Hawai`i environmental review process (Hawai`i Revised Statutes [HRS])
Background research for the proposed Project indicates that the area lies remnants of the Old Puhi Camp, which housed plantation workers of Grove Farm. The camp was built around 1920 along the present Kaumualii Highway and contained a movie hall, three stores, a Chinese laundry, a slaughterhouse, and an area for social events. Most of the Puhi Camp housing was removed in the 1970s prior to the construction of KCC and the last homes of the camp were dismantled in the 1980s.

The Project area is also linked to many mo'o'olelo (stories, oral histories) and wahi pana (storied places) that suggests early settlement of the area by a viable Native Hawaiian population. These include mo'o'olelo about Kuhiau Heiau, the largest heiau in Kaua'i, Nini and Ahukini Heiau in Kalapaki, the Menehune, wiliwili trees, and the many well-known chiefs, heroes, and gods such as the chief Papalinaola, the three sons of La'a Maikahiki, the hero Lohiau; the contest of Kemanno the sling-thrower and Kapānulou, the ravishing of Pele by Kamapua'a, demi-god Pōhaku-o-Kaua'i (Hoary Head), as well as a Kaua'i chief sent by Ka'umualii to placate Kaahumanu I on O'ahu. Mo'o'olelo with associated bodies of water within the Project area are also plentiful which include Alekoko, the largest fishpond in Kaua'i (also known as 'Alekoko, Alakoko, Pāpē'a'awa'), Huihau (Hu'ilā'a) Stream, Kilohana, and Nāwiliwili Bay. Many wahi pana of settled areas, such as Puhi, Lihu'e, and various pu'u (hills, ridges) are also associated with the Project area.

Other important findings from background research are presented and emphasized in more detail:

1. The traditional moku or districts of Kaua'i were replaced in the mid-to-late 19th century. Lihu'e became the modern district that includes the ahupua'a of Nāwiliwili, Niulau, and Ha'i'ikū. Early accounts describe the region as an open, grass-covered land that was dotted with trees and streams that flowed down from lush mountains on the way to the sea, with soils that bore a variety of crops like sugar-cane, taro, sweet-potatoes, beans and groves of kukui, candlenut, koa, hala (pandanus), and wiliwili. The abundance of water and water systems, presence of famed fishponds on the coast, along with the concentration of permanent house sites, temporary shelters, and heiau suggests early settlement along coastal areas, with a radiocarbon date of A.D. 1170 to 1400 near the mouth of Hanamā'ulu Stream, north of Nāwiliwili. In the mid-19th century, the Project area became associated with the establishment of the commercial sugar cane agriculture which required foreign indentured labor imported from Japan, China, and the Philippines. The Project area was part of the Grove Farm Plantation before the farm stopped its sugar business in 1974. Within the Project area lies remnants of the Old Puhi Camp, which housed plantation workers of Grove Farm. The camp was built around 1920 along the present Kaumualii Highway and contained a movie hall, three stores, a Chinese laundry, a slaughterhouse, and an area for social events. Most of the Puhi Camp housing was removed in the 1970s prior to the construction of KCC and the last homes of the camp were dismantled in the 1980s.

2. No known heiau currently exists within the study area although Kuhiau Heiau, reported to be the large and most famed heiau on Kaua'i, existed along the coast of Nāwiliwili Ahupua'a (Damon 1931). Listed by Bennett (1931) as Site No. 99, this heiau is reported to have been about four acres and associated with Paukini Rock, its sister heiau that marks the boundary between Nāwiliwili and Kalapaki Ahupua'a.
3. After the Māhele, Victoria Kamāmalu was awarded over two thousand acres of Nāwiliwili Ahupua’a, along with much of Niumalu and Ha’ikū. Land Commission Awards (LCAs) describe many lo’i (irrigated taro, especially for taro) and kula (plain, field, open country, pasture) lands within the study area particularly as being in the same ‘ipana (piece, slice, portion), a pattern common to the Puna District of Kaua‘i, but uncommon elsewhere in Hawai‘i. Maka’āinana (commoner) in the Puna District were referring to lands in valley bottoms as kula.

4. Many lo‘i (fishponds) were prevalent in the study area. LCAs document six in Nāwiliwili, seven in Niumalu, and claimants describe lo‘i (pond) or kiowai (water hole) in Ha‘ikū. ‘Alekoko Fishpond, also known as Menenhune Fishpond, or Niumalu Fishpond, is the largest fishpond on Kaua‘i and still exists in the study area. It is also known as SIHP No. 50-30-11-501.

5. The Project area was initially part of the Grove Farm Plantation—so named after an old stand of kulei trees. The plantation was established in 1850 and taken over by Mr. George Wilcox in 1863. He bought the farm in 1870 for $12,000 and it flourished under his leadership. In the mid-1960s, Grove Farm donated 200 acres of former sugar land to the State of Hawai‘i for KCC. Grove Farm ended its sugar business in 1974 (Wilcox 1998:76).

6. The Old Puhi Camp, which housed plantation workers of Grove Farm, extended into the Project area and consisted of about 600 homes for about 1,200 workers and their families. At the forefront of housing reforms, Puhi Camp dwellings became the standard for the plantation industry in the 1920s (Riznik 1999).

7. An archaeological reconnaissance by Palama in 1973 identified the Puhi Camp Cemetery, State Inventory of Historic Places (SIHP) No. 50-30-11-B006, old plantation camp remains associated with Puhi Camp, Puhi Camp, and an area containing possible lo‘i. A field inspection of the Project area in August, 2010, found ten historic surface features, including two previously identified historic features (CSH 9, CSH 10) by Palama (1973). An “old ‘auwai” that conforms to a portion of Grove Farm’s “Mauka Ditch”, corresponds to CSH 9 and the Puhi Cemetery corresponds to CSH 10. However, the Puhi cemetery is outside of but surrounded by the Project area. The remaining features found appear to be related to Grove Farm and date to the plantation era. The historic surface features consist of five irrigation ditches (CSH 1, CSH 2, CSH 4, CSH 6, CSH 9), one of which (CSH 1) is abandoned; three reservoirs (CSH 3, CSH 5, CSH 7) of which CSH 3 is abandoned; and an abandoned wooden flume (CSH 8).

This community consultation indicates that additional significant cultural resources, namely streams and watersheds as well as the Hule‘ia National Wildlife Refuge near and downstream from the Project area, have not been adequately documented and assessed for their ecological relationship with natural and cultural resources within and near the Project area. The study area and environs, in particular the lo‘i, kula or lands in valley bottoms in this particular context, rivers, streams and Nāwiliwili Bay, has a long history of use by Kānaka Maoli (Native Hawaiians) and other kama‘aina groups for a variety of past and present cultural activities and gathering practices. Participants consulted reveal their knowledge of these practices and resources.

At least two community contacts, Mr. Pereira, and Mr. Chun, discuss fishing, gathering ‘ōpū (limpets) and limu (seaweed, algae) in Nāwiliwili Bay, and crabbing along Hule‘ia River which still continue today among residents of the area. Both participants discuss spear and throw-net fishing which for Mr. Pereira consisted in part of catching akule (big-eye scad), manini (convict tang), and squid using his own throw net which he creates and sells to others. Several participants (Mr. Robert White, Mr. Pereira and Mr. Chun) narrate he‘enalu (surfing) practices and associated mo‘olelo in the past and in the present. At least two participants note the abundance of freshwater resources and the watershed near the Project area and highlight the ecological relationship of natural and cultural resources within or near the Project area.

Participants also relate mo‘olelo about the practice of hukilau (fish with the seine), the origin of the name “Puhi” which is connected to the cave of a shark god in Ha‘ikū, as well as the presence of spirits in the...
Project area in the form of fireballs. At least five participants relate the gathering of plants such as bamboo shoots, papaya, mangoes, passionfruit, guava and pepeiao (cloud ear fungus) in the Project area along with the catching of crayfish, ‘o’opu, and frogs in the irrigation ditches and reservoirs while at least two community contacts related about the hunting of pheasants and wild boars. Participants also discuss burials and note the existence of a historic cemetery surrounded by the Project area, and another cemetery nearby. Many participants stress the importance of respecting and sharing resources with one another, the ecological relationship that shapes natural and cultural resources, and the need to keep the ecological balance by keeping contaminants away from the watershed upon which the Project area is built to ensure a healthy environment for Nawiliwili Bay and the wildlife refuge area downstream of the Project area.

Other important findings from community consultations are presented and emphasized in more detail:

1. In the 1960s and 70s, the ahupua’a of Nawiliwili, Niumalu, and Ha’ikū, consisted of small rural towns with taro cultivated relatively close to the ocean. Mr. Chun describes Nawiliwili Valley as having had many taro fields which later turned into cattle pastures and grassland. Today, he tells of only one family in Nawiliwili and a few in the back of Niumalu who continue the practice. Mr. Pereira speaks of growing up in Niumalu with no electricity and using kerosene for cooking.

2. The Project area is agricultural land formally owned by Grove Farm where pineapple, cattle, and later sugar cane, were farmed. Plantations provided a livelihood for many residents of Kaua’i like Mr. Pereira and Kupuna Makani. Mr. Pereira worked in the sugar and pineapple plantations during the summertime as a young boy, which paid for his schooling. Mr. Chun and Mr. Pereira recall the predominance of the sugar industry which included the establishment of a sugar mill in Nawiliwili. A railway system brought cane from the fields to the mill which later became replaced by trucks.

3. The Project area includes the former Old Puhí Camp, a plantation camp for the workers of Grove Farm Plantation and their families. Since Puhí Camp was a significant part of the Project area’s history, Puhí Camp is described in more detail:
   - Participants remember Puhí as a self-sufficient plantation camp with its own stores, doctors, and medical facilities. Families shopped for groceries in plantation stores, and bought items using credit, to be paid for on payday. Plantation workers lived at Puhí for cheap rent, received kerosene for cooking, and hot water for bathing. Land was also given to anyone who wished to grow vegetables and crops were shared with each other.
   - While various accounts portray plantation life as harsh and unfulfilling, Mr. Takahashi relates that the Wilcox family treated their workers very well and life was enjoyable at Puhí. Workers were provided the opportunity to own their own homes. Those raised on the camp fondly reminisce of a simple life and special place—a close-knit community where everybody recognized and took care of each other despite their differences. “For me, growing up in Puhí was great!”, says Kupuna Makani.
   - The culture of Puhí Camp was diverse. According to Kupuna Makani, the homes in Puhí were arranged by race though “everybody lived as one people.” Participants raised in the camp, appreciate their multi-cultural upbringing through the sharing of cultural practices, folk dances, foodways, and folklife.
   - Participants recalled other cultural activities at Puhí Camp such as the ‘Social Box’ which was a dance held by the Filipinos once a month. Mr. Pereira also describes an annual Filipino carnival called the “Holy Ghost” that occurred every December. On Tuesdays, fresh bread and malasadas (Portuguese pastry) were baked and children collected firewood to keep the fire alive for baking.
   - The transition to unionization of workers in 1946 brought many changes to Puhí Camp. Kupuna Makani explains that before the union, though wages were low, housing and water were free and Grove Farm provided equipment and toys for the children. Several strikes ensued but the strikes were peaceful, unlike the massacre at Hanapepê in 1924. During the strikes, a soup kitchen run by the union, provided food for workers on strike and their families.

4. Two graveyards, known to Puhí residents as “Old Puhí Cemetery” (SHIP No. 50-30-11-B0006) and “Cement Pond,” are located outside of but within 200 meters of the Project area. The cemetery is divided into two sections for Japanese and Filipino families despite the multi-cultural makeup of Puhí. According to Mr. Takahashi, other ethnicities chose to be buried elsewhere and many graves were removed by their...
1. Participants describe an abundance of water in the Project area. From Kilohana, water collects in reservoirs that once fed the plantations. Reservoirs and ditches were utilized by Puhi residents as food sources, and for recreational swimming. Mr. Takahashi asserts that a gate that controlled water flow to these water sources and regulated flow to prevent floods, still exists. Water subsequently flowed down through streams and rivers into Nāwiliwili Bay. The Hulē'ia National Wildlife Refuge, which includes the Menelune Fishpond, is part of a watershed downstream of the Project area.

2. Mr. Chun and Mr. White indicate that development has changed water flow patterns, as well as water quality. Mr. Chun attributes muddy water in Nāwiliwili Bay not only to heavy rains flooding the Hulē'ia River but to development and land-based activities upstream, such as the previous sugar mill and the existing Marriott Hotel. Mr. Chun believes that fresh water has shaped the ecology of Nāwiliwili Bay in that corals do not grow in the presence of fresh water. He speculates that the sandy bottoms of the bay and the location of the coral reef further out in the bay, is due to the decreased salinity from the influx of fresh water. Residents like Mr. White do not eat fish from the coast because of degraded water quality.

3. Mr. Chun reiterates that the sugarcane plantations would have displaced features of cultural significance within the Project area and also points out that the population centers would have been concentrated along the coast or along the Hulē'ia River. Therefore, the likelihood of finding heiau and other cultural features would be higher along the coast than within the Project area. No participants had knowledge of any heiau within the study area. However, one participant noted a mo'olelo about fireballs, which reflect the presence of spirits in Native Hawaiian culture, near the Project area.

4. Participants describe an abundance of water in the Project area. From Kilohana, water collects in reservoirs that once fed the plantations. Reservoirs and ditches were utilized by Puhi residents as food sources, and for recreational swimming. Mr. Takahashi asserts that a gate that controlled water flow to these water sources and regulated flow to prevent floods, still exists. Water subsequently flowed down through streams and rivers into Nāwiliwili Bay. The Hulē'ia National Wildlife Refuge, which includes the Menelune Fishpond, is part of a watershed downstream of the Project area.

5. Filipino migrants came to Hawai‘i in the early 1900s as contract laborers or “sakadas,” searching for a better place to live, relates Mr. Takahashi and Kupuna Makanani. Some graves at Old Puhi Cemetery are of Filipino veterans who have no known family with only crosses in the ground for their burial, according to Mr. Takahashi. He wishes that relatives of these veterans could find them, allowing younger generations to continue their ties to their culture and family tree.

6. Mr. Chun reiterates that the sugarcane plantations would have displaced features of cultural significance within the Project area and also points out that the population centers would have been concentrated along the coast or along the Hulē'ia River. Therefore, the likelihood of finding heiau and other cultural features would be higher along the coast than within the Project area. No participants had knowledge of any heiau within the study area. However, one participant noted a mo'olelo about fireballs, which reflect the presence of spirits in Native Hawaiian culture, near the Project area.

7. Participants describe an abundance of water in the Project area. From Kilohana, water collects in reservoirs that once fed the plantations. Reservoirs and ditches were utilized by Puhi residents as food sources, and for recreational swimming. Mr. Takahashi asserts that a gate that controlled water flow to these water sources and regulated flow to prevent floods, still exists. Water subsequently flowed down through streams and rivers into Nāwiliwili Bay. The Hulē'ia National Wildlife Refuge, which includes the Menelune Fishpond, is part of a watershed downstream of the Project area.

8. Mr. Chun and Mr. White indicate that development has changed water flow patterns, as well as water quality. Mr. Chun attributes muddy water in Nāwiliwili Bay not only to heavy rains flooding the Hulē'ia River but to development and land-based activities upstream, such as the previous sugar mill and the existing Marriott Hotel. Mr. Chun believes that fresh water has shaped the ecology of Nāwiliwili Bay in that corals do not grow in the presence of fresh water. He speculates that the sandy bottoms of the bay and the location of the coral reef further out in the bay, is due to the decreased salinity from the influx of fresh water. Residents like Mr. White do not eat fish from the coast because of degraded water quality.

9. The traditional practice of lei (necklace of flowers)-making was and continues to be practiced by residents of the study area.

Impacts and Recommendations

The following cultural impacts and recommendations are based on a synthesis of all information gathered during preparation of the CIA. To help mitigate the potential adverse impacts of the proposed Project on cultural beliefs, practices, and resources, recommendations should be faithfully considered and the development of the appropriate measures to address each concern should be implemented.

1. In light of statements made by several participants in this study over the potential impact of future development at KCC on the historical remnants of the Old Puhi Camp, especially the Puhi Cemetery, it is recommended that:
   i. Large trees near the graves should be removed to prevent further destruction of headstones from falling branches. Although the cemetery is outside of the Project area, it is completely surrounded by the Project area.
   ii. Participants recommend that KCC should assume the responsibility of protecting and maintaining the cemetery, including any financial obligations that incur. Regarding a burial treatment and preservation plan, Mrs. Sakoda prefers that burials be preserved in place. If burials must be removed, Mrs. Sakoda, Mr. Takahashi and Kupuna Makanani agree that a columbarium containing all the burials be built on site. The columbarium would protect the burials of the Puhi Cemetery and solve the problem of graveyard maintenance.
   iii. Participants recommend that all families with ties to the cemetery and Project area should be consulted and included in any discussions regarding the Puhi Cemetery.

2. Kupuna Makanani remembers from her childhood how it was possible to bury family members around one’s residence, hinting to the possibility of discovering inadvertent burials in future development. Should cultural or burial sites be identified during future ground disturbance in the Project area, all work should immediately cease and the appropriate agencies notified pursuant to applicable law. Kupuna from the study area and former residents of Puhi Camp should also be consulted to
ensure proper cultural protocols are addressed.

3. As there continues to be concern from former Puhi residents about the loss of the history and memories of Puhi Camp as the campus expands, it is recommended that a replica of a bulletin board used in the everyday life of Puhi Camp and containing the history of the camp be built and installed on KCC campus. The bulletin board continues to be a traditional cultural property in the memories of the study participants, who cherish its significance.

4. Due to concerns expressed by participants about the possible impacts of the KCC expansion to the ecology and its interrelationship with the natural and cultural resources within and near the Project area, including consideration of the mauka-makai connection of the land, the possible impacts of land-based activities stemming from the college on water resources, Nāwiliwili Bay, and the ocean, as well as the potential contamination of the watershed and of the Hulē'ia National Wildlife Refuge from the use of herbicides and methods of weed control at KCC, it is recommended that KCC limit or consider the use of non-toxic pesticides and employ the appropriate best management practices.

5. Due to the current traffic congestion directly in front of the KCC campus attributed in part to vehicles turning into the Chevron gas station, and the likelihood that the traffic will likely be exacerbated by the KCC expansion, it is recommended that KCC work with the County or the State to install “the necessary signage or asphalt marking” as well as other safe means to improve the intersection flow.

Section 1 Introduction

1.1 Project Background

At the request of Wilson Okamoto Corporation and the University of Hawai‘i Community Colleges, CSH conducted a CIA for the Kau‘a‘i Community College Rezone Campus Project. The proposed Project is located in Puhi, in the ahupua’a of Nawiliwili, Ni’ihau, and Ha’ikū, approximately two miles southwest of the County seat in Līhu‘e District, Kau‘a‘i Island, on TMK parcels: [4]-3-4-007:001, [4]-3-4-007:002, [4]-3-4-007:003, and [4]-3-4-007:006. Figures 1 and 2 show the Project area.

The UHCC proposes to amend the State Land Use Boundary to re-designate the entire 199-acre KCC campus from its existing land use classification of Agricultural District to Urban District. The Project consists of the re-designation of land, as well as the construction of new buildings, additions to buildings, and new parking. A Special Permit was granted by the State Land Use Commission in 1973 for construction of the college campus within an approximately 99-acre parcel situated within TMK [4]-3-4-07:003. Most of the additional approximately 100 acres (within TMK [4]-3-4-07:01, 002, and 006) are undeveloped, except for two Hawaiian Language Immersion schools, Pūnana Leo o Kaua‘i Pre-School and Kawaikini New Century Public Charter School.

The 199-acre campus, built on former sugar cane land, is owned by the State of Hawai‘i’s University of Hawai‘i. The KCC is a two-year public community college and the only public institution of higher learning on the island of Kau‘a‘i. It provides community services in addition to its educational mission. The KCC was originally established in 1929 as Kalaeloa Vocational School and over time, the institution has developed into a comprehensive community college. In 1999, a Long Range Development Plan for the college was published which provides guidelines for the development of the campus to accommodate a population of 3,000 full-time students. Currently, the KCC has a population of approximately 700 full-time students; thus, much of the planned campus development has yet to be implemented. The land use re-designation of the KCC campus from Agricultural District to Urban District would be more consistent with its developed character.

1.2 Document Purpose

The Project requires compliance with the State of Hawai‘i environmental review process (Hawai‘i Revised Statutes [HRS] Chapter 343), which requires consideration of a proposed Project’s effect on cultural practices. Through document research and ongoing cultural consultation efforts, this report provides information pertinent to the assessment of the proposed Project’s impacts to cultural practices and resources (per the Office of Environmental Quality Control’s Guidelines for Assessing Cultural Impacts). The impacts may include Traditional Cultural Properties (TCPs) of ongoing cultural significance that may be eligible for inclusion on the State Register of Historic Places. In accordance with Hawai‘i State Historic Preservation Statute (Chapter 6E) guidelines for significance criteria in the Hawai‘i Administrative Rules (HAR) §13–275 under Criterion E, an historic property determined to be significant shall:
Have an important value to the Native Hawaiian people or to another ethnic group of the state due to associations with cultural practices once carried out, or still carried out, at the property or due to associations with traditional beliefs, events or oral accounts—these associations being important to the group’s history and cultural identity.

The document is intended to support the Project’s environmental review and may also serve to support the Project’s historic preservation review under HRS Chapter 6E and HAR Chapter 13–275.

1.3 Scope of Work

The scope of work for this CIA includes:

1. Examination of cultural and historical resources, including Land Commission documents, historic maps, and previous research reports, with the specific purpose of identifying traditional Hawaiian activities including gathering of plant, animal, and other resources or agricultural pursuits as may be indicated in the historic record.

2. Review of previous archaeological work at and near the subject parcel that may be relevant to reconstructions of traditional land use activities; and to the identification and description of cultural resources, practices, and beliefs associated with the parcel.

3. Consultation and interviews with knowledgeable parties regarding cultural and natural resources and practices at or near the parcel; present and past uses of the parcel; and/or other practices, uses, or traditions associated with the parcel and environs.

4. Preparation of a report that summarizes the results of these research activities and provides recommendations based on findings.

1.4 Environmental Setting

1.4.1 Natural Environment

The Project area is located approximately 2 miles west of Līhu’e, mauka (inland) of Kaumuali‘i Highway in Nāwiliwili, Niumalu, and Haʻikū Ahupua‘a, Līhu‘e District, on the southeastern quadrant of the island of Kaua‘i. The parcel is fairly inland, approximately 3 miles from the southeastern coast. The Project area is exposed to the prevailing northeast trade winds, and receives up to 254 cm (100 inches) of rainfall annually (Giambelluca et al. 1986). The Project area lies on moderately sloping lands that range from approximately 300 to 400 feet above mean annual sea level.

The Project area is composed of five different soil types as depicted in Figure 4. These are Puhi Salty Clay Loam, O to 3 percent slopes (PnB), Puhi Salty Clay Loam, 3 to 8 percent slopes (PnC), Puhi Salty Clay Loam (PnD), Marsh (MZ), and rough broken land (rRR). The majority of the Project area is made up of PnC while PnD, MZ, and rRR soils are found along the western border of the property. The developed region of the school is composed of mostly PnB and PnC soils.

In pre-Contact times, vegetation in the Project area consisted of lowland mesic (relatively moist) forest, woodland and shrubland (Juvik and Juvik 1998). Most of this native ecosystem was disturbed and severely diminished by early historic activities, including commercial agriculture and ranching. According to Hammatt and Creed (1993), Land Commission documents describe middle 19th century Nāwiliwili Ahupua‘a as having native vegetation of hau and wauke (paper mulberry) (See Appendix B for scientific names).

1.4.2 Built Environment

Development within the Project area consists of school and administrative buildings for KCC, Pūnana Leo o Kaua‘i Pre-School, and Kawaikini New Century Public Charter School, and associated parking and roadways (Figure 2). The town of Puhi lies immediately to the south across Kaumuali‘i Highway.

Section 2 Methods

2.1 Archival Research

Historical documents, maps and existing archaeological information pertaining to the Project area were researched at the CSH library and other archives including the University of Hawai‘i at Mānoa’s Hamilton Library, the State Historic Preservation Division (SHPD) library, the Hawai‘i State Archives, the State Land Survey Division, and the archives of the Bishop Museum. Previous archaeological reports for the area were reviewed, as were historic maps and photographs and primary and secondary historical sources. Information on LCAs was accessed through Waihona ‘Aina Corporation’s Māhele Data Base (www.waihona.com) as well as a selection of CSH library references.

For cultural studies, research for the Traditional Background section centered on Hawaiian activities including: religious and ceremonial knowledge and practices; traditional subsistence land use and settlement patterns; gathering practices and agricultural pursuits; as well as Hawaiian place names and mo‘olelo, mele (songs), oli (chants), ‘ōlo‘o no‘eau (proverbs) and more. For the Historic Background, section research focuses on land transformation, development and population changes beginning in the early post-European Contact era to the present day (see Scope of Work above).

2.2 Community Consultation

2.2.1 Sampling and Recruitment

A combination of qualitative methods, including purposive, snowball, and expert (or judgment) sampling, were used to identify and invite potential participants to the study. These methods are used for intensive case studies, such as LCAs, to recruit people that are hard to identify, or are members of elite groups (Bernard 2006:190). Our purpose is not to establish a representative or random sample. It is to “identify specific groups of people who either possess characteristics or live in circumstances relevant to the social phenomenon being studied… This approach to sampling allows the researcher deliberately to include a wide range of types of informants and also to select key informants with access to important sources of knowledge” (Mays and Pope 1995:110).

We began with purposive sampling informed by referrals from known specialists and relevant agencies. For example, we contacted the SHPD, Office of Hawaiian Affairs (OHA), Kaua‘i/Ni‘ihau Island Burial Council (KNIBC), and community and cultural organizations in the Līhu‘e District for their brief response/review of the Project and to identify potentially knowledgeable individuals with cultural expertise and/or knowledge of the study area and vicinity, cultural and lineal descendants of study area, and other appropriate community representatives and members. Based on their in-depth knowledge and experiences, these key respondents then referred CSH to additional potential participants who were added to the pool of invited participants. This is snowball sampling, a chain referral method that entails asking a few key individuals (including agency and organization representatives) to provide their comments and referrals to other locally recognized experts or stakeholders who would be likely candidates for the study (Bernard 2006:192). CSH also employs expert or judgment sampling which involves assembling a group of people with recognized experience and expertise in a specific area (Bernard 2006:189–191). CSH maintains a database that draws on over two decades of established relationships with community consultants: cultural practitioners and specialists, community representatives and cultural and lineal descendants. The names of new potential contacts were also provided by colleagues at CSH and from the researchers’ familiarity with people who live in or around the study area. Researchers often attend public forums (e.g., Neighborhood Board, Burial Council and Civic Club meetings) in (or near) the study area to scope for participants. Please refer to Table 4, Section 6, for a complete list of individuals and organizations contacted for this CIA.

CSH focuses on obtaining in-depth information with a high level of validity from a targeted group of relevant stakeholders and local experts. Our qualitative methods do not aim to survey an entire population or subgroup. A depth of understanding about complex issues cannot be gained through comprehensive surveying. Our qualitative methodologies do not include quantitative (statistical) analyses, yet they are recognized as rigorous and thorough. Bernard (2006:25) describes the qualitative methods as “a kind of measurement, an integral part of the complex whole that comprises scientific research.” Depending on the size and complexity of the project, CSH reports include in-depth contributions from about one-third of all participating respondents. Typically this means three to twelve interviews.

2.2.2 Informed Consent Protocol

An informed consent process was conducted as follows: (1) before beginning the interview the CSH researcher explained to the participant how the consent process works, the Project purpose, the intent of the study and how his/her information will be used; (2) the researcher gave him/her a copy of the Authorization and Release Form to read and sign (Appendix C); (3) if the person agreed to participate by way of signing the consent form or providing oral consent, the researcher started the interview; (4) the interviewee received a copy of the Authorization and Release Form for his/her records, while the original is stored at CSH; (5) after the interview was summarized at CSH (and possibly transcribed in full), the study participant was afforded an opportunity to review the interview notes (or transcription) and summary and to make any corrections, deletions or additions to the substance of their testimony/oral history interview; this was accomplished either via phone, post or email or through a follow-up visit with the participant; (6) the participant received the final approved interview and any photographs taken for the study for record. If the participant was interested in receiving a copy of the full transcript of the interview (if there is one, as not all interviews are audio-recorded and transcribed), a copy was provided. Participants were also given information on how to view the report on the OEQC website and offered a hardcopy of the report once the report is a public document.

If an interviewee agreed to participate on the condition that his/her name is withheld, procedures are taken to maintain his/her confidentiality (see Protection of Sensitive Information below).
2.2.3 Interview Techniques

To assist in discussion of natural and cultural resources and cultural practices specific to the study area, CSH initiated semi-structured interviews (as described by Bernard 2006), asking questions from the following broad categories: gathering practices and mauka and makai resources, burials, trails, historic properties and wahi pana. The interview protocol is tailored to the specific natural and cultural features of the landscape in the study area, identified through archival research and community consultation. These interviews and oral histories supplement and provide depth to consultations from government agencies and community organizations that may provide brief responses, reviews and/or referrals gathered via phone, email and occasionally face-to-face commentary.

2.2.3.1 In-depth Interviews and Oral Histories

Interviews were conducted initially at a place of the study participant’s choosing (usually at the participant’s home or at a public meeting place) and/or—whenever feasible—during site visits to the Project area. Generally, CSH’s preference is to interview a participant individually or in small groups (two–four); occasionally participants are interviewed in focus groups (six–eight). Following the consent protocol outlined above, interviews may be recorded on tape and in handwritten notes, and the participant photographed. The interview typically lasts one to four hours, and records the—who, what, when and where of the interview. In addition to questions outlined above, the interviewee is asked to provide biographical information (e.g., connection to the study area, genealogy, professional and volunteer affiliations, etc.).

2.2.3.2 Field Interviews

Field interviews are conducted with individuals or in focus groups comprised of kūpuna and kama‘āina who have a similar experience or background (e.g., the members of an area club, elders, fishermen, hula dancers) who are physically able and interested in visiting the Project area. In some cases, field visits are preceded with an off-site interview to gather basic biographical, affiliation and other information about the participant. Initially, CSH researchers usually visit the Project area to become familiar with the land and recognized (or potential) cultural places and historic properties in preparation for field interviews. All field activities are performed in a manner so as to minimize impact to the natural and cultural environment in the Project area. Where appropriate, Hawaiian protocol may be used before going on to the study area and may include the ho‘okupu (offering) of pule (prayer), and oli. All participants on field visits are asked to respect the integrity of natural and cultural features of the landscape and not remove any cultural artifacts or other resources from the area.

2.2.4 Study Limitations

Cultural impact assessments are limited by the time frame and costs of the study as well as community participation. Often, researchers have little control over the time frame or budget available for a project but may have more discretion over study design and the methodologies employed to illicit public participation. Various factors may affect participation, such as the availability of contact information for community members during the recruitment process, the interest of the community in the project, and the commitment of participants through several phases of the interview process. For example, once an interview is scheduled and conducted, CSH engages the interviewee at least one more time (in person or by emails or phone calls) to gain their approval of the interview transcript or summary and to incorporate any changes they make. The voluntary nature of community participation in this process, combined with restraints on time and costs, often limits the number of interviews and the depth of information gathered during the interviews.

2.3 Compensation and Contributions to Community

Many individuals and communities have generously worked with CSH over the years to identify and document the rich natural and cultural resources of these islands for cultural impact, ethno-historical and, more recently, TCP studies. CSH makes every effort to provide some form of compensation to individuals and communities who contribute to cultural studies. This is done in a variety of ways: individual interview participants are compensated for their time in the form of a small honorarium and/or makana (gift); community organization representatives (who may not be allowed to receive a gift) are asked if they would like a donation to a Hawaiian charter school or nonprofit of their choice to be made anonymously or in the name of the individual or organization participating in the study; contributors are provided their transcripts, interview summaries, photographs and—when possible—a copy of the CIA report; CSH is working to identify a public repository for all cultural studies that will allow easy access to current and past reports; CSH staff do volunteer work for community initiatives that serve to preserve and protect historic and cultural resources (for example in, Lāna‘i and Kahului). Generally our goal is to provide educational opportunities to students through internships, share our knowledge of historic preservation and cultural resources and the State and Federal laws that guide the historic preservation process, and through involvement in an ongoing working group of public and private stakeholders collaborating to improve and strengthen the Chapter 343 environmental review process.
Section 3  Traditional Background

3.1 Overview

This section focuses on the traditional background of the study area which includes the ahupua’a of Nāwiliwili, Niumalu, and Ha’i’ikū, within the Līhu’e District. Traditionally, the Island of Kaua’i was divided into five moku: Halele’a, Kona, Ko’olau, Nāpali, and Puna. The traditional moku were replaced in the middle to latter part of the 19th century by the modern political district names of Hanalei, Kawaihau, Līhu’e, Kōloa, and Waimea. Under the old district classification, the ahupua’a of the study area were in the moku of Puna which became replaced by Līhu’e under the new classification.

3.2 Wahi Pana

A Hawaiian wahi pana, also referred to as a place name, “physically and poetically describes an area while revealing its historical or legendary significance” (Landgraf 1994:v). Wahi pana can refer to natural geographic locations, such as streams, peaks, rock formations, ridges, and offshore islands and reefs, or they can refer to Hawaiian divisions, such as ahupua’a and ‘ili (land section usually a subdivision of an ahupua’a), and man-made structures, such as fish ponds. In this way, the wahi pana of Niumalu, Nāwiliwili, and Ha’i’ikū, tangibly link the kama ‘aina of these ahupua’a to their past.

The source for place names in this section is the online database of Lloyd Soehren’s Hawaiian Place Names (2010) and Frederick B. Wichman’s Kaua’i, Ancient Place-Names and Their Stories (1998). Soehren compiled all names from mid-nineteenth century land documents, such as Land Commission Awards and Boundary Commission Testimony (BCT) reports. The BCT lists boundary points for many of the ahupua’a. The names of ‘ili ‘aina (land units within an ahupua’a) and ‘ili kī (land units awarded separately from a specific ahupua’a) are compiled from the testimony in Māhele Land Commission Awards, from both awards successfully claimed and from those rejected. Place names found by authors on United States Geological Service (USGS) and Hawai’i Survey Registered Maps (HSRM) were also added to the database. The Soehren database includes place name meanings from the definitive book on Hawaiian place names, Place Names of Hawai’i (Pukui et al. 1974). For cases in which Pukui et al. (1974) did not provide a meaning, Soehren suggested meanings for simple names from the Hawaiian Dictionary (Pukui and Elbert 1986).

Many sources suggest Nāwiliwili takes its name from the wili wili tree (nā is the plural article, as in “the wili wili trees” or “place of the wili wili trees”). According to Pukui and Elbert (1986), the wili wili (Erythrina sandwicensis) is a native leguminous tree whose flowers and pods are used for lei, and whose light wood was once used for surfboards, outriggers, and net floats. Handy (1940:67) suggests a kaona (hidden meaning) for the name Nāwiliwili based on a reduplication of the word wili, which means “twisted,” as in the meandering Nāwiliwili Stream.

According to Hammatt and Creed (1993:22, Land Commission documents indicate the shoreline location of several house lots in Nāwiliwili Ahupua’a was known as Papalīnahao. Kikuchi (1973) states this was the name of “an early chief,” but Hammatt and Creed (1993) suggests it may also have been an ‘ili or the konohiki (headman of of an ahupua’a land division under the chief). Papalīnahao was also the name of an ‘auwai (ditch, canal) on the south side of Nāwiliwili Stream, associated with LCA 3566 (Hammatt and Creed 1993).

Pukui et al. (1974) list but do not translate Kalapa’aki, defined simply as “a beach” in Līhu’e district. Pukui and Elbert (1986) define the word kalapa’aki (with a small “k”) as “double-yolked egg, Kaua’i.” Aside from its beach and landing, Kalapa’aki is probably best known in a traditional sense for its heiau of Ahukini and Ninini (and possibly another at Kīki’i). Ahukini has been translated as “altar [for many [blessings]]” (brackets inserted by Pukui et al. 1974), and this was also the name of a heiau in Kāne‘ohe, O’ahu. Ninini has been translated as “pour,” as in ninini wai (to pour water), while Kalapa’aki was also the name of a village located along the coast. According to Hammatt and Creed (1993:22), Land Commission documents demonstrate that the “village of Kalapa’aki” was synonymous with the “‘ili of Kunaih.”

Niumalu literally translates as “shade [of] coconut trees,” but the word malu can also refer to “protection” or “shelter.” Niumalu’s famous fishpond (also called erroneously Niamalu in some older publications) is traditionally known as either Alekoko (or “Alekoko) or Alakoko depending on the source. According to Kikuchi (1973), Pepee‘awa is yet another name for this loko. Pukui et al. (1974) do not include either of these names for the loko at Niumalu, but there are well-known mo’olelo references to a pair of brother and sister shark guardian spirits named Alekoko and Kahalalehua (see below).

Niumalu is known for a series of pu‘u along the high ridge forming the south side of Nāwiliwili Bay and stretching back to Hā‘upu. Kalanipu‘u (779 ft elevation), located right above the entrance to the harbor, translates literally as “the royal hill.” Traditionally, it is known as a pu‘u kīheia (“calling hill”) from which the locations and movements of fish were monitored. Further mauka (up the ridge) is Kepawa (1167 ft elevation) and Hōkūnui (1608 ft elevation). Pukui et al. (1974) translated the latter literally as “large star,” but nui can also mean “supreme” or “greatest.”

Pukui et al.’s (1974) entry for Hulē‘ia refers the reader to Hulē‘ia, described as an old name for Hulē‘ia Stream, which drains into Nāwiliwili Bay. The authors (p. 53) provide this additional intriguing information regarding the literal translation of Hulē‘ia: “pushed through (Kama ravished Pele here).” A survey map of the boundaries of Niumalu Ahupua’a from the middle 19th century (Ching et al. 1973:102) depicts a stream between Nāwiliwili and Hulē‘ia Streams identified as “Waikoni Stream.” Pukui and Elbert (1986) define waikō as “water with a very strong current.” This stream is today named Pu‘ali on current USGS maps. The broad delta of the Hulē‘ia river is 1.5 miles long and in the ahupua’a of Ha‘i‘ikū which is the ahupua’a south of Niumalu. Ha‘i‘ikū literally translates as, “speak abruptly or sharp break.”

Hamamā’ulu has been translated as “tired (as from walking) bay,” which may be related to mo‘olelo and ‘o’olelo no‘eau about the stingy people of this place. Kipu is the southern-most ahupua’a of the Puna District and literally translates as, “to hold back.” An interesting feature of the landscape in this area is “Hā‘upu peak. The ridge is associated with several well-known ‘o’olelo no‘eau about observing and predicting weather phenomena in and around Nāwiliwili (see below). Hā‘upu translates literally as “recollection,” and Pukui et al. (1974) also suggest it may be named for a demi-god named Pūhaka-o-Kau‘ai, also known as Hoary Head. The great native
Hawaiian historian Samuel Kamakau (1961) identified Hāʻupu as a Kauaʻi chief sent by Kaʻumualii to placate Kamehameha I on Oʻahu.

Līhuʻe, literally translated as “cold chill”, became the modern political name for the traditional moku of Puʻun. Historical documents suggest the name Līhuʻe was first applied to this area by Kaikioe (Governor of Kauaʻi) in the 1830s, perhaps after Kaikioe’s upcountry residence on the island. On the other hand, Nathaniel Emerson’s translation of the famous oli cycle of Hiʻaka and Pele mentions Līhuʻe with the other main place names of this area. It is also well known that Līhuʻe was a traditional settlement area near the current Schofield Barracks on Oʻahu.

Kīhōana, source of Nāwiliwili and Hulēʻia Streams, is associated with moʻoʻolelo of a boy named Lahi and his uncle; there are multiple possible meanings of the name Kīhōana (Pukui et al. 1974 list three: “lookout point,” “outer tapa,” or “best, superior.”

Puʻii is a village and stream in the Līhuʻe District that literally translates as, “blow.” Ka-hōli-a-Kāne (the sprouting [made] by Kāne), was a shark god who lived in a cave in Puhi.

3.3 Moʻoʻolelo

The presence of many moʻoʻolelo in the study area suggest that the place was once well-populated. The following section presents moʻoʻolelo from the region.

3.3.1 Nāwiliwili

The menehune were known to live in the Nāwiliwili area:

It was one of the favorite playgrounds of the tribe of Menehune, the little brown work-people who played as hard as they worked. And again it is William Hyde Rice, who, more than any other teller of stories, has kept for us old tales of this happy playground. (Damon 1931:395-396)

3.3.2 Ahukini and Ninini

According to Wichman (1998), Ahukini Heiau, located near the study area, was named for Ahukini-a-laʻa (who lived about A.D. 1250), one of three sons of Laʻa-mai-kahiki. An ancestor of the Kauaʻi chiefly lines, with a close relationship to Oʻahu. Ahukini was also aliʻi nui (supreme chief) of the Puna District of Kauaʻi (Wichman 2003).

In the 1920s, the Hawaiian legend chronicler Rice (1974), a life-long resident of Kauaʻi, published this moʻoʻolelo about Ahukini in the story of “The Goddess Pele”:

Two brothers of Pele, who had come from foreign lands, saw Lohiau’s body lying as a stone where the lava flow had overtaken him. Pity welled up in their heart and they brought Lohiau to life again. One of these brothers made his own body into a canoe and carried the unfortunate Lohiau to Kauai, where he was put ashore at Ahukini. (Rice 1974: 14)

3.3.3 Kemano and Kapīnōhu

Niumalu translates as “shaded coconut trees” and derives from the moʻoʻolelo involving Kemano and Kapīnōhu (Wichman 1998:57). Kemano, known for his ability to shoot a rock from his sling five miles and never missing a shot, is said to have resided on the Kona/Puna Districts boundary. During Kapīnōhu’s travels through the islands he was warned of Kemano’s challenges to travelers. Upon their meeting, Kapīnōhu agreed to a contest with Kemano, each betting his most prized possession. Kapīnōhu bet his spear and Kemano his sling. Kalalea peak, visible from their location, was the target. Kemano slung a rock that failed to reach Kalalea and fell near Anahola. Kapīnōhu’s spear shaded the coconut trees, which led to the naming of Niumalu, “dipped into the Wailua River, hence the name Waiehu, and finally pierces the mountain at Kalalea leaving a large hole that was visible until just a few years ago” (Wichman 1998:57).

3.3.4 Niumalu and Hulēʻia

Ching et al. (1973:28) recount, without attribution, the following moʻoʻolelo about the origins of ‘Alekoko Fishpond in Niumalu Ahupuaʻa:

Living in the valley between the Kipu River [Hulēʻia] and Niumalu resided Alekoko, the brother, and Ka-lala-lehua, the sister, young chiefs of handsome countenance, who agreed together to construct a fishpond each for themselves. The work on these fishponds was done by the menehunes, it was done in one night (during the night of akua, on which there was a full moon). Stones for the walls were gathered from as far away as the sea beach of Makali'i.

(The pond of the brother was built on one side of the river, while the pond of the sister was built in the opposite bend in the river below Kalaeakapapa Point. The menehune women built the sister’s pond, and the menehune men built the brother’s pond.) As dawn approached the menehunes fled to the mountains. (The sister’s pond was never completed.)

The sister, seeing her fishpond was incomplete, was grieved and wept at its unfinished state, while the brother rejoiced at the completion of his. The stones gathered for the sister’s pond still remain in the stream to this day.

Ching et al. (1974) describe moʻoʻolelo associated with Hulēʻia, suggesting its close pili (association) with Oʻahu:

The earliest mention of the [Niumalu] area is legendary dating to 1785. After Kahekili defeated Oahu a number of chiefesses of highest rank were killed. Kekelaokalani made her escape to Kauai bringing with her some Oahu soil, part of which she deposited at Hulaia [Huleia].

3.3.5 Menehune Fishpond

‘Alekoko Fishpond was named after Chief ‘Alekoko. Today, it is known as Menehune Fishpond and its walls are believed to have been built in one night by menehune (legendary race of small people who worked at night, building fishponds). Chief ‘Alekoko and his sister,
Chieftess Ka-lālā-lehua, requested the construction of the fishpond across the Hulē‘ia River. The menehune agreed to construct the 825-meter dirt stone-faced dam only if Chief ‘Alekoko and his sister promised to stay in the house and not watch the menehune at work. The two agreed. The menehune formed two lines stretching from the Wahiauwa Plains to the Hulē‘ia River and passed stone blocks through the night. Before morning, Chief ‘Alekoko could no longer just listen to the menehune at work and the shifting of the stone. He made a small hole in the house’s grass thatch and peeked through. The menehune dropped their stones, washed their hands, and left the fishpond incomplete as a reminder that promises are not to be broken. The chief’s name and that of the fishpond, ‘Ale-koko, translates as “rippling blood” and is said to refer to the bleeding hands of the Menehune from passing the rough stone that they did not have time to polish (Wichman 1998:57-58). The pond was later completed by Chinese (Rice 1923:37).

### 3.3.6 Kuhiau and Paukini

Several historic documents discuss the close connection between Kuhiau Heiau, reportedly the largest heiau in Kaua‘i, and the pōhaku (rock) known as Paukini, which marks the ahupua‘a boundary between Nāwiliwili and Kalapakī. Damon (1931:393) writes:

> [Kuhiau Heiau] … was in its day the largest and most far-famed temple on the island. Below it, in the bay, is still the rock called Paukini, which was said to be its companion or sister heiau, and was probably also the home of the kahuna [priest], or priest, of Kuhiau. In ancient times this rock was connected with the shore near the site of the former boat landing.

### 3.3.7 Kalanipu‘u

This pu‘u kāhea directly above Nāwiliwili Bay is associated with mo‘olelo about Pele’s older sister Nā-make-o-Kaha‘i, who planted ‘awa (kava) and mai`a (bananas) upon it (Pukui et al. 1974).

### 3.3.8 Kilohana

Damon (1931) described Kilohana as a famous nesting place of ‘uwa‘u (dark-rumped petrel), a chiefly delicacy. The top of Mauna Kahili, the peak to the west of Kilohana, was a sacred burial place of Hawaiian chiefs. Kilohana is also associated with the menehune:

> One of their favorite play places was the little hill of Po-po-pii, Rounded-for climbing-up. This they had themselves built on the top of Kilohana and never were they more delighted than when they could climb it over and over again for the sheer fun of rolling down its sides, frolicking and laughing as they rolled. It was such a sport that their gleeful shouts carried clear across the Kauai channel to the southeast and startled birds at Kauhau on the island of Oahu.

> Once, a Menehune called Ka-uki-uki, The-man-of-wrath, boasted that he could climb to the top of this hill at Kilohana and snare the legs of the moon. Ridiculed by his fellow tribesmen, he valiantly attempted to make good his boast, and was turned into a stone when he failed of achievement. For many years this stone was recognized by Hawaiians as a kupua, or demigod, and offerings of lehua-

### 3.3.9 The Winds of Kaua‘i

One of the oldest and most famous mo‘olelo in Hawaiian oral tradition describes the travels and exploits of Pele, the Hawaiian volcano goddess, and one of her sisters, Hi‘iakaikopiopele (more commonly known simply as Hi‘iaka). Pele, in her lengthy oli of literally hundreds of songs are attributed to Lahi (warriors) who come into the mountains. (Damon 1931:395-396)

Beckwith (1970:331) *Hawaiian Mythology* recounts Rice’s (1923) telling of the “Wainiha Story,” a mo‘olelo about bird hunters who lure a giant to his death; and koa (warriors) who come to avenge the giant’s murder only to be thrown to their deaths by the young bird hunter Lahia:

> Lahia and his uncle Kane-alohi live in the Wainiha valley and go up to Kilohana to catch uwa‘u birds for food, a kind of bird that seeks its nest in the cliffs by day, blinded by the light. Their first enemy is a “giant” whom they lure into a hole and kill. Their next is the chief with “four hundred soldiers who objects to the depredations among the birds. They sit on a rock eating birds and watching the rippling of the water below for men approaching. The boy hides at the pass and throws all four hundred men over the cliff. The chief comes last and, recognizing Lahia as his own son, invites him to the village. He prepares a trap, but this boy discovers and, burning down the house with his treacherous father and followers within, takes over the rule of the land.

### 3.4 Mele (Songs)

#### 3.4.1 Mele associating Nāwiliwili with the mokihana (*Pelea anisata*) flower

Bowers (1984) compiled the lyrics (in Hawaiian and English) to over two dozen mele about Kaua‘i, several of which mention Nāwiliwili, Līhu‘e, and Niumalu. These mele are attributed to a variety of composers (sometimes there is no specific person listed); most of these songs were...
probably written in the 20th century, based on their style (e.g., the second song below uses the term “uapo,” also spelled in some sources as “uapao,” defined by Pukui and Elbert 1986 as a historically-introduced (i.e., “pidgin”) term for “wharf”). Regardless of their age—whether they are decades or centuries old—these songs are cherished by many people, and speak to a great love for the beauty of Nāwiliwili, in particular.

The following song (Bowers 1984:3), attributed to “Hanaui Kahalewai’s Trio with the Waikiki Serenaders” (Kamehameha School Hawaiian Music Collection Record No. 574), associates Nāwiliwili with the nearby Hā‘upu and the mokihana flower:

Kaulana ma nei a‘o Nāwiliwili
He nani nō Ninini
He nani mōlī nō
Ka pua mokihana ‘ea
Ka pua nani o Kaua‘i
Ho‘ohihi ka māna‘o ʻī Kaua‘i
Eō mai kō oleo aloha
Kaulana ma nei a‘o Nāwiliwili
He nani mōlī nō

Another mele entitled “Kaulana ka inoa a‘o Kaua‘i” (Bowers 1984:2), attributed to a recording (Music of Old Hawaii) by the famous Sons of Hawai‘i, again mentions the mokihana:

Kaulana ka inoa a‘o Kaua‘i
Ku‘u lei mokihana poina ‘ole.
Ku kilikila ‘oe Wai‘ale‘ale
Me ka nau nani Kaua‘i
La‘ue‘a makana ka‘u aloha
Me ka uapo nani a‘o Ninumalu
E pi‘ina i ke ‘ike a‘o Kipu
Me ka wai‘a unapapua e kaulana nei.
I aloha ia noa o Waima‘e
Me ke one kani ia a‘o Nohili
Pu‘ili kou aloha ma ku‘u poli
Homehone kou leo me he ipo ala.
Hea aku no au e o mai ‘oe
Lei ana Kaua‘i ka mokihana

The mokihana is a native (endemic) tree, found only on Kaua‘i, considered traditionally to be a variety of ‘alani (a general term for ci trus tree). The lei made of mokihana is a traditional symbol of the island of Kaua‘i. According to Abbott (1992), the mokihana were used to make the most treasured and rare seed lei in the Hawaiian islands.

3.4.2 Līhu‘e

The song, “Līhu‘e” speaks of the rustling leaves of Ninumalu:
Aloha ‘ia no au Līhu‘e
Beloved is Līhu‘e
I ka ne‘e mai a ka ua Paupili
When the Paupili rain comes.
Ua pili no au me ku‘u aloha
I cling to my beloved
Me ke kau nehe mai au Ninumalu.
Under the soft rustling [leaves] of Ninumalu [Clark 1990:2].

3.5 Heiau

Historic maps show that only one heiau, Kuhiau Heiau, existed along the shoreline of the study area (Figures 5 and 6) in Nāwiliwili Ahupua‘a. This heiau is thought to be associated with its sister heiau, Paukini Rock, which marks the boundary between Nāwiliwili and Kalapaki. Three other heiau nearby, as shown in Figures 5 and 6, were located in Kalapaki Ahupua‘a, directly north of Nāwiliwili. These include remnants of an unknown heiau at Kūki‘i Point, and two heiau along rocky points at Ninini and Ahukini. Physical evidence of these heiau have been obliterated by historic activities and more recent development. Nevertheless, the sacred nature of the landscape in and around these heiau, are still appreciated.

3.5.1 Kuhiau Heiau and Paukini Rock

Kuhiau Heiau, also known as SIHP No. 99, was recorded in Bennett’s (1931) archaeological survey in the late 1920s. Figure 5 shows that Kuhiau Heiau was located near the courthouse, near the ocean. Two decades prior to Bennett’s study, Thrum had described this heiau as already “long since destroyed” (Bennett 1931:124). According to Thrum:

[a] large paved heiau, whose enclosure covered an area of about four acres…The rock Paukini, now separated from but formerly connected with the shore, was where the kahuna lived. This is said to have been the largest and most famous on Kauaʻi in its day. (Bennett 1931:124)

Damon (1931) describes Kuhiau Heiau’s close connection with Paukini, the pōhaku that marks the boundary between Nāwiliwili and Kalapaki. He writes:

[Kuhiau Heiau] … was in its day the largest and most far-famed temple on the island. Below it, in the bay, is still the rock called Paukini, which was said to be its companion or sister heiau, and was probably also the home of the kahuna, or priest, of Kuhiau. In ancient times this rock was connected with the shore near the site of the former boat landing. Damon (1931:393)

3.5.2 Heiau at Kūki‘i Point, Ninini and Ahukini

An 1881 map of Nāwiliwili Harbor in Figure 5, depicts “remnants of an ancient heiau” near Kūki‘i Point. Ninini Heiau (SHIP No. 100) and Ahukini Heiau (SHIP No. 101) were both
described by Bennett as totally destroyed. According to Thrum (Bennett 1931:125), Ahukini was “[a] heiau of medium size; foundations only now remain.”

Figure 5. An 1881 map of Nāwiliwili Harbor by Lt. George G. Jackson, showing remnant of ancient heiau near Kūki'i Point; also note the area called “Kuhiau” near the courthouse (left-hand side), previous location of Kuhiau Heiau

Figure 6. Map showing heiau along the coastal areas within and near the study area (adapted from Damon 1931)

3.6 Freshwater Resources and Fishponds

3.6.1 Streams

Nāwiliwili and Hulē’ia Streams originate on the slopes of Kilohana Crater, and (Hulē’ia only) upon more distant Wai‘ale‘ale. The meandering streams of Nāwiliwili and Hulē’ia have formed extensive natural (alluvial) terraces along their lengths. These abundant terraces consist of small level areas formed along major meanders that could be planted with relatively little preparation of the landscape. Higher terraces were irrigated by diverting some of the stream flow, which was carefully managed by community leaders or konohiki. It is likely that there were once other smaller drainages between the Nāwiliwili and Hulē’ia Streams and that native Hawaiian planters used and modified these as ‘auwai. Most of these smaller drainages have been changed beyond recognition by historic and modern land use and development. However, it appears that some of these smaller streams were still flowing into the early 20th century. For example, two smaller streams, Koena‘awa nui and Koena‘awa iki, are identified in Land Commission documents as draining into Kalapaki Bay (Figure 7).
Figure 7. Kalapaki Bay, showing two streams with red Xs marking their mauka locations and outlets to Kalapaki Bay; Koena’awa-nui Stream is on the left (Source: Kauai Historical Society n.d.)

3.6.2 Fishponds

3.6.2.1 Menehune Fishpond/ Niulului Fishpond/ ‘Alekoko Fishpond

Menehune Fishpond, also known as Alakoko in Land Commission documents and alternatively, Alekoko or ‘Alekoko in other sources (Kikuchi 1987), was first described and mapped scientifically by Bennett in the late 1920s. According to Handy and Handy (1972:426), Bennett incorrectly named this site Niulului (Niululu) Fishpond probably due to the proximity of nearby Niululu Ahupua’a. It is located along the Hule‘ia Stream near its mouth to Nawiliwili Bay. Kikuchi (1973, 1987) considered it a loko wai (fresh-water pond or lake) class fishpond because of its inland location along a meander of the Hule‘ia Stream; other sources (perhaps inaccurately) consider it a loko kua‘apā (fishpond made by building a wall on a reef). The overall area of the pond has apparently varied through time from as small as 32 acres to as large as 39 acres. Figure 8 shows the fishpond in 1912 and by 1934, it was still in use (Figure 9). Menehune Fishpond was placed on the National Register of Historic Places in 1973 as SHIP No. 50-30-11-501.

Bennett (1931:124) describes the dimensions and construction features of Niululu [sic] Fishpond:

The Niululu [sic] fish pond consists principally of a stone-faced, dirt wall that runs for over 900 yards and cuts off a large bend in the river for use as a fish pond. It is today [in the early 1930s] used both for fish and ducks. Cement walls and iron gates have obscured any old method of controlling the water or the fish.

This fishpond is associated with the mo’olelo of the brother and sister shark guardian spirits named ‘Alekoko and Kalalelehue, who were said to have given the task of construction to the menehune (Kaiwi 1921). According to Rice (1974), it is said the menehune failed to completely finish their task, thus leaving a small opening that was later finished by people who did an inferior job of it; this inferior stone-work being still visible in historic times. See Section 3.3.5 for a more detailed description of the mo’olelo associated with the fishpond.

Figure 8. Menehune Fishpond, 1912 (Bishop Museum; Photographer, Ray Jerome Baker)
3.7 Settlement and Subsistence

The ahupua’a of Nāwiliwili, Niiumalu, and Ha’ikū were permanently inhabited and intensively used in pre-Contact and early historic times, based on archaeological, historical, and oral-history documentation. The archaeological record of early Hawaiian occupation in this area indicates a date range of c. A.D. 1100 to 1650 for pre-Contact Hawaiian habitations (Walker et al. 1991). A radiocarbon date of A.D. 1170-1400 was obtained from excavated sediments near the mouth of Hanamā’ulu Stream, north of Nāwiliwili. Mo’olelo associated with the study area are also plentiful suggesting early settlement of the area by a viable Native Hawaiian population. The archaeological record of early Hawaiian occupation in this area indicates a date range of c. A.D. 1100 to 1650 for pre-Contact Hawaiian habitations (Walker et al. 1991). A radiocarbon date of A.D. 1170-1400 was obtained from excavated sediments near the mouth of Hanamā’ulu Stream, north of Nāwiliwili. Mo’olelo associated with the study area are also plentiful suggesting early settlement of the area by a viable Native Hawaiian population. The abundance of water and the presence of distinguished fishponds along the coast and water systems is testament to early settlement.

The coastal areas were the concentration of permanent house sites and temporary shelters, heiau, including ko’a (shrine) and kū’ula (both types of relatively small shrines dedicated to fishing gods), numerous trails, and fishponds. There were numerous house sites and intensive cultivation areas within the valley bottoms of Nāwiliwili and Hulē’ia Streams. According to Hammatt and Creed (1993:22), Land Commission documents indicate the shoreline location of several house lots in Nāwiliwili Ahupua’a, known as Papalinahoa. Kikuchi (1973) states this was the name of “an early chief,” but Hammatt and Creed (1993) suggest it may also have been the name of an ‘ili or of the konohiki. Papalinahoa was also the name of an ‘auwai o Kaua‘i Island, in the south side of Nāwiliwili Stream, associated with LCA 3566 (Hammatt and Creed 1993). Before the historic era, there was a village at Kalapaki (probably between Kalapaki Beach and Ahukini), and another, likely larger, at Nāwiliwili to the southwest. Another village was located near the mouth of the Hanamā’ulu Stream.

Handy describes the study area in 1935 as a land with many lo‘i and good fishing. Handy (1940:67) describes Nāwiliwili Valley in his chapter on the main kalo (taro) growing locations in Puna, Kaua‘i:

For 3 miles inland from the sea the Nāwiliwili River twists (wāiliwili) through a flat valley bottom which was formerly all in terraces. Inland, just above the bay, three Hawaiian taro planters cultivate wet taro in a few small terraces. Most of the land is [now] in pasture. There are one small cotton plantation and several small garden plots. For about a half mile below and a half mile above the mill the valley is mostly filled with plantation camp and other structures, with many small clumps of bananas, some garden plots, and a few old breadfruit trees. The old terrace area extended half a mile up into the small valley that opens out northwest just above the mill. Approximately the last mile of flat valley bottom, before the river beds becomes a narrow gulch, used to be in terraces but is now pasture and ranch land.

Handy describes Niiumalu Ahupua‘a as having among the best fishing grounds on the island of Kaua‘i. Handy relates:

Niumalu is a tiny ahupua‘a, a mere wedge between Nāwiliwili and Haiku, but it was, and is, one of the most important fishing localities on Kauai, and contained a fairly large area of terraces along the lower mile of Puali Stream. There were a few terraces at the lower end of Halehaka Stream where it joins the Puali about 1.5 miles inland. (1940:67)

Handy and Handy (1972:427) additionally note:

….southward of the Huleia River and harbor [Niiumalu] … had fairly large lo‘i areas at the seaward ends of its two streams, Puali and Halehaka. Niiumalu was noted in the past, as it is today, for being one of the most important fishing localities on Kauai.

Hulē‘ia Valley, which is defined by Kīpū Ahupua‘a (south bank) and Ha‘ikū Ahupua‘a (north bank), is also described:

[Ha‘ikū] contains the broad delta plain of the Huleia River, 1.5 miles long and about a half wide at its widest point. This area was all in terraces. One large section is now in rice, and four small terraces belonging to four Hawaiian taro planters are in wet taro… Small terrace areas existed along the course of the
Huleia for at least 2.5 miles above the delta area… Where the highway crossed the Huleia River at Halfway Bridge, there are groups of old terraces, old breadfruit, and mango trees, indicating that here was a group of *kuleana* something over 6 miles inland form the mouth of the river. (Handy 1940:66)

Ching et al. (1973; Appendix 6) list kapu (prohibited) resources for the ahupua’a of the study area (Table 1) which were gleaned from Land Commission documents on these areas. These were akule for Nāwiliwili and Niunalu Ahupua’a and ‘opihi (limpet) for Ha’ikū Ahupua’a. Kapu wood was koa for Nāwiliwili, ‘ōhi’a for Niunmalu, and none was listed for Ha’ikū.

Table 1. Kapu resources mentioned in Land Commission documents from the ahupua’a of Nāwiliwili, Niunalu, and Ha’ikū (source: Ching et al. 1973)

### Section 4 Historical Background

#### 4.1 Overview

This section briefly summarizes the historical background of the study area from the time of the arrival of Captain Cook in Hawai’i in 1778 or the early post-Contact period, to modern times.

#### 4.2 Early Post-Contact Period

The first written accounts of Kaua’i are from travelers, missionaries, and surveying expeditions. Missionary accounts of the first half of the nineteenth century provide the majority of the early written records for this region of Kaua’i. Hiram Bingham’s 1820s map (Figure 11) of the island identifies the place names Hulâia [Hulē’ia], Niunaru [Niunalu], Haitu [Ha’ikū], and Tipu [Kīpū].

Damon (1931:401) wrote about Bingham’s 1824 observations from his memoir, *A Residence of Twenty-One Years in the Sandwich Islands*, published in 1847. According to Damon, Bingham described the lands near Kilohana, a summit and crater in the Līhu’e District near the Project area, as “finer country than the western part of the island.” He describes:

In 1824, when walking around the island from Waimea to counsel the people after the wreck of The Cleopatra’s Barge, Rev. Hiram Bingham crossed from Hanapēpē, as has been seen, over the old upland trail back of Kilohana, and wrote of it as “a country of good land, mostly open, unoccupied and covered with grass, sprinkled with trees, and watered with lively streams that descend from the forest-covered mountains and wind their way along ravines to the sea, —a much finer country than the western part of the island.”

In the 1830s, another missionary, Rev. Peter Gulick, was living on Kaua’i at Waimea and Kīloa. He made the following observation about the kind of provisions one could find in Hanamā’ulu, a place immediately north of the study area, at the time:

…The governor [Kaikioewa] reached Hananamu in his canoe just as we entered on horse back… This is the governor’s custom, when he travels. A man is sent before to give notice that provision may be made, at the different stopping places, for him and his train: which frequently amounts to two hundred [people]… I with a few natives had a comfortable house at Hananamu. The inhabitants brought us fish fresh from the ocean, fowls, taro, potatoes, and a pig, all except the fish roasted or baked in the ground… A youth who went with me for the purpose prepared my food. My bed, which was made with mats, was covered with ten tapas; these were the bed clothes which according to custom were presented to the guest for whom they were spread. (Damon 1931:360)
By 1830, the sandalwood trade had waned and the whaling industry was just beginning. At the same time, commercial agriculture was being established on Kaua‘i. When the first crop of sugar cane was harvested at Kōloa, the king himself commanded that portions of his private land be planted in cane. In 1839, Governor Kaikioe’wa began farming the slopes of Nāwiliwili Bay where there was more rain than at Kōloa (Dorrance and Morgan 2000). He also built a house and church in Nāwiliwili Ahupua‘a.

Donohugh (2001:94) describes Governor Kaikioe’wa’s attempt to establish the first commercial sugar mill and plantation in Līhu‘e in 1839:

During the early decades of Kōloa Plantation, other sugar plantations had started up on the island. One was to result in the ascendency of Līhu‘e to the principal town and seat of government on Kaua‘i, replacing Wailua. When Kaikioe’wa was appointed governor, he located his home in what is now the Līhu‘e District. He planned to grow sugar cane but died in 1839 before his plans could be realized. Kaikioe’wa was responsible for the name [Līhu‘e], which means “cold chill,” the name of his previous home at a higher and chillier altitude on O‘ahu.

Donohugh (2001:94) describes observations by James Jarves, who passed through Līhu‘e in 1838:

… [He] found only a church built by Kaikioe’wa and a few grass houses. He commented the governor had selected Hanamā‘ulu Bay as the harbor, “entirely overlooking the fact that it opened directly to the windward.”

As mentioned by Donohugh (2001:4), Kaikioe’wa died in 1839 soon after the start of the sugar plantation, which lasted only one year and closed down in 1840 (Dorrance and Morgan 2000).

Around this time, perhaps as late as 1842, the first missionaries settled in the Līhu‘e area led by Dr. and Mrs. Thomas Lafon, and assisted by Rev. and Mrs. Peter Gulick from Kōloa. Schools were opened, and some missionaries attempted to grow cotton as the first intensive cash crop, but were unsuccessful (Damon 1931).

An account of the United States Exploring Expedition, which passed through Līhu‘e in 1840, talks about the area, but also mentions the forced removal of kama‘īna from the coastal areas:

At noon they reached Lihui, a settlement lately undertaken by the Rev. Mr. Lafon, for the purpose of inducing the natives to remove from the sea-coast, thus abandoning their poor lands to cultivate the rich plains above. Mr. Lafon has the charge of the mission district lying between those of Koloa and Waioli. This district [Līhu‘e] was a short time ago formed out of the other two.

The principal village is Nāwiliwili, ten miles east of Koloa. This district contains about forty square miles, being twenty miles long by two broad. The soil is rich: it produces sugar-cane, taro, sweet-potatoes, beans, etc. The only market is that of Koloa. The cane suffers somewhat from the high winds on the plains.

The temperature of Lihui has much the same range as that of Koloa, and the climate is pleasant: the trade-winds sweep over it uninterruptedly, and sufficient...

Historical Background

4.3 The Māhele (1848)

Prior to 1848, all land belonged to the akua (gods), held in trust for them by the paramount chief and managed by subordinate chiefs. In the mid-1800s, Kamemeha III decreed a division of lands called the Māhele, which divided land for private land ownership in Hawaiian society (Chinen 1958). In 1848, lands were divided into three portions: crown lands, government lands, and lands set aside for the chiefs. Individual plots, called kuleana (Native Hawaiian land rights) awards, were granted within these divided lands to native inhabitants who lived on and farmed the lands they reserved for their lands, usually about one-third the value of any unimproved lands. Awardees usually “returned” a portion of the lands awarded to pay the commutation fee for the lands they “retained.” The returned lands usually became government lands (Chinen 1958:13).

The Kuleana Act was legislated in 1950 allowing maka‘āinana (folk; commoners) to own land parcels which they were currently and actively cultivating and/or residing. In theory, this ‘set aside’ hundreds of thousands of acres as potential kuleana parcels which led to about 10,000 claimants obtaining approximately 30,000 acres. The konohiki, 252 chiefs, divided up about a million acres. Many Hawaiians were disenfranchised by these acts (Cordy et al. 1991).

4.3.1 Nāwiliwili Ahupua‘a

Victoria Kamāmalu was awarded over two thousand acres of Nāwiliwili Ahupua‘a (LCA 7713), along with much of Niulimu, Ha’iikū and Kāpū, as well as Kalapaki and Hanamā‘ulu. In addition to Kamāmalu’s large award at Nāwiliwili, there were many smaller kuleana awards. Within the ahupua‘a of Nāwiliwili, there were 33 LCAs of which 20 were awarded (Waihona ‘Aina 2000). A study by Hammat and Creed (1993) describes LCAs in Nāwiliwili Valley:

Within the valley floor and adjacent to the alluvial plain [in Nāwiliwili] … are 14 land Commission Awards for which there are testimonies available in the Land Commission records … The awards vary in size between one to two acres and are generally around one acre. The majority of land recorded is for lo‘i (wetland agriculture) but kula (dryland plots) are present as are a few house lots.

In all there are 54 lo‘i recorded. Each award is generally two to three lo‘i plots. The largest award comprised eight lo‘i; a single award consisted of one lo‘i. All awards contained lo‘i and nine of the fifteen total awards had kula lots. Without exception, the nine awards containing kula mention only one kula per award. This is of interest because it shows that the alluvial plain was not entirely dedicated to wetland planting and that a small kula lot was essential for subsistence agriculture.

Some awards at Nāwiliwili mention house lots along the shoreline. Figure 12 depicts Nāwiliwili Valley with its many lo‘i near the ocean.

According to Kikuchi (1973), Nāwiliwili was home to at least five other fishponds in addition to Alekoko (Menenchu) Loko. The names of two of these were unknown, but the others are Kalalalehua, Lokopo‘ono and Papalinaho. LCA documents identify the konohiki for Nāwiliwili at the time of the Māhele as Daniela Oleloa.

4.3.2 Niulimu Ahupua‘a

As described earlier, Victoria Kamāmalu was awarded much land in Niulimu Ahupua‘a. According to Ching et al. (1973), there are 21 LCAs for Niulimu which contained 80 lo‘i. Many lo‘i and kula lands are described as being in the same ‘apa‘a, a pattern that is common to Puna District of Kaua‘i, but not common elsewhere in Hawai‘i. Perhaps maka‘āinana were creating kula lands by piling up soil adjacent to wet lands. Throughout most of the Hawaiian Islands, kula lands refer specifically to dry sloping lands between the mountains and the sea. However, maka‘āinana were referring to lands in valley bottoms as kula in the Puna District of Kaua‘i. Some claimants describe their lands as being trampeled by cattle.

Niulimu had seven other ponds in the vicinity of the well-known Alekoko (Menenchu) Loko. Survey notes (Ching et al. 1973:105) for Niulimu Ahupua‘a state that “[t]he fishing privilege...
[sic] of Huleia River belongs to the Ahupuaʻa of Niumalu from its mouth to the Road crossing it to Kīpū Kai.”

Figure 12. Taro terraces in Nāwiliwili Valley (Kauai Historical Society, n.d.)

4.3.3 Haʻikū Ahupuaʻa

Waïhona ‘Aina (2000), lists 41 LCAs for Haʻikū of which 37 were awarded. According to Ching et al. (1973), Haʻikū has many separate ʻili and lists 237 separate loʻi within the ahupuaʻa. Claimants describe loko or kiowai. Puʻali (Figure 13) is the current USGS map name for the stream between Nāwiliwili and Hulē’ia Streams; this drainage is also named Waikonui on a Land Commission-era survey map.

Figure 13. Taro cultivated in the vicinity of Puʻali Stream in 1905 (Kauaʻi Historical Society, 1905)

4.4 Mid Nineteenth to Twentieth Century

4.4.1 Population

A map by Coulter (1971) indicates that the population of Kauaʻi circa 1853 concentrated along the coastal areas. Within the Puna District, the map indicates an estimated population of approximately 1,700 people in the vicinity of Nāwiliwili Bay (Figure 14).

Figure 14. Map showing population estimate for Kauaʻi in 1853 (adapted from Coulter 1931:16)
### 4.4.2 Changing District Names

The traditional moku or districts of Kaua‘i were replaced in the middle to latter part of the 19th century by modern political district names (Figure 15). Given its economic importance to the island, Līhu‘e became the modern district name and includes the ahupua‘a of the proposed Project, previously under the Puna District. Rice describes:

The name, Lihue, applied in a larger sense, included the districts of what are now Kawaihau and Lihue, reaching from Anahola to the Gap, being made so by law in about the year 1861, according to early court records, but some years later divided into the present two districts. The large district was also known as the Puna district, and is found on early maps as such. It was August thirteenth, 1880, that the district was divided into two, by act of Legislature with King Kalākaua’s signature... Lihue, in a local sense, and from which the name of the district was derived meant only that little portion of land upon which the present village, as consisting of bank, post office and store, now stands. (Rice 1914:46)

![Figure 15. 1936 map of the political districts of the County of Kaua‘i, Territory of Hawai‘i](image)

### 4.4.3 Commercial Sugar Cane Agriculture

As Western dominance grew in Hawai‘i, sugar came to dominate economic, political, and social life in the islands. In 1835, commercial cultivation of sugar began at Kōloa on Kaua‘i which created needs for a larger supply of indentured, contract laborers (Riznik, 1999). Plantations were established throughout Hawai‘i, but by the beginning of the mid-nineteenth century, reduced Native Hawaiian populations could no longer meet plantations’ needs for a constant supply of cheap labor. Thus, foreign labor was imported by plantations particularly from Japan, China, and the Philippines (Riznik, 1999).

#### 4.4.3.1 Lihue Plantation

Following the Māhele and the availability of large tracts of land for sale, Lihue Plantation “was established on the site Kaikio‘ewa had chosen, and the cluster of homes and stores around it was the start of the town of Lihue.” (Donohugh 2001:94). Situated adjacent to the Project area, Lihue Plantation began as a partnership between Henry Augustus Pierce, Judge William Little Lee and Charles R. Bishop in 1849 (Damon 1931). The first 3,000 acres were purchased in Nāwiliwili and an additional 300 acres were purchased in Ahukini in 1866. The Lihue Plantation became the most modern plantation at that time in all Hawai‘i. It featured a steam-powered mill built in 1853, the first use of steam power on a Hawaiian sugar plantation. The ten-mile-long Hanamā'ulu Ditch was also built in 1856 by plantation manager, William H. Rice, the first large-scale irrigation project for any of the sugar plantations (Moffatt and Fitzpatrick 1995:103).

Hawaiians made up the labor force of Lihue Plantation, and many built their homes on the land surrounding the mill (Figure 16). Planting began in 1850 and the first crop was grown in 1853 (Joesting 1984:173). From 1854 to 1862, under the management of William Harrison Rice, the plantation invested heavily in irrigation ditch infrastructure known initially as “Rice’s Folly” (Krauss and Alexander 1984:67). George Norton Wilcox, son of the ABCFM teacher Abner Wilcox, was raised on Kaua‘i and observed Rice’s successful utilization of irrigation. Wilcox attended Yale University and studied engineering and surveying, earning a certificate in 1862. Upon returning to Kaua‘i in 1863 he soon began work as a surveyor for Judge Herman Widemann, owner of the Grove Farm Plantation at the time.

![Figure 16. Lihue Plantation Sugar Mill, 1941 (U.S. National Archives and Records Administration)](image)
Commercial sugar cane agriculture continued in Lihu’e until 2000, when Lihue Plantation and the Kekaha Sugar Co. finally shut down and terminated approximately 400 workers. The nearby Kīpū Plantation, founded in 1907, operated until 1942 (Dorrance and Morgan 2000).

Lihue Plantation remained a vibrant and successful commercial operation throughout most of the 20th century, in part, because of a continued interest in technological innovation. For example, in 1912, Lihue Plantation installed two 240-kilowatt generators above the cane fields on the slopes of Kilohana Crater, becoming one of the first hydroelectric power producers (along with Kekaha, Kaua‘i) in the Hawaiian Islands (Dorrance and Morgan 2000).

First-hand recollections about life in the early 20th century plantation days of Lihu’e are documented and archived at the Grove Farm Museum. The following example, which appeared in the Honolulu Advertiser on April 24, 2000, describes the struggles of 78-year-old Tadeo Suenori to keep his house at the so-called Rice Camp (TenBruggencate 2000:B-1). Mr. Suenori was born and lived his whole life at this house, which was previously one of a total of 18 plantation cottages on a 14-acre parcel owned by Wm. Hyde Rice, Ltd. When the landowner began moving people out in 1989 to sell the property to the museum, Mr. Suenori refused to vacate: “They never evicted me. I said, “I ain’t moving out” (TenBruggencate 2000:B-1). He was eventually allowed to rent the place for the remainder of his life, but had wished to restore and rehabilitate the old Rice Camp. Mr. Suenori shared his concerns:

He is concerned about the environment, and particularly about pollution in Nāwiliwili Stream, which runs below his house. It was clean when he and his childhood friends skinny dipped there while the U.S. stock market was crashing in 1929. It was the place where they caught prawns and ‘o‘o pu‘u and frogs...Today the streams runs brown and smells bad. Only a few frogs and mosquito fish live there. That angers Suenori. He wants someone to clean it up. (TenBruggencate 2000:B-2)

4.4.3.2 Grove Farm Plantation (1864-1974)

Grove Farm Plantation, which was named after an old stand of kukui trees, was established by Warren Goodale after acquiring the land in 1850. He sold the property the same year to James F. B. Marshall for $3,000 who sold it to Judge Widemann for $8,000 in 1856. At the end of 1863 Judge Widemann asked George Wilcox to undertake the supervision of the cutting of a water lead or irrigation ditch for the Grove Farm Plantation using Hawaiian labor. The following year, Wilcox leased Grove Farm Plantation from Widemann and rapidly expanded development of the irrigation infrastructure.

Western commerce between Kōloa and Lihu’e took off during the second half of the 19th century. A visitor to Kaua‘i in 1865, William T. Brigham, described the route between Lihu’e and Kōloa:

From Lihu’e the road led over the plain with the mountains on the left. A ditch crossed and recrossed the road as it wound along the hills from the mountains to the canefields below. Owls (pueo) were very abundant. The Pass over the mountains was very good and not at all steep, and all the way which was some twelve miles, the road was very good, in fact a carriage road. Two hours riding brought me to Dr. Smith’s [in Kōloa] at eight. (Lydgate 1991:143)

The “ditch” Brigham described probably included “1st Ditch” excavated in 1864 and “2nd Ditch” which was completed in 1865. Prior to the completion of 1st Ditch, Krauss and Alexander write that Wilcox:

...drove an ox cart to the beach and around the bay to a Hawaiian settlement called Niumalu where the natives grew sugar cane, as a supplementary food crop, on the earthen dams that separated their taro patches, George carefully chose stands of healthy cane, making sure that they were original plantings and not rations. (Krauss and Alexander 1984:133)

In 1870, Wilcox bought Grove Farm from Widemann for $12,000, three-quarters of which was borrowed. Four years later he had 200 acres under cultivation. The cane was milled at the Lihu’e Mill and exported from Nāwiliwili. In 1874, Wilcox renewed a 25-year lease with Princess Ruth Ke‘elikōlani, for 25 years, for a 10,000-acre tract of Ha‘i‘ikī Ahupua‘a (Krauss and Alexander 1984:179). On April 1, 1881 George Wilcox bought 10,500 acres of Ha‘i‘ikī Ahupua‘a from Princess Ruth increasing the acreage of Grove Farm nearly ten-fold (Krauss and Alexander 1984:206). The sale was part of a package deal whereby Mr. Rice also received Kīpū and Kīpū Kai for a total price of $27,500—money that Princess Ruth used to build her palace that rivaled Kalākaua’s palace, on Emma Street in Honolulu. [Figures 17 and 20]

An 1878 Government Survey map shows the plantation boundary and the Project area vicinity and sugar plantations which have not expanded to their later extent; Grove Farm fields are to the southeast, and Lihue Plantation is to the east. Kaumualii’s Highway appears to be an un-improved or dirt road.

4.4.3.3 Puhi Camp

Grove Farm (Figure 18) operated under Mr. George Wilcox until 1933 when he died. During that time, the plantation flourished and many innovations like new cultivation and planting methods developed. Grove Farm was also at the forefront of housing improvements during a time when plantation housing throughout the Hawaiian Islands was inadequate (Riznik, 1999). Unsanitary and crowded housing for workers compounded the spread of infectious diseases which spurred interest in housing reform on individual plantations. Between 1917 to 1920, Grove Farm built 120 houses in a single new camp for workers which became known as Puhi Camp. The new housing at Puhi attracted the attention of the Hawaiian Sugar Planters’ Association (HSPA) and the dwellings became the standard for the plantation industry in the 1920s (Figures 19 and 20).

In 1917, Robert S. Thurston, the Experiment Station’s agriculturalist described the buildings at Grove Farm:

The buildings being erected are of three types: (1) Two or three rooms in a row, all under an inverted V roof, without a kitchen. (2) Two rooms under the same kind of roof, but with a kitchen adjoining in the rear. (3) A three room bungalow [sic] with adjoining kitchen in the rear. The first type is for bachelors; the second for a couple and one or two children; and the third for larger families. The kitchen
In 1948, Grove Farm purchased Koloa Plantation. This doubled the size of Grove Farm, gave Grove Farm its own sugar mill for the first time, and eliminated duplication in manpower, equipment and administrative costs. In 1948-1949, a cane haul truck tunnel (the Wilcox Tunnel) was excavated under the Hoary Head Range connecting the sugar cane fields of Ha’iku to the Kōloa Mill (Krauss and Alexander 1984:366-368). Figure 18 shows Grove Farm, identifying the plantation’s original areas and subsequent acquisitions. The graphic also shows “Mauka Ditch” extending north to south through the center of the Project area.

In 1954, an airstrip was developed at Ha’iku for aerial spraying of fertilizer and herbicides. In the early 1960s, the nearly one mile long Kuia-Waita Tunnel was completed bringing Ha’iku water to the drier Kōloa side. Development within the Project area and its vicinity can be seen on the 1963 U.S. Geological Survey map (Figure 23). The symbols for buildings adjacent to Kaumuali’i Highway on Figure 23 are the homes within Puhi Camp.

Wilcox (1998:76) reports that despite almost 100 years of irrigation ditch construction, “Grove Farm’s ditch system was a modest one not known for any outstanding technical or physical achievements. This may reflect the limited watershed available to Grove Farm, the small size of the plantation’s acreage, or G.N.’s [Wilcox] personal sense of scale.”

**4.5 Modern Land Use**

In the mid-1960s, Sam Wilcox of Grove Farm donated 200 acres of former sugar land to the state for KCC. A 1965 aerial photograph (from Foote et al. 1972) (Figure 24) shows the extent of sugar cane cultivation within the Project area and vicinity prior to the construction of KCC (Kamins and Potter 1998:275). Grove Farm ended its sugar business in 1974, setting aside lands for development and also for the continuation of sugar cultivation by leasing its Lihu’e lands to Lihu’e Plantation, and its Koloa lands to McBryde Sugar (Wilcox 1998:76). A 1977-1978 aerial (Figure 25) shows the new college campus and development within its vicinity although the northern- and western-most portions of the approximately 200-acre campus still appear to be undeveloped.

Most of the Puhi Camp housing was removed in the 1970s prior to the construction of KCC. In the 1980s, the last homes in Puhi Camp were dismantled (Chang 2007). Currently, newer buildings for the Pānana Leo o Kaua’i Pre-School and Kawaikini New Century Public Charter School, and a few agricultural plots occupy some of the former Puhi Camp lands.

Section 5  Archaeology

5.1 Previous Archaeological Research

5.1.1 Previous archaeological studies in the study area 

The first comprehensive archaeological survey of Kaua‘i was conducted by Bennett (1931) of the Bishop Museum. Bennett’s survey report identifies no archaeological sites within or in the immediate vicinity of the Project area. The report identifies Bennett Site 98 as the “Niamalu” or “Menehune” Fishpond located approximately 3 kilometers (km) southwest of the Project area. According to Bennett:

The Niamalu [sic] fish pond consists principally of a stone-faced, dirt wall that runs for over 900 yards and cuts off a large bend in the river for use as a fish pond. It is today [in the early 1930s] used both for fish and ducks. Cement walls and iron gates have obscured any old method of controlling the water or the fish. (Bennett 1931:124)

The focus of more recent archaeological studies in the vicinity of the Project area has been along the mouth of the Hulē‘ia River, Nāwiliwili Bay, and the associated river banks leading down to Nāwiliwili Bay. The agricultural fields within and surrounding the Project area have been slowly converted to other uses, particularly in the 1990s, and some archaeological work has been undertaken within these areas. Archaeological studies near the Project area are summarized in Table 2 and Figure 26.

48
Neller and Palama (1973) carried out an archaeological reconnaissance of the lower portion of the Hulē'ia River and its vicinity recording a number of historic properties. The archaeological richness of that area from the “Menehune Fishpond” downstream and near the crest of the trail to Kīpū Kai is clear. They did, however, also document four historic properties upstream of the Menehune Fishpond, the nearest of which (SIHP -3010) consists of contiguous rock wall enclosures and several other features. This historic property is described as:

…a compound, probably belonging to a chief or other important person. Nearby there are stone-faced river terraces, irrigation ditch (auwai), and a stone bridge crossing the auwai. The area is worth restoring to its prehistoric condition. It is an impressive site. (Neller and Palama 1973:3)

SIHP -3009, also identified by Neller and Palama, is approximately 1.6 km from the current Project area, and consists of an “agricultural area along both sides of the river, including rock-walled terraces and irrigation ditches (auwai). Also includes cement covered grave of G. Kalili, died Dec. 17, 1898” (Neller and Palama 1973:11).

Ching et al. (1973) conducted detailed research on Alekoko (Menehune) Fishpond and its vicinity. Nine archaeological features and feature complexes were identified and documented, including three fishpond features (loko kuapā and two loko wai), two ‘auwai, and four lo‘i complexes.

Walker and Rosendahl (1988) conducted an archaeological surface and subsurface inventory survey of 450-acre Grove Farm from Puhi Town, south of Kaumuali‘i Highway nearly to Nawiliwili Bay. A total of two historic properties were identified, a historic Japanese cemetery SIHP -503, and a historic residence SIHP -9390. The following year, Paul Rosendahl (1989) produced an addendum report covering eight additional separate small adjacent areas. No historic properties or cultural material were identified. Henry et al. (1993) covers the same project area and is the final archaeological inventory survey for this area.

O‘Hare et al. (1993) carried out an archaeological inventory survey on a 100-acre Puakea Golf and Country Club project area located approximately one km south east of Puhi Town. No historic properties or cultural materials were identified.

5.1.2 Previous archaeological studies within or adjacent to the Project area

5.1.2.1 KCC Archaeological Reconnaissance (Palama 1973)

In 1973, the Archaeological Research Center Hawaii conducted an archaeological reconnaissance of approximately 57 acres of the gully portion of KCC (Palama 1973), an area north and west of the currently developed portion of KCC. During the archaeological reconnaissance an “old ‘auwai”, an old military complex, a Japanese Cemetery, old plantation camp remains, an extant plantation camp, and possible lo‘i were found (Figure 27). Palama (1973:2) asked plantation camp residents whether they ever found evidence of taro cultivation or if they farmed within the gully in the western-most portion of the current Project area. Apparently only very limited farming had ever been conducted in the gully, and the plantation workers were not aware of any taro cultivation. Palama (1973:2) “recommended that no further work is warranted” for the historic features he identified and no state site numbers were assigned.
5.1.2.2 Rosendahl (1989)/ Henry et al. (1993) Archaeological Inventory Survey

One of the eight additional separate small adjacent areas surveyed by Paul Rosendahl (1989) in the addendum report described above, is within the southwestern portion of the Project area and adjacent to Kaumuali‘i Highway. Designated as Area 1, it is described as consisting of “residential homesteads and yards” (Henry et al. 1993:18).

5.1.2.3 Lihue/Puhi/Hanamalu Master Plan (Walker et al. 1991)

Approximately 220 acres within and adjacent to the Project area were included in the 1,550 acre Lihue/Puhi/Hanamalu Master Plan (Walker et al. 1991). Designated as Section No. 1, this area is described as:

...bounded on the north and east by the Nawiliwili Stream gulch, on the south by Kauai Community College and Kaumuali‘i Highway, and on the west by the Puhi Stream gulch. This entire parcel has been modified and is presently in sugar cane (Saccharum officinarum L. hybrid) cultivation. (Walker et al. 1991:2)

The report states that:

areas in sugar cane were only sampled ... [and] were not generally surveyed ...because areas altered by sugar cane cultivation are unlikely to contain archaeological features, and because sugar cane cultivation within the present project area does not occur in low swale or alluvial flat areas that may contain buried cultural deposits. (Walker et al. 1991:7)

While Section No. 1 is listed as an area subjected to “inventory-level” survey in the report, this statement is further explained that “only very limited surface survey was done in sugar cane fields .... [and] no subsurface testing was performed in sugar cane fields” (Walker et al. 1991:18). No additional descriptions of the Project area and its vicinity are included in the report. Additionally, none of the ten historic properties (SIHP -1838 through -1847) identified during the Walker et al. (1991) study, including a concrete bridge, concrete wharf, cultural deposits, terraces, roads, walls, retaining walls, a possible agricultural area, and a historic cemetery, was observed during the entire survey although four historic properties (two archaeological sites and two historic properties) were found during the field inspection. As the area for that project was under sugar cane cultivation for many decades and its location observed to be graded with an established lawn, the study concluded that cultural impacts associated with the proposed project was unlikely.

A summary of the proposed project and its findings was mailed to Dr. Pua Aiu (then) of the Office of Hawaiian Affairs and to Mr. Dennis Chun of the Hawaiian Studies program of KCC on December 23, 2003. Follow-up telephone consultation was held with Mr. Chun on February 19, 2004 and with Dr. Aiu on February 24, 2004. A brief telephone conversation on the subject was also held with Ms. LaFrance Kapakana-Abielsa of the Kaua‘i Office of Hawaiian Affairs and the Kaua‘i/Ni‘ihau Islands Burial Council on February 20, 2004. None of these parties expressed any concerns for adverse impacts to cultural practices by the proposed project. Subsequently, the SHPD concluded that: “No further archaeological work [was] needed for the project.”

5.2 Archaeological study for the proposed Project

CSH archaeologists, Gerald K. Ida, B.A. and Nanicce “Missy” Kamai, B.A., completed the field inspection for the proposed Project at KCC between August 18 and August 25, 2010, which required eight person-days. On two of the days, only one archaeologist carried out fieldwork. All fieldwork was conducted under CSH’s annual archaeological permit No. 10-10 issued by SHPD per HAR Chapter 13-282, under the general supervision of the principal investigator, Hallett H. Hammatt, Ph.D.

The field inspection consisted of a pedestrian inspection of the KCC campus. Few access restrictions impeded the inspection, however, ground visibility was somewhat obstructed by vegetation and previous development. A visit of ten historic surface features, including two previously identified historic features (CSH 9, CSH 10), were found during the field inspection. CSH 9, an “old ‘auwai” that conforms to a portion of Grove Farm’s “Mauka Ditch”, (see Figure 27) was previously found during an archaeological reconnaissance (Palama 1973) of the western portion of the Project area. Palama (1973) also recorded the location of a cemetery that was identified during the current field inspection as CSH 10. The Puhi Camp Cemetery, SHIP # 50-30-11-B006 / CSH 10, is outside of but surrounded by the Project area.

The nine features found within the Project area appear to be related to Grove Farm and date to the plantation era. The historic surface features consist of five irrigation ditches (CSH 1, CSH 2, CSH 4, CSH 6, CSH 9), one of which (CSH 1) is abandoned; three reservoirs (CSH 3, CSH 5, CSH 7) of which CSH 3 is abandoned; and an abandoned wooden flume (CSH 8).

Palama’s (1973) archaeological reconnaissance had identified old plantation camp remains associated with Puhi Camp, Puhi Camp, and an area containing possible lo‘i. These features were not present during the current field inspection. An old military complex identified by Palama (1973) is outside of the current Project area, and no evidence of the complex was found during the field inspection.
As discussed in Section 4.5, all Puali Camp plantation housing was removed by the 1980s. Currently, newer buildings for the Pūnana Leo o Kaua‘i Pre-School and Kawaikini New Century Public Charter School, and a few agricultural plots occupy some of the former Puali Camp lands.

Descriptions and photograph documentation of each of the historic features identified during the field inspection are shown in Table 3 and Figure 28.

Section 6  Community Consultation

Throughout the course of this assessment, an effort was made to contact and consult with Hawaiian cultural organizations, government agencies, and individuals who might have knowledge of and/or concerns about traditional cultural practices specifically related to the study area. This effort was made by letter, e-mail, telephone and in person contact. The initial outreach effort began in September, 2011, and community consultation was completed in February, 2012.

In the majority of cases, a letter (Appendix D), map, and an aerial photograph of the Project area were mailed. In most cases, one to multiple attempts were made to contact individuals, organizations, and agencies apposite to the CIA for the Project. The results of the community consultation process are presented in Table 4. Written statements from organizations, agencies, and community members are presented in Sections 6.1–6.3 below and summaries of interviews with individuals are presented in Section 7.

Nāʻiʻi, Mr. Clyde
Office of Hawaiian Affairs
CSH mailed the initial contact letter on 09/29/2011. CSH sent a second letter on 11/03/2011. OHA responded with letter dated 11/17/2011. Refer to Appendix F.

Okubo, Mr. Saemi
Old Puhi Camp Reunion Participant
CSH mailed the first contact letter on 10/15/2011 but the letter was returned to CSH on 10/25/2011.

Pereira, Mr. Charlie
Kupuna who grew up in Niulalu
CSH mailed the initial contact letter on 11/15/2011. With assistance of Kalen Kelekona, Mr. Pereira was contacted on 11/18/2011 for an interview on 05/08/2011. Refer to Section 7.3 for his interview transcript.

Pratt, Mr. David
Treasurer, Niu Pia Land Company
Acquainted with residents associated with Puhi Camp.
Mr. Pratt wrote on 08/24/2011 in a letter to Mr. Earl Matsukawa of Wilson Okamoto Corporation that he would be happy to help Mr. Hal Hammatt connect with people at Grove Farm Company, Inc., or Grove Farm Homestead Museum. CSH mailed the initial contact letter on 09/29/2011. Mr. Pratt replied on 10/21/2011.

Requilman, Ms. Mary
Director, Kauaʻi Historical Society
CSH mailed the initial contact letter on 10/08/2011. CSH sent a second letter on 11/3/2011.

Rossi, Ms.
Pualiiimaikalani
Instructor, Department of Hawaiian Studies, Kauaʻi Community College
CSH sent the initial contact letter on 11/15/2011.

Sakoda, Mrs. Bernie
Former Puhi Camp resident
CSH mailed the initial contact letter on 10/08/2011. CSH sent a second letter on 11/03/2011. Mrs. Sakoda was contacted on 10/15/2011 but the letter was returned to CSH on 11/03/2011. With assistance of Kalen Kelekona, Mr. Pereira was contacted on 11/18/2011 for an interview on 05/08/2011. Refer to Section 7.3 for his interview transcript.
6.1 SHPD Response

CSH mailed the initial contact letter on 09/29/2011 and a second letter on 11/03/2011 to Ms. Piu Aiu of the SHPD. Ms. Cayan responded on behalf of the SHPD with a letter dated 1/03/2012. The letter stated that, “the rezoning from agriculture to urban district always raise concern that range from cultural practices for access and gathering to spirituality at sacred sites, to protecting ancient burials—all potential issues should the project expose or degrade such cultural resources and/or sites in this very large area.”

The SHPD recommended consulting with as many Kaua‘i groups/folks as possible and provided names of potential community members with their contact information. Refer to Appendix E for a copy of the response letter from SHPD.

6.2 OHA Response

CSH mailed the initial contact letter to Mr. Clyde Nāmu'o, Administrator of OHA, on 09/29/2011. In a written response to CSH dated 11/17/2011, Mr. Nāmu'o recommended consulting with two Hawaiian Immersion Schools located on the KCC campus, Pūnana Leo o Kaua‘i and Kawaikini New Century Public Charter School (see Appendix F).” The letter also identified the Puhi Camp Cemetery and stated that, “while it appears this cemetery is excluded from or outside of the DBA petition area, OHA believes it should be considered because of its location.” OHA recommended consulting with lineal descendents of those buried in the cemetery.

6.3 Statement by Mr. Frederic Ellamar

CSH initially contacted Mr. Ellamar by telephone on 10/14/2011 and on 10/21/2011 and mailed the initial contact letter on 10/24/2011. CSH called on 10/26/2011 and spoke with Mr. Ellamar who stated that there is an old graveyard inside the camp [Puhi], very close to a reservoir. He explained that there is a reservoir inside as well as outside the camp and the burials are near the inside reservoir. He noted that, “You can’t stop progress. Kaua‘i is overcrowded.” He grew up in the 1950s and can remember life back then. Now, he describes Kaua‘i as having cars bumper-to-bumper, and overflowing with people. Mr. Ellamar called CSH on 10/28/2011 and stated that, “My concern is just about the graveyard and [to] put one plaque or something to signify the Old Puhi Camp. I don’t want no other discussion already. That is my final input on this matter.”

6.4 Statement by Ms. Amber McClure

CSH initially contacted Ms. McClure by telephone on 10/21/2011 and again on 10/26/2011 and left messages. Ms. McClure called on 11/02/2011 and left her address. CSH mailed the initial contact letter on 11/03/2011. CSH called on 11/08/2011 to follow-up and Ms. McClure referred her mother, Daphne Hirokane McClure, who has family buried in the cemetery located next to the Project area. She also provided the following statement: “The area [cemetery] needs to be taken care of, and if there are any plans to disturb or alter that area, the family should be notified.”

Section 7  Interviews

Kama'aina and kupuna with knowledge of the proposed Project and study area participated in semi-structured interviews for this CIA. CSH attempted to contact 32 individuals of which 22 responded and eight participated in formal interviews from September, 2011, to February, 2012. CSH initiated the interviews with questions from broad categories such as wahi pana and mo'olelo, agriculture and gathering practices, freshwater and marine resources, trails, cultural and historic properties, and burials. Participants’ biographical backgrounds, comments, and concerns about the proposed development and study area and environs are presented below.

7.1 Acknowledgements

The authors and researchers of this report extend our deep appreciation to everyone who took time to speak and share their mana’o with CSH whether in interviews or brief consultations. We request that if these interviews are used in future documents, the words of contributors are reproduced accurately and not in any way altered, and that if large excerpts from interviews are used, report preparers obtain the express written consent of the interviewee/s.

7.2 Site Interview with Ms. Audrey Kawado, Kupuna Mabel Makanani, Mrs. Hirokane McClure, Ms. Amber McClure, and Mr. Dennis Takahashi

CSH met with and accompanied five community contacts, Ms. Audrey Hirokane Kawado, Kupuna Mabel Makanani, Mrs. Daphne Hirokane McClure, her daughter Ms. Amber McClure, and Mr. Dennis Takahashi. Kupuna Makanani, on December 5, 2011, to tour several sites of the former Puhi Plantation Camp, now part of the Kaua‘i Community College, in Līhu‘e, Kaua‘i. The entire group, with the exception of CSH staff and Ms. Amber McClure, was in Puhi Camp. As mentioned above, Puhi Camp was built for Grove Farm plantation workers in the early 1920s. In 1974, an area consisting of about 200 acres of the camp became part of what is now KCC.

At 84 years old, Kupuna Mabel Makanani was the oldest member of the group. With the possible exception of one other family, Kupuna Makanani’s family was the only Native Hawaiian family in Puhi Camp. At the start of the site visit, she provided CSH with a written statement where she summed up her life in Puhi Camp. The following is entirely Kupuna Makanani’s words, with the exception of two words in brackets included by CSH for clarity:

This is what I remember as a child growing up in Puhi. It was a typical plantation-style camp. We all grew up together as one people, although we lived in homes by race. I think my dad was the only pure Hawaiian in the camp, with the exception of Mr. Malaia, I’m not sure if he was pure, but he spoke the language, I often heard them together. We lived in rows by race and shared cultural practices in music, dance and games, even movie nights, where we had a Hall for movies and monthly events—Filipino movies, Japanese, English, etc. The only people that lived away from us were the Chinese—they lived in a valley close by, called “Pake Valley.”

We lived simple lives. Grove Farm gave us [land], who ever wanted a piece of land to grow vegetables and we shared what we grew with each other. We bought from our crops.

Someone in the camps also raised (bo) hives. Going swimming up in the hills, called “Cement Pond,” we passed the bee hives and if the owner was there, he’d give us some honey dripping from the wax and it was a treat for us.

We learned a lot growing up in a camp especially the different kinds of instruments different races used and their cultural customs and dances; for me, born and raised in Puhi was great, [I] learned the background of my mother and was amazed at all the instruments my dad could play. My mom taught me everything she knew from her mom. I was raised as a Catholic and followed all.

Stating that her heart is here in Puhi Camp, Kupuna Makanani explains what made it special:

I was born and raised here. It was a different lifestyle. It was one people. A generation of one people. No matter who you were, you recognized each other. It is not like today.

The first stop of the Project site tour was at the Old Puhi Camp Cemetery, which is divided into two sections, a Japanese cemetery and a Filipino cemetery. Although there were other ethnicities such as Portuguese people who worked in Puhi camp, most of them chose to be buried elsewhere. As she looked over the old graves, Kupuna Makanani voiced her concern about the protection of the remaining Puhi Camp places, especially the cemetery.

Beside her was Mr. Takahashi who also expressed his worry that no one will be left to take care of the cemetery (Figure 29). Although many of the graves were removed by families already, there are still some that remain. He recalled that when he was a young boy, a group of Japanese workers kept a community fund to be used to maintain the graves. Once a year, before the Obon festival, the designated group would come and clean up the graves using hoes and rakes. Mr. Takahashi would assist in caring for the graves, something which he continues to do so even now.

While at the Puhi Camp Cemetery, Mr. Takahashi pointed to a proposed Project area aerial map and asked if the proposed re-zoning would affect the cemetery and caused a disturbance of burials. To him, it seemed from the aerial map that the Project would be developed very close if not in the actual area where the cemetery is. Both Kupuna Makanani and Mr. Takahashi stressed the need for Puhi Cemetery to be taken care of, as the current volunteer caretaker, Mr. James Kazuo Amimoto, is getting older. In addition, both sides of the cemetery need to be maintained, including the Filipino side which contained more weeds than the Japanese section.
Besides some of the graves in the Japanese cemetery are vases for flowers (see Figure 30 above). Mr. Takahashi admits that one of his goals is to get all the headstones cleaned and then translated by a Buddhist priest. He has always been interested in learning about Kaua‘i history and genealogy. Since he was young, he has made it a point to read old newspapers and spend time with elders. “You know after the older generation pass on, the younger ones, they [are] not gonna know nothing, yeah,” Mr. Takahashi states.

Kupuna Makanani’s father drove Grove Farm’s train. According to her, men had the freedom to move all over the place. Her father was George Makaniole, and he drove Train Number 1. When the plantation days were over, his train was sold to China. Somewhere possibly in Grove Museum, there is a nice picture of her father posing with the Number 1 train.

Mr. Takahashi’s father was Takeshi Takahashi, who was a machinist for Grove Farm, and his mother was Katsuko Takahashi, who worked for Kaua‘i Inn and Kaua‘i Surf Hotel. His parents had three boys, and Mr. Takahashi was the middle child. He was born in 1945, in Līhu‘e, and his family moved to the camp in the early 1950s. Although his parents did not attend college as they were too busy working for their families starting from a young age, they instilled the importance of a college education and as a result, all of the Takahashi boys went on to college, with Mr. Takahashi obtaining a degree in business management. He later worked for Times Supermarket in Honolulu, and retired in 2007.

Although Mr. Takahashi noted that he understands the school has to grow, he considers the preservation of the Puhi Camp cemetery to be of utmost importance. After pointing out to CSH how erosion is causing some of the headstones to be close to toppling over, Mr. Takahashi also remarked how big trees near the graves should be removed in case a big storm could cause the tree or its branches to fall and destroy the headstones.

When asked about the proposed Project, Mr. Takahashi commented:

...The development is okay, but they should preserve you know the past, yeah. Because this is supposed to be the final resting place of the people, ah. You know, who worked on our plantation...so they shouldn’t be disturbed.

The significance of the continuing relevance of the Puhi Camp cemetery to the living community was underscored during the site visit, when shortly after Mr. Takahashi expressed his recommendation for preservation, Mrs. McClure discovered the grave of a relative, Alice, located in the cemetery (Figure 31). Up until that point, she had no idea that her cousin was buried in the cemetery, and using the headstone as a guide, she narrated to the group about her family ties and memories of her cousin Alice, who passed away at 30 years old and who was married to Tomas. Kupuna Makanani also shared her memory of Alice as a young girl and how much she enjoyed playing with paper dolls.
Like Mr. Takahashi, Kupuna Makanani would like the place to be preserved, relating an additional recommendation that in her opinion, families who still have ties to the cemetery and Project area should be consulted before anyone else, and that Project proponents should take care of the preservation financially:

...I would go along with whatever the people who live here, the people who have families here, their concerns would be number one...If ever in time that they would still continue to develop, then I think the community should make an amendment where whoever is building, would provide a separate place for them and take care of all the finances to remove and to preserve and to set up.

Kupuna Makanani recollected that when she was growing up, she remembers how it was possible to bury family members around one’s residence. It does not surprise her that now, burials are found whenever there is a construction being done or building being renovated. The only people who would know and who should be consulted are those who lived in the area, and if graves are unknown, it illustrates the need to continue to care for the information to do it. This makes it even more crucial to have meetings and exchange of cultural information, much like the site visit tour for the Project CIA. States Kupuna Makanani:

That the people would...get together like how we’re meeting, cultural...It’s the ones that [are] left behind that plant the importance of their ancestors to upkeep.

Mr. Takahashi pointed out how some of the graves in the Filipino side of the family are those of Filipino veterans who have no known family, and only crosses in the ground were put for their burial. It would be ideal if somehow, relatives of these veterans would be able to find them and be reunited. He decried the forgetting of one’s roots and expressed his hopes that the younger generation would continue their ties to their culture and family tree.

Indicating a grave with an “Unknown” in the marker, Mr. Takahashi stated the following:

Maybe...whoever this is, has relatives in the Philippines. Maybe they’ve been over here but they have no family here and he died. But, we don’t know who this person is.

Both Kupuna Makanani and Mr. Takahashi related the history of Filipino migrants to Hawai‘i, how Filipinos came to Hawai‘i starting in the early 1900s as contract laborers, “sakadas,” searching for a better place to live. They remarked on how Filipinos maintain their ties to the Philippines by supporting their families through remittances. The group found one Filipino veteran’s grave that dated back to World War I. In addition, there are children also buried in the graveyard. One grave was that of a two month old baby buried in the Filipino side of the Puhi Cemetery (Figure 32).

Given this example and others, Kupuna Makanani emphasized that whatever can be preserved should be done so because soon, people are not going to be able to have control of what they know. She cites the example of Mrs. McClure finding the grave of her cousin. Although the toll of time has taken its toll, finding her grave is a good example of the value of conserving one’s past.

Like Kupuna Makanani, Mr. Takahashi remembers the old days with fondness, describing when everybody was like one big family. For him, it was the close-knit feeling of community and family, where people knew each other and looked after one another.
...All the different nationalities...you know all the da kids, eh? We were so close. You know we go to each others' homes...people just open up their home, [share] da food. You normally have like weddings, birthday parties, all kinds of parties you know. We intermingle with all different nationalities. Everybody was on an equal basis, eh. Which is, you know, rare today, eh.

Despite the fact that various accounts of plantation life portrayed it as a harsh, unfulfilling life, Mr. Takahashi relates that the Wilcox family treated their workers very well and life was enjoyable in Puhi Camp. According to Mr. Takahashi, everyone who was a Grove Farm worker agreed that they were looked after by the Wilcox family, and people were provided the opportunity to own their own home.

Families shopped for groceries in plantation stores, and bought items using credit, to be paid for when payday came. As a young child, Mr. Takahashi was given the specific job of tending to the vegetable garden. For extra money, he cleaned the yards of neighbors. The Takahashi family moved out of Puhi Camp in 1969 when Grove Farm built a subdivision across the road from what is now KCC, selling the lots to workers.

7.2.1 Strikes and Unions

Both Mr. Takahashi and Kupuna Makanani described the strikes and the effects of unionization on Puhi Camp. During one strike in the 1960s, plantation workers had a soup kitchen provided by the union that was able to provide them food. Mr. Takahashi relates how each dinner time, each family would be given their allotted share of rice and main dish. Workers would bring their pot so it could be filled with rice as well as the viands for the day. If the family had several children, the soup kitchen provided enough for each member. The soup kitchen lasted as long as the strike. Mr. Takahashi recalled one particularly long strike, which lasted six months.

The strikes of Grove Farm plantation workers were mostly peaceful affairs that did not turn bloody as the one in Hanapepe in 1924, when 16 Filipino workers were killed along with four local policemen. Mr. Takahashi put it this way:

Yeah, they would picket, but in the meantime you know everybody had to report and then take care of the garden because no more food!

Although most Puhi Camp residents had their own garden they used to supplement their meals, the main source of food during strikes was the soup kitchen, which Mr. Takahashi noted as a “real humble experience.” But those were the times too, when the community came together, and when all the workers from different nationalities would “chip in” and work “side by side.” Life during strikes was undeniably difficult, according to Kupuna Makanani:

It was hard, but you know, because we lived simple lives you know we survived. It was like, “Oh my goodness, what’s gonna happen now...we have no food!” But we were...we were standing in line for food.

The transition from non-union to union came in 1946 and was not without controversy. With unionization came changes, some as major as housing which no longer was provided free to workers. Kupuna Makanani asserts:

We had free water, free house, we had everything free! Our equipment to play was free, the plantation would provide bats and balls and everything that the kids needed...

Once the union came in, there were stipulations that were made. Kupuna Makanani listed some of the advantages before the unionization of workers:

You don’t have to pay house rent...you don’t have to pay water, you could use as much water as you can, you know...there it was. The pay was very small but you learned to live without...You don’t go over it, you live without...And everybody trusted each other. Not like today...you gotta lock doors and lock windows and put alarms and you see these people doing that in the house and it’s sad because who do you trust? There’s no trust.

7.2.2 Everyday Life in Puhi Camp

The group also reminisced about life each day in the camp. Some of Mr. Takahashi’s favorite memories of growing up at Puhi Camp included making swords from straight tree branches and swimming in one of the three reservoir ponds, which were clean. Pointing out the type of vines he once used, Mr. Takahashi shared how he would cling to the vines to swing about and imagine he was Tarzan (Figure 33).

Figure 33. Mr. Takahashi shows the type of vines he used as a child (CSH 12/05/2011)
He recalled searching for special V-shaped branches from guava or strawberry guava trees and breaking it off in order to make homemade slingshots using the inner tube from wheels of old cars. With the slingshot, he and his friends would practice by shooting pebbles at bottles before attempting to hunt for birds. Laughing at the memory, he admitted he failed catching birds with his slingshot.

It was a great childhood for Mr. Takahashi. For him, a typical day involved attending Līhuʻe School in the morning, and after school, he did chores such as chopping firewood to heat up water. He collected firewood from eucalyptus trees surrounding the camp which were planted by the Wilcox family years ago. The Wilcox family allowed their employees to utilize the trees for their firewood.

After chores and school, he would visit friends, and they would then go around to visit other houses. One of his former neighbors was a Filipino family who had one of the first televisions in the camp. Mr. Takahashi chuckled at the memory of how he and all the other children in the camp would go to the house with the television and watch shows during the 1950s.

Mr. Takahashi also explored the irrigation tunnels with friends such as Mrs. Kawado and Mrs. McClure, who are sisters. Mrs. McClure was born in 1948 and her memories of Puhi Camp in the 1950s remain clear. She vividly described the days when houses stood side-by-side where current roads now run and when the road to the Puhi cemetery was once covered with camp buildings. Mrs. McClure lived in the camp until she went away to college in 1966, and by the time she came back, the camp was already gone. However, her daughter Amber, helped capture some of the memories on film when she recorded the oral histories of former Puhi Camp residents for her ethnographic film From Where We Come, in fulfillment of a master’s degree for University of London.

Kupuna Makanani was the youngest of three siblings and had two older brothers. When she was growing up, she was raised differently from them in the sense that it was a more protective manner. However, she did enjoy activities such as swimming in the irrigation ditches with her school friends. She remembered:

All of the kids swam. I remember Shigeno Amimoto…behind where they lived, there was an irrigation ditch… we would put on our swimsuit and swim in the ditch because it wasn’t polluted, you know…and we would go down the stream together.

She recalled that there were softball teams for boys and girls, with different ethnic groups having their own games. For example, Filipinos had “stigma,” which consists of the player continuously trying to hit a designated “mark” on the side of their feet without losing the “mark.” Kupuna Makanani shared how the games were “so good” and enjoyable.

Like many others in Puhi Camp, Kupuna Makanani attended Līhuʻe Grammar School and walked with her brothers to go to school, until the time came when she was forbidden to walk to school. World War II began when she was in high school, and she decided to sneak out and sign up to work in the Kapaʻa Pineapple Cannery. Eventually her family, especially her brothers, found out that she was working as the truck from Kōloa came very early to pick up all the workers. By then, however, she had already committed to working:

... I said, “No, but all my friends in high school they fine working...I never wanted to sit and do nothing, I wanted to do something. And so they couldn’t do anything---I signed up already.

Kupuna Makanani continued to work while she attended school. She worked only on weekends and during vacations:

...Every summer I would go work. What we had [was] office work at the coffee building, we had different things that you could go. But, because my family didn’t want me to go work, I stayed in class. And unless on Fridays, this was every Friday they could go. The boys would put up barbwire, you know all the kinds at beaches and whatever you had to work and the girls could go work in the office or where ever work was needed. Yeah...so it was like...but it was good because I got to work.

Like the majority in Puhi Camp, her family maintained a vegetable garden. In addition to all kinds of vegetables, Kupuna Makanani shared memories of her mother’s flower garden:

My mom loved flowers so we had all kinds of flowers. She had everything from lilies to orchids to ferns, maiden-hair...I remember conifers. We used to come and tell her, “Please we want you to take out your maiden-hair,” she had gorgeous maiden-hair...all different varieties, begonias...Our yard was full of flowers, tuberose, roses, [for] my dad every weekend, my mom would make a hat for him...[for] riding or where ever we would go.

Her mother would also make all of her father’s leis, using the flowers growing in her garden. Kupuna Makanani recalled fondly how much her father loved roses, and how carnations bloomed along the walkway from the gate to their house in Puhi Camp. There were always two patches of carnations along the path.

One of the few Puhi Camp places that is left is the cement house, which has been converted to become the Pūnana Leo o Kauaʻi School. Kupuna Makanani took the group to the site of her former house that once stood in the upper part of Puhi Camp. Although the house is no longer standing, a huge mango tree that once served as a landmark still remains (Figure 34).

She described a valley that went down past her childhood home which was the family’s original vegetable garden. Across the street from their house was a vegetable garden for everybody.
Her Catholic faith is a source of strength and to serve God is the reason why she maintains her involvement in numerous activities helping others:

So we were brought up Catholics, you know to worship God and do all the right things and so my dad was born a Mormon so it’s two different lines of worship. Although you are worshipping God, but the rules was different. But, my dad never did stop my mom from raising us as Catholics but he stopped going to Mormon church [temple]. I think he was ordained as an elder. I remember something about him going into the Mormon temple so you have his family, my dad’s family were Mormon, very strong Mormon. My mom’s family was coming from Portugal so the [maternal] line is Catholic. And my great-grandparents served the priests and took care of the priests and their house and their clothes. And so that tradition came to Hawai‘i with my grandmother, so my mom has that tradition. Now I’m born, I do the same thing.

Her Catholic faith is a source of strength and to serve God is the reason why she maintains her involvement in numerous activities helping others:

It’s that culture steering me to serve the one God. And so I’m still doing it and...I go back in time and it’s telling me that my generation for my ancestors were serving God from the beginning. It’s from Portugal coming here. My grandmother lives in Kōloa and goes to that church. It’s still that church and that ministry...I’m born and raised in that same line of service and that’s what I do today. I serve the Lord whatever. And it’s always in hospitality. You know, it’s serving. Making food for the ones who need, taking care of those that don’t have nothing, you know you give, that’s my life…that’s my life.

Sharing her mana‘o about the Project area is part of her desire to serve:

I feel for the people because I grew up here in a wonderful time. You know, we didn’t steal from each other...if your neighbor needed something, they could come to your house and go through your cabinets and take whatever they need and then the next day they would bring back. Somebody is sick in the camp...so you raise chickens, ducks, pig or whatever you make something and you would bring to their house....You never had to call, “Oh so and so is sick, can you provide a meal?” Not before, before it came natural. You serve your friends, your neighbors and you don’t think of their color, creed or whatever. You know they’re neighbors, they’re friends, you’re growing up with them, you learn from them.

Kupuna Makanani lived in Puihi Camp until her early years of marriage, and moved only when her own house was constructed in Wailua House lots, the first house in that area. Even after she and her husband moved and had a child, her parents remained in Puihi Camp and took care of her daughter during the day. She learned to shoot with a .22 rifle with her husband, and practiced by taking shooting cans with her rifle before hunting for pheasants with her husband when he came home from work. Once they caught a pheasant, they would return home and roast the pheasant. She credits her childhood growing up with many ethnicities for her ability to enjoy eating different kinds of foods and being appreciative of other cultures:

So now, I can eat any other food, I can go to any party and I can say, “I can eat that,” not, “I don’t like that, it doesn’t look good” or you know, “I don’t want that.” We were brought up different, our generation is really different...to appreciate one another and love them...

These days, Kupuna Makanani’s daily diet consists of mostly vegetables and fish. She likes to eat everything, but does not care too much for meat. Her advice is not to overdo eating. She usually bakes her food and sometimes fries it. In particular, she loves baked salmon and fried fish. As for sashimi, she does not eat it probably because when her children were growing up, she gave them sashimi and she did not acquire a taste for it. But she enjoys eating poke which her children did not favor when they were little.

7.2.3 Foodways in Puihi Camp

Throughout the Project area tour, the group freely recalled many memories which involved the tastes of their childhood and how the food incorporated the marine and plant resources around them. Kupuna Makanani shared that whenever her family needed some vegetables, they would go to their garden, or forage for bamboo shoots by the back of the three reservoirs which
were connected and had bamboo on one side. This is where many people in Puhi Camp came to
to get their bamboo shoots. They also took care of their own chickens as well as ducks.

Mr. Takahashi described foraging during spring for young bamboo shoots, called “takenoko”
by the Japanese and hunting for a type of fungus called “pepeiao” (edible jelly fungus) which
were gathered around the camp boundaries. For seafood, he and his friends fished for crayfish
by lowering lines with small meat bait, and they also caught fish like bass in the reservoir.

The pepeiao was prepared by Mr. Takahashi’s mother to be fried or cooked with chop suey,
chicken or pork. Chickens were usually bought from the store as the wild chickens tended to
roam in the valley away from Puhi Camp, but there were lots of wild boars that could be hunted,
which Mr. Takahashi’s uncle regularly did.

For treats, he and other children would usually enjoy homemade goodies like pickled green
mangoes and guava jelly and jam. The children were sent off to pick ripe guavas on the roadside
to be used for making preserves and for juice. Mr. Takahashi reminisced how his mother would
squeeze the guavas for their juice and freeze the juice in ice trays. Passion fruit juice was also a
to be used for making preserves and for juice. Mr. Takahashi reminisced how his mother would
make passion guava and mix the two together, eh.

Figure 35. A passion fruit flower grows in the Project area (CSH 12/05/2011)

As for pickling mango seeds, his grandparents, aunts, and uncles would make these by taking
mango seeds, peeling their skin, cutting them and drying them for about two days before
boiling them in sugar and adding Chinese spices like five-spice. Mr. Takahashi describes the
fibrous seed as the “best part, because all the flavor would soak into that.” He laments that
nowadays, hardly anyone makes pickled mango seed from scratch anymore.

There was a small mom-and-pop store in Puhi Camp that was run by the Funada family, and
in addition to canned goods and everyday items, there was dried abalone available in glass jars.
For about 50 or 60 cents, each child could get a nice chewy slice cut from the big piece that
could be chewed for what seemed like hours. “Real delicious, eh. Today so expensive you can’t
even buy it now,” Mr. Takahashi notes. The Funada store was located in the Puhi Camp area.
There were three stores in Puhi Camp, including a Chinese meat market.

Gathering and hunting for tasty edible food sometimes took on a competitive edge. The search
for bamboo shoots or takenoko took on a more competitive edge as people came up with ways to
try and hide the tender shoots that sprout up after storms. Kupuna Makani states:

We used to go when it stormed, yeah, when it stormed, the bamboo would grow
and so we’d always get our grab bags and a clean knife or a sharp knife and we’d
go right across the street. Yeah, we used to wear long sleeves, shirt and then dig
and then you cheat because some people know that...maybe [a] couple of weeks
more rain...it’s gonna come up so they cover it. Yeah.

The takenoko had to be harvested before it got too hard and too bitter, as both characteristics
become more pronounced, the older the bamboo shoot. It therefore needs the right time to grow
before being picked. To help ensure that, people would cover the place with dirt and hide the
shoot until harvest time. The group reminisced how much fun it was to walk around and try to
see if there were shoots underneath small piles of freshly dug earth (Figure 36).

The preparation of the takenoko involved boiling and changing the water. Kupuna Makani
recalled that her mother boiled and changed the water which was red, and Mr. Takahashi shared
that once the water is clear or white, then the takenoko is ready to be eaten. Slices were enjoyed
in chop suey and other stir fried dishes and also in nishime, a Japanese stew made with root
vegetables.

The group then walked to an irrigation ditch, where Mr. Takahashi pointed out the minnows
and other small fish swimming in the low-level water. He described how he and other children
would frequently wade in the water through a tunnel. Mr. Takahashi noted how he used to catch
ducks. “Like chicken.” Toads were another matter, though, and when they appeared at night with their big eyes gleaming, the toads
scared Mrs. Kawado.

Going through the tunnel was an exciting, scary adventure for the young Mr. Takahashi and
his childhood friends Mrs. Kawado and Mrs. McClure (Figure 37). He stated:
Small kid time we used to play. You could walk all the way to outside, yeah. Even when the water is like this, not too bad. You know, you can walk through, eh. This is the tunnel that go under the road...We used to catch frogs over here, too.

He shared that he would make spooky sounds to scare the girls while they were going into the tunnel and they would respond with screams, prompting Mrs. Kawado to remember how she did not like going through the tunnel.

Besides frogs, Mr. Takahashi would also catch crayfish in the irrigation ditches and the reservoirs. According to Mr. Takahashi, crayfish looked and tasted a lot like regular shrimp and was delicious when pan fried with shoyu and sugar. He detailed how he would catch them, employing pieces of meat like pork dangled in the water using a fishing line.

What we do is catch it...and then we’d lure it and then the thing would just grab onto the meat and then roll and pick it up and then we would have a bucket...Little meat fire ‘em up through a string or a fishing line, yeah. No hook or anything, but the thing would come out and then with the hook, that pincher they’ll go for the meat, eh and get stuck on there. And you gotta be real careful you know and they fall off...Just shake ‘em and they fall off’ cause there’s no hook, yeah. ‘O’opu also flourished in the irrigation ditches and reservoir and were enjoyed by Mr. Takahashi and other Puhi Camp residents. However, he believes that ‘o’opu are no longer present. ‘O’opu was pan fried, sometimes flavored with shoyu and sugar. “Lot of bones, but the thing was delicious,” he recalls.

A gate to control the water flow to the irrigation ditch still exists, indicated by Mr. Takahashi, who noted that Grove Farm still likely owns the water rights. For Mr. Takahashi, the gate remains an integral part of history as it provided water to the ditches and reservoirs and regulated the flow to prevent floods.

At one point during the site tour, the group came upon a papaya tree full of flowers. Kupuna Makanani illustrated how she would use the flowers to make into leis (Figure 38). Both Kupuna Makanani and Mr. Takahashi enjoyed green papaya soup with chicken, or chicken tinola, a Filipino dish. Another fond memory the group shared among one another was the regular baking of fresh bread, which were usually done on Tuesdays along with malasadas. Even the yeast was made by hand, with a little piece taken out, used and replaced each baking.

During baking days at Puhi Camp, the job of the children would be to gather the wood and keep the fire going. The children would be given a special kind of bread baked in a long pan, like a muffin pan, made just for them, according to Kupuna Makanani:

And when we were full, we would go out in play. And then the other kids would come, and they would take care [of the fire]. And they would give the kids some bread and butter. And you know because you can smell the bread coming out.

The group took note of plants that grow in and around the Project area, which also include orchids (Figure 39), koa trees, as well as fruit trees like mango, papaya, and others.
7.2.4 Puhi Camp Memories

When the group hiked toward a second cemetery, referred by Mr. Takahashi as being near the “Cement Camp,” located in the perimeter just outside the Project area, Mrs. Kawado reminisced about her experiences in Puhi Camp with CSH. Mrs. Kawado was born in 1945 and grew up in Puhi Camp. Her maiden name was Hirokane. She was the oldest child in a family of four children: two girls and two boys. Each child was a year apart and each one had names whose first letter corresponded with the order of their birth. Since she was the oldest, her name was “Audrey,” followed by Boyd, her brother, then Chad another brother, and Daphne, the youngest, now Mrs. McClure.

Mrs. Kawado continues to cherish her memories of Puhi Camp:

...The fact that, even though all of us were from families that didn’t have a lot of money, it didn’t feel like we were missing out on anything because we had good friends, people take care of you...they didn’t treat you like you were lacking anything...we didn’t have beautiful houses; some of us had out houses, we didn’t have toilets that flushed. But still...it was such a special place for me.

Each day as a young child, Mrs. Kawado would walk to Līhu'e School with her friends. During her seventh grade, they built a new school, the Elsie H. Wilcox elementary school. Her mom would prepare hot cocoa for breakfast for her and her siblings. For lunch, she would eat peanut butter sandwiches. At the time, the peanut butter in the jar was very hard to spread, so her mother would dip the spoon in a cup of warm water before using it to spoon the peanut butter spread for sandwiches.

After school, she swam in the reservoirs and fished there too. For after school treats, one of her favorites was called “V apple,” a local fruit that was tart and eaten with a mixture of shoyu, vinegar, sugar and pepper. Another treat was slices of dried abalone, bought and eaten like beef jerky, confirming what Mr. Takahashi remembers.

It was Mrs. Kawado’s responsibility after school to get the daily newspaper and bread at the store. She recalled the Afong store, which was also a meat market, and another store that was called Puhi store. The post office was also in the store. Her friends were Filipino, Portuguese, Puerto Rican and Japanese, and she grew familiar with their favorite foods, including the tastes and terms for each one. Mrs. Kawado also played the folk games from her friends’ culture; one of her favorites was a Filipino children’s game called “panio” or “alapanio” where they ran around the cane fields and hid from people designated to find them.

She admitted that it was a hard life with no running water for toilets and baths taken in a “furo” (Japanese bath tub) where water had to be heated up by hand. Before using the furo, they all had to scrub and wash up to be clean, since the furo water would be recycled to water the plants. Her father planted lots of vegetables including lima beans which grew on a wire fence. It was a happy childhood where she played with her siblings and helped out with the chores.

When she was 14, the day of her brother’s 13th birthday, their father died from a sudden stroke, an event that marked in a way the end of a happy childhood. Mr. Hirokane supplemented...
their table with the wild fruits and vegetables that grew around them, in addition to planting their own:

He used to do that, he used to get wild lilikoi, takenoko, so we kinda lived off the land in that way...and he never came home one day. So I guess my mom called the police. She was reporting him missing and he had a stroke, he had fallen...some place where they have takenoko.

After her father’s death, her mother continued to work as a maid for the Wilcox family. The Wilcox family owned the Kilohana Plantation and a 16,000 square foot mansion in the Tudor style close to Puhi Camp. The mansion was built in 1935 by Gaylord Wilcox and his wife, Ethel. According to the Kilohana Plantation website, Gaylord Wilcox was the descendant of Abner Wilcox who was among the first missionaries in Hawai‘i. Mr. Gaylord Wilcox was the manager of Grove Farm Plantation at the time the mansion was built.

Each morning, Mrs. Hirokane walked to her work each day as she did not know how to drive and the children were too young. She raised all four of her children singlehandedly, and two of them went to college. Years later, Mrs. Kawado remains in awe of what her mother did for her and her siblings:

Yeah! And you know, we never went on welfare or food stamps. Well we didn’t have food stamps in those days, but social security I think saved us. Yeah, my dad had been working many years so he had. He just didn’t earn a lot of money because he worked for the plantation, but it was enough for her, she was the one who practically raised me all the way...to go to college. But I said, “You know, I want to go to college, but you know what are the chances?”...And then she made all arrangements, she looked into college, she looked into getting a loan for me and all that! She was amazing! I think she wanted that for her kids, to be self-sufficient.

Mrs. Kawado first went to Maui to Maunaolu Junior college that was surrounded by cane fields and which reminded her of the days in Puhi camp. Then she went on to University of Hawai‘i and majored in Sociology. Shortly after she graduated in 1968, she was offered a position with the State of Hawai‘i in the Department of Social Services. The year she graduated, Mrs. Kawado married Mr. Alan Kiyoji Kawado, and they had three sons. She would have celebrated her 43rd anniversary with her husband last year but he recently passed away. She recalled with a laugh how her husband was known to everyone as “Mr. Aloha Airlines,” and he was fiercely loyal to the airline. If friends ever flew another airline, they knew better than to tell him.

The last site that the group visited is located off a dirt trail some 200 meters north of the Project area (Figure 40). Mr. Takahashi referred to the second graveyard as the “Cement Pond” cemetery. In the 1950s, when he was about 10 or 12 years old, Mr. Takahashi was bicycling with a friend when they came across the cemetery. According to him, the general area where the second cemetery is located is called “Cement Pond” by Puhi Camp residents because there was a big tank where all the drinking water came from, and when a new tank was built, all the children swam in there.

The Cement Pond cemetery contains at least three graves with headstones (Figure 41). As for the graves, a royal palm tree marks their location on the side of the trail. The tree has been there as a marker ever since Mr. Takahashi was a child.
The smoke was coming out, was coming out, and it seemed the whole place would be burned down. But no...meanwhile I was passing, and I never seen that. Only [that] one time I saw it. And so coming back the next day, there’s two ways to go up there, so coming back, I thought to check, because I saw the smoke. There was nothing burned, nothing. It was in the field by a big water tank. The smoke was white, white, white, like a cloud.

The similarity of the environment around Cement Camp and the area around Stable Camp made Kupuna Makanani recall more details about what she saw:

There was also a water tank...I seen the forest and I seen smoke so I said, “Oooh...that’s spooky, they gonna make fires and there’s the trees,” and so I went to my friend’s house and then, I didn’t tell them anything and the next time I went up, I told them, “Oooh, you know, funny there’ smoke, but when I came back the next day, there was nothing burning. But I say, “I seen it.” And then he told me, “Oh we forgot to tell you that that road is “obake” [Japanese term for “spirit”]. Yeah. And I said, “What?” So I never wanted to go that time and I usually go in usually when I get to work.

For Kupuna Makanani, both the smoke she witnessed and the fireball are one and the same: they are “spirits” according to the Hawaiian belief system. Mr. Takahashi agreed with her.

Mr. Takahashi pointed out no one knows how old the area is. He noted that Kaua‘i is the oldest of islands:

And the first to be probably inhabited so what was here before the missionaries came, nobody know...A lot of the heiau were all run down when the missionaries came, so might have been a heiau up here and nobody knows, you know.

He related that a while back, he had seen some shards of glass and opium bottles as well as pottery bits when he was working on the field. This led to his theory that Chinese people as well as Hawaiians were former inhabitants of the area where the fireball was seen.

After the site visit to Cement Pond cemetery, the group discussed their thoughts about the Project. Mr. Takahashi notes that it would be good for KCC to eventually be a four-year program, in order to attract more students. He sees the need for new buildings, and a new parking lot so the school can grow. He and others like Mrs. Kawado also want to preserve the remnants of Puhi Camp for the education of future generations.

Kupuna Makanani is of the same mindset as Mr. Takahashi. She thinks the expansion of the community college is good, providing there are some limitations. “Your children and your grandchildren will benefit, but if they have nothing, they are going to move,” she states. She wants to know what Project proponents have in mind in order to provide her recommendations. Kupuna Makanani knows, however, what she doesn’t want. She does not want the burials to be moved but she can see that the reservoir and the graveyard are in the middle of the Project area. Kupuna Makanani appreciates that a CIA is being done.
Later during the day, a smaller group consisting of Kupuna Makanani, Mr. Takahashi, Amber McClure, and CSH visited the offices of Bernie Sakoda, who was instrumental in organizing past Puhi Camp reunions. Born in 1946, Mrs. Sakoda was raised in Puhi Camp and three generations of her family worked for Grove Farm. Her father, Robert Seiyei Tokuda, was a truck driver for Grove Farm while her grandmother, Kama Tokuda, raised ten children as well as did the laundry for the working men, among her many activities.

Mrs. Sakoda recalls her weekly chore of collecting firewood, as well as certain ingredients needed for the homemade pig stew. Ingredients for the stew included honohono grass, papayas, and avocados:

My family thought I was crazy but I thought it was the greatest job, it was hard work but I didn’t mind chopping and cooking it. We would cook it once a week and the 50 gallon slop would last the whole week. Everyday, we could re-heat some of it and put it in a can on the wagon and take it to the piggery.

If the pig was slaughtered, all the parts of the pig was used, and nothing was left to waste. Mrs. Sakoda recalled with some pride how her family raised rabbits, ducks, turkeys, and had “a most beautiful garden” in the backyard. “We lived off the land pretty much, we can be very self-sufficient. It was wonderful times, and the community was really a solid community,” she relates. Even if her parents were having hard times, she did not realize it because her father would provide meat from the family “mini-farm” as well as produce from the garden.

Kupuna Makanani adds that no one wanted to be on welfare:

You shamed if you were on welfare...You worked and everything went on the table. Nobody said this is mine; there was one pot for everybody. If you had a dollar or 50 cents, you were satisfied. You don’t ask questions why, you were satisfied.

All of the group members who were present, including Mr. Takahashi, Kupuna Makanani, and Mrs. Sakoda emphasized the importance of respect that was instilled in them. Mrs. Sakoda narrates that just a stare from her parents was enough to make her stop her misbehavior. But the lack of respect she sees in children brought up today may be due to the different circumstances in the home:

You can’t blame the kids, I think both parents are struggling in this age now, and both parents work. In our days, we had someone at home all the time, watching over us. The discipline was so different in the past...We were brought up in the Asian custom of “you listen to adults and you respect the adults.” If we answered back, we were sent out of the room. It’s so amazing how respectful we were to our parents and when we knew we were doing wrong.

The rod was not spared either, the group agreed. Mrs. Sakoda notes that as older children, they received a spanking and they knew when it was coming. Overall, her childhood was a wonderful experience where she learned the value of not just respect but also the meaning of sharing with one another. Puhi Camp residents were from all over. For example, she cited how Japanese residents came from different prefectures in Japan as well as from Okinawa.

Everybody’s culture was different. We shared. We had “Up” and “Down” camp, and a lot of people in between. In our camp, we had a good mixture of Filipino, Portuguese, Puerto Rican, Chinese... We grew up in the community where everyone shared food...and it’s not only the food, but all of their history. For us, it was playing with “taiko” [Japanese percussion instrument] drums and concerts with Okinawans, for the Portuguese, who did all the cooking in the outdoor oven, we baked bread. We ate “kimchi” [Korean fermented spicy cabbage].

7.2.5 More Foodways

Food was an important part of the cultural education for Mrs. Sakoda, and she relates how “miso” was made by fermenting beans in a huge barrel. She also shared the recipe for an Okinawan dish that plantation families enjoyed. It involves boiling down pork fat until it gets crispy. Then miso, sugar, and ginger are added so that it is like a paste. The crispy pork pieces are mixed into the paste and the whole thing is served over hot rice.

Food was such an indelible part of life in Puhi Camp that during the camp reunion in 2003, the amount of food prepared was enormous. Dishes that Mrs. Sakoda credits as being part of the Puhi Camp repertoire included Chicken Hekka, Hulihuli chicken, and Chicken Papaya with “malunggay” (moringa) leaves. The group then traded stories of foodways, specifically the different ways to prepare dishes from all the ethnic groups, including the taste of “pansit” (a Filipino noodle dish), “pinakbet” (Filipino vegetable stew with vegetables and “bagoong” (fermented shrimp paste) or shrimp with pork as flavoring). There was also mochi rice, adobo, “cascaron” (also known as “bitsu-bitsu” balls, a Filipino dessert usually served on a stick made with mochi flour, coconut and sugar).

Even today, Mrs. Sakoda prepares many of the dishes she ate at Puhi Camp. She relates:

I have a malunggay tree in my backyard because we love it so. Wild bitter melon and green beans and squash—we love pinakbet. We love adobo [Filipino dish involving meat cooked with vinegar, soy sauce, and bay leaves, most likely from Mexico].

7.2.6 The Social Box or Box Dance

An important part of Puhi Camp was the hall provided by Grove Farm, a gathering place near Puhí store, where people would go to have holidays, weddings, and other events. According to the group, Filipinos held an occasion called “the Social Box.” At pay day once a month, all the women would prepare whatever delicacy or dish they wanted to make, such as musubi (rice with seaweed that usually has something such as spam or another filling), which they place into a box the size of a shoebox. They would then take the box lunches to a dance in the hall. Ostensibly, the dance was held for single Filipino men, but everybody participated because it was a fun evening, according to Mrs. Sakoda.
It was a night to go out and socialize, and we didn’t have TV at that time. The women would auction their boxed lunch, that’s why it was called a “Box Dance.” They would auction off their boxed lunch to the highest bidder. The highest bidder gets to dance with them and to eat the lunch...It’s like matchmaking.

The women could also have someone prepare lunches for them if they were too busy working in the pineapple field or cannery. Mrs. Kawado and Mrs. McClure’s mom, Mrs. Hirokane, was well-known for her cooking and her boxed lunches were in demand among busy, working women. When asked what the primary goal was of the dance, Mrs. Sakoda describes it as a way to socialize where men can dance with women. The boxed lunches were also a way to make some extra money on the side. Kupuna Makanani notes that there was no alcohol that was served but the dance was still fun with music and an emcee. Such social events like these is credited by Mrs. Sakoda for teaching her about other cultural practices:

There was Filipino music, Japanese music from the Japanese and so on...That’s why we all know how to do the bamboo dance, we all know how to do the hula, we all could play the ‘ukulele. That’s what the communities all were [doing] on weekends. If you wanted to take ‘ukulele, you could go there, if you wanted to sew, you could go there.

Both Mrs. Sakoda and Mr. Takahashi traded memories of Chinese men who would sell *manapua* (steamed meat buns), and delicious hot sainim. Eggs and milk were delivered to residents. Other vendors included tofu sellers, including one particular lady from Līhu‘e. Mrs. Sakoda describes the following:

She had a stick across her back, and the cans, cracker cans would be balanced. The cans had tofu. One would bring one’s bowl to buy the tofu. If you wanted bean curd...there was also *nishime*.

The holidays were a special time for the children in Puhi Camp, marked by food. Mrs. Sakoda describes how each Christmas, each child received a gift from Grove Farm:

Every Christmas, we would have a handful of mixed nuts, fruit, an apple, and an orange and some candy. It was so precious for us to get that each Christmas, that little brown bag with just that. If we only could re-create that, it was so valuable to have that apple and orange...we were fortunate. The unions were very good to our camps.

**7.2.7 Recommendations**

The group then discussed the certain style of plantation homes in Puhi Camp. Old Japanese homes, for example, usually had a “china hutch” that had screens on the doors where food was kept and flies were prevented from coming in. The legs of the china hutch were placed in containers of water to keep ants from climbing up. Although there are no more Puhi Camp houses that remain standing, Mrs. Sakoda drew attention to the Grove Farm Museum where there are replicas of plantation homes. Preserving the past became an issue for Puhi Camp residents when the 2003 reunion committee pondered on what was valuable to remember. Mrs. Sakoda states:

...It never crossed our minds until we did the [Puhi] camp reunion, and then we realized it was really too late because all the homes were destroyed. When they asked to relocate the remains in the cemetery, that’s the first we knew that there were going to be development there...Those days, we were never aware or made aware of all the history that was going to be lost.

The significance of the camp bulletin board and the role it played in the everyday life of the workers was one of the main things that the Puhi Camp reunion committee wanted to preserve. The board contained communication vital to the daily life of the camp, everything from union meetings, holiday events and seasonal announcements. Because there were no computers in those days, the bulletin board was one centralized area that could effectively communicate all upcoming events affecting the camp’s residents.

According to Mrs. Sakoda, the reunion committee had asked Grove Farm to make a replica of the bulletin board as a memorial to Puhi Camp which can then be located somewhere in campus where students and visitors can read about its history. States Mrs. Sakoda:

When we were doing this [2003] reunion, we thought it would be a good idea because we remember our laborers had that bulletin board...We want to use that as a re-created one or restore it to use again. It was a bulletin board with an attached roof, with all the announcements pertinent to the camp life...We know KCC has a carpentry department, and it would nice for them to re-create that bulletin board, and restore our oven. But keep it on campus, so it would remind people [of Puhi Camp], and it has to look the same as when we were growing up.

As for the Puhi Cemetery, Mrs. Sakoda shares that her little brother could still be buried somewhere in the cemetery. Her first preference is that the graves will remain where they are. The group talked about who will clean the graves in the future. In the end, Mrs. Sakoda, Mr. Takahashi and Kupuna Makanani agreed that if it is possible, a columbarium containing all the graves should be built on site. Then it would be able to maintain itself. The columbarium has to be in the area so that people would know it was Puhi Cemetery.

Mrs. Sakoda shares the following question that she would like answered by Project proponents:

What is the intent, their intentions regarding Puhi cemetery? The group is wondering why they have not gotten notification about the Project proponents’ intentions regarding the cemetery. They would like to be part of the discussion when a decision has been made.
7.3 Mr. Charlie Pereira

CSH interviewed Mr. Charlie Pereira at the Waipā Foundation site in Hanalei, Kaua‘i, on 12/08/2011. Mr. Pereira is from Niumalu Ahupua‘a where he spent the majority of his childhood years. He states that it was during those years that he learned to fish. Mr. Pereira is a reknowned fishermen and a master fishing net weaver who was weaving his most recent fishing net during parts of the interview with CSH (Figure 42). As a young boy, Mr. Pereira worked in the sugar and pineapple plantations then at 21 years of age, he was drafted to the U.S. Army. During his time in the military, Mr. Pereira spent 11 years in Scholfield Barracks then worked in Korea, Germany, and Texas. When he retired from the military, Mr. Pereira returned to Kaua‘i and worked at Coco Palms for 24 years. He laments that he missed the fishing. He has two daughters, five grandchildren, and five great-grandchildren. He currently lives in Namaholo with his two daughters. On Thursdays, Mr. Pereira volunteers at the Waipā Foundation in Hanalei, making poi.

Figure 42. Mr. Pereira weaving a fishing net (CSH 12/08/2011)

Regarding his connection to the Project area, Mr. Pereira explains that his uncle, Joe Texeria, lived at Puhi Camp, which was formally located on the Project area. Mr. Pereira tells of spending a lot of time with his uncle and would visit him at the camp often. During a flooding event, water reached their home in Niumalu so his family spent the night at Puhi with his uncle.

Mr. Pereira recalls that the location of the KCC was formally agricultural land with pineapple, cattle, and later, sugar cane. He explains that it was a hard life living in the plantation camp. He shares his memories of Puhi:

Where the college is at KCC, that used to be all agriculture and pineapple. They also had cattle grazing there. They only raised cattle and pineapple and then sugar. They got their water from reservoirs. They had ponds. They got them in Puhi. I remember the plantation having the bathrooms outside. They had water running for the bathroom and the plantation gave them kerosene for their cooking and for hot water for baths. Their life was pretty hard. The Filipinos got together once a year around December I think. We’d go too, but it was a Filipino celebration. When I was growing up, they called the celebration the “Holy Ghost.” The Catholic Church had a carnival and now they call it “Carnival” but at that time, it was “Holy Ghost.” They made sweet bread, you know, malasadas. As the years went by they made some pretty good stuff.

Mr. Pereira worked for the sugar and pineapple plantation for many years especially during the summer time as a young boy. He explained:

It was sugar and pineapple. I was twelve years old when I worked for the plantation. I worked there in the summer time. That’s how we made our money for school. We had to buy our clothes. I worked in the plantation for a dollar a day. I had a German boss. The only thing I didn’t do in the sugar cane was irrigate, you know, water the cane, but I was in the fertilizing and the harvesting of the field. There was very little machinery when we first started but as the years went by, they had more improved machinery for cutting the cane.

When asked about fishing practices in Niumalu, Mr. Pereira shares the following recollections. He also tells of his passion for fishing and making nets and shares with CSH a picture of himself casting his first fishing net at the age of 12 (Figure 43):

There was a lot of fishing in Niumalu. There was a guy, Mr. Coney, who caught the akule with the net. We’d go out to catch the akule in the bay. We’d bring it in and take out the fish and we’d sell it and eat some of it too. We were always playing in the bay. I’d be on the break water picking up ‘opih and spear. I did a little spear fishing with the boys but my interest was the net, once I got into the net. We’d catch mostly small fish–manini [convict tang], squid [he’e], and other good fish [See Appendix B for scientific names].

Fishing is my thing. I make the nets. I sell them to whoever wants to buy them. I learnt from my dad and he learnt from the Hawaiian people. My dad was Portuguese. Grandpa and Uncle were fishermen. Commercial fishermen, and now it’s my nephew. He uses the nets with the floaters and the weights and surrounds the akule schools of fish. The nets I make are smaller. Throw net they call it

They dredged the harbor [Nāwiliwili] to make it deeper. It was too shallow for the big boats. I have a picture of me there with my fishing net. Where I’m standing in the picture, today, there’s gas tanks there. This one here, this is the picture [as he
shows CSH his picture]. I had a bigger one with my net in my folder, but I don’t have it in my wallet. This picture was taken when I was twelve years old with my first net. My mom took this picture.

In addition to net fishing, ‘ōphi-picking, and spear-fishing, Mr. Pereira also used to fish for crab using crab nets:

I used to go crab fishing with the crab net and catch crabs. It’s a round net with the wire ring. We used to catch crabs over there at Ni‘ilmalu Bay. We used to catch a white crab [possibly kihōma] and the Samoan crab with the blue pinchers.

They call it Samoan crab [See Appendix B for scientific names].

Mr. Pereira also used to paddle from Ni‘ilmalu on his surfboard to surf in Nāwiliwili Bay. He describes the following, “from Ni‘ilmalu, I’d go on the surf board I went all the way around the harbor to where that Marriott Hotel is, just to catch a couple of waves. I went all the way back too on the surfboard and the surfboards were made out of plywood.”

Figure 43. Mr. Pereira with his first fishing net at the age of 12 (Courtesy of Mr. Pereira)

Mr. Pereira reminisces about growing up in Ni‘ilmalu and portrays a picture of how rural life was like during that time:

We didn’t have our electricity until probably after the war—1945 or 1946. We didn’t have electricity before that so my mom used kerosene for cooking. Mom was good at making bread. Home-made bread. I used to sell it to the Hawaiians for ten cents and I couldn’t collect ten cents. You could buy a loaf of bread for ten cents and an ice-cream for a nickel. I remember those days. We didn’t have electricity. Same thing with my wife in Anahola. They didn’t get electricity until about 1957 or 1958. Then I lived in Moloka‘i. Our house is there. My wife got the property through her dad and we didn’t get electricity until 1982 over there. Everything was kerosene. My wife was raised with kerosene lamps the same way.
It [Nāwiliwili] was a small town at the time. I remember that valley, it’s not on these maps [pointing to maps]. The mill is over here and the valley comes around here and goes toward Kalapaki. Down in that valley where we used to live, there were taro patches. Now it’s all pastures and grassland but before, they used to be taro patches. Someone is still planting taro there. There’s still some taro patches down here. In Niumalu, there’s three ways in the back. I remember when we wanted lil’au [young taro tops, especially as baked in coconut cream and chicken or octopus] leaves or taro, we’d go down there. There’s only one family I knew who had taro but they got old and didn’t continue it. I think the landowner down there was Kanoa Estates. They sold some parcels but they leased out the land for cattle.

The Andrades, from Kalaheo, used to have cattle down there. This was around the sixties to mid-seventies. After that, the place just went to grass.

He recalls the sugar cane industry as a child and of a railway that brought sugar from the plantations to a mill in Nāwiliwili. According to Mr. Chun, the land on which the KCC campus is located, was also cultivated in sugar cane. He recalls that Pahi Camp, a plantation camp, was also located within the Project area. He is doubtful that any archeological, historical, or cultural sites remain within the Project area due to the prior cultivation of sugar cane on the property. He states:

This campus used to sit on sugar cane land. I remember as a kid that this side over here [pointing to map], was a plantation camp. The Pahi Camp. It was here and also here. This was all sugar. As far as archaeological, historic, or cultural sites, I don’t know if there’d be anything left because this was all sugar cane land.

Mr. Chun shares his memories of Pahi Camp and explains that the camp was predominantly Filipino. He describes life in the plantation camp:

Pahi Camp was all single-family homes. Old style. It was run by Li’hue Plantation or it may have been Grove Farm. They provided housing for their plantation workers. I think the workers paid for their housing but it was cheap. That was part of the plantation mentality at the time. Workers were brought in, paid the minimum wage, and housing was provided. At that time, most of the camp was Filipino because that was the latest immigration group that was brought in to work the plantations. They were the majority of this plantation camp. They [Pahi Camp] had their own plantation doctor, medical facilities, and plantation store. So the money stayed within the company. It was like that for awhile. You know where the Macy’s is located at the Shopping Center? Back then, Liberty House was there. It started off as a plantation store for American Factor’s Corporation which was one of the Big Five Corporations. They had their own plantation stores to supply their own plantation workers so that the money would come back into the corporation. Originally, it was called Heckfield and Sons which is a German family but then during the war, World War I, they didn’t want to have any affiliation with something German so they changed the name to Liberty House. Something American.

Mr. Chun explains how water flowed down from Kilohana mountain and fed the plantations. He describes an abundance of water that collected in reservoirs. However, he suggests that developments, such as roads, have changed how water once flowed. He explains:

One of these sites here was a reservoir. The water for that reservoir came from a spring up here…down from Kilohana. There’s another reservoir here, and another here and here. So the water fed these reservoirs then the water went out to the sugar cane fields in this area. Now, the water comes down still. This one is dry, right outside of our building [Hawaiian Studies Building]. When it rains, the water runs off and overflows. When there’s heavy rain, the water drains and kind of fills up the road that comes out in front of here. This one [reservoir] still runs and goes to this stream that comes down here some place [pointing to map]. They’re putting in culverts and all sorts of thing in the road construction in front of the campus so I have no idea where the water all goes. Before, the water used to just go across the road and go down here [pointing to map]. This was all Pahi Camp, plantation camp over here.

Mr. Chun explains that freshwater flows down into Nāwiliwili Bay through rivers and streams, such as the Hule’ia River. He has observed changes in the water quality of Nāwiliwili Bay over time and attributes muddy water in the bay not only to heavy rains flooding the Hule’ia River but to activity upstream at the sugar mill, as well as the development of the Marriott Hotel. He explains:

When there’s heavy rains in the Hule’ia River, the whole bay gets muddy. That river flushes. Another stream comes up from the mill up this way and brings water down to Kalapaki side. When I think back, Nāwiliwili Bay wasn’t always muddy from rain because it didn’t depend on the rain, at least on the Kalapaki side. It depended on what the mill was doing. It didn’t depend on the weather. If it rained hard, yeah, then it would get muddy from the Hule’ia River but on this side [Kalapaki], it was more dependent on the mill. I think what happened is that the sugar mill up here used that stream to wash their cane so the stream would get silty and rubbish from the mill would come down into the bay. The water quality used to be junk.

Today, there’s another runoff stream that comes up here [pointing to map]. It used to come down on the backside of the Marriott. When the Marriott Hotel was built, they diverted the stream and made underground culverts for the water. Remember those really heavy rains when it rained everyday for a long time? Four years ago? When the dam broke, these culverts they had under ground to divert the stream collapsed, and made major damage to the hotel parking area and entrance. It was...
major. Because of that, whenever it rains, silt comes down through this and here too and joins and makes this real muddy.

Mr. Chun believes that fresh water has shaped the ecology of Nāwiliwili Bay in that corals do not grow where there is fresh water. He believes that the sandy bottoms of the bay and the location of the coral reef further out in the bay, is due to the decreased salinity of the water from fresh water.

There’s a rock here in the middle of the beach where water comes along here and out. That’s why it’s all sandy in the middle of the bay because coral is not going to grow where there’s fresh water. That’s why the reef is further out. In between this area, it’s all sandy on the bottom because fresh water comes in here and here [pointing tot map].

Mr. Chun describes Nāwiliwili Bay during his childhood and shares surfing stories in the bay. He also tells of mo‘olelo associated with sharks and shark gods in the bay:

The jetty wasn’t like the harbor where it is today. We didn’t have the breakwater outside. When they dredged this harbor, they made this jetty. Here’s inside lighthouse and outside lighthouse there. There’s a rock over here I heard a story about. I don’t know the name but they say that one of the shark gods came to this place. When we were kids, we used to surf over here and I’d think, “I don’t know if I wanna go surf over there. Sharks come around.” See these lighthouse here? There’s a break over here. They say that on this side, there’s another cave where the sharks give birth. So everytime we’d surf over here, we’d always look around. One time, we’re out here surfing as kids, maybe fourteen, fifteen and we looked around behind us and we saw this fish swimming behind us coming around this way. It’s all cliff here but there’s a little indentation that’s kind of low over here so we paddled to it. We climbed up this little indentation and we looked behind us and there’s this ten-foot shark behind us. That’s why I hardly go surfing there nowadays. They say, and it still holds today with the kids, some of them say, sharks give birth over here. A number of years ago, we’re surfing in this area along the rock where the reef is when these guys shout, “shark coming in”, so we’re all paddling and jump on the wall along here. The shark came. It was a hammerhead shark. The water was only chest-deep but it gave birth so there was a lot of thrashing and blood in the water. They kind of swim around here and went out. That doesn’t happen often but that’s one of the stories.

Mr. Chun recites previous research that his colleague, Mr. Pila Kikuchi, had conducted a survey in the area which indicates that the place name, “Puhī,” even though it means, “to blow,” was the name of a cave where a shark god lived. He believes that the cave was located in Ha‘ikū, near the Menehune Fishpond. He explains:

The place name, “Puhī,” means “to blow.” A shark god lived in a cave in the area. The name of the cave was Puhī, therefore, the name of the area. But where? See this? This area is in the ahupua‘a of Ha‘ikū. So it would have to be down in this area, near the fishpond [Menehune].

Regarding fishing practices in the bay, Mr. Chun recalls seeing a hukilau event at the bay as a child. He shares the story:

The first time I saw a hukilau was over there. It was in front of the Old Kaua‘i Surf. It was old style Hawai‘i kine of a hotel, part of the Big Five hotel chain. It was pretty low key, like CocoPalms, and open. They’d just started building it when I saw the hukilau. They had it here [pointing to map] and I thought it was so cool. They were just pulling in ropes with leaves tied to it and all these fish were coming in. It was pretty cool. I saw that once and I never saw that again. It was one family. I don’t even know whose family it was. Maybe it was Aunty Sarah’s family. Kalikea was the family. She passed away already but they were one of the old time Hawaiian families that lived in this area. In fact, they still have one house along here and I think the son still lives there. There was also uncle Gable ‘i. The Lovells were another one. Those are the families I remember.

Mr. Chun talks more about fishing practices in the bay and states that not too much fishing occurs in the bay today. Instead, people go to Waialua to fish. However, he maintains that people still gather limu and ‘opihi inside the bay and go crabbing along the Hule‘ia River. He states:

There’s not too much fishing in the bay. There is some but not that much. For us, we’d kind of go this side, to Waialua for fishing. We’d also walk down to Ninini Point, by the outside lighthouse. We’d use the roads and go down, park our cars, and go down along the coastline. Before, I don’t know if there still is, but there used to be a dirt road that goes there. You could also go by the airport and go along the coastline to the outside lighthouse. As far as limu and ‘opihi, we could get them right inside the bay. It was not a problem. People would go crabbing right along here, the Hule‘ia. We used to do that. People still do that. ‘Opihi, you can still get all along there in the bay, along the seawall. But, it’s so easy, people pick them small because it’s convenient. If people just want a handful for eating tonight, they’d go there.

Mr. Chun also mentions Menehune Fishpond as the largest fishpond in Kaua‘i and the main one in the vicinity of the Project area:

Menehune Fishpond is probably the largest. There’s one in Hanalei that I know of, right behind the Wilcox family house, Hanalei Bay. But, Menehune Fishpond is the main one in this area.

When asked his knowledge of burials and other features of cultural significance within the Project area, Mr. Chun indicates that he knew of a cemetery located near the campus. He identifies the cemetery on the map, which also appears on the map. He reiterates that the sugarcane plantations would have displaced features of cultural significance within the Project area and also points out that the population centers would have been concentrated along the coast or along the Hule‘ia River. Therefore, the likelihood of finding heiau and other cultural features would be higher along the coast than within the Project area. He knows no heiau in the ahupua‘a of the Project area.
There’s a cemetery up here. It’s on the map. It’s a separate parcel. That’s the only burials that I know of, at least, in recorded times but I don’t know as far as pre-history. I haven’t heard of anything here. I think because this was all sugar cane fields, everything got reburied, hidden, displaced, or destroyed by the time we came about. If there’s anything remaining, it’s probably destroyed. I’m sure that were stories. If we go back far enough, we’ll find written accounts of things but to find that now is difficult. I know what people would look for in digging around this area. They’d be looking for artifacts like old bottles and things like that. I see that happening more than for Hawaiian artifacts. In those days, I don’t think the population centers would have been up here. If anything, it would down along this area along the coast or along Hulē‘ia. I don’t know of any heiau around here. Heiau I know that would’ve been around the coastline. Not any that I know of in any of these ahupua‘a’s.

7.5 Mr. Robert White

CSH met with Mr. Robert (Bob) White on 12/07/2011 at his residence in Niumalu. Mr. White and his family moved to Kaua‘i in 1970 and spent most of the summers surfing and camping at the beach in Kalapaki since he was 10 years old. He has lived in Wailua and ‘Ōma‘o, but moved to his current residence approximately fifteen years ago. His home is located directly adjacent to the Hulē‘ia River and minutes away from the Menehune Fishpond. Mr. White, therefore, lives within the study area and near the Project area. He and his wife have two children who have grown up in Ni‘ihau and attended Kaua‘i High School. They have a strong sense of place and love the island and its people. Mr. White expressed the following sentiments about Kaua‘i: “We have a really strong sense of feeling for this island. So, we’re very open to this Project because we love Kaua‘i. We love the area, and we love the people.” He shared with CSH his mana‘o regarding the proposed Project.

Mr. White acknowledged the importance of the proposed Project to the well-being of the island of Kaua‘i and supports the plans to develop the school. He states, “I think it makes perfect sense to develop the school. It’s in a great location.” Being familiar with the area, Mr. White points out that should the college expand, mitigation plans to ease potential traffic problems attributed to the location of the Chevron Station near the main intersection on Puhì Street, directly in front of the campus, should be addressed. He explains that motor vehicles turning into the Chevron station is currently causing traffic congestion and foresees the problem to exacerbate if the campus expands. He shares his views on the traffic problem:

Numerous times, I have seen dangerous driving behavior and unnecessary traffic congestion at the intersection of Puhì Road and Kaamauli‘i Highway. The issue is that cars are turning left on Puhì Road into the Chevron station but there are cars generally stopped at the traffic light along Puhì Road. This creates an unnecessary traffic jam as the traffic along Puhì Road blocks the cars attempting to turn left into the station. In terms of easing traffic, it might make sense for Kaua‘i’s Public Works to mark the road “Do not block” so people can make their left turns into the Chevron station without holding up traffic. It would also make ingress and egress into the Chevron station safer for motorists.

Mr. White recommends that, “as they expand the school, it would make sense to have that intersection flow better. Even though the State is improving the highway there, there is still going to be a traffic issue at this corner unless the County can install the necessary signage or asphalt marking.”

Mr. White also points out that should the college expand, he was concerned about the potential effects of any herbicide usage for weed control on the surrounding areas. Mr. White acknowledges that the study area is a watershed which includes the Hulē‘ia National Wildlife Refuge near and downstream from the Project area. He states:

One thing that is a valuable point to mention is the County or the State’s use of herbicide or weed control. I just wonder how many of those chemicals end up in our watershed and how much that is affecting our aquatic reserves and resources. I would say, they should be sensitive about the fact that this is a watershed and that it is feeding down to the National Wildlife Refuge. This is actually a wildlife refuge, just around the corner. This whole area, where the Menehune Fishpond is, is in a wildlife refuge now. So, all the more reason to consider careful usage of spray or pesticides.”

He is concerned about potential contamination of the watershed, particularly that of the Hulē‘ia National Wildlife Refuge near the Project area, from any use of herbicides and methods of weed control. He recommends careful usage of these substances by the State of Hawai‘i and/or the County of Kaua‘i.
Section 8 Cultural Landscape

Discussions of specific aspects of traditional Hawaiian culture as they may relate to the Project area are presented below. This section integrates information from Sections 3–7 in order to examine cultural resources and practices identified within or in proximity to the Project area in the broader context of the encompassing landscape of Nāwiliwili, Niumalu, and Ha‘ikū. Excerpts from consultations are incorporated throughout this section where applicable.

8.1 Hawaiian Habitation and Agriculture

As discussed in Section 3.7, the ahupua‘a of Nāwiliwili, Niumalu, and Ha‘ikū were permanently inhabited and intensively used in pre-Contact and early historic times as far back as possibly A.D. 1100 (Walker et al. 1991). Historically, settlement of the study area was predominantly along the coastal areas as evidenced by the concentration of permanent house sites, temporary shelters, heiau, fishponds, and intensive cultivation in these areas. In 1853, Coulter recorded the population around Nāwiliwili Bay to be approximately 1,700 and indicated on his map that settlement was predominantly along the coast, most likely reflecting a high dependence on marine resources for subsistence. A photograph in 1886 of Nāwiliwili, shown in Figure 44, suggests that some 40 years later, the study area was still highly engaged in taro cultivation. However, observations by Handy (1940) of Nāwiliwili in 1935 suggest that major changes to the landscape of the study area occurred between 1886 and 1935 in which lo‘i cultivation had significantly decreased and replaced by pastureland and sugar-cane plantation-related activities.

This drastic change in the landscape was likely attributed to the prevalence of the sugar-cane industry particularly in the early twentieth century. Consultations with Mr. Chun, who grew up in Nāwiliwili in the 1960s, describes the valley of Nāwiliwili during his childhood as a small town where taro was once cultivated and later replaced by pastures for cattle. He relates that even during the 1960s, taro was still being cultivated in the area, though probably to a lesser extent than in 1935. Today, taro patches are almost non-existent in the study area with only a few families who still cultivate taro.

Regarding the Project area, Mr. Chun reiterates that, “[i]n those days, I don’t think the population centers would have been up here [around the Project area]. If anything, [they] would be down along this area along the coast or along Hulē‘ia.” Thus, it is very likely that the Project area did not support much human habitation until the plantation era with the establishment of Puhi Camp in the early twentieth century. Consultations with residents of the study area and of the former Puhi Camp indicate that the landscape of the Project area was formerly under sugar-cane cultivation though Mr. Pereira also made references to the farming of pineapple and of cattle.

An archaeological study by Palama in 1973, in and around the Project area, found ‘auwai and a possible lo‘i (Figure 27). Follow-up interviews with plantation workers at the time indicated that none had any knowledge of taro cultivation in the Project area (Palama 1973). Consultations for the proposed Project also indicated no knowledge amongst former Puhi Camp residents or amongst residents of the study area, of taro cultivation in the area. However, literature research and consultations indicate that Puhi Camp families were given land by Grove Farm Plantation to plant vegetables and crops for subsistence. Therefore, it is possible that taro may have been cultivated during this time.

Figure 44. Taro was grown along the Nāwiliwili Stream to half a mile up above the mill. (Bishop Museum 1886)
8.2 Wahi Pana and Mo'olelo

Wahi pana and mo'olelo provide a unique insight into the cultural and natural landscape of the past. Wahi pana and mo'olelo associated with the study area are plentiful suggesting early settlement of the area by a viable Native Hawaiian population. In the case of the Project area, the wahi pana of “Puhi,” the name of the area in which the Project area is located, is associated with a shark god. Mr. Chun explains:

The place name, “Puhi,” means “to blow.” A shark god lived in a cave in the area. The name of the cave was Puhi, therefore, the name of the area. But where? See this? [Pointing to map] This area is in the ahupua’a of Ha’i’ki. So it would have to be down in this area, near the fishpond [Menchune].

Thus, Puhi was the cave of a shark god, which is thought to be possibly located within the ahupua’a of Ha’i’ki, near the Menchune Fishpond. Though Puhi is located several miles inland from the coast, the association with sharks reflects a culture deeply connected with the ocean and emphasizes the mauka–makai orientation of the land that is central to Native Hawaiian culture. Mr. Chun also shares other mo’olelo (see Section 7.4) associated with sharks and shark gods residing in and around Nawiliwili Bay.

8.3 Burials

Archaeological studies discussed in Section 5 and consultations presented in Section 6 and 7 indicate that two graveyards, the Puhi Camp Cemetery and Cement Pond, though outside of the Project area, are located within 200 meters of the proposed Project. Thus, known burials in the vicinity of the Project area are historically, relatively recent. Kupuna Makanani recalls how it was possible to bury family members around one’s residence when she was growing up; therefore, she expressed that discovering inadvertent burials is possible. Acknowledging the agricultural history of the Project area, Mr. Chun explains that “the sugar cane plantations would have displaced features of cultural significance within the Project area.”

8.4 Heiau

Literature research indicates that no known heiau currently exists within the study area though Kuhiau Heiau, reported to be the largest and most famed heiau on Kaua‘i, on the coast of Nawiliwili Ahupua‘a. Consultations with participants for the proposed Project revealed that none had any knowledge of heiau in the study area probably because these structures have been physically obliterated.

However, consultations reveal that residents of the study area may still have some knowledge of mo’olelo associated with heiau that existed in the Project area. Mr. Chun describes a rock near the lighthouses along Kalapaki with stories associated with a shark god. The rock that he describes may possibly be Paunkini rock, the sister heiau of Kuhiau Heiau described above. Mr. Chun shares his mana’o:

Here’s inside lighthouse and outside lighthouse there [pointing to map]. There’s a rock over here I heard a story about. I don’t know the name but they say that one of the shark gods came to this place.

8.5 Marine and Freshwater Resources

Early accounts describe the study area as a rich land with abundant fresh water and marine resources (Section 4.2). In Section 3.7, Handy describes Ni‘ihau Ahupua‘a in the mid-twentieth century as having among the best fishing grounds on the island of Kaua‘i. Inhabitants of the study area fished the reefs, farmed fishponds, and utilized the many freshwater streams and rivers flowing seaward from Kōloha not only for lo‘i cultivation, but for fishing. During the sugar cane plantation era, which began in the 1830s in Kaua‘i, fresh water was used to support the largest industry that drove the economy of the Project area at the time. Within the Project area, Grove Farm Plantation diverted freshwater streams to build reservoirs and ditches that supported the life and daily activities of the plantation. The literature and consultations with residents of the study area suggest that since the mid-nineteenth century, demands of population increase and its associated development have negatively affected the health and quality of these water systems.

8.5.1 Streams

Section 3.6.1 discusses streams within the study area in more detail and affirms that modern development has modified the flow of these water systems. Consultations with residents of the study area reveal the types of changes they have observed over their lifetime. Mr. Chun explains that fresh water flows down into Nawiliwili Bay through rivers and streams, such as the Hule‘ia River. He has observed changes in the water quality of Nawiliwili Bay over time and attributes muddy water in the bay not only to heavy rains flooding the Hule‘ia River but to activity upstream at the sugar mill, as well as the development of the Marriott Hotel.

Mr. Chun’s observations highlight the mauka-makai connection of the land in that the impacts of land-based activities are not only localized but may have more far-reaching impacts on distant locations and ecosystems. Streams and rivers act as media that connect points along the land with the ocean. With this knowledge in mind, Mr. White is concerned that should the college expand, herbicide usage for weed control from the college may affect surrounding areas. Mr. White acknowledges that the study area is a watershed which includes the Hule‘ia National Wildlife Refuge located near to and downstream from the Project area. He is concerned about potential contamination of the watershed, particularly of the Hule‘ia National Wildlife Refuge with herbicides and methods of weed control used by KCC.

8.5.2 Fishing

As discussed earlier, the study area was known for being one of the best fishing places in Kaua‘i. Handy (1940:67) relates that, “Ni‘ihau is a tiny ahupua‘a, a mere wedge between Nawiliwili and Haiku, but it was, and is, one of the most important fishing localities on Kaua‘i.”
Thus, by the mid-twentieth century, fishing within the study area is described to have been widely practiced with an abundance of fish. However, participants consulted for this Project believe that the abundance of marine resources has declined over time and though people continue to gather limu, pick 'opihi in the bay, and crab, many prefer to fish in Wailua, north of the study area. Mr. White no longer eats fish from Niumalu Bay due to pollution.

Mr. Chun, Mr. White, and Mr. Pereira, long-time residents of Niumalu and Nāwiliwili who have spent many years fishing in the area, share their knowledge and experience of fishing. They indicate that fishing mainly occurred along the coastal areas of the study area, particularly at Nāwiliwili Bay. They recall fishing for akule with large nets, picking 'opihi on the breakwater along the bay, spear-fishing, netting, and crabbing for a white crab (possibly kūhonu) and Samoan crabs along the Hulē’ia River and in Niumalu Bay. Mr. Pereira also recalls catching he’e and fish like manini. Mr. Chun remembers a hukilau event at Nāwiliwili Bay during his childhood but has never seen another in his lifetime.

Mr. Chun believes that fresh water has shaped the ecology of Nāwiliwili Bay in that corals do not grow where there is fresh water. He believes that the sandy bottoms of the bay and the location of the coral reef further out in the bay, is due to the decreased salinity of the water from fresh water. He states:

“There’s a rock here in the middle of the beach where water comes along here and out. That’s why it’s all sandy in the middle of the bay because coral is not going to grow where there’s fresh water. That’s why the reef is further out. In between this area, it’s all sandy on the bottom because fresh water comes in here and here [pointing to map].

Within the Project area, Puhi Camp residents fished for ‘o’opu and crayfish, and caught frogs in nearby ditches and reservoirs to supplement their diet (See Appendix B for scientific names). It is not clear whether these reservoirs are still utilized by residents of the study area for fishing.

8.5.3 Loko I’a

According to LCA records, fishponds were abundant in the study area with six in Nāwiliwili, seven in Niumalu, and many ki’owai throughout Ha’ikū. Menehune Fishpond, the largest of all fishponds in Kaua‘i still exists, as shown in Figure 45. Menehune Fishpond has experienced many changes as documented in Section 3.6.2.1. Comparisons of recent imagery of the fishpond in Figure 45 to those from a century ago (Figures 8 and 9), show that mangroves have encroached upon the fishpond, decreasing its size. Today, the fishpond is a historic property (SIHP No. 50-30-11-501) that is a major tourist attraction in Kaua‘i.

8.5.4 He‘enalu

Consultations for this Project indicate that surfing was and continues to be a Native Hawaiian cultural practice within the coastal areas of the study area. Mr. Chun, Mr. White, and Mr. Pereira all share surfing stories from the bay. Mr. Pereira recalls using surfboards made of plywood. Today, surfing is a significant recreational activity, not only for residents of the study area but for tourism.
Section 9 Summary and Recommendations

CSH undertook this CIA at the request of Wilson Okamoto Corporation. The cultural survey broadly included the entire study area, and more specifically the approximately 199-acre Project area.

9.1 Results of Background Research

Background research for the proposed Project indicates that the Project area, which lies approximately two miles southwest of Līhu‘e Town, is part of a traditional region encompassing the ahu‘ua of Nāwiliwili, Ni‘ihau, and Ha‘ikū. Early accounts describe the region as an open, grass-covered land that was dotted with trees and streams that flowed down from lush mountains on the way to the sea, with soils that bore a variety of crops like sugar-cane, taro, sweet-potatoes, beans and groves of kukui, candlenut, hau (beach hibiscus), koa, hala (pandanus), and wiliwili. The abundance of water and water systems, presence of famed fishponds on the coast, along with the concentration of permanent house sites, temporary shelters, and heiau suggests early settlement along coastal areas, with a radiocarbon date of A.D. 1170 to 1400 near the mouth of Hanamā‘ulu Stream, north of Nāwiliwili.

In the mid-19th century, the Project area became associated with the establishment of the commercial sugar cane agriculture which required foreign indentured labor imported from Japan, China, and the Philippines. The Project area was part of the Grove Farm Plantation before the farm stopped its sugar business in 1974. Within the Project area lies remnants of the Old Puhi Camp, which housed plantation workers of Grove Farm. The camp was built around 1920 along the present Kaumuali‘i Highway and contained a movie hall, three stores, a Chinese laundry, a slaughterhouse, and an area for social events. Most of the Puhi Camp housing was removed in the 1980s prior to the construction of KCC and the last homes of the camp were dismantled in the 1980s.

The Project area is also linked to many mo‘olelo (stories, oral histories) and wahi pana (storied places) that suggests early settlement of the area by a viable Native Hawaiian population. These include mo‘olelo about Kuhiau Heiau, the largest heiau in Ka‘au‘i, Ninini and Ahukuni Heiau in Kalapaki, the Menehune, wiliwili trees, and the many well-known chiefs, heroes, and gods such as the chief Papolainalu, the three sons of Lā‘a Maikahiki, the hero Ho‘oha‘au‘a, the contest of Kēkēhele the sling-thrower and Kapōhena, the ravishing of Pele by Kamapua‘a, Pōhaku Stream, Kilohana, and Nāwiliwili Bay. Many wahi pana of settled areas, such as Puhi, Līhu‘e, and various pu‘u (hills, ridges) are also associated with the Project area.

Other important findings from background research are presented and emphasized in more detail:

1. The traditional moku or districts of Kaua‘i were replaced in the mid-to-late 19th century. Līhu‘e became the modern district that includes the ahu‘ua of the proposed Project, previously under the Puna District. “Līhu‘e,” which literally translates as “cold chill,” was not consistently used until the establishment of commercial sugar cane agriculture in the mid-19th century (Creed et al. 1999). Between the 1830s and the Māhele, the names Nāwiliwili and Līhu‘e were used somewhat interchangeably to refer to a settlement along Nāwiliwili Bay.

2. No known heiau currently exists within the study area although Kuhiau Heiau, reported to be the largest and most famed heiau on Kaua‘i, existed along the coast of Nāwiliwili. Listed by Bennett (1931) as Site No. 99, this heiau is reported to have been about four acres and associated with Paukini Rock, its sister heiau that marks the boundary between Nāwiliwili and Kalapaki Ahupua‘a.

3. After the Māhele, Victoria Kamāmalu was awarded over two thousand acres of Nāwiliwili Ahupua‘a, along with much of Ni‘ihau and Ha‘ikū. Land Commission Awards (LCAs) describe many lo‘i (irrigated taro, especially for taro) and kula (plain, field, open country, pasture) lands within the study area particularly as being in the same ‘āpana (piece, slice, portion), a pattern common to the Puna District of Kaua‘i, but uncommon elsewhere in Hawai‘i. Maka‘īānana (commoner) in the Puna District were referring to lands in valley bottoms as kula.

4. Many loko i‘a (fishponds) were prevalent in the study area. LCAs document six in Nāwiliwili, seven in Ni‘ihau, and claimants describe loko (pond) or kiowai (water hole) in Ha‘ikū. ‘Alekoko Fishpond, also known as Menehune Fishpond, or Ni‘ihau Fishpond, is the largest fishpond on Kaua‘i and still exists in the study area. It is also known as SHIP No. 50-30-11-501.

5. The Project area was initially part of the Grove Farm Plantation—so named after an old stand of kukui trees. The plantation was established in 1850 and taken over by Mr. George Wilcox in 1863. He bought the farm in 1870 for $12,000 and it flourished under his leadership. In the mid-1960s, Grove Farm donated 200 acres of former sugar land to the State of Hawai‘i for KCC. Grove Farm ended its sugar business in 1974 (Wilcox 1998:76).

6. The Old Puhi Camp, which housed plantation workers of Grove Farm, extended into the Project area and consisted of about 600 homes for about 1,200 workers and their families. At the forefront of housing reforms, Puhi Camp dwellings became the standard for the plantation industry in the 1920s (Riznik 1999).

7. An archaeological reconnaissance by Palama in 1973 identified the Puhi Camp Cemetery, State Inventory of Historic Places (SIHP) No. 50-30-11-B006, old plantation camp remains associated with Puhi Camp, Puhi Camp, and an area containing possible lo‘i. A field inspection of the Project area in August, 2010, found ten historic surface features, including two previously identified historic features (CSH 9, CSH 10) by Palama (1973).
An "old ‘auwai" that conforms to a portion of Grove Farm’s “Mauka Ditch”, corresponds to CSH 9 and the Puhi Cemetery corresponds to CSH 10. However, the Puhi cemetery is outside of but surrounded by the Project area. The remaining features found appear to be related to Grove Farm and date to the plantation era. The historic surface features consist of five irrigation ditches (CSH 1, CSH 2, CSH 4, CSH 6, CSH 9), one of which (CSH 1) is abandoned; three reservoirs (CSH 3, CSH 5, CSH 7) of which CSH 3 is abandoned; and an abandoned wooden flume (CSH 8).

9.2 Results of Community Consultation

CSH attempted to contact 32 community members, government agencies, community organizations, and individuals, including residents, “recognized” descendants, and cultural practitioners. Community consultations began in September, 2011 until February, 2012. Of the 22 people that responded, eight kūpuna and/or kama'āina participated in formal interviews for more in-depth contributions to the CIA and two people provided statements via e-mail and telephone.

This community consultation indicates that additional significant cultural resources, namely streams and watersheds as well as the Hālē‘ia National Wildlife Refuge near and downstream from the Project area, have not been adequately documented and assessed for their ecological relationship with natural and cultural resources within and near the Project area. The study area and environs, in particular the lo‘i, kula or lands in valley bottoms in this particular context, rivers, streams and Nāwiliwili Bay, has a long history of use by Kānaka Maoli (Native Hawaiians) and other kama‘aina groups for a variety of past and present cultural activities and gathering practices. Participants consulted reveal their knowledge of these practices and resources.

At least two community contacts, Mr. Pereira, and Mr. Chun, discuss fishing, gathering ‘öpūhi (limpets) and limu (seaweed, algae) in Nāwiliwili Bay, and crabbing along Hulē‘ia River which still continue today among residents of the area. Both participants discuss spear and throw-net fishing which for Mr. Pereira consisted in part of catching akule (big-eye scad), manini (convict tang), and squid using his own throw net which he creates and sells to others. Several participants (Mr. Robert White, Mr. Pereira and Mr. Chun) narrate he‘enalu (surfing) practices and associated mo’olelo in the past and in the present. At least two participants note the abundance of freshwater resources and the watershed near the Project area and highlight the ecological relationship of natural and cultural resources within or near the Project area.

Participants also relate mo’olelo about the practice of hukilau (fish with the seine), the origin of the name “Puhi” which is connected to the cave of a shark god in Ha‘ikū, as well as the presence of spirits in the Project area in the form of fireballs. At least five participants relate the gathering of plants such as bamboo shoots, papaya, mangoes, passionfruit, guava and pepepiao (cloud ear fungus) in the Project area along with the catching of crayfish, ‘o’opu, and frogs in the irrigation ditches and reservoirs while at least two community contacts related about the hunting of pheasants and wild boars. Participants also discuss burials and note the existence of a historic cemetery surrounded by the Project area, and another cemetery nearby. Many participants stress the importance of respecting and sharing resources with one another, the ecological relationship that shapes natural and cultural resources, and the need to keep the ecological balance by keeping contaminants away from the watershed upon which the Project area is built to ensure a healthy environment for Nāwiliwili Bay and the wildlife refuge area downstream of the Project area.

Other important findings from community consultations are presented and emphasized in more detail:

1. In the 1960s and 70s, the ahupua‘a of Nāwiliwili, Niumalu, and Ha‘ikū, consisted of small rural towns with taro cultivated relatively close to the ocean. Mr. Chun describes Nāwiliwili Valley as having had many taro fields which later turned into cattle pastures and grassland. Today, he tells of only one family in Nāwiliwili and a few in the back of Niumalu who continue the practice. Mr. Pereira speaks of growing up in Niumalu with no electricity and using kerosene for cooking.

2. The Project area is agricultural land formally owned by Grove Farm where pineapple, cattle, and later sugar cane, were farmed. Plantations provided a livelihood for many residents of Kaua‘i like Mr. Pereira and Kupuna Makanani. Mr. Pereira worked in the sugar and pineapple plantations during the summertime as a young boy, which paid for his schooling. Mr. Chun and Mr. Pereira recall the predominance of the sugar industry which included the establishment of a sugar mill in Nāwiliwili. A railway system brought cane from the fields to the mill which later became replaced by trucks.

3. The Project area includes the former Old Puhi Camp, a plantation camp for the workers of Grove Farm Plantation and their families. Since Puhi Camp was a significant part of the Project area’s history, Puhi Camp is described in more detail:

- Participants remember Puhi as a self-sufficient plantation camp with its own stores, doctors, and medical facilities. Families shopped for groceries in plantation stores, and bought items using credit, to be paid for on payday. Plantation workers lived at Puhi for cheap rent, received kerosene for cooking, and hot water for bathing. Land was also given to anyone who wished to grow vegetables and crops were shared with each other.
- While various accounts portray plantation life as harsh and unfulfilling, Mr. Takahashi relates that the Wilcox family treated their workers very well and life was enjoyable at Puhi. Workers were provided the opportunity to own their own homes. Those raised on the camp fondly reminisce of a simple life and special place—a close-knit community where everybody recognized and took care of each other despite their differences. “For me, growing up in Puhi was great!” says Kupuna Makanani.
- The culture of Puhi Camp was diverse. According to Kupuna Makanani, the homes in Puhi were arranged by race though “everybody lived as one people.” Participants raised in the camp, appreciate their multi-cultural upbringing through the sharing of cultural practices, folk dances, foodways, and folk life.
- Participants recalled other cultural activities at Puhi Camp such as the ‘Social Box’ which was a dance held by the Filipinos once a month. Mr. Pereira also describes an annual Filipino carnival called the “Holy Ghost” that occurred every
December. On Tuesdays, fresh bread and malasadas (Portuguese pastry) were baked and children collected firewood to keep the fire alive for baking.

- The transition to unionization of workers in 1946 brought many changes to Puhi Camp. Kupuna Makanani explains that before the union, though wages were low, housing and water were free and Globe Farm provided equipment and toys for the children. Several strikes ensued but the strikes were peaceful, unlike the massacre at Hanapepe in 1924. During the strikes, a soup kitchen run by the union, provided food for workers on strike and their families.

4. Two graveyards, known to Puhi residents as “Old Puhi Cemetery” (SIHP No. 50-30-11-0006) and “Cement Pond,” are located outside of but within 200 meters of the Project area. The cemetery is divided into two sections for Japanese and Filipino families despite the multi-cultural makeup of Puhi. According to Mr. Takahashi, other ethnicities chose to be buried elsewhere and many graves were removed by their families. “Cement Pond,” exists approximately 200 meters north of the Project area and consists of three burials. Participants speculate that these burials are not of Puhi Camp residents but possibly of affluent Japanese. Kupuna Makanani recalls how it was possible to bury family members around one’s residence when she was growing up.

5. Filipino migrants came to Hawai‘i in the early 1900’s as contract laborers or “sakadas,” searching for a better place to live, relates Mr. Takahashi and Kupuna Makanani. Some graves at Old Puhi Cemetery are of Filipino veterans who have no known family with only crosses in the ground for their burial, according to Mr. Takahashi. He wishes that relatives of these veterans could find them, allowing younger generations to continue their ties to their culture and family tree.

6. Mr. Chun reiterates that the sugarcane plantations would have displaced features of cultural significance within the Project area and also points out that the population centers would have been concentrated along the coast or along the Hule‘ia River. Therefore, the likelihood of finding heiau and other cultural features would be higher along the coast than within the Project area. No participants had knowledge of any heiau within the study area. However, one participant noted a mo‘olelo about fireballs, which reflect the presence of spirits in Native Hawaiian culture, near the Project area.

7. Participants describe an abundance of water in the Project area. From Kilohana, water collects in reservoirs that once fed the plantations. Reservoirs and ditches were utilized by Puhi residents as food sources, and for recreational swimming. Mr. Takahashi asserts that a gate that controlled water flow to these water sources and regulated flow to prevent floods, still exists. Water subsequently flowed down through streams and rivers into Nāwiliwili Bay. The Hule‘ia National Wildlife Refuge, which includes the Menehune Fishpond, is part of a watershed downstream of the Project area.

8. Mr. Chun and Mr. White indicate that development has changed water flow patterns, as well as water quality. Mr. Chun attributes muddy water in Nāwiliwili Bay not only to heavy rains flooding the Hule‘ia River but to development and land-based activities upstream, such as the previous sugar mill and the existing Marriott Hotel. Mr. Chun believes that fresh water has shaped the ecology of Nāwiliwi Bay in that corals do not grow in the presence of fresh water. He speculates that the sandy bottoms of the bay and the location of the coral reef farther out in the bay, is due to the decreased salinity from the influx of fresh water. Residents like Mr. White do not eat fish from the coast because of degraded water quality.

9. The traditional practice of lei (necklace of flowers)-making was and continues to be practiced by residents of the study area.

9.3 Impacts and Recommendations

The following cultural impacts and recommendations are based on a synthesis of all information gathered during preparation of the CIA. To help mitigate the potential adverse impacts of the proposed Project on cultural beliefs, practices, and resources, recommendations should be faithfully considered and the development of the appropriate measures to address each concern should be implemented.

1. In light of statements made by several participants in this study over the potential impact of future development at KCC on the historical remnants of the Old Puhi Camp, especially the Puhi Cemetery, it is recommended that:
   i. Large trees near the graves should be removed to prevent further destruction of headstones from falling branches. Although the cemetery is outside of the Project area, it is completely surrounded by the Project area.
   ii. Participants recommend that KCC should assume the responsibility of protecting and maintaining the cemetery, including any financial obligations that incur. Regarding a burial treatment and preservation plan, Mrs. Sakoda prefers that burials be preserved in place. If burials must be removed, Mrs. Sakoda, Mr. Takahashi and Kupuna Makatanana agree that a columbarium containing all the burials be built on site. The columbarium would protect the burials of The Puhi Cemetery and solve the problem of graveyard maintenance.

   iii. Participants recommend that all families with ties to the cemetery and Project area should be consulted and included in any discussions regarding the Puhi Cemetery.

2. Kupuna Makanani remembers from her childhood how it was possible to bury family members around one’s residence, hinting to the possibility of discovering inadvertent burials in future development. Should cultural or burial sites be identified during future ground disturbance in the Project area, all work should immediately cease and the appropriate agencies notified pursuant to applicable law. Kupuna from the study area and former residents of Puhi Camp should also be consulted to ensure proper cultural protocols are addressed.

3. As there continues to be concern from former Puhi residents about the loss of the history and memories of Puhi Camp as the campus expands, it is recommended that a replica of a bulletin board used in the everyday life of Puhi Camp and containing the history of the camp be built and installed on KCC campus. The bulletin board continues to be a traditional cultural property in the memories of the study participants, who cherish its significance.

Cultural Impact Assessment for the Kaua‘i Community College Redesignation of Urban District Project, Nāwiliwili, Ni‘ihau, and He‘eia ‘Ulu‘u Park, Līhu‘e District, Kaua‘i Island.

TMK: [4]-3-4-007-001, [4]-3-4-007-002, [4]-3-4-007-003, and [4]-3-4-007-006
4. Due to concerns expressed by participants about the possible impacts of the KCC expansion to the ecology and its interrelationship with the natural and cultural resources within and near the Project area, including consideration of the mauka-makai connection of the land, the possible impacts of land-based activities stemming from the college on water resources, Nāwiliwili Bay, and the ocean, as well as the potential contamination of the watershed and of the Hule'ia National Wildlife Refuge from the use of herbicides and methods of weed control at KCC, it is recommended that KCC limit or consider the use of non-toxic pesticides and employ the appropriate best management practices.

5. Due to the current traffic congestion directly in front of the KCC campus attributed in part to vehicles turning into the Chevron gas station, and the likelihood that the traffic will likely be exacerbated by the KCC expansion, it is recommended that KCC work with the County or the State to install “the necessary signage or asphalt marking” as well as other safe means to improve the intersection flow.

Appendix A  Glossary

To highlight the various and complex meanings of Hawaiian words, the complete translations from Pukui and Elbert (1986) are used unless otherwise noted. In some cases, alternate translations may resonate stronger with Hawaiians today; these are placed prior to the Pukui and Elbert (1986) translations and marked with “(common).”

Diacritical markings used in the Hawaiian words are the ‘okina and the kahakō. The ‘okina, or glottal stop, is only found between two vowels or at the beginning of a word that starts with a vowel. A break in speech is created between the sounds of the two vowels. The pronunciation of the ‘okina is similar to saying “oh-oh.” The ‘okina is written as a backwards apostrophe. The kahakō is only found above a vowel. It stresses or elongates a vowel sound from one beat to two beats. The kahakō is written as a line above a vowel.

<table>
<thead>

Dear Ms. Angela Fanene,

Subject: SHPD Response Letter

Thank you for your letter dated January 2, 2013, in response to the Cultural Impact Assessment for the Kaua‘i Community College Redesignation of Urban District Project, Nāwiliwili, Niumalu, and Ha‘ikū Ahupua‘a, Līhu‘e District, Kaua‘i Island. TMK 4-3-4-007-001, 4-3-4-007-002, 4-3-4-007-003, and 4-3-4-007-006.

We understand your concerns and appreciate the effort you have made to address them.

Sincerely,

[Signature]

SHPD History & Cultural Resources Chief

Re: Cultural Impact Assessment Consultation
State Land Use Boundary Amendment
Kaua‘i Community College
Pāhia, Island of Kaua‘i

Aloha a Angela Polunani and Margaret Magel,

The Office of Hawaiian Affairs (OHA) is in receipt of your September 29, 2011 letter with enclosed soliciting comments ahead of a cultural impact assessment (CIA) which will be prepared to support a petition from the Kaua‘i’s Community College (KCC) to the State Land Use Commission (SLUC) for a District Boundary Amendment (DBA). If approved by the SLUC, the DBA will facilitate the implementation of the KCC Long Range Development Plan which will eventually accommodate a student enrollment of 3,500 full-time students.

By letter dated June 3, 2011, OHA provided comments on a draft environmental assessment (EIA) which had already been prepared to support the petition to the SLUC for a DBA. This letter is attached for your reference. The DBA petition area encompasses multiple tax map key parcels and a total of 199 acres. Of this total, 99 acres constitute the existing KCC campus and 100 acres are currently undeveloped, but part were subject to previous intensive agricultural cultivation as shown on the recent aerial photographs included with your letter.

OHA recommends that you contact the two Hawaiian Language Immersion Schools (Punaha Lani o Kaua‘i and Kawainui Makahiki Public Charter Schools) which are situated on the KCC campus, as they may be willing to participate in CIA consultation and share their thoughts with you. OHA notes that a study area is depicted on the U.S. Geological Survey map included with your letter. While it appears this study area is enclosed from or outside of the DBA petition area, OHA believes it should be considered because of its location. The U.S. (p-3 – 18) identifies this study area as SBP number 50-30-11B065 the Paaua Camp Campus”. While OHA has no specific information relative to this campus at this time, it is possible that certain linear descriptors of such building may be interested in participating in CIA consultation and sharing their thoughts with you.

Thank you for furnishing consultation and for the opportunity to provide comments at this early stage. We look forward to reviewing the completed CIA and providing additional comments at that time.

‘O wai ia lea me koe ‘o ia‘ia?

Cheryl W. Nakamura
Chief/Interactive Officer

CWO:

C: OHA - Kaua‘i Community Outreach Coordinator
The Office of Hawaiian Affairs (OHA) is in receipt of your March 2, 2011 letter requesting comments on a draft environmental assessment (DEA) which has been prepared to support an amendment to State Land Use Boundary and re-designate four new map key parcels (TMKs) consisting of approximately 199 acres of land from the Agricultural District to the Urban District (section 5) which are located in the Town of Waimea (C-1B). Approximately 98 acres of land which are subject to this action (TMK 5-4-07-605) contains the existing Kaua‘i Community College (KCC) campus which was constructed in 1977 on lands donated by Cone Bros. in 1972. Development of the KCC campus within the Agricultural District was facilitated by a special use permit granted by the State Land Use Commission in 1973. The majority of the remaining three TMKs lie within a parcel of approximately 100 acres undeveloped with two Hawaiian Language immersion schools situated on a portion of TMK 5-4-07-602. (DEA, Chapter 2.2).

This action will ensure appropriate land use entitlements an KCC moves forward with improvements that will facilitate the implementation of their Long Range Development Plan (LRDP) which will eventually see KCC accommodate a student enrollment of 2,000 full-time students (DEA, Chapter 2.6). Since KCC is the only public provider of higher learning on Kaua‘i, OHA recognizes the importance of the LRDP and we applaud the efforts of all involved in increasing educational programs and opportunities on Kaua‘i.

We do not anticipate that the two Hawaiian Language Immersion Schools (Kapa‘aina Kaua‘i and Kalakaua Nui Century Public Charter Schools) which are situated on KCC lands have been consulted on this action. It may be appropriate for the location of these schools and
