## PULELEHUA DEVELOPMENT

### EXECUTIVE SUMMARY

Maui Oceanview LP is proposing to develop the Pulelehua development (hereinafter referred to as "Project") in Lahaina, Maui. The Project will be bounded by Honoapiilani Highway to the west, Kapalua Airport to the east and proposes to develop approximately 304.255 acres of land.

#### Project Description

The Project will provide 898 multi-family (MF) residential units, 2 single-family residential lots (for future residential development), an elementary school, a 10-acre park and two (2) retail centers, totaling 70,000 square feet (SF). In addition, a trail will be constructed just east and parallel to Honoapiilani Highway that will provide bike and pedestrian access to link the Project's development north and south of Mahinahina Gulch. The Project will be constructed in six (6) phases, but for purposes of this TIAR, will be analyzed as four (4) scenarios. See Table ES-1 for the land use breakdown and vehicle trips generated by each of the four (4) Project Scenarios.

Although it is not part of this TIAR, the Project envisions future expansion at the north end of the Project site (currently identified as 2 single-family residential lots) with an additional 302 residential units, bringing the total residential unit count to 1,200 residential units. Future traffic analysis and roadway mitigation measures will be assessed at a later date.

Table ES.1: Pulelehua Land Use Summary

| Buildout Year    | Project Scenario | Project Land Use                              | New Project Trips<br>AM(PM)[Sat MD] |
|------------------|------------------|-----------------------------------------------|-------------------------------------|
| Future Year 2022 | Scenario 1       | - 240 Residential Units                       | 89(125)[106]                        |
|                  | Scenario 2       | - 240 Residential Units<br>- 70,000 SF Retail | 210(332)[666]                       |
|                  | Scenario 3       | - 420 Residential Units<br>- 10-acre Park     | 168(255)[257]                       |
| Future Year 2027 | Scenario 4       | - Elementary School<br>(assumed 750-students) | 312(101)[0]                         |

Notes:

SF = Square feet

Scenario 1 – Project's initial residential phase, north of Akahele Street. Direct access will be provided by two (2) new Project roadways, Road A and Road C, bisecting Akahele Street.

Scenario 2 - Residential and retail uses south of Akahele Street. Primary access to residential & retail components will be provided by Akahele Street. The north retail area will also be serviced by a proposed right-in, right-out (RIRO) access via Honoapiilani Highway.

Based on the developer forecast absorption for the retail component, approximately 15,000 SF of retail space will be occupied by Year 2022, with subsequent occupancy occurring at a pace of 5,000 SF of retail space every 2 years thereafter. Therefore, full build-out and occupancy will likely occur well beyond Year 2022, but was assumed to be fully built out by Year 2022 for this TIAR

Scenario 3 – Remaining residential spaces both north and south of Mahinahina Gulch and 10-acre park. Access will be provided by Akahele Street and a new Project roadway, Road J, intersecting Honoapiilani Highway south of Mahinahina Gulch.

Scenario 4 – Future DOE elementary school site, with access to be provided by Akahele Street. Since the development of the school is not in the direct controller of the Pulelehua development, the timeframe for this school has yet to be determined. For purposes of this TIAR, a forecast build-out of 2027 was assumed for the TIAR.

### **Existing and Base Year Traffic Analysis Without the Project**

This TIAR evaluated existing conditions along Honoapiilani Highway at 11 major signalized intersections from Napilihau Street to Keawe Street. Existing traffic counts were taken in November and December 2016 during the weekday AM/PM and Saturday midday (MD) peak hours of traffic. Various intersections along the highway operate with either fixed coordinated signal timing plans or uncoordinated plans with lengthy through volume green times. As a result, numerous mainline left-turn movements and minor street approaches at various study intersections operate at LOS E/F conditions due to lengthy delays from the signal timing plans that favor the through movements along Honoapiilani Highway. Signal coordination is currently provided along Honoapiilani Highway between Leialii Parkway to Keawe Street.

As part of this TIAR, traffic was forecast to years 2022 and 2027 without the Project to constitute the Base Year (no build) scenarios. These buildout years coincide with the anticipated build-out years of the Project's Scenarios 1-4. By Base Year 2022 and 2027, numerous planned roadway improvements and nearby developments are anticipated to be completed within the Project study area and were included in the TIAR. By Base Year 2022 without the Project, traffic at the study intersections along Honoapiilani Highway is estimated to increase overall by approximately 10-30% on various parts of the corridor during the AM, PM and WE peak hours of traffic. All study intersections are forecast to operate similar to existing conditions. Overall intersection delays generally increased by only 1-5 seconds at most study intersections.

Table ES-2 summarizes the roadway improvements that are anticipated to occur by Base Years 2022 and 2027 without the Project.

Table ES.2: Roadway Improvements Summary WITHOUT Pulelehua

| Buildout Year                                     | Project Scenario | Intersection                                                   | Roadway Improvement                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------|------------------|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Planned Roadway Improvements<br>(Without Project) | --               | Lahaina Bypass Road                                            | <u>Lahaina Bypass Road (LBR) Phase 1B-2</u><br>- Extend LBR from Hokiokio Place to its southern terminus with Honoapiilani Highway<br>- Reroute all northbound traffic to use LBR instead of Honoapiilani Highway<br>- Signalize and modify intersection laneage along LBR at its intersections with Kai Hele Ku Street and Hokiokio Place |
|                                                   |                  | Honoapiilani Highway/<br>Keawe Street/<br>Lahaina Cannery Mall | - Construct an additional southbound left-turn lane, resulting in dual southbound left-turn lanes<br>- Optimize signal timing plans along the coordinated corridor from Leialii Parkway to Keawe Street                                                                                                                                    |

| Base Year 2027<br>(Without Project)               | --               | --                                                             | - No roadway improvements recommended                                                                                                                                                                                                                                                                                                      |

### **Future Year Traffic Analysis With the Project**

As mentioned above, Table ES-1 summarizes the Project's land use breakdown and vehicle trips generated by each of the four (4) Project Scenarios. In total, the Project's Scenarios 1-4 will generate 779(813)[1,029] new external vehicular trips during the AM(PM)[Sat MD] peak hours, respectively. The Project will increase both regional traffic and local (those providing direct access to the Project) traffic along Honoapiilani Highway with the following traffic percentile increases:

- Scenario 1 – Increase overall regional traffic by less than 5% and local traffic by less than 10% from Base Year 2022 conditions.
- Scenario 2 – Increase overall regional traffic by 5-15% and local traffic by 10-40% from Base Year 2022 conditions.
- Scenario 3 – Increase overall regional traffic by 5-20% and local traffic by 10-50% from Base Year 2022 conditions.
- Scenario 4 – With a new Elementary School in the Project site, many students will transfer to this site from the Kaanapali, Honokowai, Kahana, Napili and Kapalua regions. Trips generated by the new elementary school were rerouted from existing traffic along Honoapiilani Highway to the new site. As a result, the majority of traffic increases consisted of turning movement traffic into and out of Akahahele Street on the east leg of its intersection with Honoapiilani Highway. Traffic reductions to various through movements along the highway were a result of the reroute.

Table ES-3 summarizes the roadway improvements that are anticipated to occur by Future Years 2022 and 2027 with the Project.

Table ES.3: Roadway Improvements Summary WITH Pulelehua

| Buildout Year                      | Project Scenario | Intersection                                                                   | Roadway Improvement                                                                                                                                                                                                                                                                                                                                                                                    |

|                                    |                  | Akahele Street @<br>Road A & Road C<br>intersections                           | - Consider installing left-turn storage lanes along Akahele Street at Road A and Road C intersections                                                                                                                                                                                                                                                                                                  |
|                                    | Scenario 3       | Honoapiilani Highway/<br>Road J (Project South<br>Access) <sup>1</sup>         | - Provide a median refuge lane along Honoapiilani Highway for westbound left-turn vehicles.<br>- Northbound right-turn lane → Provide a new right-turn with at least a 100 feet of storage space<br>- Southbound left-turn lane → Provide a new left-turn with at least a 100 feet of storage space<br>- Westbound left-turn lane → Provide a new right-turn with at least a 100 feet of storage space |
| Future Year 2027<br>(With Project) | Scenario 4       | Honoapiilani Highway/<br>Kapunakea Street                                      | - Consider restriping to provide exclusive eastbound left-turn lane and shared through/right-turn lane.                                                                                                                                                                                                                                                                                                |

Notes:

1. Right-turn and left-turn lane lengths show required minimum storage space only. Additional taper length and/or deceleration length to be provided/verified upon intersection design. Based on AASHTO Green Book, 425 feet is recommended to accommodate full deceleration length with a design speed of 50 mph.

## TRAFFIC IMPACT ANALYSIS REPORT

### PULELEHUA DEVELOPMENT

#### Lahaina, Maui, Hawaii

## 1. INTRODUCTION

This report documents the findings of a traffic study conducted by Austin, Tsutsumi & Associates, Inc. (ATA) to evaluate the potential traffic impacts resulting from the proposed Pulelehua Development (hereinafter referred to as the "Project").

### 1.1 Location

The Project is located upon approximately 304.255 acres of undeveloped land in Lahaina on the island of Maui. The Project will be bounded by Honoapiilani Highway to the west and the Kapalua Airport to the east. See Figure 1.1 for the Project location.

### 1.2 Project Description

A Traffic Impact Analysis Report (TIAR) was completed for the Project in October 2008 and updated in May 2009. Since 2009, the Project's site plan has undergone some modifications and currently proposes to develop approximately 304.255 acres of land to provide 898 multi-family (MF) residential units, 2 single-family residential lots (for future residential development), an elementary school, a 10-acre park and two (2) retail centers, totaling 70,000 square feet (SF). In addition, a trail will be constructed just east and parallel to Honoapiilani Highway that will provide bike and pedestrian access to link the Project's development north and south of Mahinahina Gulch. The Project will be constructed in six (6) phases, but for purposes of this TIAR, will be analyzed as four (4) scenarios.

Although it is not part of this TIAR, the Project envisions future expansion at the north end of the Project site (currently identified as 2 single-family residential lots) with an additional 302 residential units, bringing the total residential unit count to 1,200 residential units. Future traffic analysis and roadway mitigation measures will be assessed at a later date.

Figure 1.2 shows the Project site plan.

Scenario 1 – Develop Phase 1 with a build-out of early 2022 that includes the following:

- 240 MF residential units north of Akahele Street, with direct access provided by two (2) new Project roadways, Road A and Road C, bisecting Akahele Street.

Scenario 2 - Develop Phase 2 and Retail component with a build-out of early 2022 that includes the following:

- 240 MF residential units south of Akahele Street with direct access provided by Road A and Road C.
- Retail Area North consisting of 50,000 square feet (SF) of space located on the northeast corner of the Honoapiilani Highway/Akahele Street intersection.
- Retail Area South consisting of 20,000 SF of space located adjacent to Retail Area North on the southeast corner of the Honoapiilani Highway/Akahele Street intersection.
  - o Access to Retail Area North and South will be provided by Road A. Retail Area North will also be serviced by a right-in, right-out (RIRO) access via Honoapiilani Highway.
  - o Based on the developer forecast absorption for the Retail Area North and South component, approximately 15,000 SF of retail space will be occupied by Year 2022, with subsequent occupancy occurring at a pace of 5,000 SF of retail space every 2 years thereafter. Therefore, full build-out and occupancy of Retail Areas North and South will likely occur well beyond Year 2022, but was assumed to be fully built out by Year 2022 for this TIAR.

Scenario 3 – Develop Phases 3-5 with a build-out of late 2022 that include the following:

- 100 MF residential units (Phase 3) south of Akahele Street, with access provided by Road C.
- 318 MF residential units (Phase 3 and Phase 4) south of Mahinahina Gulch, with access provided by a new Project roadway, Road J, intersecting Honoapiilani Highway south of Mahinahina Gulch.
- 2 single-family residential lots north of Akahele Street, with access provided by Road A and Road C.
- 10-acre park with two (2) practice fields south of Mahinahina Gulch, with access provided by Road J.

Scenario 4 – A future elementary school, to be planned/developed by the Department of Education (DOE). Since the development of the school is not in the direct controller of the Pulelehua development, the timeframe for this school has yet to be determined. For purposes of this TIAR, a forecast build-out of 2027 was assumed for the TIAR.

- 750-student elementary school, with access provided by Road A.

## 2. METHODOLOGY

### 2.1 Study Methodology

This study will address the following:

- Assess existing traffic operating conditions at key intersections during the weekday morning (AM) and afternoon (PM) and Saturday midday (WE) peak hours of traffic within the study area.
- Traffic projections for Base Year 2022 and 2027 (without the Project) including traffic generated by other known developments in the vicinity of the Project in addition to an ambient growth rate. These other known developments are projects that are currently under construction or known new/future developments that are anticipated to affect traffic demand and operations within the study area.
- Trip generation and traffic assignment characteristics for the proposed Project.
- Traffic projections for Future Year 2022 (with the Project Scenario 1, 2 and 3) and Future Year 2027 (with the Project Scenario 4), which includes Base Year traffic volumes in addition to traffic volumes generated by the four (4) Project scenarios.
- Recommendations for Base Year and Future Year roadway improvements or other mitigative measures, as appropriate, to reduce or eliminate the adverse impacts resulting from traffic generated by known developments in the region or the Project.

### 2.2 Intersection Analysis

Level of Service (LOS) is a qualitative measure used to describe the conditions of traffic flow at intersections, with values ranging from free-flow conditions at LOS A to congested conditions at LOS F. The Highway Capacity Manual (HCM), dated 2010, includes methods for calculating volume to capacity ratios, delays, and corresponding Levels of Service that were utilized in this study. LOS definitions for signalized and unsignalized intersections are provided in Appendix B.

Analyses for the study intersections were performed using the traffic analysis software Synchro, which is able to prepare reports based on the methodologies described in the HCM. These reports contain control delay results as based on intersection lane geometry, signal timing, and hourly traffic volumes. Based on the vehicular delay at each intersection, a LOS is assigned to each approach and intersection movement as a qualitative measure of performance. These results, as confirmed or refined by field observations, constitute the technical analysis that will form the basis of the recommendations outlined in this report.

### 3. EXISTING CONDITIONS

#### 3.1 Roadway System

The following are brief descriptions of the existing roadways in the vicinity of the Project:

Honoapiilani Highway – is a State highway that provides regional connection for the majority of West Maui. Honoapiilani Highway begins in Wailuku where it transitions from South High Street and continues southward toward Maalaea. The highway borders the coastline as it curves back around West Maui and northward again toward Kapalua, where it transitions into Kahekili Highway near Honokohau Bay. In the vicinity of the Project, Honoapiilani Highway is generally a two-way, two-lane undivided road with a posted speed limit of 45 miles per hour (mph) in the vicinity of the Project.

Napili Hau Street – is a roadway that provides access to businesses and residential areas. The roadway begins to the northwest at its intersection with Lower Honoapiilani Road and travels southeast to Honoapiilani Highway before terminating to the southwest at Maui Preparatory Academy. In the vicinity of the Project, Napili Hau Street is generally a two-way, one-lane undivided road with a posted speed limit of 20 mph.

Hoohui Road – is a roadway that provides access to businesses and residential areas. The roadway begins to the west at its intersection with Lower Honoapiilani Road and terminates to the east at its intersection with Kahana Ridge Drive. West of its intersection with Honoapiilani Highway, Hoohui Road is a two-way, one-lane undivided road with a speed limit of 20 mph. East of its intersection with Honoapiilani Highway, Hoohui Road is a two-way, two-lane undivided road with a posted speed limit of 25 mph.

Akahele Street – is a roadway that provides access to residential areas and the Kapalua Airport. The roadway begins to the west at its intersection with Lower Honoapiilani Road and terminates to the east at the Kapalua Airport. In the vicinity of the Project, Akahele Street is a two-way, one-lane undivided road with a posted speed limit of 30 mph.

Lower Honoapiilani Road – is a County collector that provides access to hotels, businesses and residential areas. The roadway begins at its intersection with Honoapiilani Highway and runs north parallel to the highway and the coast before terminating at its intersection with Office Road near the Kapalua Golf Course. In the vicinity of the Project, Lower Honoapiilani Road is generally a two-way, one-lane undivided road with a posted speed limit of 20 mph.

Halawai Drive/Kai Malina Parkway – is a roadway that provides access to various businesses and hotels. Halawai Drive is a roadway east of Honoapiilani Highway and Kai Malina Parkway is a roadway west of the highway, servicing Honua Kai Resort and Spa.

Puukolii Road – is a roadway that provides access to residential areas. The roadway begins to the west at its intersection with Honoapiilani Highway and terminates to the southeast at its intersection with Oil Road. In the vicinity of the Project, Puukolii Road is a two-way, one-lane undivided road with a posted speed limit of 30 mph.

Kai Ala Drive – is a County roadway that begins to the east at its intersection with Honoapiilani Highway and travels west to provide access to Kahekili Beach Park and several hotels. In the vicinity of the Project, Kai Ala Drive is a two-way, one-lane divided road.

Kaanapali Parkway – is a roadway that provides access to various hotels and businesses. The roadway begins to the east at its intersection with Honoapiilani Highway and travels northwest before terminating near the Royal Kaanapali Golf Course. In the vicinity of the Project, Kaanapali Parkway is a two-way, two-lane divided road.

Halelo Street – is a roadway that provides access to residential areas. The roadway begins to the west at its intersection with Honoapiilani Highway and travels southeast before terminating. In the vicinity of the Project, Halelo Street is a two-way, one-lane undivided road.

Leialii Parkway – is a collector road that provides access to residential areas, civic center and the post office. The roadway begins to the west at its intersection with Honoapiilani Highway and terminates to the east. In the vicinity of the Project, Leialii Parkway is a two-way, one-lane undivided road with a posted speed limit of 25 mph.

Fleming Road – is a roadway that provides access to residential areas. The roadway begins to the west at its intersection with Honoapiilani Highway and terminates to the east. In the vicinity of the Project, Fleming Road is a two-way, one-lane undivided road with a posted speed limit of 20 mph.

Front Street – is a County collector road that provides access to businesses and residential areas. The roadway begins to the south at its intersection with Honoapiilani Highway just north of Hokiokio Place. The road then travels north parallel to the coast and the highway before reconnecting with Honoapiilani Highway at Fleming Road. In the vicinity of the Project, Front Street is a two-way, one-lane undivided road with a posted speed limit of 20 mph.

Kapunakea Road – is a roadway that provides access to businesses and residential areas. The roadway begins to the west at its intersection with Front Street and terminates to the east past its intersection with Honoapiilani Highway. West of its intersection with Honoapiilani Highway, Kapunakea Road is a two-way, two-lane undivided roadway. East of its intersection with Honoapiilani Highway, Kapunakea Road is a two-way, one-lane undivided roadway.

Keawe Street – is a County collector road that provides access to businesses and residential areas. The roadway begins to the west at its intersection with Honoapiilani Highway and terminates to the east at its intersection with Lahaina Bypass Road. In the vicinity of the Project, Keawe Street is a two-way, two-lane divided roadway.

### **3.2 Existing Traffic Volumes**

The AM peak hour turning movement data utilized in this report were collected on December 1, 2016 and December 7, 2016. The PM peak hour turning movement data were collected on November 30, 2016 and December 6, 2016. The WE hourly turning movement data were collected on December 10, 2016. Based on the proximity to the proposed Project site, the following intersections were studied in the existing conditions scenario.

- [1] Honoapiilani Highway/Napili Hau Street (signalized)
- [2] Honoapiilani Highway/Hoohui Road (signalized)
- [3] Honoapiilani Highway/Akahele Street (signalized)
- [4] Honoapiilani Highway/Lower Honoapiilani Road (signalized)
- [5] Honoapiilani Highway/Halawai Drive/Kai Malina Parkway (signalized)

- [6] Honoapiilani Highway/Puukoolii Road/Kai Ala Drive (signalized)
- [7] Honoapiilani Highway/Kaanapali Parkway/Halelo Street (signalized)
- [8] Honoapiilani Highway/Leialii Parkway (signalized)
- [9] Honoapiilani Highway/Fleming Road/Front Street (signalized)
- [10] Honoapiilani Highway/Kapunakea Road (signalized)
- [11] Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall (signalized)

Based on the count data, it was determined that the weekday AM peak hour of traffic occurs between 7:15 AM and 8:15 AM, the weekday PM peak hour of traffic occurs between 3:45 PM and 4:45 PM, and the Saturday WE peak hour of traffic occurs between 11:30 AM and 12:30 PM. The turning movement count data is included in Appendix A.

### **3.3 Existing Traffic Conditions Observations and Analysis**

#### **3.3.1 Regional Analysis**

Honoapiilani Highway generally operates as a two (2) lane highway from Napili Hau Street to Lower Honoapiilani Road and continues south as a four (4) lane highway from Lower Honoapiilani Road to beyond Keawe Street. As discussed in Section 3.3.2 below, various intersections along the highway operate with either fixed coordinated signal timing plans or uncoordinated plans with lengthy through volume green times. As a result, numerous mainline left-turn movements and minor street approaches at various study intersections operate at LOS E/F conditions due to lengthy delays from the signal timing plans that favor the through movements along Honoapiilani Highway. However, with the exception of the southbound left-turn movement at the Honoapiilani Highway/Keawe Street intersection described below, all vehicular movements at each study intersection operate adequately with under-capacity conditions. Signal coordination is currently provided along Honoapiilani Highway between Leialii Parkway to Keawe Street.

#### **3.3.2 Existing Intersection Analysis**

The observations and analysis described below are based on prevailing observations during the time at which the data was collected. Hereinafter, observations that are expressed as ongoing and current shall represent the conditions that prevailed at the time at which the data was collected. All movements at the study intersection generally operated adequately at LOS D or better and under-capacity conditions, except for the following:

##### **[1] Honoapiilani Highway/Napili Hau Street**

This intersection operated at overall LOS B during all peak hours of traffic. However, the southbound left-turn movement experienced LOS F during the AM and PM peak hours due to low left-turn turning volumes ( $\leq 10$  vehicles) and long cycle length.

##### **[3] Honoapiilani Highway/Akahahele Street**

This intersection operated at overall LOS B during all peak hours of traffic. However, various left-turn movements operated at LOS E/F during all peak hours of traffic due to low left-turn turning volumes ( $\leq 10$  vehicles) and long cycle length.

#### [4] Honoapiilani Highway/Lower Honoapiilani Road

This intersection operated at overall LOS B during all peak hours of traffic. However, the southbound left-turn movement experienced LOS E during the PM peak hour due to a low left-turn turning volume (1 vehicle) and long cycle length. Observations indicate the northbound left-turn movement would occasionally queue beyond its storage length. However, due to a long northbound left-turn signal phase, most vehicles would clear within a single signal cycle.

#### [5] Honoapiilani Highway/Kai Malina Parkway/Halawai Drive

This intersection operated at overall LOS A during all peak hours of traffic. However, the southbound left-turn movement experienced LOS E during the PM peak hour due to a low left-turn turning volume (8 vehicles) and long cycle length.

#### [6] Honoapiilani Highway/Puukolii Road/Kai Ala Drive

This intersection operated at overall LOS B during all peak hours of traffic. However, various major street left-turn movements and minor street approaches operated at LOS E/F during the AM and PM peak hours due to fixed signal cycle lengths from the weekday signal coordination.

#### [7] Honoapiilani Highway/Kaanapali Parkway/Halelo Street

This intersection operated at overall LOS D or better during all peak hours of traffic. All mainline through movements operated at LOS D or better at under-capacity conditions. Numerous major street left-turn movements and minor street approaches operate at LOS E/F conditions during the PM peak hour due to lengthy delays as a result of the through movement green time that can provide over 200 seconds per cycle. However, observations indicated that the through signal phase would often gap out prior to reaching its maximum through movement timing.

#### [8-10] Honoapiilani Highway from Leialii Parkway to Kapunakea Street

All intersections along this stretch are coordinated during all peak hours of traffic and operated at overall LOS B or better. Various major street left-turn movements and minor street approaches operated at LOS E/F during the AM and PM peak hours due to fixed signal cycle lengths from the signal coordination timing plans.

#### [11] Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall

This intersection is also coordinated with the above three (3) intersections and operated at overall LOS D or better during all peak hours of traffic. However, the southbound left-turn operated at LOS F and over-capacity during the PM peak hour. Observations indicated the southbound left-turn movement can queue beyond its storage lane and require two signal cycle lengths to clear. This intersection currently serves as the northern terminus connection to Honoapiilani Highway to/from the Lahaina Bypass Road.

Figure 3.1 illustrates the existing lane configurations, volumes and LOS. See Table 3.1 for a summary of the existing conditions analysis.

## 4. BASE YEAR TRAFFIC CONDITIONS

The Base Year 2022 was selected to reflect the completion years of Scenarios 1, 2 and 3 of the Project and Base Year 2027 was selected to reflect the completion year of Scenario 4 of the Project as described in Section 1.2. The Base Year 2022 and 2027 scenarios represent the traffic conditions within the study area without the Project. Base Year traffic projections were formulated by applying a defacto growth rate to the existing 2016 traffic count volumes and adding trips generated by known future developments in the vicinity of the Project.

### 4.1 Defacto Growth Rate

Projections for Base Year 2022 and 2027 traffic were based upon a correlation between the existing traffic counts collected by ATA, HDOT's Maui Regional Travel Demand Model (MRTDM) growth for forecast years between 2007 and 2020, and nearby developments in the immediate vicinity of the Project. Many of the known background developments that were added separately to the study network are included in the MRTDM. Therefore, an overall annual growth rate of 0.5% was applied along Honoapiilani Highway for Base Years 2022 and 2027.

### 4.2 Traffic Forecasts for Known Developments

#### 4.2.1 Background Projects

By Year 2022, numerous developments are anticipated to be completed within the Project study area. Many of the following known developments were determined to be accounted for in the MRTDM. The known developments that are projected to be complete by Year 2022 and generate traffic within the Project study area are illustrated in Figure 4.1 and listed below based on the best information available:

1. Kahoma Village – This project is located south of the Lahaina Cannery Mall on 22 acres of land. The project proposes to develop 101 single-family homes and 102 multi-family homes. Construction of the project began in late 2016, and completion is expected to occur at the end of 2018.
2. Kahoma Residential Subdivision – This project is located east of the proposed Kahoma Village and south of the Kahoma Stream Flood Control Channel. The project proposes to develop 68 single-family lots and a neighborhood park. There is currently no expected completion date, however, was included in the Project TIAR.
3. Lanikeha Kaanapali – This project is located east of Honoapiilani Highway and across from Kaanapali Parkway. The project consists of 132 lots in a gated community, with Honoapiilani Highway access provided via Kekaa Drive and Kualapa Loop. Completion and full occupancy of the project is expected by 2017.
4. Kai A Ulu Affordable Homes – This project is located east of Honoapiilani Highway in the Kaanapali region. The project proposes to develop 33 affordable single-family homes with Honoapiilani Highway access provided via Kekaa Drive and Kualapa Loop. Completion of the project is expected in 2017.
5. Westin Nanea Ocean Villas – This project is located west of Honoapiilani Highway at the Honoapiilani Highway/Halawai Drive/Kai Malina Parkway intersection. The project proposes to develop a 390-villa timeshare resort. Completion of the project is expected in the summer of 2017.

6. West Maui Village – This project is located south of Honoapiilani Highway just east of Maui Preparatory Academy. The project proposes to develop 158 single-family units in 25 buildings. Completion of the project is expected in 2018.
7. West Maui Hospital and Medical Center – This project is located east of Honoapiilani Highway in the Kaanapali region. The project proposes to develop a critical access hospital, a skilled nursing facility, medical office buildings and a behavioral health center. Completion of the project is expected in late 2018.
8. Honua Kai – This project is located west of Honoapiilani Highway in the Kaanapali region. The project's remaining component includes 72 luxury townhouses and assumed to be completed by Year 2022.

Forecasts for Base Year 2027 include all background developments assumed to be completed by Year 2022. In addition, the known development that is projected to be complete by Year 2027 and generate traffic within the Project study area is illustrated in Figure 4.1 and listed below based on available information:

1. Kaanapali Golf Course Redevelopment – This project is located both mauka and makai of Honoapiilani Highway in the vicinity of the Honoapiilani Highway/Kaanapali Parkway/Halelo Street and Honoapiilani Highway/Kekaa Drive intersections. We understand the project proposes to redevelop the existing Kaanapali Golf Course to potentially provide a 136-room boutique hotel, 102 residential condos and an 80,000 square-foot shopping center. Completion is assumed to occur by Year 2027.

#### **4.2.2 Trip Generation**

The Institute of Transportation Engineers (ITE) publishes a book based on empirical data compiled from a body of more than 4,250 trip generation studies submitted by public agencies, developers, consulting firms, and associations. This publication, titled Trip Generation Manual, 9<sup>th</sup> Edition, provides trip rates and/or formulae based on graphs that correlate vehicular trips with independent variables. The independent variables can range from Dwelling Units (DU) for single-family attached homes to Gross Floor Area (GFA) for commercial or office development. These trip rates/formulae and their associated directional distributions were used to estimate the increase in the number of vehicular trips generated by the proposed Project. The rates selected were based on the land use description.

See Tables 4.1 and 4.2 for Trip Generation formulae and projections for the background developments.

## Notes

- SF DU = Single-Family Dwelling Unit
- MF DU = Multi-Family Dwelling Unit
- Forecast trips derived from available TIAR's for each Project, ITE Trip Generation and/or updated to reflect current status.
- Table 4.2 shows total external trips generated by known developments in the vicinity of the Project.

1. Includes approximate 18% internal trip reduction consistent with ITE Trip Generation Handbook, 3rd Edition. Also includes 20% pass-by trip reductions to retail component. Trip reductions applied to only weekday PM and weekend trips.

### 4.3 Planned Roadway Improvements

The following roadway improvements are anticipated to be constructed to support various developments and overall growth of the Lahaina region and were assumed to be completed by Year 2022 and 2027 without the Project.

#### Lahaina Bypass Road Phase 1B-2

The Lahaina Bypass Road (LBR) is a major bypass road that is expected to be completed in 4 phases to address regional traffic congestion near the historic town of Lahaina. The first two phases (1A and 1B-1) were completed in 2013 and ends at Hokiokio Place. Phase 1B-2 will extend LBR from Hokiokio Place to its southern terminus with Honoapiilani Highway and is expected to be completed in January 2018. Future Phases 1C and 1D will extend the bypass highway further north and result in the bypass highway stretching from Olowalu to just south of the existing Kapalua Airport.

Completion of Phase 1B-2 of the LBR is expected to reduce traffic along Honoapiilani Highway by diverting traffic to the LBR and impact traffic patterns south of the Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall intersection. With the LBR Phase 1B-2, there will be five (5) connections between the LBR and Honoapiilani Highway and include Keawe Street, Lahainaluna Road, Hokiokio Place, Kai Hele Ku Street, and the southern terminus. At the southern terminus of the LBR, all regional northbound traffic will be rerouted to the LBR while regional southbound traffic will be able to utilize both Honoapiilani Highway and the LBR. The extension is expected to decrease the north and southbound through movement volumes along Honoapiilani Highway because of an increase in regional throughput traffic using the LBR and intersection improvements at the Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall intersection that will help route more southbound traffic to LBR. Rerouted traffic was generally based on forecast capacity thresholds at the southern terminus and Keawe Street intersection with Honoapiilani Highway.

#### Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall

An additional southbound left-turn lane is planned for the Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall intersection, resulting in dual southbound left-turn lanes. Based on existing conditions, the existing single southbound left-turn lane movement operates at over-capacity conditions. The addition of a second left-turn storage lane is expected to increase capacity and reduce queue spillback. Completion of the double left-turn is expected by 2018.

#### Honoapiilani Highway/Napili Hau Street

An exclusive right-turn lane on the northbound Honoapiilani Highway approach and an exclusive left-turn lane and shared through/right-turn lane on the westbound Napili Hau Street approach is anticipated to be constructed as part of West Maui Village roadway improvements. These changes are expected to mitigate potential traffic problems from the proposed development. Completion of the roadway improvements is expected to occur in 2018 with completion of the development.

### 4.4 Base Year 2022 Analysis

It is anticipated that by Base Year 2022, traffic will have increased over existing conditions due to the development in the Lahaina and Kaanapali regions. Actual growth within the study region may vary based upon the actual construction of the various nearby developments.

#### 4.4.1 Base Year 2022 Intersection Analysis

By Base Year 2022 without the Project, traffic at the study intersections along Honoapiilani Highway is estimated to increase overall by approximately 10-20% on various parts of the corridor during the AM, PM and WE peak hours of traffic. All study intersections are forecast to operate similar to existing conditions. Overall intersection delays generally increased by only 1-5 seconds at most study intersections. The majority of intersection movements currently operating at LOS E/F conditions will continue to operate similarly in Base Year 2022.

##### [7] Honoapiilani Highway/Kaanapali Parkway/Halelo Street

During the PM peak hour, the eastbound shared left-turn/through movement is expected to operate at LOS F and over-capacity. Mitigation is proposed in Section 4.4.2.

##### [8-11] Honoapiilani Highway from Leialii Parkway to Keawe Street

Since the Honoapiilani Highway/Keawe Street intersection will be widened to provide dual southbound left-turn lanes, it was assumed that some of the signal timing plans for intersections along the coordinated corridor from Leialii Parkway to Keawe Street would be reoptimized to make signals run more efficient and improve throughput progression.

Figure 4.2 illustrates the Base Year 2022 forecast traffic volumes and LOS for the study intersection movements. Table 4.3 summarizes the Base Year 2022 LOS at the study intersections compared to existing conditions. LOS worksheets are provided in Appendix C.

#### 4.4.2 Base Year 2022 With Mitigation Intersection Analysis

##### [7] Honoapiilani Highway/Kaanapali Parkway/Halelo Street

- Modify the eastbound approach to incorporate a dedicated left-turn lane, a shared left-turn/through lane and two (2) dedicated right-turn lanes.

With the recommended mitigation, the intersection is anticipated to improve and operate adequately at overall LOS D or better during all peak hours of traffic. Similar to existing conditions, numerous minor street approaches and major street left-turn movements will continue operating at LOS E/F during the PM peak hour due to the long through movement green time and cycle length.

Figure 4.3 illustrates the Base Year 2022 with mitigation forecast traffic volumes and LOS for the study intersection movements. Table 4.3 summarizes the Base Year 2022 with mitigation LOS at the study intersections compared to Base Year 2022 without mitigation. LOS worksheets are provided in Appendix C.

\* Denotes overcapacity condition, v/c ≥ 1.

## 4.5 Base Year 2027 Analysis

It is anticipated that by Base Year 2027, traffic will have increased over Base Year 2022 conditions due to the continued development of the Lahaina and Kaanapali regions. Actual growth within the study region may vary based upon the actual construction of the various nearby developments.

### 4.5.1 Base Year 2027 Intersection Analysis

By Base Year 2027 without the Project, traffic at the study intersections along Honoapiilani Highway is estimated to generally increase by an additional 5-10% for most parts along the corridor during the AM, PM and WE peak hours of traffic over Base Year 2022 conditions. The majority of study intersections are forecast to operate similar to existing conditions. Overall intersection delays generally increased by only 1-5 seconds at most study intersections from Base Year 2022 conditions. The majority of intersection movements operating at LOS E/F conditions during Base Year 2022 will continue to operate similarly in Base Year 2027.

#### [3] Honoapiilani Highway/Akahele Street

During the PM peak hour, the westbound left-turn movement is expected to experience a significant increase in delay with the increase in through traffic along Honoapiilani Highway. However, because the turning volume is low (10 vehicles), no mitigation is proposed.

#### [7] Honoapiilani Highway/Kaanapali Parkway/Halelo Street

With the proposed developments in the Kaanapali region, delay is expected to increase at this intersection. The intersection will worsen from overall LOS C(D)[C] during Base Year 2022 to LOS C(E)[C] during Base Year 2027. However, the major through movements will continue operating at LOS D or better during all peak hours. No mitigation is proposed beyond Base Year 2022 mitigation.

Figure 4.4 illustrates the Base Year 2027 forecast traffic volumes and LOS for the study intersection movements. Table 4.4 summarizes the Base Year 2027 LOS at the study intersections compared to Base Year 2022 conditions. LOS worksheets are provided in Appendix C. Full Base Year 2022 and 2027 roadway improvements are listed in Appendix D.

## 5. FUTURE YEAR SCENARIOS

### 5.1 Background

The Project is located upon approximately 304.255 acres of undeveloped land in Lahaina, bounded by Honoapiilani Highway to the west and the Kapalua Airport to the east. The Project proposes to provide 898 multi-family (MF) residential units, 2 single-family residential lots (for future residential development), an elementary school, a 10-acre park and two (2) retail centers, totaling 70,000 square feet (SF). In addition, a trail will be constructed just east and parallel to Honoapiilani Highway that will provide bike and pedestrian access to link the Project's development north and south of Mahinahina Gulch. The Project will be constructed in six (6) phases, but for purposes of this TIAR, will be analyzed as four (4) scenarios described below.

Although it is not part of this TIAR, the Project envisions future expansion at the north end of the Project site (currently identified as 2 single-family residential lots) with an additional 302 residential units, bringing the total residential unit count to 1,200 residential units. Future traffic analysis and roadway mitigation measures will be assessed at a later date.

Scenario 1 – Develop Phase 1 with a build-out of early 2022 that includes the following:

- 240 MF residential units north of Akahele Street, with direct access provided by two (2) new Project roadways, Road A and Road C, bisecting Akahele Street.

Scenario 2 - Develop Phase 2 with a build-out of early 2022 that includes the following:

- 240 MF residential units south of Akahele Street with direct access provided by Road A and Road C.
- Retail Area North consisting of 50,000 square feet (SF) of space located on the northeast corner of the Honoapiilani Highway/Akahele Street intersection.
- Retail Area South consisting of 20,000 SF of space located adjacent to Retail Area North on the southeast corner of the Honoapiilani Highway/Akahele Street intersection.
  - o Access to Retail Area North and South will be provided by Road A. Retail Area North will also be serviced by a RIRO access via Honoapiilani Highway.
  - o Based on the developer forecast absorption for the Retail Area North and South component, approximately 15,000 SF of retail space will be occupied by Year 2022, with subsequent occupancy occurring at a pace of 5,000 SF of retail space every 2 years thereafter. Therefore, full build-out and occupancy of Retail Areas North and South will likely occur well beyond Year 2022, but was assumed to be fully built out by Year 2022 for this TIAR.

Scenario 3 – Develop Phases 3-5 with a build-out of late 2022 that include the following:

- 100 MF residential units (Phase 3) south of Akahele Street, with access provided by Road C.
- 318 MF residential units (Phase 3 and Phase 4) south of Mahinahina Gulch, with access provided by a new Project roadway, Road J, intersecting Honoapiilani Highway south of Mahinahina Gulch.

- 2 single-family residential lots north of Akahahele Street, with access provided by Road A and Road C.
- 10-acre park; for purposes of this TIAR, assumed two (2) practice fields south of Mahinahina Gulch, with access provided by Road J.

Scenario 4 – A future elementary school, to be planned/developed by the Department of Education (DOE). Since the development of the school is not in the direct controller of the Pulelehua development, the timeframe for this school has yet to be determined. For purposes of this TIAR, a forecast build-out of 2027 was assumed for the TIAR.

- Assumed 750-student elementary school, with access provided by Road A.

### **5.1.1 Travel Demand Estimations**

The State of Hawaii Department of Transportation (HDOT) and Maui County provide various Transportation Demand Management (TDM) programs that promote the use of transit, walking, biking and alternative modes of transportation to reduce the use of single-occupant vehicles on roadways. These TDM measures have only been identified and conservatively assumed to yield NO vehicular reductions for Project generated traffic.

Maui County currently provides a bus system that offers several routes that connect the major areas in Maui. The Lahaina Islander Route #20 provides regional connectivity between Lahaina and Kahului. The Lahaina Villager Route #23, Kaanapali Islander Route #25 and Napili Islander Route #30 provide transportation within the towns of Lahaina, Kaanapali and Napili.

HDOT currently provides the Bike Plan Hawaii Master Plan, which identifies existing and proposed bicycle routes that could potentially be implemented in the future. In the vicinity of the Project, a signed shared roadway is currently provided along the 24.4 mile route along Honoapiilani Highway between Waiale Road in Wailuku and Fleming Beach Park in Kapalua. A signed shared roadway is also proposed along the 5.2 mile stretch of Lower Honoapiilani Highway from Lower Aloe Drive to Honoapiilani Highway.

### **5.1.2 Trip Generation**

The Institute of Transportation Engineers (ITE) publishes a book based on empirical data compiled from a body of more than 4,250 trip generation studies submitted by public agencies, developers, consulting firms, and associations. This publication, titled Trip Generation Manual, 9<sup>th</sup> Edition, provides trip rates and/or formulae based on graphs that correlate vehicular trips with independent variables. The independent variables can range from Dwelling Units (DU) for single-family attached homes to Gross Floor Area (GFA) for commercial or office development. These trip rates/formulae and their associated directional distributions were used to estimate the increase in the number of vehicular trips generated by the proposed Project. The rates selected were based on the land use description.

The Project's mixture of residential and retail land uses interact to create vehicle trips that can be considered internal to the development. Calculation of internal trip capture rates was done using the ITE Trip Generation Handbook, 3<sup>rd</sup> Edition for retail and residential land uses and generally resulted in an approximate 16% internal capture reduction for the PM peak hour. A minimal 1% internal capture reduction was applied to AM peak hour and no reduction for WE peak hour. Pass-by trip reductions were also applied and based upon information within the ITE Trip Generation Handbook. As a conservative measure, a pass-by rate of 20% was applied to the retail component for the PM and WE peak hours of traffic. No pass-by reductions were

applied to the AM peak hour. See Tables 5.1 and 5.2 for Trip Generation formulae and projections for the Project.

### 5.1.3 Trip Distribution and Assignment

Trips generated by the Project were assigned throughout the study area generally based upon existing travel patterns. The traffic generated by the Project was added to the forecast Base Year 2022 and 2027 traffic volumes within the vicinity of the Project to constitute the traffic volumes for Future Year 2022 Scenario 1, 2 and 3 and Future Year 2027 Scenario 4 traffic conditions. Figures 5.1, 5.3, 5.6 and 5.8 illustrate the Project-generated trip distribution for Future Year 2022 Scenario 1, Future Year 2022 Scenario 2, Future Year 2022 Scenario 3 and Future Year 2027 Scenario 4, respectively.

Table 5.1: Trip Generation Rates

| Land Use (ITE Code)                  | Independent Variable | AM Peak Hour |         | PM Peak Hour |         | WE Peak Hour |         |

## 5.2 Future Year 2022 Scenario 1 Analysis

By completion of Scenario 1 in Future Year 2022, the Project is projected to generate a total of 89(125)[106] new external trips during the AM(PM)[WE] peak hours of traffic. Trips generated by the Project are expected to result in growth along major roadways in the study area. All generated traffic will access the site via Honoapiilani Highway at its intersections with Akahele Street. Due to the relatively minimal traffic increases due to Scenario 1, regional traffic at the study intersections (those not providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by less than 5%, while local traffic at the study intersections (those providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by less than 10% from Base Year 2022 without the Project scenario, during the AM, PM and WE peak hours of traffic.

### 5.2.1 Future Year 2022 Scenario 1 Intersection Analysis

All study intersections are forecast to operate similar to Base Year 2022. The majority of intersection movements forecast to operate at LOS E/F for Base Year 2022 conditions will continue to operate similarly with Future Year 2022 Scenario 1 of the Project. The majority of high volume through movements only experienced delay increases ranging from 1-5 seconds.

#### [3] Honoapiilani Highway/Akahele Street

Since this intersection is the exclusive access from Honoapiilani Highway into the Project's Scenario 1 site, turning movements into and out of Akahele Street will increase. As a result, the intersection will worsen from Base Year 2022, but will continue to operate adequately at overall LOS B(C)[B] for the Future Year 2022 Scenario 1. Various left-turn movements will continue to operate at LOS E/F conditions during all peak hours, mainly due to those left-turn volumes remaining relatively low. It is recommended that the existing signal timing be optimized to accommodate turning movement increases.

Based on A Policy on Geometric Design of Highways and Streets, by the American Association of State Highway and Transportation Officials, dated 2011 (hereinafter referred to as the "AASHTO Green Book"), left-turn storage lane lengths at the Honoapiilani Highway/Akahele Street intersection were determined. See Table 5.3 for the recommended storage lane lengths. Based on the AASHTO Green Book, all anticipated left-turn storage at the intersection is currently accommodated, and no extensions will be required upon completion of Scenario 1.

#### [14-15] Akahele Street intersection with Road A and Road C

Akahele Street currently services very low existing traffic, with through volumes under 25 vehicles in each direction for all peak hours of traffic, resulting in lengthy gaps along Akahele Street. With the addition of the Project's bisecting Road A and Road C, forecast through traffic along Akahele Street will continue to operate with low through volumes (under 25 vehicles) at the Road C intersection and slightly higher through volumes, between 30-50 vehicles, at the Road A intersection during all peak hours.

Figures 5.1 illustrate the Project-generated trips for Future Year 2022 Scenario 1. Figure 5.2 illustrates the Future Year 2022 Scenario 1 forecast traffic volumes and LOS for the study intersection movements. Table 5.4 summarizes the Future Year 2022 Scenario 1 LOS at the study intersections compared to Base Year 2022 with mitigation conditions. LOS worksheets are provided in Appendix C.

| Westbound Left-turn lane                           | PM        | 30                           | 100                | 36              | 1                      | 2                           | 60         | Storage accommodated                                       |
|                                                    | WE        | 35                           | 100                | 36              | 1                      | 2                           | <b>60</b>  |                                                            |

Notes:

1. AM peak hour omitted, since PM and WE left-turns were highest volumes.
2. Minimum storage length is 1.5 times the average number of vehicles per cycle; assume 1 vehicle length = 25 ft.
3. Recommended storage length is exclusive of taper length or deceleration length. To be verified upon design.
4. Cycle Length based on existing observation. Majority of cycles < 100 seconds.
5. Observations: Existing NBLT majority average 1-3 car queue (75 ft storage) with a few occasional maximum 7 car queue (175 ft storage)

Table 5.4: Base Year 2022 with Mitigation and Future Year 2022 Scenario 1 Level of Service Summary

### 5.3 Future Year 2022 Scenario 2 Analysis

By completion of Scenario 2 in Future Year 2022, the Project is projected to generate a total of 210(332)[666] new external trips during the AM(PM)[WE] peak hours of traffic. Trips generated by the Project are expected to result in growth along major roadways in the study area. Traffic will access the site via Honoapiilani Highway at its intersections with Akahahele Street and the Project's proposed RIRO driveway for Retail Area North.

By Future Year 2022 WITH the cumulative increases of Project Scenarios 1 and 2, regional traffic at the study intersections (those not providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by approximately 5-15%, while local traffic at the study intersections (those providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by approximately 10-40% from Base Year 2022 without the Project scenario, during the AM, PM and WE peak hours of traffic.

#### 5.3.1 Future Year 2022 Scenario 2 Intersection Analysis

All study intersections are forecast to operate similar to Future Year 2022 Scenario 1 with the exception of the Honoapiilani Highway/Akahahele Street intersection described further below. The majority of intersection movements forecast to operate at LOS E/F for Future Year 2022 Scenario 1 conditions will continue to operate similarly with Future Year 2022 Scenario 2 of the Project. The majority of high volume through movements only experienced delay increases ranging from 1-5 seconds.

##### [3] Honoapiilani Highway/Akahahele Street

Since this intersection is the primary access from Honoapiilani Highway into the Project's Scenario 2 site, turning movements into and out of Akahahele Street will increase. As a result, the intersection will worsen, but operate adequately from an overall LOS B(C)[B] during the Future Year 2022 Scenario 1 condition to an overall LOS C(D)[C] for the Future Year 2022 Scenario 2. Various left-turn movements will operate at LOS E conditions during all peak hours, due to the long cycle length and increased turning movements at the intersection. However, all movements will continue to operate under capacity. It is recommended that the existing signal timing be optimized to accommodate turning movement increases.

Based on the AASHTO Green Book, left-turn storage lane lengths at the Honoapiilani Highway/Akahahele Street intersection were determined. See Table 5.5 for the recommended storage lane lengths. Based on the AASHTO Green Book, the following is recommended. Note, additional taper length and/or deceleration length to be provided/verified upon design:

- Northbound left-turn lane → Lengthen left-turn lane to provide at least 275 feet of storage space.
- Southbound left-turn lane → Lengthen left-turn lane to provide at least 275 feet of storage space.
- Westbound left-turn lane → Lengthen left-turn lane to provide at least 300 feet of storage space.

#### [12] Honoapiilani Highway/Retail Area North RIRO

The new RIRO access along Honoapiilani Highway, north of Akahahele Street, was analyzed as a stop-controlled intersection with stop control on the westbound right-turn movement out of Retail Area North. The westbound right-turn movement is expected to operate adequately with LOS C or better during all peak hours. It is recommended that a northbound right-turn deceleration lane be provided for entry into Retail Area North. Based on the AASHTO Green Book, the following is recommended:

- Northbound right-turn lane → Provide at least 100 feet of storage space. Additional taper length and/or deceleration length to be provided based upon design and constraints related to access location to nearby Honoapiilani Highway/Akahahele Street intersection. Based on AASHTO Green Book, 425 feet accommodates full deceleration length with a design speed of 50 mph.

#### [14-15] Akahahele Street intersection with Road A and Road C

With the completion of Scenario 2, volumes along Akahahele Street are expected to increase. However, the roadway will continue to operate with low through volumes (under 25 vehicles) at the Road C intersection and slightly higher through volumes, between 50-150 vehicles, at the Road A intersection during all peak hours. The 50-150 vehicles traveling through the Road A intersection will still yield lengthy gaps in throughput traffic along Akahahele Street, eliminating occurrences of long queues for opposing left-turn movements turning from Akahahele Street. However, exclusive left-turn storage lanes should be considered to remove left-turns from the through lanes on Akahahele Street.

During the WE peak hour, the northbound shared left-turn/through/right-turn lane on Road A is expected to operate at LOS E due to the high left-turn volumes and the high volumes on Akahahele Street. However, as noted above, lengthy gaps are still expected along Akahahele Street as a result of the nearby Honoapiilani Highway/Akahahele Street signal.

Figure 5.3 illustrates the Project-generated trips for Future Year 2022 Scenario 2. Figure 5.4 illustrates the Future Year 2022 Scenario 2 forecast traffic volumes and LOS for the study intersection movements. Figure 5.5 illustrates the Future Year 2022 Scenario 2 forecast traffic volumes, LOS and intersection laneage along Akahahele Street and at the Project Retail Area North RIRO access. Table 5.6 summarizes the Future Year 2022 Scenario 2 LOS at the study intersections compared to Base Year 2022 with mitigation and Future Year 2022 Scenario 1 conditions. LOS worksheets are provided in Appendix C.

|                                                    | WE        | 215                          | 135                | 27              | 8                      | 12                          | 300 | 183           | 305                   |                                         |

Notes:

1. AM peak hour omitted, since PM and WE left-turns were highest volumes.
2. Minimum storage length is 1.5 times the average number of vehicles per cycle; assume 1 vehicle length = 25 ft.
3. Eastbound left-turn storage currently accommodated.
4. Recommended storage length is exclusive of taper length or deceleration length. To be verified upon design.

## 5.4 Future Year 2022 Scenario 3 Analysis

By completion of Scenario 3 in Future Year 2022, the Project is projected to generate an additional 168(255)[257] new external trips during the AM(PM)[WE] peak hours of traffic. Trips generated by the Project are expected to result in growth along major roadways in the study area. Traffic generated by Project Scenario 3 will access the site via a new Road J which is proposed to connect to Honoapiilani Highway and service the areas south of Mahinahina Gulch.

By Future Year 2022 WITH the cumulative increases of Project Scenarios 1, 2 and 3, regional traffic at the study intersections (those not providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by approximately 5-20%, while local traffic at the study intersections (those providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by approximately 10-50% from Base Year 2022 without the Project scenario, during the AM, PM and WE peak hours of traffic.

### 5.4.1 Future Year 2022 Scenario 3 Intersection Analysis

With the additional trips generated by Scenario 3, all study intersections are forecast to operate similar to Future Year 2022 with Scenario 2, with no major changes to LOS or capacity with the exception of the Honoapiilani Highway/Akahele Street intersection described further below. All intersection movements forecast to operate at LOS E/F for Future Year 2022 Scenario 2 conditions will continue to operate at LOS E/F conditions during Future Year 2022 Scenario 3. The majority of high volume through movements only experienced delay increases ranging from 1-5 seconds.

#### [3] Honoapiilani Highway/Akahele Street

Due to the continued development of areas north of Mahinahina Gulch, turning movements into and out of Akahele Street will increase. As a result, the intersection will worsen, but operate adequately from an overall LOS C(D)[C] during the Future Year 2022 Scenario 2 condition to an overall LOS C(D)[D] for the Future Year 2022 Scenario 3. The majority of left-turn movements will operate at LOS E conditions during all peak hours, due to the long cycle length and increased turning movements at the intersection. However, all movements will continue to operate under capacity. All left-turn storage lane lengths recommended in Table 5.5 accounts for traffic generated for the Future Year 2022 Scenario 3.

#### [13] Honoapiilani Highway/Road J

The proposed Honoapiilani Highway/Road J intersection was analyzed as an unsignalized intersection, which includes exclusive westbound left-turn and right-turn lanes, an exclusive southbound left-turn lane and an exclusive northbound right-turn lane. A southbound median refuge lane along Honoapiilani Highway is also recommended to facilitate westbound vehicles making the left-turn movement from Road J onto Honoapiilani Highway. Based on the Manual on Uniform Traffic Control Devices (MUTCD), Federal Highway Administration, dated 2009, Four-Hour Vehicular Volume traffic signal warrant, a traffic signal is not forecast to be warranted. Signal warrant figures are shown in Appendix D. Based on the AASHTO Green Book, the following is recommended:

- Northbound Approach → Provide one (1) through lane and a new right-turn deceleration lane with at least 100 feet of storage space. Additional taper length and/or deceleration length to be provided based upon design. AASHTO Green Book recommends 425 feet to accommodate full deceleration length with a design speed of 50 mph.

- Southbound Approach → Provide one (1) through lane and a new left-turn storage lane with at least 100 feet of storage space. Additional taper length and/or deceleration length to be provided based upon design. AASHTO Green Book recommends 425 feet to accommodate full deceleration length with a design speed of 50 mph.
  - o Construct a median refuge lane to facilitate westbound left-turn traffic exiting Road J going onto Honoapiilani Highway.
- Westbound Approach → Provide a new left-turn storage lane and a new 100 feet right-turn storage lane.

Based on the above configuration, the westbound left-turn out of the Project is expected to operate at LOS F during the PM peak hour of traffic and LOS E during the WE peak hour of traffic. However, gaps in through traffic along Honoapiilani Highway will help facilitate westbound left-turn movements due to traffic being controlled by the upstream signal at Akahele Street to the north and downstream signal at Lower Honoapiilani Road to the south. Also, a median refuge lane is proposed to provide two-stage movement for left-turn vehicles to cross one direction at a time.

Figure 5.6 illustrates the Project-generated trips for Future Year 2022 Scenario 3. Figure 5.7 illustrates the Future Year 2022 Scenario 3 forecast traffic volumes and LOS for the study intersection movements. Table 5.7 summarizes the Future Year 2022 Scenario 3 LOS at the study intersections compared to Base Year 2022 with mitigation and Future Year 2022 Scenario 2. LOS worksheets are provided in Appendix C.

## 5.5 Future Year 2027 Scenario 4 Analysis

As discussed earlier, a future elementary school will be planned/developed by the Department of Education (DOE). Since the development of the school is not in the direct controller of the Pulelehua development, the timeframe for this school has yet to be determined. For purposes of this TIAR, a forecast build-out of 2027 with inclusion of the elementary school as part of the Project was assumed as Scenario 4 for the TIAR.

By completion of Scenario 4 in Future Year 2027, the Project is projected to generate an additional 312(101)[0] new external trips during the AM(PM)[WE] peak hours of traffic. Elementary school students in Lahaina are currently serviced primarily by Princess Nahienaena Elementary School and King Kamehameha III Elementary School, further south of Keawe Street. It's anticipated that upon opening of the new Elementary School in the Project site, many students will transfer to this site from the Kaanapali, Honokowai, Kahana, Napili and Kapalua regions. Trips generated by the new elementary school were rerouted from existing traffic along Honoapiilani Highway to the new site. As a result, the majority of traffic increases were turning movement traffic turning into and out of Akahele Street on the east leg of its intersection with Honoapiilani Highway. Traffic reductions to various through movements along the highway were a result of the reroute.

### 5.5.1 Future Year 2027 Scenario 4 Intersection Analysis

With the additional trips generated by Scenario 4 and background traffic growth, several study intersections are forecast to operate with increased delay from Base Year 2027 without the Project and Future Year 2022 with Scenarios 1, 2 and 3. All intersection movements forecast to operate at LOS E/F for Future Year 2022 Scenario 3 conditions will continue to operate at LOS E/F conditions during Future Year 2027 Scenario 4.

#### [3] Honoapiilani Highway/Akahele Street

With the increase in turning movements at Akahele Street due to traffic generated by Scenario 4, several minor street and left-turn movements will worsen to LOS E/F during the peak hours of traffic. However, the major through movements will operate at LOS D or better. All left-turn storage lane lengths recommended in Table 5.5 accounts for traffic generated for the Future Year 2027 Scenario 4.

#### [7] Honoapiilani Highway/Kaanapali Parkway

As discussed in Section 4.5.1, this intersection will worsen from overall LOS C(D)[C] during Base Year 2022 to LOS C(E)[C] during Base Year 2027 even without the Project. Therefore, during Future Year 2027 with Project, overall LOS will generally be maintained at LOS C(E)[D]. However, the major through movements will continue operating at LOS D or better during all peak hours. Based on Scenario 4 trip distribution, the Project is anticipated to reduce some of the through traffic along Honoapiilani Highway due to the Elementary School reroutes.

#### [10] Honoapiilani Highway/Kapunakea Street

During the PM peak hour of traffic, the southbound shared through/right-turn movement is expected to operate at over-capacity conditions. The eastbound approach could be restriped to provide an exclusive left-turn lane and a shared through/right-turn lane, consistent with the striping on the westbound approach. With the restriping, all movements will operate under-

capacity with the major through movements operating at LOS B or better during all peak hours of traffic. Numerous left-turn movements will continue operating at LOS E/F due to the long coordinated cycle length.

#### [11] Honoapiilani Highway/Keawe Street

During the PM peak hour of traffic, the westbound right-turn movement is expected to operate at LOS F and over-capacity conditions because the intersection serves as a critical junction between Honoapiilani Highway and Lahaina Bypass Road. Plans for Lahaina Bypass Road Phase 1C will extend the roadway further north to the Kaanapali area and provide a new connection between the bypass road and Honoapiilani Highway, which will help alleviate the high volume turning movements at the Honoapiilani Highway/Keawe Street intersection. Because there is currently no set completion date for Phase 1C, the bypass extension is not included as a mitigative measure. However, the extension is expected to improve operations at the Honoapiilani Highway/Keawe Street intersection when completed.

Figures 5.8 illustrate the Project-generated trips for Future Year 2027 Scenario 4. Figure 5.9 illustrates the Future Year 2027 Scenario 4 forecast traffic volumes and LOS for the study intersection movements. Table 5.8 summarizes the Future Year 2027 Scenario 4 LOS at the study intersections compared to Base Year 2027 and Future Year 2022 Scenario 3. LOS worksheets are provided in Appendix C. Full Future Year 2022 and 2027 roadway improvements for Scenarios 1-4 are listed in Appendix D.

\* Denotes overcapacity condition, v/c ≥ 1.

\*\* For Future Year 2027 Scenario 4, the analysis for Honoapiilani Highway/Kapunakea Street includes restriping the eastbound approach to provide an exclusive left-turn lane and a shared through/right-turn lane.

## 6. CONCLUSIONS

The Project is located upon approximately 304.255 acres of undeveloped land in Lahaina, bounded by Honoapiilani Highway to the west and the Kapalua Airport to the east. The Project proposes to provide 898 multi-family (MF) residential units, 2 single-family residential lots (for future residential development), an elementary school, a 10-acre park and two (2) retail centers, totaling 70,000 square feet (SF). In addition, a trail will be constructed just east and parallel to Honoapiilani Highway that will provide bike and pedestrian access to link the Project's development north and south of Mahinahina Gulch. The Project will be constructed in six (6) phases, but for purposes of this TIAR, will be analyzed as four (4) scenarios.

Although it is not part of this TIAR, the Project envisions future expansion at the north end of the Project site (currently identified as 2 single-family residential lots) with an additional 302 residential units, bringing the total residential unit count to 1,200 residential units. Future traffic analysis and roadway mitigation measures will be assessed at a later date.

Scenario 1 – Develop Phase 1 with a build-out of early 2022 that includes the following:

- 240 MF residential units north of Akahele Street, with direct access provided by two (2) new Project roadways, Road A and Road C, bisecting Akahele Street.

Scenario 2 - Develop Phase 2 with a build-out of early 2022 that includes the following:

- 240 MF residential units south of Akahele Street with direct access provided by Road A and Road C.
- Retail Area North consisting of 50,000 square feet (SF) of space located on the northeast corner of the Honoapiilani Highway/Akahele Street intersection.
- Retail Area South consisting of 20,000 SF of space located adjacent to Retail Area North on the southeast corner of the Honoapiilani Highway/Akahele Street intersection.
  - o Access to Retail Area North and South will be provided by Road A. Retail Area North will also be serviced by a RIRO access via Honoapiilani Highway.
  - o Based on the developer forecast absorption for the Retail Area North and South component, approximately 15,000 SF of retail space will be occupied by Year 2022, with subsequent occupancy occurring at a pace of 5,000 SF of retail space every 2 years thereafter. Therefore, full build-out and occupancy of Retail Areas North and South will likely occur well beyond Year 2022, but was assumed to be fully built out by Year 2022 for this TIAR.

Scenario 3 – Develop Phases 3-5 with a build-out of late 2022 that include the following:

- 100 MF residential units (Phase 3) south of Akahele Street, with access provided by Road C.
- 318 MF residential units (Phase 3 and Phase 4) south of Mahinahina Gulch, with access provided by a new Project roadway, Road J, intersecting Honoapiilani Highway south of Mahinahina Gulch.
- 2 single-family residential lots north of Akahele Street, with access provided by Road A and Road C.
- 10-acre park south of Mahinahina Gulch, with access provided by Road J.

Scenario 4 – A future elementary school, to be planned/developed by the Department of Education (DOE). Since the development of the school is not in the direct controller of the Pulelehua development, the timeframe for this school has yet to be determined. For purposes of this TIAR, a forecast build-out of 2027 was assumed for the TIAR.

- Assumed 750-student elementary school, with access provided by Road A.

## 6.1 Existing Conditions

In the vicinity of the Project, Honoapiilani Highway services the area as the main thoroughfare that connects the West Maui region. Honoapiilani Highway generally operates as a two (2) lane highway from Napilihau Street to Lower Honoapiilani Road and continues south as a four (4) lane highway from Lower Honoapiilani Road to beyond Keawe Street. In the vicinity of the Project, the intersections along the highway operate with either fixed coordinated signal timing plans or uncoordinated plans with lengthy through volume green times. As a result, numerous mainline left-turn movements and minor street approaches at various study intersections operate at LOS E/F conditions due to lengthy delays from the signal timing plans that favor the through movements along Honoapiilani Highway. Numerous movements also operate with low left-turning volumes (< 25 vehicles), which contribute to the LOS E/F conditions.

However, with the exception of the southbound left-turn movement at the Honoapiilani Highway/Keawe Street intersection, all vehicular movements at each study intersection operate adequately with under-capacity conditions.

## 6.2 Base Year 2022

It is anticipated that by Year 2022, traffic will have increased over existing conditions due to various anticipated new developments in the Lahaina region shown in Figure 4.1 and a 0.5% ambient growth rate, adjusted and applied from HDOT's MRTDM. By Base Year 2022 without the Project, traffic at the study intersections along Honoapiilani Highway is estimated to increase overall by approximately 10-20% on various parts of the corridor during the AM, PM and WE peak hours of traffic.

By Year 2022, it is assumed that various planned roadway improvements will be implemented even without the Project and include the Lahaina Bypass Road Phase 1B-2, an additional southbound left-turn lane for the Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall intersection, resulting in dual southbound left-turn lanes and various widening/restriping improvements at the Honoapiilani Highway/Napilihau Street intersection.

With the anticipated growth in traffic and planned roadway improvements, all study intersections are forecast to operate similar to existing conditions. Overall intersection delays generally increased by only 1-5 seconds at most study intersections. The majority of intersection movements currently operating at LOS E/F conditions will continue to operate similarly in Base Year 2022 and at under-capacity conditions, with the exception of the eastbound shared left-turn/through movement at Honoapiilani Highway/Kaanapali Parkway intersection during the PM peak hour of traffic, which is forecast to operate at LOS F and over-capacity conditions.

### 6.3 Base Year 2022 With Mitigation

The following mitigations were proposed for Base Year 2022.

#### [7] Honoapiilani Highway/Kaanapali Parkway/Halelo Street

- Modify the eastbound approach to incorporate a dedicated left-turn lane, a shared left-turn/through lane and two (2) dedicated right-turn lanes.

With the recommended mitigation, the intersection is anticipated to improve and operate adequately at overall LOS D or better during all peak hours of traffic. Similar to existing conditions, numerous minor street approaches and major street left-turn movements will continue operating at LOS E/F due to the long through movement green time and cycle length.

#### [8-11] Honoapiilani Highway from Leialii Parkway to Keawe Street

Since the Honoapiilani Highway/Keawe Street intersection will be widened to provide dual southbound left-turn lanes, it was assumed that some of the signal timing plans for intersections along the coordinated corridor from Leialii Parkway to Keawe Street would be reoptimized to make signals run more efficient and improve throughput progression.

### 6.4 Base Year 2027

It is anticipated that by Year 2027, traffic will have increased over Base Year 2022 due to various new developments in the region shown in Figure 4.1 and a 0.5% ambient growth rate, adjusted and applied from HDOT's MRTDM. By Base Year 2027 without the Project, traffic at the study intersections along Honoapiilani Highway is estimated to generally increase by an additional 5-10% for most parts along the corridor during the AM, PM and WE peak hours of traffic over Base Year 2022 conditions.

With the anticipated growth in traffic, the majority of study intersections are forecast to operate similar to existing conditions. Overall intersection delays generally increased by only 1-5 seconds at most study intersections. The majority of intersection movements operating at LOS E/F conditions during Base Year 2022 will continue to operate similarly in Base Year 2027.

Select movements at Honoapiilani Highway/Akahele Street and Honoapiilani Highway/Kaanapali Parkway/Halelo Street are expected to experience significant increases in delay. However, no mitigation is proposed for either intersection as all major through movements will continue to operate adequately.

### 6.5 Future Year 2022 Scenario 1

By completion of Scenario 1 in Future Year 2022, the Project is projected to generate a total of 89(125)[106] new external trips during the AM(PM)[WE] peak hours of traffic. Trips generated by the Project are expected to result in growth along major roadways in the study area. All generated traffic will access the site via Honoapiilani Highway at its intersections with Akahele Street.

Due to the relatively minimal traffic increases due to Scenario 1, regional traffic at the study intersections (those not providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by less than 5%, while local traffic at the study intersections (those providing direct access to the Project) along Honoapiilani Highway is estimated to increase

overall by less than 10% from Base Year 2022 without the Project scenario, during the AM, PM and WE peak hours of traffic.

All study intersections are forecast to operate similar to Base Year 2022 because of the minimal traffic generated by Scenario 1. Based on the AASHTO Green Book, all existing left-turn storage lane lengths at the Honoapiilani Highway/Akahele Street intersection are adequate for the additional traffic generated by Scenario 1.

## 6.6 Future Year 2022 Scenario 2

By completion of Scenario 2 in Future Year 2022, the Project is projected to generate a total of 210(332)[666] new external trips during the AM(PM)[WE] peak hours of traffic. Trips generated by the Project are expected to result in growth along major roadways in the study area. Traffic will access the site via Honoapiilani Highway at its intersections with Akahele Street and the Project's proposed RIRO driveway for Retail Area North.

By Future Year 2022 WITH the cumulative increases of Project Scenarios 1 and 2, regional traffic at the study intersections (those not providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by approximately 5-15%, while local traffic at the study intersections (those providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by approximately 10-40% from Base Year 2022 without the Project scenario, during the AM, PM and WE peak hours of traffic.

All study intersections are forecast to operate similar to Future Year 2022 Scenario 1 with the exception of the Honoapiilani Highway/Akahele Street intersection. Since this intersection is the primary access from Honoapiilani Highway into the Project's Scenario 2 site, turning movements into and out of Akahele Street will increase. As a result, the intersection will worsen, but operate adequately from an overall LOS B(C)[B] during the Future Year 2022 Scenario 1 condition to an overall LOS C(D)[C] for the Future Year 2022 Scenario 2. Various left-turn movements will operate at LOS E conditions during all peak hours, due to the long cycle length and increased turning movements at the intersection. However, all movements will continue to operate under capacity. Based on the AASHTO Green Book, various storage lengths are recommended at the intersection as shown in Table 5.5.

The new RIRO access along Honoapiilani Highway was analyzed as a stop-controlled intersection with stop control on the westbound right-turn movement out of Retail Area North. The westbound right-turn movement is expected to operate adequately with LOS C or better during all peak hours. It is recommended that a northbound right-turn deceleration lane be provided for entry into Retail Area North.

With the addition of the Project's bisecting Road A and Road C, forecast traffic indicates that throughput traffic along Akahele Street will continue to operate with low through volumes (under 25 vehicles) at the Road C intersection and slightly higher through volumes, between 50-150 vehicles, at the Road A intersection during all peak hours. The 50-150 vehicles traveling through the Road A intersection will still yield lengthy gaps in throughput traffic along Akahele Street, eliminating long queues for left-turn movements turning off from Akahele Street onto Road A. However, exclusive left-turn storage lanes should be considered to remove left-turns from the through lanes and increase left-turning vehicle sight distance with the proposed median on Akahele Street.

During the WE peak hour, the northbound shared left-turn/through/right-turn lane on Road A is expected to operate at LOS E due to the high left-turn volumes and the high volumes on Akahele Street. However, lengthy gaps are still expected along Akahele Street as a result of the nearby Honoapiilani Highway/Akahele Street signal.

## **6.7 Future Year 2022 Scenario 3**

By completion of Scenario 3 in Future Year 2022, the Project is projected to generate an additional 168(255)[257] new external trips during the AM(PM)[WE] peak hours of traffic. Trips generated by the Project are expected to result in growth along major roadways in the study area. Traffic generated by Project Scenario 3 will access the site via the Honoapiilani Highway/Road J intersection.

By Future Year 2022 WITH the cumulative increases of Project Scenarios 1, 2 and 3, regional traffic at the study intersections (those not providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by approximately 5-20%, while local traffic at the study intersections (those providing direct access to the Project) along Honoapiilani Highway is estimated to increase overall by approximately 10-50% from Base Year 2022 without the Project scenario, during the AM, PM and WE peak hours of traffic.

All study intersections are forecast to operate similar to Future Year 2022 Scenario 2, with no major changes to LOS or capacity with the exception of the Honoapiilani Highway/Akahele Street intersection. Due to the continued development of areas north of Mahinahina Gulch, turning movements into and out of Akahele Street will increase. As a result, the intersection will worsen, but operate adequately from an overall LOS C(D)[C] during the Future Year 2022 Scenario 2 condition to an overall LOS C(D)[D] for the Future Year 2022 Scenario 3. The majority of left-turn movements will operate at LOS E conditions during all peak hours, however, all movements will continue to operate under capacity. All left-turn storage lane lengths recommended in for Future Year 2022 Scenario 2 accounts for traffic generated for the Future Year 2022 Scenario 3.

The new Honoapiilani Highway/Road J intersection was analyzed as an unsignalized intersection, which includes an exclusive westbound left-turn and westbound right-turn lane, an exclusive southbound left-turn lane and an exclusive northbound right-turn lane. A southbound median refuge lane along Honoapiilani Highway is also recommended, to facilitate westbound vehicles making the left-turn movement from the Full Access onto Honoapiilani Highway. Based on the Manual on Uniform Traffic Control Devices (MUTCD), Federal Highway Administration, dated 2009, Four-Hour Vehicular Volume traffic signal warrant, a traffic signal is not forecast to be warranted. Signal warrant figures are shown in Appendix D. Based on the AASHTO Green Book, various storage lengths are recommended at the intersection.

With the proposed configuration, the westbound left-turn out of the Project is expected to operate at LOS F during the PM peak hour of traffic and LOS E during the WE peak hour of traffic. However, gaps in through traffic along Honoapiilani Highway and the median refuge lane will help facilitate westbound left-turn movements.

## **6.8 Future Year 2027 Scenario 4**

As discussed earlier, a future elementary school will be planned/developed by the Department of Education (DOE). Since the development of the school is not in the direct controller of the Pulelehua development, the timeframe for this school has yet to be determined. For purposes

of this TIAR, a forecast build-out of 2027 with inclusion of the elementary school as part of the Project was assumed as Scenario 4 for the TIAR.

By completion of Scenario 4 in Future Year 2027, the Project is projected to generate an additional 312(101)[0] new external trips during the AM(PM)[WE] peak hours of traffic. Elementary school students in Lahaina are currently serviced primarily by Princess Nahienaena Elementary School and King Kamehameha III Elementary School, further south of Keawe Street. It's anticipated that upon opening of the new Elementary School in the Project site, many students will transfer to this site from the Kaanapali, Honokowai, Kahana, Napili and Kapalua regions. Trips generated by the new elementary school were rerouted from existing traffic along Honoapiilani Highway to the new site. As a result, the majority of traffic increases were turning movement traffic turning into and out of Akahale Street on the east leg of its intersection with Honoapiilani Highway. Traffic reductions to various through movements along the highway were a result of the reroute.

With the additional trips generated by Scenario 4 and background traffic growth, several study intersections are forecast to operate with increased delay from Base Year 2027 without the Project and Future Year 2022 with Scenarios 1, 2 and 3. All intersection movements forecast to operate at LOS E/F for Future Year 2022 Scenario 3 conditions will continue to operate at LOS E/F conditions during Future Year 2027 Scenario 4

However, the majority of movements expected to experience an increase in delay are minor or left-turn movements that will operate at LOS E/F due to long through movement green times and cycle lengths. The southbound shared through/right-turn at Honoapiilani Highway/Kapunakea Street and the westbound right-turn at Honoapiilani Highway/Keawe Street are expected to operate at over-capacity conditions by Future Year 2027 Scenario 4.

The Lahaina Bypass Road Phase 1C is expected to alleviate some through traffic in the Lahaina area and reduce turning movement volumes at Honoapiilani Highway/Keawe Street by providing an additional connection between the bypass road and the highway. Because there is currently no set completion date for Phase 1C, the bypass extension is not included as a mitigative measure. However, the extension is expected to improve operations at both the Honoapiilani Highway/Kapunakea Street and Honoapiilani Highway/Keawe Street intersections when completed. Additional mitigation is proposed for Honoapiilani Highway/Kapunakea Street.

## 7. RECOMMENDATIONS

Full Base Year and Future Year 2022 and 2027 roadway improvements are listed in Appendix D and discussed in more detail below.

### 7.1 Planned Roadway Improvements

The following roadway improvements are planned to be constructed by other entities by Year 2022.

#### Lahaina Bypass Road Phase 1B-2

- Phase 1B-2 will extend LBR from Hokiokio Place to its southern terminus with Honoapiilani Highway and is expected to be completed in January 2018.

#### Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall

- An additional southbound left-turn lane is planned for the Honoapiilani Highway/Keawe Street/Lahaina Cannery Mall intersection, resulting in dual southbound left-turn lanes.
- Since the Honoapiilani Highway/Keawe Street intersection will be widened to provide dual southbound left-turn lanes, it was assumed that some of the signal timing plans for intersections along the coordinated corridor from Leialii Parkway to Keawe Street would be reoptimized to make signals run more efficient and improve throughput progression.

#### Honoapiilani Highway/Napili Hau Street

- An exclusive right-turn lane on the northbound Honoapiilani Highway approach and exclusive left-turn lane and shared through/right-turn lane on the westbound Napili Hau Street approach will be constructed as part of West Maui Village roadway improvements.

### 7.2 Base Year 2022 Mitigation

The following mitigations are proposed for Base Year 2022 by other entities.

#### [7] Honoapiilani Highway/Kaanapali Parkway/Halelo Street

- Modify the eastbound approach to incorporate a dedicated left-turn lane, a shared left-turn/through lane and two (2) dedicated right-turn lanes.

### 7.3 Future Year 2022 Scenario 2 Mitigation

The following mitigations are proposed for Future Year 2022 Scenario 2.

#### [3] Honoapiilani Highway/Akahele Street

- Optimize existing signal timing to accommodate turning movement increases
- Lengthen existing left-turn storage lane lengths to provide the following storage space. Note, storage lane lengths shown below are exclusive of taper length or deceleration length and will need to be verified upon design:

- o Northbound left-turn lane → Lengthen left-turn lane to provide at least 275 feet of storage space.
- o Southbound left-turn lane → Lengthen left-turn lane to provide at least 275 feet of storage space.
- o Westbound left-turn lane → Lengthen left-turn lane to provide at least 300 feet of storage space.

#### [12] Honoapiilani Highway/Retail Area North RIRO

- Provide a new RIRO access for direct entry/exit to Retail Area North via Honoapiilani Highway. Storage lane lengths shown below are exclusive of deceleration/taper length and will need to be verified upon design. Based on AASHTO Green Book, 425 feet accommodates full deceleration length with a design speed of 50 mph.
  - o Northbound right-turn lane → Provide at least 100 feet of storage space.

#### [14-15] Akahele Street intersection with Road A and Road C

- Consider providing exclusive left-turn storage lanes along Akahele Street at its intersections with Road A and Road C to remove left-turns from the through lanes along Akahele Street.

### **7.4 Future Year 2027 Scenario 3 Mitigation**

#### [13] Honoapiilani Highway/Road J

- Provide a new unsignalized stop-controlled intersection south of the existing Honoapiilani Highway/Akahele Street intersection, with the westbound approach as the stopped approach:
  - o Northbound Approach → Provide one (1) through lane and a new right-turn deceleration lane with at least 100 feet of storage space. Additional taper and/or deceleration length to be provided based upon design. AASHTO Green Book recommends 425 feet for full deceleration length with a design speed of 50 mph.
  - o Southbound Approach → Provide one (1) through lane and a new right-turn deceleration lane with at least 100 feet of storage space. Additional taper and/or deceleration length to be provided based upon design. AASHTO Green Book recommends 425 feet for full deceleration length with a design speed of 50 mph.
    - Construct a median refuge lane to facilitate westbound left-turn traffic exiting Road J going onto Honoapiilani Highway.
  - o Westbound Approach → Provide a new left-turn storage lane and a new 100 feet right-turn storage lane.

### **7.5 Future Year 2027 Scenario 4 Mitigation**

#### [10] Honoapiilani Highway/Kapunakea Street

- Restripe the eastbound approach to provide an exclusive left-turn lane and a shared through/right-turn lane.

## **APPENDIX B**

### **LEVEL OF SERVICE CRITERIA**

---

---

## APPENDIX B – LEVEL OF SERVICE (LOS) CRITERIA

### VEHICULAR LEVEL OF SERVICE FOR SIGNALIZED INTERSECTIONS (HCM 2010)

Level of service for vehicles at signalized intersections is directly related to delay values and is assigned on that basis. Level of Service is a measure of the acceptability of delay values to motorists at a given intersection. The criteria are given in the table below.

Level-of Service Criteria for Signalized Intersections

| Level of Service | Control Delay per<br>Vehicle (sec./veh.) |
|------------------|------------------------------------------|
| A                | < 10.0                                   |
| B                | >10.0 and ≤ 20.0                         |
| C                | >20.0 and ≤ 35.0                         |
| D                | >35.0 and ≤ 55.0                         |
| E                | >55.0 and ≤ 80.0                         |
| F                | > 80.0                                   |

Delay is a complex measure, and is dependent on a number of variables, including the quality of progression, the cycle length, the green ratio, and the v/c ratio for the lane group or approach in question.

### VEHICULAR LEVEL OF SERVICE CRITERIA FOR UNSIGNALIZED INTERSECTIONS (HCM 2010)

The level of service criteria for vehicles at unsignalized intersections is defined as the average control delay, in seconds per vehicle.

LOS delay threshold values are lower for two-way stop-controlled (TWSC) and all-way stop-controlled (AWSC) intersections than those of signalized intersections. This is because more vehicles pass through signalized intersections, and therefore, drivers expect and tolerate greater delays. While the criteria for level of service for TWSC and AWSC intersections are the same, procedures to calculate the average total delay may differ.

Level of Service Criteria for Two-Way Stop-Controlled Intersections

| Level of<br>Service | Average Control Delay<br>(sec/veh) |
|---------------------|------------------------------------|
| A                   | ≤ 10                               |
| B                   | >10 and ≤15                        |
| C                   | >15 and ≤25                        |
| D                   | >25 and ≤35                        |
| E                   | >35 and ≤50                        |
| F                   | > 50                               |
