Re: **Special Use Permit (SUP) No. 2008/SUP-2; State Land Use Commission (LUC) Docket No. SP09-403; <u>In re Department of Environmental Services, City and County of Honolulu</u>; Application to Modify SUP No. 2008/SUP 2 by Modifying the LUC's Order Adopting the City and County of Honolulu Planning Commission's Findings of Fact, Conclusions of Law, and Decision and Order with Modifications dated October 22, 2009**

The Department of Environmental Services, City and County of Honolulu (the "Applicant" or the "Department of Environmental Services"), respectfully moves the Planning Commission, City and County of Honolulu (the "Planning Commission"), for an Order modifying State Special Use Permit ("SUP") No. 2008/SUP-2, which superseded State SUP No. 86/SUP-5, and which permitted a 92.5 acre expansion and time extension to capacity as allowed by the Department of Health, State of Hawaii ("DOH") for the disposal of solid waste at the Waimanalo Gulch Sanitary Landfill ("WGSL" or "Landfill").

This Application is made in accordance with Section 2-18 and Section 2-49 of the Rules of the Planning Commission and Section 15-15-70 of the State of Hawaii, Land Use Commission ("LUC") Rules. Further, the LUC has formally asserted to the Circuit Court of the First Circuit that there is nothing precluding the Department of Environmental Services from requesting relief from conditions of the 2009 LUC Order in the future: "there is nothing to preclude ENV from requesting [from the Planning Commission] an extension of the 2012 date if it is unable, using reasonable diligence as required in Condition No. 4, to identify and develop a new landfill site." <u>See</u> Exhibit "A," Appellee State of Hawai'i, Land Use Commission's Answering Brief, filed on April 12, 2010, <u>In the Matter of Department of Environmental Services, City and County of</u>

DPP 2

Honolulu vs. Land Use Commission, State of Hawaii, et al., Civil No. 09-1-2719-11, p. 9, attached hereto and incorporated herein.

Also, presenting this Application first to the Planning Commission for its consideration, rather than directly to the LUC, will promote the maximum opportunity for public participation and input by all interested parties. Furthermore, in light of the lack of specificity in the applicable rules, enabling both the Planning Commission and the LUC to consider Applicant's request will reduce the possibility of a procedural challenge. Finally, if the Planning Commission determines that it does not have the authority to consider this request, it may so conclude and direct Applicant to seek consideration from the LUC.

Applicant specifically requests that the Planning Commission modify the LUC's Order Adopting the City and County of Honolulu Planning Commission's Findings of Fact, Conclusions of Law, and Decision and Order with Modifications, dated October 22, 2009 (the "2009 LUC Decision"), by deleting the July 31, 2012, deadline to cease disposal of municipal solid waste ("MSW") at WGSL, as set forth in Condition No. 14 of said Order. The Department of Environmental Services seeks to use the WGSL until it reaches its permitted capacity, as allowed by the DOH, and as set forth in the Planning Commission's Findings of Fact, Conclusions, and Decision, dated August 4, 2009 (the "2009 Planning Commission Decision").

The basis for this Application is that the current permitted area of the Landfill, approximately 200 acres, has a useful life well beyond July 31, 2012. See *Final Environmental Impact Statement, Waimanalo Gulch Sanitary Landfill Lateral Expansion, Waimanalo Gulch, Oahu, Hawaii, TMKs: (1) 9-2-003: 072 and 073*, dated October 2008 ("2008 FEIS")[1] at Section 1.1, Proposed Action at pg. 1-1 ("The landfill has been in operation since 1989 and has capacity remaining with the unused 92.5 acres of the approximately 200 acre property for an estimated minimum life of approximately 15 years") (footnote omitted); see also Section 2.6.3, Landfill Capacity at pg. 2-27 ("At present, the lifespan of WGSL is projected for a minimum period of 15 years.") The 2008 FEIS, which was accepted by the Department of Planning and Permitting, City and County of Honolulu ("Department of Planning and Permitting") on October 13, 2008, thoroughly studied the current footprint, operations and environmental impacts associated with the use of the WGSL to capacity. See 2009 Planning Commission Decision, pg. 2, ¶ 3; see also 2008 FEIS at Section 1, Executive Summary; Section 3, Introduction; Section 4, Project Description; and Section 5, Environmental Setting, Potential Impacts and Mitigation Measures. Neither the permitted area nor the methods of operation will change with this

---

[1] Although the 2008 FEIS is a part of the record in Docket No. SP09-403, for ease of reference, attached hereto and incorporated herein as Exhibit "B" is the 2008 FEIS on CD-ROM.

Application. See 2008 FEIS at Section 1.1, Proposed Action; Section 4, Project Description. Moreover, the Landfill's current footprint has already been approved by the Planning Commission and the LUC and the Landfill has a solid waste permit from the DOH. See 2009 Planning Commission Decision, Decision and Order, pg. 24; see also 2009 LUC Decision pgs. 4-5; Declaration of Timothy E. Steinberger ("Dec. Steinberger"), ¶¶ 17, 19. It is therefore in the public interest to use WGSL, the only permitted MSW landfill on O'ahu, to capacity: this ensures maximum utility of our island's finite land resources and allows Applicant to properly manage the MSW of the City and County of Honolulu ("City") so as to protect the public health and safety of O'ahu's residents and visitors.

If the Landfill is forced to cease accepting MSW for disposal on July 31, 2012, in accordance with Condition No. 14 of the 2009 LUC Order, there will be no viable options to meet O'ahu's solid waste management needs. See 2008 FEIS at Section 1.2.2., No Action Alternative at pgs. 1-2 ("The No Action Alternative, which would involve taking no further action to extend the use of the WGSL was rejected because the consequences would result in an unacceptable health, safety, and economic impact to all communities on O'ahu."); see also Section 9.3., No Action Alternative, pgs. 9-6 to 9-8. For example, certain types of MSW, including special wastes such as sewage sludge, animal carcasses, treated medical waste; residue from the City's Honolulu Program of Waste Energy Recovery waste-to-energy facility ("H-POWER"); and bulky item waste cannot be disposed of at H-POWER and must be disposed of at a permitted landfill. See 2009 Planning Commission Decision, ¶¶ 94, 97, pg. 19. That landfill is WGSL. See 2009 Planning Commission Decision, ¶¶ 91, 92, 94, pgs. 18-19. Without WGSL, the inability to dispose of various wastes will potentially create serious health and safety issues. See 2009 Planning Commission Decision, ¶ 93, pg. 18.

In order to alleviate this potential health and safety risk, it is respectfully requested that the Planning Commission modify SUP No. 2008/SUP-2 by deleting Condition No. 14 of the 2009 LUC Decision, thereby allowing the usage of WGSL to dispose of MSW until the site reaches its permitted capacity as provided in the 2009 Planning Commission Decision.

I. BACKGROUND

A. Establishment of the Landfill

On October 17, 1985, the Director of Land Utilization, City and County of Honolulu (nka the Department of Planning and Permitting), accepted the Environmental Impact Statement for the establishment of a landfill at Waimanalo Gulch, Honouliuli, 'Ewa, O'ahu, Hawai'i. See 2008 FEIS at Section 2.5, Historical Background of the State Special Use Permit, at pgs. 2-18.

On February 4, 1987, the Planning Commission approved the SUP application to establish the Landfill on approximately 60.5 acres of land within the Agricultural District, subject to six conditions. The application was submitted by the Department of Public Works, City and County of Honolulu (nka the Department of Environmental Services). Id.

Because the SUP was for land greater than fifteen acres, on April 20, 1987, the LUC also approved the issuance of the SUP in Special Permit Docket Number 87-362 to establish the Landfill, subject to eight conditions.[2] See the LUC's Findings of Fact, Conclusions of Law and Decision and Order dated April 20, 1987, attached hereto and incorporated herein as Exhibit "C."

B. Expansion of the Landfill by 26 acres

On July 26, 1989, the Planning Commission approved an amendment to the SUP to expand the Landfill by 26 acres, with one additional condition. Applicant had requested the amendment because 26 acres had been inadvertently left out of the original SUP. The additional 26 acres was necessary to allow enough land area for the proposed administration building, weighing station, drainage structures and access roads. See 2008 FEIS at pgs. 2-19.

On October 31, 1989, the LUC also approved the SUP amendment to expand the existing permitted area by 26 acres, with the additional condition as recommended by the Planning Commission. See the LUC's Findings of Fact, Conclusions of Law and Decision and Order dated October 31, 1989, attached hereto and incorporated herein as Exhibit "D," pgs. 9-10.

C. Further Expansion of the Landfill by 21 acres

On January 10, 2003, the Department of Planning and Permitting accepted the Final Supplemental Environmental Impact Statement ("FEIS"), which addressed a proposed 21-acre expansion of the landfill. See 2008 FEIS at pgs. 2-19.

On March 13, 2003, the Planning Commission granted the application of the Department of Environmental Services to expand the landfill by 21 acres ("2003 Planning Commission Decision" attached hereto and incorporated herein as Exhibit "E"), which, at that time, was projected to extend the life of the landfill by 5 years. The proposed

---

[2] "Special permits for areas greater than fifteen (15) acres require approval of both the planning commission and the land use commission." Rules of Planning Commission § 2-38; see also Hawai'i Revised Statutes ("HRS") § 205-6.

expansion included four cells (E1 through E4) for disposing of MSW, berms, detention and stilling basins, drainage channels and access routes. In this Decision, the Planning Commission recommended that the Department of Environmental Services submit an alternative landfill site, or sites, to the City Council by December 31, 2003. The Planning Commission did not, however, condition its approval on this recommendation. See 2003 Planning Commission Decision.

With its approval of the 21-acre expansion, the Planning Commission imposed two additional conditions. One of those conditions, Condition No. 10, required the following:

> Within 5 years from the date of this Special Use Permit Amendment approval or date of the Solid Waste Management Permit approval for this expansion, whichever occurs later but not beyond May 1, 2008, the 200-acre property shall be restricted from accepting any additional waste material and be closed in accordance with an approved closure plan.

Id., at p. 5.

On June 9, 2003, the LUC issued the 2003 LUC Decision, attached hereto and incorporated herein as Exhibit "F." The LUC adopted Condition No. 10 of the 2003 Planning Commission Decision as Condition No. 12 in the 2003 LUC Decision. The LUC Decision also required the City Council to select a new site for a landfill, with the assistance of the Blue Ribbon Site Selection Committee, by June 1, 2004. See 2003 LUC Decision, pgs. 7-9.

D. Resolution Adopted by City Council Selecting WGSL as the City's Future Landfill Site.

After receiving from the LUC an extension of the deadline to make its determination, on December 1, 2004, the City Council selected WGSL as the City's future landfill site. The resolution setting forth the City Council's decision, Resolution No. 04-348, CD1, FD1 (December 1, 2004), City Council, City and County of Honolulu ("WGSL Resolution"), is attached hereto and incorporated herein as Exhibit "G." In selecting the Landfill as the future site, the City Council noted, in pertinent part, the following:

> (1) The site currently has over 15 years capacity left with further expansion, and this capacity can be further extended should the city be successful in reducing the amount of waste currently entering the landfill through recycling and the use of new technologies;

> (2) The city already owns the property and the infrastructure is already in place, making the site the most economical and least expensive to develop and maintain as a landfill;
>
> (3) Other sites will require a large capital outlay by the city to acquire the land through condemnation and to develop and construct the site and required supporting infrastructure;
>
> (4) A landfill management contract is already in place for 15 years;
>
> (5) This is the only site where the costs and revenues for a landfill are known factors; and
>
> (6) The current landfill operator is committed to implementing necessary improvements to landfill operations to address community concerns regarding visual impact, odors, airborne waste, litter and dust control[.]

WGSL Resolution, pgs. 2-3.

As expressed in the WGSL Resolution, the City Council decided that WGSL would satisfy O‘ahu's need for a landfill to manage its solid waste for the foreseeable future.

E. Extension of Waste Acceptance Deadline at WGSL.

On July 6, 2007, the Department of Environmental Services filed an application with the Department of Planning and Permitting to amend Condition No. 10 of the 2003 Planning Commission Decision, by extending the deadline to accept waste at WGSL from May 1, 2008, to May 1, 2010, or until WGSL reached its permitted capacity, whichever occurred first. This timeline extension was necessary in order to accommodate and implement the City Council's selection of WGSL as the City's future landfill site. See State Special Use Permit (SUP) No. 86/SUP-5, In re Department of Environmental Services, City and County of Honolulu (FKA Department of Public Works, City and County of Honolulu); Application to Modify (1) the Findings of Fact, Conclusions and Decision dated March 13, 2003, and (2) the Decision and Order Approving Amendment to Special Use Permit Issued June 9, 2003, filed with the Department of Planning and Permitting on July 6, 2007, without accompanying exhibits ("2007 Application"), attached hereto and incorporated herein as

Exhibit "H." An FEIS for the further expansion of WGSL by approximately 92.5 acres, to the full acreage of the site at approximately 200 acres, needed to be completed before the Department of Environmental Services could prepare an application for a new SUP that would cover the entire WGSL property. See 2008 FEIS at pgs. 2-21.

On January 16, 2008, the Planning Commission granted the Department of Environmental Services' application to amend Condition No. 10 of the 2003 Planning Commission Decision to extend the waste acceptance deadline by two years (to May 1, 2010), or until WGSL reached its permitted capacity, and issued its Findings of Fact, Conclusions of Law, and Decision and Order (the "2008 Planning Commission Decision"), attached hereto and incorporated herein as Exhibit "I." The Planning Commission recommended that the LUC similarly amend Condition No. 12 of the 2003 LUC Decision. See 2008 Planning Commission Decision, pgs. 7-8.

On March 7, 2008, the LUC issued its Findings of Fact, Conclusions of Law, and Decision and Order adopting with Modifications, the City and County of Honolulu Planning Commission's Recommendation to Approve Amendment to Special Use Permit on March 14, 2008 (the "2008 LUC Decision"), attached hereto and incorporated herein as Exhibit "J." The LUC adopted the Planning Commission's recommendation with modifications by amending the waste acceptance deadline from May 1, 2010, to November 1, 2009, and by requiring the Department of Environmental Services to report to the LUC every six months on the actions taken to alleviate further use of WGSL. See 2008 LUC Decision, p. 18.

F. Application for a New SUP to Supersede Prior SUP to Allow a 92.5-Acre Expansion and Time Extension for WGSL.

On December 3, 2008, the Department of Environmental Services filed an application for a new SUP (the "Application") to supersede the existing SUP (State Special Use Permit No. 86/SUP-5), to allow a 92.5-acre expansion and time extension for the existing operating portion of WGSL. See 2009 Planning Commission Decision, ¶ 5, pg. 2. The Department of Environmental Services concurrently sought to withdraw its existing SUP permit for approximately 107.5 acres (File No. 86/SUP-5) and the conditions imposed therein, if the new SUP permit was granted. Id. at ¶ 6, pg. 3. The Application, designated as County Special Use Permit File No. 2008/SUP-2, was processed by the Department of Planning and Permitting, which recommended to the Planning Commission that the Application be approved with conditions. Id. at ¶ 10, pg. 3.

The Planning Commission conducted a contested case hearing on the Application on June 22, 2009, June 24, 2009, July 1, 2009, July 2, 2009, and July 8, 2009. Id. at ¶¶ 19, 20, 22, 23, 25, pgs. 5-6. On July 31, 2009, the Planning Commission recommended approval of the Application subject to 10 conditions, and further recommended approval of the withdrawal of the prior SUP for WGSL (SUP File No. 86/SUP-5) upon 2008/SUP-2 taking effect, and that all conditions previously placed on the Property under SUP File No. 86/SUP-5 would then be null and void. The decision of the Planning Commission was set forth in its Findings of Fact, Conclusions of Law, and Decision and Order dated August 4, 2009, attached hereto and incorporated herein as Exhibit "K." The 2009 Planning Commission Decision was based on the evidence presented at the contested case hearing, the credibility of the witnesses testifying at the hearing, the proposed findings of fact, conclusions of law, and decisions and orders submitted by the parties and their respective responses thereto, and the written arguments of the parties. Id. at pg. 1.

Notably, the 2009 Planning Commission Decision does not contain any expiration date for the SUP or any deadline for the acceptance of waste at WGSL. Commissioner Kerry Komatsubara ("Komatsubara"), who authored this Decision, explained that "[t]he term or the length of the new SUP shall be until the Waimanalo Gulch landfill reaches its capacity as compared to a definite time period of 'X' number of years." Komatsubara noted that the Department of Environmental Services had "demonstrated that we need a landfill. I think it's pretty obvious; we need a landfill on this island for us to move forward…it would not be in the community's best interest if we were to close this landfill before we find another landfill." Komatsubara further explained his reasoning as follows:

> In my opinion, simply putting on a new closure date to this new SUP will not lead to the closure of the Waimanalo Gulch Sanitary Landfill. I believe that the focus should not be on picking a date. The focus should be on how do we get the City to select a new site because you're not going to close this landfill until you find another site. I don't think it's in the interest of our community not to have a landfill.
>
> ***
>
> So what this proposal does is, it says look, [Applicant] can keep [WGSL] open until your [*sic*] full, until you've reached the capacity, but you have an obligation starting from next year [2010] to start looking for a new site. Now whether you take it seriously or not, that's up to you because we have the power to call you in, and you have the obligation now to report every year on what you're doing to find a new landfill site whether it be a replacement site or supplemental site or both. We have the right to hold a hearing at any time we feel that you are not…the applicant is not in good faith moving forward with reasonable diligence to find a new site.

***

> ...I think going down the old path of just putting a [closure] date in there has not worked. We put it down three or four times before and every time we came to that date, it was extended further and further...I'd rather not say it's a certain date only to know that when we reach that date we're going to extend it further until we find the new site. I'd rather focus on an effort to find a new site and have [Applicant] come in every year and explain to us where you are in your effort to find a new site. That's what this [order] does.

Relevant portions of the transcript of the July 31, 2009, decision-making hearing of the Planning Commission are attached hereto and incorporated herein as Exhibit "L."

On October 22, 2009, the LUC issued its written Order Adopting the City and County of Honolulu Planning Commission's Findings of Fact, Conclusions of Law, and Decision and Order with Modifications ("2009 LUC Decision"), attached hereto and incorporated herein as Exhibit "M."

The 2009 LUC Decision granted the Application subject to "(1) the withdrawal of County Special Use Permit File No. 86/SUP-5 and LUC Docket No. SP87-362, provided that the existing conditions therein shall be incorporated to the extent they are consistent with and applicable to this decision and are not duplicative of any additional conditions imposed hereafter; (2) the conditions as recommended by the Planning Commission in County Special Use Permit File No. 2008/SUP-2 (LUC Docket No. SP09-403) and modified as appropriate"; and (3) the following relevant conditions:

> 14. Municipal solid waste shall be allowed at the WGSL up to July 31, 2012, provided that only ash and residue from H-POWER shall be allowed at the WGSL after July 31, 2012.
>
> 15. The Honolulu City Council through the City Administration shall report to the public every three months on the efforts of the City Council and the City Administration in regard to the continued use of the WGSL, including any funding arrangements that are being considered by the City Council and the City Administration.
>
> 16. The City Council and the City Administration shall have a public hearing every three months to report on the status of their efforts to either reduce or continue the use of the WGSL.

2009 LUC Decision, pgs. 4, 8-9.

G. Subsequent Court Proceedings Related to the 2009 LUC Decision

On November 19, 2009, the Department of Environmental Services filed its Notice of Appeal; Statement of the Case; Designation of Record on Appeal; Order for Certification and Transmission of Record; Exhibits "A" and "B" to the Circuit Court of the First Circuit ("Circuit Court"). Specifically, the Department of Environmental Services appealed the LUC's imposition of a July 31, 2012, deadline to cease the disposal of MSW at WGSL, as set forth in Condition No. 14 of the 2009 LUC Decision, as arbitrary and capricious, characterized by abuse of discretion and a clearly unwarranted exercise of discretion in light of the record developed before the Planning Commission. The Department of Environmental Services further appealed the LUC's imposition of reporting requirements, as set forth in Condition Nos. 15 and 16 of the 2009 LUC Decision, as in excess of the statutory authority and jurisdiction of the LUC. See Dec. Steinberger, ¶ 20.

Oral arguments were held before the Honorable Judge Rhonda A. Nishimura of the Circuit Court on July 14, 2010. Id.

On September 21, 2010, the Circuit Court issued its Order Affirming Land Use Commission's Order Adopting the City and County of Honolulu Planning Commission's Findings of Fact, Conclusions of Law and Decision and Order Dated October 22, 2009 with Modifications, which is attached hereto and incorporated herein as Exhibit "N." Said Order modified Conditions No. 15 and 16 of the 2009 LUC Decision by deleting the references to the Honolulu City Council and the City administration, and substituting the same with the Department of Environmental Services. The Order also erroneously affirmed Condition No. 14 of the 2009 LUC Decision. Id.

Final Judgment was filed on October 19, 2010, and the Notice of Entry of Judgment was filed on October 21, 2010. On November 12, 2010, the Department of Environmental Services timely filed its Notice of Appeal and Civil Appeals Docketing Statement to the Intermediate Court of Appeals ("ICA") relating to that portion of the Circuit Court's Order which wrongly affirmed the LUC's arbitrary and unsupported deadline of July 31, 2012, to cease acceptance of MSW at WGSL. See Dec. Steinberger, ¶¶ 20, 21.

The Department of Environmental Services filed its Opening Brief to the ICA on February 15, 2011. Briefing is not yet concluded and the case remains pending before the ICA. Id.

II. REQUEST FOR MODIFICATION OF SUP No. 2008/SUP-2

Section 2-49 of the Rules of the Planning Commission provides, in relevant part:

> (a) A petitioner who desires a modification or deletion of a condition imposed by the commission shall make such a request to the commission in writing. This request shall be processed in the same manner as the original petition for a SUP. A public hearing on the request shall be held prior to any commission action.
>
> . . .
>
> (c). . . Modification of conditions for areas greater than fifteen (15) acres will require the concurrence of the land use commission.

As discussed above, the Planning Commission did not place any expiration date on 2008/SUP-2 or any deadline for the acceptance of waste at WGSL. See generally 2009 Planning Commission Decision; see also Exhibit "L." The LUC, however, imposed the July 31, 2012, deadline to close WGSL to MSW in Condition No. 14. See 2009 LUC Decision, pg. 8.

The current DOH Solid Waste Management Permit for WGSL, which encompasses the approximately 200 acre property, was issued on June 4, 2010, and is attached hereto and incorporated herein as Exhibit "O." That permit states that WGSL "may accept MSW and ash for disposal until the date specified in the associated Special Use Permit or until the landfill/monofill reaches its permitted capacity, whichever comes first." Id. at pgs. 1, 9. The SUP now in effect requires that the Landfill stop accepting MSW on July 31, 2012, well before WGSL will reach its permitted capacity. See 2008 FEIS at Section 1.1, Proposed Action at pg. 1-1; Section 2.6.3, Landfill Capacity at pg. 2-27; see also Dec. Steinberger, ¶ 22. For the reasons that follow below, it is not only practical to extend the Landfill's solid waste acceptance deadline, but also necessary and critical for effective and safe management of the City's solid waste.

A. The Currently Permitted Landfill Has a Useful Life that Will Extend Well Beyond the July 31, 2012, Deadline.

WGSL is located on approximately 200 acres of land and has years of capacity remaining within this permitted area. See 2008 FEIS at Section 1.1, Proposed Action at pg. 1-1; Section 2.6.3, Landfill Capacity at pg. 2-27; see also Dec. Steinberger, ¶ 22. Based upon typical rates of disposal at WGSL, that remaining capacity is estimated to be approximately fifteen years.[3] Id. From 2005 through 2009, the volume of municipal solid waste disposed of at WGSL is illustrated as follows:

Disposal of MSW at WGSL[4]

Year	2005	2006	2007	2008	2009
Tons	391,579	286,842	306,691	233,065	178,512

This chart reflects that the Department of Environmental Services has been actively reducing waste volumes that are directed to WGSL through its various waste diversion programs.[5] See 2009 Planning Commission Decision, ¶ 100, pg. 20 ("The City is actively reducing waste volume that is directed to the landfill."). However, even with such waste diversion programs, WGSL remains vitally important to the City's Integrated Solid Waste Management Plan. See 2009 Planning Commission Decision, ¶ 91, pg. 18. The continued availability of WGSL is a DOH permit condition to operate H-POWER (e.g., to dispose of the waste that exceeds the capacity of H-POWER, or waste that is diverted from that facility due to routine maintenance or unanticipated closures). See 2009 Planning Commission Decision, ¶ 92, pg. 18. The Landfill is also needed for clean up in the event of a natural

---

[3] The remaining capacity of WGSL is an estimate only as rates of disposal fluctuate based upon numerous factors, e.g., the economy, waste diversion programs such as the implementation of island-wide recycling, possible disaster events, etc.

[4] See Opala.org, Recycling and Landfill Diversion, http://www.opala.org/solid_waste/archive/facts2.html.

[5] For example, the Department of Environmental Services is expanding its H-POWER plant with a third boiler, which is expected to increase the facility's capacity by an additional 300,000 tons of MSW per year by late 2011 or early 2012. See 2009 Planning Commission Decision, ¶ 100, pg. 20; see also Dec. Steinberger, ¶ 23. The Department of Environmental Services also completed full implementation of its island-wide, curbside recycling program in May 2010, which is in addition to its program of community recycling bins. Dec. Steinberger, ¶ 23. A facility at the City's Sand Island Wastewater Treatment Plant turns bio-solids into fertilizer pellets, so that such material may be reused as a soil amendment product. Id. The Department of Environmental Services' other initiatives include awarding a contract for a new recycling facility that will accept green waste, food waste and sewage sludge. Id.

disaster, to properly dispose of special wastes such as screenings and sludge from sewage treatment plants, animal carcasses, tank bottom sludge, contaminated food waste that cannot be recycled, and contaminated soil that is below certain toxicity levels ("special wastes") and bulky wastes, and because there is waste material that cannot be combusted, recycled, reused, or shipped.[6] See 2009 Planning Commission Decision, ¶ 92, 97, pgs. 18-19.

The City remains committed to adopting and implementing waste handling programs that will reduce O'ahu's dependency on landfilling. Dec. Steinberger, ¶ 23. The fact remains, however, that there are no methods or technologies that will completely eliminate the need for landfilling. See 2008 FEIS, Appendix K, Alternatives Analysis, 2008. If WGSL is forced to cease accepting MSW for disposal on July 31, 2012, then there will be no permitted landfill to serve O'ahu's municipal solid waste disposal needs, and this could have significant public health and safety implications for the residents and visitors of this island. See 2008 FEIS at Section 9.3., No Action Alternative, pgs. 9-6 to 9-8.

B. WGSL Remains an Integral Part of the City's Solid Waste Management System.

The Landfill is a critical component of the City's solid waste management system and the final destination for certain solid wastes including MSW, recycling residue, and H-POWER generated ash, residue and waste that cannot further be combusted, recycled or reused. See 2009 Planning Commission Decision, ¶¶ 92, 95, 97, pgs. 18-19. If SUP No. 2008/SUP-2 is not amended by deleting Condition No. 14 of the 2009 LUC Decision, the Landfill will be forced to stop accepting MSW as of July 31, 2012, and special wastes, bulky wastes and waste material that cannot be combusted, recycled, reused, or shipped, will have nowhere to go for proper disposal. See 2009 Planning Commission Decision, ¶¶ 92, 97, pgs. 18-19; 2008 FEIS at Section 9.3., No Action Alternative, pgs. 9-6 to 9-8; see also Dec. Steinberger, ¶ 24. This stoppage will have an adverse, island-wide impact on all of the communities on O'ahu because the City will no longer have the ability to dispose of certain wastes in a sanitary manner. Id. The City would also no longer be permitted to operate H-POWER, as that facility must have a MSW landfill disposal option as required by its DOH solid waste permit. See 2009 Planning Commission Decision, ¶ 92, pg. 18; see also Dec. Steinberger, ¶ 24. Furthermore, in the event of a disaster such as a hurricane or a tsunami, the City would have no permitted site to dispose of the ensuing debris. Id. In other words, not only would there be no sanitary or secure means of disposing of special wastes and bulky wastes, H-POWER would no longer be permitted to accept any MSW and there would be no facility to properly dispose of disaster debris. Dec. Steinberger, ¶ 24. Therefore, forcing the Landfill to cease accepting MSW will likely result in major public

---

[6] As explained in part 2 herein, off-island shipment of MSW is not a viable option.

health and safety problems for the City, its residents and visitors, and the State of Hawai'i. See 2009 Planning Commission Decision, ¶ 93, pg. 18.

1. WGSL Remains Necessary Even with an Expanded H-POWER.

Although most municipal waste is currently directed to the H-POWER facility, H-POWER does not have the capacity, or ability, to accept all of Oahu's refuse. See 2009 Planning Commission Decision, ¶ 97, pg. 19. WGSL also remains necessary in order to dispose of disaster debris, bulky wastes and special wastes. Id.; see also ¶ 92, pg. 18. Further, as discussed previously, the DOH solid waste permit for H-POWER requires that a landfill disposal option for MSW be available. Id. at ¶ 92, pg. 18.

The recent closure of WGSL from January 12 to January 28, 2011, due to unprecedented storms in December 2010 and in January 2011, has served to highlight the need for a landfill. During that seventeen-day closure period, there were delays in the disposal of H-POWER residue, bulky item waste, and wastewater sludge. All such wastes cannot be disposed of at H-POWER and must be disposed of in the Landfill. The closure of WGSL greatly impacted the disposal of H-POWER residue, bulky item waste, and wastewater sludge, all of which cannot be disposed of at H-POWER and must be disposed of at WGSL, the only permitted facility on O'ahu to accept these types of waste. The closure of WGSL also hampered H-POWER's ability to accept MSW because of the backlog of residue that accumulated at the facility. City refuse transfer stations that depend on H-POWER for waste disposal were also adversely impacted and experienced heavy buildups of trash. City wastewater treatment facilities resorted to temporary on-site storage of sewage sludge to cope with the situation. Further, the Department of Environmental Services ceased collection of bulky item wastes, resulting in unsightly piles of waste in many neighborhoods across the island. Generators of other special wastes that are normally disposed of at WGSL had to make their own arrangements to store or otherwise dispose of their waste until the Landfill could be reopened. The closure of WGSL had far reaching impacts upon the City's ability to dispose of solid waste, with restrictions imposed at all six of the City's convenience centers, as well as at its three transfer stations. On April 13, 2011, the WGSL and all City refuse facilities resumed normal operations and were opened to the public. See Dec. Steinberger, ¶ 25.

By 2012, when H-POWER's third boiler is expected to be fully operational, the City anticipates that about eighty percent (80%) of the island's waste stream will be diverted from landfill disposal. See 2009 Planning Commission Decision, ¶ 101, pg. 20. Twenty percent (20%), however, of O'ahu's waste will still need to be landfilled at WGSL, as certain wastes cannot be recycled or combusted. Id., see also ¶¶ 92, 97, pgs. 18-19. Further, the expanded H-POWER facility will still require the continued availability of WGSL as a permit condition to operate, to ensure proper disposal of MSW that is diverted from H-POWER due to routine maintenance, unanticipated closures or if the amount of waste exceeds the capacity of the facility. Id. at ¶ 92, pg. 18; Dec. Steinberger, ¶ 24.

2. Transshipment of solid waste off-island is no longer a viable alternative.

The off-island shipment of O'ahu's solid waste is no longer a viable alternative, not even for the short term. The City did attempt to ship waste to the mainland but only as an interim solid waste disposal alternative until the H-POWER facility was expanded with the addition of a third boiler. See Planning Commission Transcript dated 07/01/09 at 198:23-199:4; see also Dec. Steinberger, ¶ 26. However, this attempt was not successful and shipping is now precluded by a court imposed injunction on the shipping of waste from Hawai'i to Washington and Oregon via the Columbia River. Dec. Steinberger, ¶ 26.

In January 2008, the City issued an Invitation for Bids ("IFB") for the baling, shipping, offloading, transporting and disposing (transshipment) of City-provided MSW to a U.S. Mainland landfill for a term of at least 36 months. The City received and opened three bids on June 17, 2008. Following the bid opening, the two highest bidders filed a total of four procurement protests, disputing for various reasons the adequacy of the apparent low bid. These protests were resolved after several months, with all the protests ultimately being denied, and no appeals being taken of those denials. See Dec. Steinberger, ¶ 27.

Pursuant to the requirements of the State Procurement Code, the City was prohibited from taking any actions toward the award of a contract during the pendency of the protests. With the protests resolved, the City reviewed the apparent low bid submitted by Hawaiian Waste Systems, LLC ("HWS"), and eventually the City's Chief Procurement Officer issued a determination that the low bid was not responsive to the requirements of the IFB. Pursuant to the State Procurement Code, HWS appealed this determination to the Office of Administrative Hearings at the Department of Commerce and Consumer Affairs ("DCCA"). See Dec. Steinberger, ¶ 28.

Following a hearing at DCCA, and prior to the deadline for the Hearings Officer to issue a decision on the appeal, the City and HWS agreed to settle the procurement protest. The settlement was confirmed in an Order approved by the Hearings Officer. Id. Pursuant to the Settlement and Order, the contract for interim shipment of MSW was awarded to HWS on August 27, 2009. The commencement of services under the contract was to begin by the end of September 2009. The City issued a Notice to Proceed to HWS for September 25, 2009. Both parties agreed that delivery of MSW would start on September 28, 2009. See Dec. Steinberger, ¶ 29.

HWS asked the City to cease delivering waste on April 1, 2010. At that point, approximately 20,000 tons of MSW had been delivered to HWS, which baled, wrapped and stockpiled the MSW at three locations, and no waste had been shipped due to HWS' inability to obtain required permits for the contracted services. See Dec. Steinberger, ¶ 30.

The environmental assessment for HWS' revised plan to ship the baled waste to different ports (Longview, WA; Rainier, OR; and Portland, OR)[7] was posted on the Federal Register on January 19, 2010 and the closing date for comments was February 18, 2010. On May, 27, 2010 the United States Department of Agriculture ("USDA") concluded their responses to public comments and published a Finding of No Significant Impact ("FONSI"). The required Compliance Agreements were issued in June 2010. See Dec. Steinberger, ¶ 31.

On July 8, 2010, the USDA issued a Notification of Suspension of Operations Pursuant to Compliance Agreement No. Oahu RGOO2 to HWS. Dec. Steinberger, ¶ 32. On August 30, 2010, the United States District Court, Eastern District of Washington issued an injunction enjoining the shipment of waste from Hawaii to Washington or Oregon ports on the Columbia River and/or to the Roosevelt Landfill in Washington in Confederated Tribes and Bands of the Yakama Nation, et al., v. United States Department of Agriculture, et al., No. CV-10-3050-EFS, attached hereto and incorporated herein as Exhibit "P." The USDA has canceled the Compliance Agreement permits of all Hawaii shippers that might otherwise have enabled the shipment of waste to the mainland. As of the filing of this Application, the Yakama Nation lawsuit remains active and the injunction continues in effect. See Dec. Steinberger, ¶ 32.

Accordingly, no waste was ever shipped to the mainland due to various problems encountered by HWS. In order to properly dispose of the approximately 20,000 tons of baled MSW, HWS agreed to disassemble the bales, sort the waste and take the burnable waste to H-POWER and the non-burnable waste to the Waimanalo Gulch Landfill. As of January 2011, approximately 11,000 tons had been taken to H-POWER and 140 tons had been taken to WGSL. See Dec. Steinberger, ¶ 33.

On January 6, 2011, there was a fire at the HWS facility that damaged the building in which the waste bales were disassembled. Because HWS' solid waste permit requires the waste to be processed under cover, without the use of the building, HWS' breaking apart and sorting of the waste for disposal at H-POWER and WGSL had to be suspended. Thereafter, the City and HWS continued to work together, in collaboration with DOH, to dispose of the remaining tons of baled waste. On May 12, 2011, the last bale of waste at the HWS facility

---

[7] The original environmental assessment reviewed HWS' originally proposed port located in Roosevelt, WA. Dec. Steinberger, ¶ 31.

was removed and delivered to a City waste disposal facility. Of the original 20,000 tons in its possession, HWS delivered 14,779 tons to H-POWER (76%) and 4,565 (24%) tons to WGSL. HWS was able to extract and recycle 1,525 tons of metal. See Dec. Steinberger, ¶ 34.

Accordingly, because WGSL is the only currently permitted landfill available to serve O'ahu's municipal solid waste needs, it is also the City's best and only viable option for disposal of certain wastes. See 2009 Planning Commission Decision, ¶¶ 92, 94, 97, pgs. 18-19. Requiring the landfill to stop accepting MSW on July 31, 2012, will have immediate and dire consequences for all of O'ahu. 2009 Planning Commission Decision, ¶ 93, pg. 18; see also 2008 FEIS at Section 9.3., No Action Alternative at pgs. 9-6 to 9-8.

C. Additional Time Is Needed To Identify One or More New Landfill Sites That Shall Either Replace Or Supplement WGSL.

Condition No. 1 of the 2009 Planning Commission Decision, which was adopted in most part by the LUC as Condition No. 4 of the 2009 LUC Decision,[8] provides:

> On or before November 1, 2010, the Applicant shall begin to identify and develop one or more new landfill sites that shall either replace or supplement the WGSL. The Applicant's effort to identify and develop such sites shall be performed with reasonable diligence, and the Honolulu City Council is encouraged to work cooperatively with the Applicant's efforts to select a new landfill site on Oahu. Upon the selection of a new landfill site or sites on Oahu, the Applicant shall provide written notice to the Planning Commission. After receipt of such written notice, the Planning Commission shall hold a pubic hearing to reevaluate 2008/SUP-2 (SP09-403) and shall determine whether modification or revocation of 2008/SUP-2 (SP09-403) is appropriate at that time.

2009 Planning Commission Decision, pg. 25.

Funding for the new landfill site selection process was appropriated in the City's Fiscal Year (FY) 2010 budget with additional funds appropriated in FY 2011. In November 2009, the Department of Environmental Services began the process to allot appropriated funds for a procurement to contract a consultant to facilitate the landfill site selection process. On June 25, 2010, the City contracted with the R.M. Towill Corporation,

---

[8] Condition No. 1 of the 2009 Planning Commission Decision is identical to Condition No. 4 of the 2009 LUC Decision except that Condition No. 4 included the added requirement that the "Planning Commission shall make a recommendation to the Land Use Commission." 2009 LUC Decision,
pg. 6.

specifically to assist the Mayor's Landfill Site Selection Advisory Committee ("Landfill Advisory Committee"). The Landfill Advisory Committee is charged by the Mayor to provide advisory recommendations to the City concerning the selection of a future site or sites for a landfill to accept MSW, ash and residue from the City's H-POWER waste-to-energy facility, and construction and demolition debris waste. The procedure involving the use of an advisory committee to assist in landfill site selection was set forth in the City's Integrated Solid Waste Management Plan (October 2008). The Mayor chose 12 members to serve on the Landfill Advisory Committee based upon numerous criteria including technical expertise and experience, community involvement, and availability to serve. See Dec. Steinberger, ¶¶ 35, 36.

The members of the Landfill Advisory Committee are: Bruce Anderson, David Arakawa, Thomas Arizumi, David Cooper, John DeSoto, John Goody, Joe Lapilio, Tesha H. Malama, Janice Marsters, Richard Poirier, Chuck Prentiss, and George West. Due to various personal reasons, however, Bruce Anderson, David Cooper and John DeSoto have since resigned from the committee. See Dec. Steinberger, ¶ 36.

The first meeting of the Landfill Advisory Committee was held on January 20, 2011, and subsequent meetings were held on February 10, March 10, March 31, and May 12, 2011. The next tentatively scheduled meetings are June 23 and July 19, 2011. Additional meetings may be scheduled as needed by the Landfill Advisory Committee. Barring unforeseen delays, the Landfill Advisory Committee's final report is expected to be completed and sent to the Mayor by October 2011. All Committee meetings are open to the public and to public comment. Handouts provided to the Landfill Advisory Committee as well as the Group Memory of each meeting are posted online at opala.org. See Dec. Steinberger, ¶ 37.

Once a site or sites are identified by the Landfill Advisory Committee, as acknowledged in both the 2009 Planning Commission Decision and the 2009 LUC Decision, it will take more than seven years to acquire, permit, design and construct the new landfill site(s). See 2009 Planning Commission Decision, ¶¶ 33, 34; see also 2009 LUC Decision at pgs. 4-5. As noted, the work of the Landfill Advisory Committee is anticipated to be concluded within the third quarter of 2011; the Department of Environmental Services must then continue on with various additional steps, anticipated to require a number of years to complete. Dec. Steinberger, ¶ 38. These tasks include, but are not limited to, the following:

1. Hawai‘i Revised Statutes (“HRS”) Chapter 343, Environmental Impact Statement (“EIS”)

The preparation and processing of an EIS in full compliance with HRS Chapter 343 and related administrative rules for O‘ahu’s next landfill site or sites to replace or supplement WGSL must satisfy all necessary requirements, including but not limited to conducting site surveys and investigations, analyzing alternatives including alternative sites and technologies, obtaining public and governmental agency input, analyzing direct, secondary, and cumulative impacts, developing appropriate mitigation measures, and ensuring the opportunity for public participation and comments. Dec. Steinberger, ¶ 39.

The EIS process will include among other things the filing of three principal documents with the Office of Environmental Quality Control, State of Hawaii (“OEQC”): (1) a Final Environmental Assessment/EIS Preparation Notice (“FEA/EISPN”), which upon publication will invoke a mandatory thirty (30) day public comment period; (2) a Draft EIS that will incorporate and address all relevant public comments that are received in response to the FEA/EISPN; the publication of the Draft EIS, which will invoke a mandatory forty-five (45) day public comment period; and (3) the acceptance of the Final EIS that will incorporate and address all relevant public comments received in response to the Draft EIS. Id.

The Department of Environmental Services fully expects that because of the inherent difficulty in identifying a new landfill site or sites for O‘ahu, extensive environmental documentation will likely be required before the Final EIS for said site(s) can be completed. For example, the 2008 FEIS for WGSL was delayed by approximately one year in order to complete the requisite environmental documentation mandated by HRS Chapter 343.[9]

Based upon the prior experience with the 2008 FEIS, the Department of Environmental Services estimates that the time needed to complete an EIS for the new landfill site(s) is between one and two years, provided that there are no legal challenges. Id. Any legal challenges will only lengthen the time needed to complete an EIS. Id.

---

[9] Examples of additional environmental disclosure documentation that was required for the 2008 FEIS included: (1) the discovery of three stone uprights that required archaeological investigation and coordination with the State Historic Preservation Division and cultural informants; and (2) the commissioning of an Invertebrate Survey for the 2008 FEIS. Dec. Steinberger, ¶ 39; see also 2007 Application.

2. Acquisition of the Selected Landfill Site(s)

This task is dependent upon the alternative landfill site(s) that is selected. If the site(s) is not presently owned by the City, the land acquisition process could be lengthy. If the City must acquire new land, a summary of the process is as follows: an appraisal of the land value; a determination by the City regarding the funding source for the acquisition; and approval for the expenditure of public funds by the Honolulu City Council. See Dec. Steinberger, ¶ 40.

Moreover, if the City does not own the property and the landowner is unwilling to sell the property to the City, a condemnation process could ensue. This process is expected to be lengthy and would likely involve litigation. Id.

For these reasons, it is difficult for the Department of Environmental Services to estimate the length of time required to acquire a new landfill site(s). For the purposes of this Application, however, an approximate estimate of time is one to three years. Id.

3. Detailed Engineering Studies, Construction and Bid Documents, and Other Approvals

Following the completion of the EIS process and the acquisition of the site(s), detailed engineering studies will need to be completed to support the landfill design. These studies will include, but are not limited to: land surveys; geotechnical soils and structural investigations; hydrology and hydrogeological investigations. The completion of these studies is required so that the landfill construction drawings can incorporate civil design requirements, such as the provision of drainage, access roadways, and infrastructure, to support the use of the site. Coordination with governmental agencies, utilities, and adjoining landowners, consistent with mitigation measures identified in the EIS, will also be required to minimize disturbance to nearby property owners and utilities. See Dec. Steinberger, ¶ 41.

The length of time required for the completion of detailed engineering studies, construction drawings and bid documents, and the processing of procurements for the design and construction contractors (which could include the selection of a qualified landfill operator), as well as the acquisition of building permits, land use approvals such as a SUP or district boundary amendment, depending on where the site(s) is located, and other necessary approvals, is estimated to be between one and three years. Id.

Based on the foregoing, no new landfill site or sites intended to replace or supplement WGSL will be operational as of the July 31, 2012, deadline to cease accepting

MSW at WGSL as imposed by Condition No. 14 of the 2009 LUC Decision. See 2009 Planning Commission Decision, ¶ 34, pg. 8; see also Dec. Steinberger, ¶ 42.

III. CONCLUSION

In accordance with the foregoing, the Applicant requests that the Planning Commission modify SUP No. 2008/SUP-2 by deleting Condition No. 14 of the 2009 LUC Decision to enable WGSL to continue accepting MSW until the Landfill reaches its permitted capacity as provided in the 2009 Planning Commission Decision.

For all the foregoing reasons, the Department of Environmental Services respectfully requests that the Planning Commission grant this application.

Sincerely,

Timothy E. Steinberger, P.E.
Director

NOTARY CERTIFICATION

DECLARATION OF TIMOTHY E. STEINBERGER

I, TIMOTHY E. STEINBERGER, hereby declare as follows:

1. I am the Director for the Department of Environmental Services.

2. I make this declaration based upon personal knowledge in support the Application to Modify State Special Use Permit ("SUP") No. 2008/SUP-2 by modifying the State of Hawaii Land Use Commission's (the "LUC's") Order Adopting the City and County of Honolulu Planning Commission's Findings of Fact, Conclusions of Law, and Decision and Order with Modifications, dated October 22, 2009, by deleting the July 31, 2012, deadline to cease disposal of municipal solid waste ("MSW") at the Waimanalo Gulch Sanitary Landfill ("WGSL" or "Landfill"), as set forth in Condition No. 14 of said Order.

3. Attached hereto as Exhibit "A" is a true and correct copy of relevant portions of Appellee State of Hawaii Land Use Commission's Answering Brief to the Circuit Court of the First Circuit, filed on April 12, 2010, In the Matter of Department of Environmental Services, City and County of Honolulu vs. Land Use Commission, State of Hawaii, et al., Civil No. 09-1-2719-11.

4. Attached hereto as Exhibit "B" is a true and correct CD copy of the *Final Environmental Impact Statement, Waimanalo Gulch Sanitary Landfill Lateral Expansion, Waimanalo Gulch, Oahu, Hawaii, TMKs: (1) 9-2-003: 072 and 073*, dated October 2008.

5. Attached hereto as Exhibit "C" is a true and correct copy of the LUC's Findings of Fact, Conclusions of Law and Decision and Order issued April 20, 1987.

6. Attached hereto as Exhibit "D" is a true and correct copy of the LUC's Findings of Fact, Conclusions of Law and Decision and Order issued on October 31, 1989.

7. Attached hereto as Exhibit "E" is a true and correct copy of the Planning Commission's Findings of Fact, Conclusions and Decision dated March 13, 2003 (the "2003 Planning Commission Decision").

8. Attached hereto as Exhibit "F" is a true and correct copy of the LUC's Decision and Order Approving Amendment to Special Use Permit issued June 9, 2003 (the "2003 LUC Decision").

9. Attached hereto as Exhibit "G" is a true and correct copy of Resolution No. 04-348, CD 1, FD 1, adopted by the Honolulu City Council on December 1, 2004.

10. Attached hereto as Exhibit "H" is a true and correct copy of State Special Use Permit (SUP) No. 86/SUP-5, In re Department of Environmental Services, City and County of Honolulu (FKA Department of Public Works, City and County of Honolulu); Application to Modify (1) the Findings of Fact, Conclusions and Decision dated March 13, 2003, and (2) the Decision and Order Approving Amendment to Special Use Permit Issued June 9, 2003, filed with the Department of Planning and Permitting on July 6, 2007, without accompanying exhibits ("2007 Application").

11. Attached hereto as Exhibit "I" is a true and correct copy of the Planning Commission's Findings of Fact, Conclusions of Law, and Decision and Order dated January 16, 2008 (the "2008 Planning Commission Decision").

12. Attached hereto as Exhibit "J" is a true and correct copy of the LUC's Findings of Fact, Conclusions of Law, and Decision and Order adopting with

Modifications, the City and County of Honolulu Planning Commission's Recommendation to Approve Amendment to Special Use Permit, dated March 14, 2008 (the "2008 LUC Decision").

13. Attached hereto as Exhibit "K" is a true and correct copy of the Planning Commission's Findings of Fact, Conclusions of Law, and Decision and Order dated August 4, 2009 ("2009 Planning Commission Decision").

14. Attached hereto as Exhibit "L" is a true and correct copy of relevant portions of the transcript of the July 31, 2009, decision-making hearing of the Planning Commission.

15. Attached hereto as Exhibit "M" is a true and correct copy of the LUC's Order Adopting the City and County of Honolulu Planning Commission's Findings of Fact, Conclusions of Law, and Decision and Order with Modifications, dated October 22, 2009 ("2009 LUC Decision").

16. Attached hereto as Exhibit "N" is a true and correct copy of the Circuit Court of the First Circuit's Order Affirming Land Use Commission's Order Adopting the City and County of Honolulu Planning Commission's Findings of Fact, Conclusions of Law and Decision and Order Dated October 22, 2009 with Modifications, dated September 21, 2010 ("Circuit Court Order").

17. Attached hereto as Exhibit "O" is the State of Hawai'i, Department of Health Solid Waste Management Permit No. LF-0182-09, issued on June 4, 2010

18. Attached hereto as Exhibit "P" is a true and correct copy of the United States District Court, Eastern District of Washington's order granting an injunction to enjoin the shipment of waste from Hawaii to Washington or Oregon ports on the

Columbia River and/or to the Roosevelt Landfill in Washington in Confederated Tribes and Bands of the Yakama Nation, et al., v. United States Department of Agriculture, et al., No. CV-10-3050-EFS, dated August 30, 2010.

19. On June 4, 2010, the State of Hawai'i, Department of Health ("DOH") issued Solid Waste Management Permit No. LF-0182-09, which encompasses the Landfill's current footprint, which consists of approximately 200 acres. That DOH permit states that WGSL "may accept MSW and ash for disposal until the date specified in the associated Special Use Permit or until the landfill/monofill reaches its permitted capacity, whichever comes first."

20. On November 19, 2009, in relation to the 2009 LUC Decision, the Department of Environmental Services filed its Notice of Appeal; Statement of the Case; Designation of Record on Appeal; Order for Certification and Transmission of Record; Exhibits "A" and "B" to the Circuit Court of the First Circuit ("Circuit Court"). Specifically, the Department of Environmental Services appealed the LUC's imposition of a July 31, 2012, deadline to cease the disposal of MSW at WGSL, as set forth in Condition No. 14 of the 2009 LUC Decision, as arbitrary and capricious, characterized by abuse of discretion and a clearly unwarranted exercise of discretion in light of the record developed before the Planning Commission. The Department of Environmental Services further appealed the LUC's imposition of reporting requirements, as set forth in Condition Nos. 15 and 16 of the 2009 LUC Decision, as in excess of the statutory authority and jurisdiction of the LUC. Oral arguments were held before the Honorable Judge Rhonda A. Nishimura of the Circuit Court on July 14, 2010. On September 21, 2010, the Circuit Court issued its Order Affirming Land Use Commission's Order

Adopting the City and County of Honolulu Planning Commission's Findings of Fact, Conclusions of Law and Decision and Order Dated October 22, 2009 with Modifications. Said Order modified Conditions No. 15 and 16 of the 2009 LUC Decision by deleting the references to the Honolulu City Council and the City administration, and substituting the same with the Department of Environmental Services. The Order also erroneously affirmed Condition No. 14 of the 2009 LUC Decision. Final Judgment was filed on October 19, 2010, and the Notice of Entry of Judgment was filed on October 21, 2010.

21. On November 12, 2010, the Department of Environmental Services timely filed its Notice of Appeal and Civil Appeals Docketing Statement to the Intermediate Court of Appeals ("ICA") relating to that portion of the Circuit Court's Order which wrongly affirmed the LUC's arbitrary and unsupported deadline of July 31, 2012, to cease acceptance of MSW at WGSL. The Department of Environmental Services filed its Opening Brief to the ICA on February 15, 2011. Briefing is not yet concluded and the case remains pending before the ICA.

22. The current permitted area of the Landfill, which is approximately 200 acres, has the capacity to continue to accept MSW well beyond the July 31, 2012, deadline to cease accepting MSW at WGSL imposed by the 2009 LUC decision. Based upon typical rates of disposal at WGSL, the remaining capacity in the permitted area is estimated to be approximately fifteen years. The remaining capacity of WGSL is an estimate only as rates of disposal fluctuate based upon numerous factors, <u>e.g.</u>, the economy, waste diversion programs, such as the implementation of island-wide recycling, possible disaster events, etc.

23. The Department of Environmental Services has been actively reducing waste volumes that are directed to WGSL through its various waste diversion programs. For example, the Department of Environmental Services is expanding its H-POWER plant with a third boiler, which is expected to increase the facility's capacity by an additional 300,000 tons of MSW per year by late 2011 or early 2012. The Department of Environmental Services also completed full implementation of its island-wide, curbside recycling program in May 2010, which is in addition to its program of community recycling bins. A facility at the City's Sand Island Wastewater Treatment Plant turns bio-solids into fertilizer pellets, so that such material may be reused as a soil amendment product. The Department of Environmental Services' other initiatives include awarding a contract for a new recycling facility that will accept green waste, food waste and sewage sludge. The City remains committed to adopting and implementing waste handling programs that will reduce O'ahu's dependency on landfilling.

24. If SUP No. 2008/SUP-2 is not amended by deleting Condition No. 14 of the 2009 LUC Decision, the Landfill will be forced to stop accepting MSW as of July 31, 2012, and special wastes, bulky wastes and waste material that cannot be combusted, recycled, reused, or shipped, will have nowhere to go for proper disposal. This stoppage will have an adverse, island-wide impact on all of the communities on O'ahu because the City will no longer have the ability to dispose of certain wastes in a sanitary manner. The City would also no longer be permitted to operate H-POWER, as that facility must have a MSW landfill disposal option as required by its DOH solid waste permit. Furthermore, in the event of a disaster such as a hurricane or a tsunami, the City would have no permitted site to dispose of the ensuing debris. In other words, not

only would there be no sanitary or secure means of disposing of special wastes and bulky wastes, H-POWER would no longer be permitted to accept any MSW and there would be no facility to properly dispose of disaster debris. Further, even when the H-POWER facility is expanded, it will still require the continued availability of WGSL as a permit condition to operate, to ensure proper disposal of MSW that is diverted from H-POWER due to routine maintenance, unanticipated closures or if the amount of waste exceeds the capacity of the facility.

25. The recent closure of WGSL from January 12 to January 28, 2011, due to unprecedented storms in December 2010 and in January 2011, has served to highlight the need for a landfill. During that seventeen-day closure period, there were delays in the disposal of H-POWER residue, bulky item waste, and wastewater sludge. All such wastes cannot be disposed of at H-POWER and must be disposed of in the Landfill. The closure of WGSL greatly impacted the disposal of H-POWER residue, bulky item waste, and wastewater sludge, all of which cannot be disposed of at H-POWER and must be disposed of at WGSL, the only permitted facility on O‘ahu to accept these types of waste. The closure of WGSL also hampered H-POWER's ability to accept MSW because of the backlog of residue that accumulated at the facility. City refuse transfer stations that depend on H-POWER for waste disposal were also adversely impacted and experienced heavy buildups of trash. City wastewater treatment facilities resorted to temporary on-site storage of sewage sludge to cope with the situation. Further, the Department of Environmental Services ceased collection of bulky item wastes, resulting in unsightly piles of waste in many neighborhoods across the island. Generators of other special wastes that are normally disposed of at WGSL had to make their own

arrangements to store or otherwise dispose of their waste until the Landfill could be reopened. The closure of WGSL had far reaching impacts upon the City's ability to dispose of solid waste, with restrictions imposed at all six of the City's convenience centers, as well as at its three transfer stations. On April 13, 2011, the WGSL and all City refuse facilities resumed normal operations and were opened to the public.

26. The off-island shipment of O'ahu's solid waste is no longer a viable alternative, not even for the short term. The City did attempt to ship waste to the mainland but only as an interim solid waste disposal alternative until the H-POWER facility was expanded with the addition of a third boiler. However, this attempt was not successful and shipping is now precluded by a court imposed injunction on the shipping of waste from Hawai'i to Washington and Oregon via the Columbia River.

27. In January 2008, the City issued an Invitation for Bids ("IFB") for the baling, shipping, offloading, transporting and disposing (transshipment) of City-provided MSW to a U.S. Mainland landfill for a term of at least 36 months. The City received and opened three bids on June 17, 2008. Following the bid opening, the two highest bidders filed a total of four procurement protests, disputing for various reasons the adequacy of the apparent low bid. These protests were resolved after several months, with all the protests ultimately being denied, and no appeals being taken of those denials.

28. Pursuant to the requirements of the State Procurement Code, the City was prohibited from taking any actions toward the award of a contract during the pendency of the protests. With the protests resolved, the City reviewed the apparent low bid submitted by Hawaiian Waste Systems, LLC ("HWS"), and eventually the City's Chief

Procurement Officer issued a determination that the low bid was not responsive to the requirements of the IFB. Pursuant to the State Procurement Code, HWS appealed this determination to the Office of Administrative Hearings at the Department of Commerce and Consumer Affairs ("DCCA").

29. Following a hearing at DCCA, and prior to the deadline for the Hearings Officer to issue a decision on the appeal, the City and HWS agreed to settle the procurement protest. The settlement was confirmed in an Order approved by the Hearings Officer. Pursuant to the Settlement and Order, the contract for interim shipment of MSW was awarded to HWS on August 27, 2009. The commencement of services under the contract was to begin by the end of September 2009. The City issued a Notice to Proceed to HWS for September 25, 2009. Both parties agreed that delivery of MSW would start on September 28, 2009.

30. HWS asked the City to cease delivering waste on April 1, 2010. At that point, approximately 20,000 tons of MSW had been delivered to HWS, which baled, wrapped and stockpiled the MSW at three locations, and no waste had been shipped due to HWS' inability to obtain required permits for the contracted services.

31. Originally, HWS' proposed port on the U.S. mainland was located in Roosevelt, WA. HWS submitted a revised plan to ship baled waste to different ports (Longview, WA; Rainier, OR; and Portland, OR) and the environmental assessment for HWS' revised plan was posted on the Federal Register on January 19, 2010, and the closing date for comments was February 18, 2010. On May, 27, 2010 the United States Department of Agriculture ("USDA") concluded their responses to public comments and

published a Finding of No Significant Impact ("FONSI"). The required Compliance Agreements were issued in June 2010.

32. On July 8, 2010, the USDA issued a Notification of Suspension of Operations Pursuant to Compliance Agreement No. Oahu RGOO2 to HWS. On August 30, 2010, the United States District Court, Eastern District of Washington issued an injunction enjoining the shipment of waste from Hawaii to Washington or Oregon ports on the Columbia River and/or to the Roosevelt Landfill in Washington in Confederated Tribes and Bands of the Yakama Nation, et al., v. United States Department of Agriculture, et al., No. CV-10-3050-EFS. The USDA has canceled the Compliance Agreement permits of all Hawaii shippers that might otherwise have enabled the shipment of waste to the mainland. As of the filing of this Application, the Yakama Nation lawsuit remains active and the injunction continues in effect.

33. Accordingly, no waste was ever shipped to the mainland due to various problems encountered by HWS. In order to properly dispose of the approximately 20,000 tons of baled MSW, HWS agreed to disassemble the bales, sort the waste and take the burnable waste to H-POWER and the non-burnable waste to the Waimanalo Gulch Landfill. As of January 2011, approximately 11,000 tons had been taken to H-POWER and 140 tons had been taken to WGSL.

34. On January 6, 2011, there was a fire at the HWS facility that damaged the building in which the waste bales were disassembled. Because HWS' solid waste permit requires the waste to be processed under cover, without the use of the building, HWS' breaking apart and sorting of the waste for disposal at H-POWER and WGSL had to be suspended. Thereafter, the City and HWS continued to work together, in

collaboration with DOH, to dispose of the remaining tons of baled waste. On May 12, 2011, the last bale of waste at the HWS facility was removed and delivered to a City waste disposal facility. Of the original 20,000 tons in its possession, HWS delivered 14,779 tons to H-POWER (76%) and 4,565 (24%) tons to WGSL. HWS was able to extract and recycle 1,525 tons of metal.

35. As required by Condition No. 1 of the 2009 Planning Commission Decision and Condition No. 4 of the 2009 LUC Decision, the Department of Environmental Services is diligently working towards identifying one or more new landfill sites that shall either replace or supplement the WGSL. Funding for the new landfill site selection process was appropriated in the City's Fiscal Year (FY) 2010 budget with additional funds appropriated in FY 2011. In November 2009, the Department of Environmental Services began the process to allot appropriated funds for a procurement to contract a consultant to facilitate the landfill site selection process. On June 25, 2010, the City contracted with the R.M. Towill Corporation, specifically to assist the Mayor's Landfill Site Selection Advisory Committee ("Landfill Advisory Committee").

36. The Landfill Advisory Committee is charged by the Mayor to provide advisory recommendations to the City concerning the selection of a future site or sites for a landfill to accept MSW, ash and residue from the City's H-POWER waste-to-energy facility, and construction and demolition debris waste. The procedure involving the use of an advisory committee to assist in landfill site selection was set forth in the City's Integrated Solid Waste Management Plan (October 2008). The Mayor chose 12 members to serve on the Landfill Advisory Committee based upon numerous criteria including technical expertise and experience, community involvement, and availability to

serve. The members of the Landfill Advisory Committee are: Bruce Anderson, David Arakawa, Thomas Arizumi, David Cooper, John DeSoto, John Goody, Joe Lapilio, Tesha H. Malama, Janice Marsters, Richard Poirier, Chuck Prentiss, and George West. Due to various personal reasons, however, Bruce Anderson, David Cooper and John DeSoto have since resigned from the committee.

37. The first meeting of the Landfill Advisory Committee was held on January 20, 2011, and subsequent meetings were held on February 10, March 10, March 31, and May 12, 2011. The next tentatively scheduled meetings are June 23 and July 19, 2011. Additional meetings may be scheduled as needed by the Landfill Advisory Committee. Barring unforeseen delays, the Landfill Advisory Committee's final report is expected to be completed and sent to the Mayor by October 2011. All Committee meetings are open to the public and to public comment. Handouts provided to the Landfill Advisory Committee as well as the Group Memory of each meeting are posted online at opala.org.

38. Once a site or sites are identified by the Landfill Advisory Committee, it will take more than seven years to acquire, permit, design and construct the new landfill site(s). As noted, the work of the Landfill Advisory Committee is anticipated to be concluded within the third quarter of 2011; the Department of Environmental Services must then undertake various additional steps, anticipated to require a number of years to complete.

39. The preparation and processing of an Environmental Impact Statement ("EIS") in full compliance with Hawai'i Revised Statutes ("HRS") Chapter 343 and related administrative rules for O'ahu's next landfill site or sites to replace or supplement

WGSL must satisfy all necessary requirements, including but not limited to conducting site surveys and investigations, analyzing alternatives including alternative sites and technologies, obtaining public and governmental agency input, analyzing direct, secondary, and cumulative impacts, developing appropriate mitigation measures, and ensuring the opportunity for public participation and comments. The EIS process will include among other things the filing of three principal documents with the Office of Environmental Quality Control, State of Hawaii ("OEQC"): (1) a Final Environmental Assessment/EIS Preparation Notice ("FEA/EISPN"), which upon publication will invoke a mandatory thirty (30) day public comment period; (2) a Draft EIS that will incorporate and address all relevant public comments that are received in response to the FEA/EISPN; the publication of the Draft EIS, which will invoke a mandatory forty-five (45) day public comment period; and (3) the acceptance of the Final EIS that will incorporate and address all relevant public comments received in response to the Draft EIS. The Department of Environmental Services fully expects that because of the inherent difficulty in identifying a new landfill site or sites for O'ahu, extensive environmental documentation will likely be required before the Final EIS for said site(s) can be completed. For example, the 2008 FEIS for WGSL was anticipated to be completed by December 2007, but was delayed by approximately one year in order to complete the requisite environmental documentation mandated by HRS Chapter 343 in relation to the discovery of three stone uprights that required archaeological investigation and coordination with the State Historic Preservation Division and cultural informants as well as to commission an Invertebrate Survey. Based upon the prior experience with the 2008 FEIS, the Department of Environmental Services estimates that the time needed to complete an EIS for the new landfill site(s) is between one and two years, provided that there are no legal challenges. Any legal challenges will only lengthen the time needed to complete an EIS.

40. The timeline for the acquisition of the landfill site or sites identified by the Landfill Advisory Committee is dependent upon the alternative landfill site(s) that is selected. If the site(s) is not presently owned by the City, the land acquisition process could be lengthy. If the City must acquire new land, a summary of the process is as follows: an appraisal of the land value; a determination by the City regarding the funding source for the acquisition; and approval for the expenditure of public funds by the Honolulu City Council. Moreover, if the City does not own the property and the landowner is unwilling to sell the property to the City, a condemnation process could ensue. This process is expected to be lengthy and would likely involve litigation. For these reasons, it is difficult for the Department of Environmental Services to estimate the length of time required to acquire a new landfill site(s). For the purposes of this Application, however, an approximate estimate of time is one to three years.

41. Following the completion of the EIS process and the acquisition of the site(s), detailed engineering studies will need to be completed to support the landfill design. These studies will include, but are not limited to: land surveys; geotechnical soils and structural investigations; hydrology and hydrogeological investigations. The completion of these studies is required so that the landfill construction drawings can incorporate civil design requirements, such as the provision of drainage, access roadways, and infrastructure, to support the use of the site. Coordination with governmental agencies, utilities, and adjoining landowners, consistent with mitigation

measures identified in the EIS, will also be required to minimize disturbance to nearby property owners and utilities. The length of time required for the completion of detailed engineering studies, construction drawings and bid documents, and the processing of procurements for the design and construction contractors (which could include the selection of a qualified landfill operator), as well as the acquisition of building permits, land use approvals such as a SUP or district boundary amendment, depending on where the site(s) is located, and other necessary approvals, is estimated to be between one and three years.

42. Based on the foregoing, no new landfill site or sites intended to replace or supplement WGSL will be operational as of the July 31, 2012, deadline to cease accepting MSW at WGSL as imposed by Condition No. 14 of the 2009 LUC Decision.

I DECLARE UNDER PENALTY OF LAW THAT THE FOREGOING IS TRUE AND CORRECT.

DATED: Honolulu, Hawai'i, June 28, 2011.

EXHIBIT A

> City Council is encouraged to work cooperatively with the Applicant's effort to select a new landfill site on Oahu. Upon the selection of a new landfill site or sites on Oahu, the Applicant shall provide written notice to the Planning Commission. After receipt of such written notice, the Planning Commission shall hold a public hearing to reevaluate 2008/SUP-2(SP09-403) and shall determine whether modification or revocation of 2008/SUP-2(SP09-403 is appropriate at that time. The Planning Commission shall make a recommendation to the Land Use Commission.

(ROA 0166.)

Clearly ENV is required by condition No. 4 to identify and develop a new landfill site or sites.

1. ENV is Not Precluded from Requesting Relief from the Conditions in the Future.

Although ENV may claim that Condition No. 14 does not provide adequate time to identify and develop a new landfill, ENV has been on notice for years in prior special permit proceedings relating to WGSL that it was required to do so. Indeed, the special permit for the existing landfill required closure of WGSL in 2008 and was extended to November 2009. ENV has had years to begin the process of identifying a new landfill site or sites. Further, there is nothing to preclude ENV from requesting an extension of the 2012 date if it is unable, using reasonable diligence as required in Condition No. 4, to identify and develop a new landfill site. In the prior special permit, as noted above, ENV requested and was given extensions of time because the City was unable to identify a new site. Even the Planning Commission and ENV's witness recognized this:

> GAYNOR: I'm not sure if you're gonna be comfortable answering this so if you're not, I'll get it answered later on, but one of the exhibits that we have is the 2005 Planning Commission Findings of Fact and Decision

Section 1

Executive Summary

This ~~Draft~~ Final Environmental Impact Statement (~~D~~FEIS) has been prepared for the proposed Waimānalo Gulch Sanitary Landfill (WGSL) Lateral Expansion project, located in Waimānalo Gulch, Oʻahu, Hawaiʻi. This ~~D~~FEIS has been prepared in accordance with Chapter 343, Hawaiʻi Revised Statutes (HRS), and Chapter 11-200, Hawaiʻi Administrative Rules (HAR), pertaining to the preparation of EIS documents.

1.1. Proposed Action

The Waimānalo Gulch Sanitary Landfill (WGSL) is an essential and necessary City & County of Honolulu facility that provides municipal and solid waste disposal for all the communities of Oʻahu. Refuse that is disposed of at the landfill includes Municipal Solid Waste (MSW); recycling residue; and, Honolulu Program of Waste Energy Recovery (H-POWER) ash and residue[1]. The landfill has been in operation since 1989 and has capacity remaining with the unused 92.5 acres of the approximately 200 acre property for an estimated minimum life of approximately 15 years[2]. This will extend the use of the site beyond November 1, 2009[3], the date the amended State Special Use Permit will prohibit the further acceptance of waste at the WGSL.

In addition to the expansion of the area of landfilling, the proposed project will involve the development of landfill associated support infrastructure (e.g., drainage, access roadways, landfill gas and leachate collection and monitoring systems, stockpile sites and other related features), a public drop off center, and a landfill gas to energy (LFGTE) system.

---

[1] See Section 4.2.1. Waste Accepted at Landfill, for details on waste permitted for disposal at WGSL.

[2] Based on no unforeseen circumstances including natural or other disasters that would require disposal of clean up or recovery related debris. In such an event space at the landfill could be exhausted sooner.

[3] In March 2008, the State Land Use Commission approved the extension of time for the State Special Use Permit allowing the use of the current area of landfilling from May 1, 2008 to November 1, 2009.

1.2. Alternatives Considered

1.2.1. Introduction

The following alternatives to the proposed project were evaluated:

No Action - Landfilling at the Waimānalo Gulch Sanitary Landfill would cease on November 1, 2009, with no alternative site or technology available.

Delayed Action - The action on the permit would be delayed. Given the time needed to process the permits, the delayed and no action alternatives have the same effect.

Transshipment - O‘ahu’s MSW would be baled and transported to a mainland landfill for disposal. Even with this alternative, not all MSW can be transshipped.

Alternative Technologies - Technologies other than landfilling that could reduce the amount of material requiring disposal and generate electricity or another beneficial reuse product. Alternative technologies that were considered include:

- Thermal and non-thermal technologies;
- Enhanced recycling;
- The expansion of H–POWER; and
- Alternative methods of landfilling, such as the disposal of ash and MSW in the same cell, and use of a bioreactor landfill.

Alternative Sites - Alternative sites on O‘ahu for the landfill. The five alternative landfill sites considered in the analysis were:

- Ameron Quarry;
- Mā‘ili Quarry;
- Makaiwa Gulch;
- Nānākuli B; and
- Waimānalo Gulch Sanitary Landfill.

1.2.2. No Action Alternative

The No Action Alternative, which would involve taking no further action to extend the use of the WGSL was rejected because the consequences would result in an unacceptable health, safety, and economic impact to all communities on O‘ahu.

1.2.3. Delayed Action Alternative

The Delayed Action Alternative involves delaying further effort to extend the use of the WGSL. Because the Delayed Action and No Action Alternatives would have similar results, it was rejected.

1.2.4. Transshipment of Waste Off-Island

Waste transshipment involves the packaging of MSW for shipment to a disposal site located off-island. Transshipment is a potential alternative that can reduce the need for a municipal sanitary landfill, but cannot completely replace it because of major issues.

1.2.5. Alternative Technologies to Refuse Disposal

There are currently no alternatives that have been proven to completely eliminate the need for a landfill. Alternative technologies reduce the demand for a landfill, but some residue will need to be disposed of in a landfill. The alternative technologies considered included (PWCG, 2008)[4]:

1. Non Thermal Technologies: (1) Anaerobic Digestion; (2) Aerobic Digestion; and (3) Hydroloysis
2. Thermal Technologies: (1) Plasma Arc; and (2) Gasification/Pyrolysis
3. Waste to Energy
4. Expanded Recycling: (2) Improvements to Recycling Infrastructure; and (2) Recycling to Energy
5. Wet Cell Landfill
6. Co-Disposal of MSW, Ash, and Residue

Conclusion Regarding Alternative Technologies

- Emerging or existing technology based approaches show promise for use in the City & County of Honolulu. However, none of the approaches are capable of completely eliminating the need for a municipal landfill.

---

[4] See Section 9.5. Alternative Technologies to Refuse Disposal for further discussion.

- Some alternative technologies, such as hydrolysis (generation of process wastewater and other byproducts), involves the potential for environmental impacts that would require further examination.
- A number of the technologies that produce a secondary product, e.g., fuels for the generation of electricity or recovered plastic, metal, or glass products, do not have established commercial markets in the State.
- Certain alternative technologies such as waste to energy, are viable when considered as part of the City's waste management system. It is expected that other technologies and approaches will be developed as they mature and demonstrate feasible application in other municipalities.

1.2.6. Alternative Sites for a Municipal Landfill

A total of 42 landfill sites were evaluated for the proposed project. In addition to the evaluation of these sites, the City considered (1) the use of two more landfill sites for MSW and ash and residue, as well as (2) the use of two or more landfill sites to separately handle MSW in one landfill and ash and residue in another. The use of two or more sites was considered by ENV for the proposed project, but was not selected for consideration based on (FSEIS, Waimānalo Gulch Sanitary Landfill Expansion, 2002):

1. Land resources on O‘ahu are finite and limited. Use of more than one landfill site for the disposal of MSW and/or ash and residue would foreclose or limit other alternative land uses that might otherwise be provided.
2. Potential for negative environmental impacts associated with the development of any landfill requires major effort to ensure mitigation. Development of two or more landfill sites would increase potential for negative environmental impacts and costs.
3. Economies of scale from an appropriately sized facility would generally result in more efficient use of land than two smaller facilities that may not be as easily planned from a landfill development perspective.

The sites that were considered are identified in **Table 1-1, Potential Landfill Sites**.

Table 1-1, Potential Landfill Sites

Site Name	TMK	Size (Acres)	Capacity (MM cy*)	Life (Years)
Auloa	4-2-14:por 1	55	2.8	4.7
Ameron Quarry	4-2-15:01	391	9.0	15.0
Barbers Point	9-1-16:18, por 1	15	0.7	1.2

Waimanalo North	4-1-8: 13	171	9.6	16.0

* Million cubic yards (cy)

** Information has been updated since the Mayor's Committee Report, but prior to the preparation of this EIS. The current lateral expansion acreage is approximately 92.5 acres. The actual area of use may be changed as the design is refined and reviewed by government regulatory agencies.

Note: Based on Final EIS for Waimanalo Gulch Expansion, December 2002.

1.2.7. Preferred Alternative

Alternative technologies and the transshipment of waste show promise toward reducing the need for landfills. The generation of MSW that exceeds the processing capacity of H-POWER as well as the generation of ash and residue, however, requires a municipal landfill as part of the City's long term waste management system. (PWCG, 2008).

The time between preparation of this EIS and the date of compliance with the State LUC Order, November 1, 2009, is insufficient for the administrative processes to permit another alternative for all MSW and H-POWER refuse requiring disposal. The State LUC Order calling for a halt to the acceptance of any further ~~MSW~~ waste deliveries to the WGSL will come into effect on November 1, 2009. Even if this timeframe were extended the schedule for preparation and approval of a new alternative site can be expected to take several years. (PWCG, 2008).

The WGSL is the only alternative currently available to dispose of MSW and H–POWER ash and residue. Continued use of the WGSL until it has been filled to its physical capacity to accept waste is the Preferred Alternative (PWCG, 2008).

1.3. Potential Project Impacts and Mitigation Measures

Potential project impacts and proposed mitigation measures include:

1.3.1. Environmental Setting

Climate and Rainfall

The proposed project is not anticipated to result nor constitute a source of impact to the climate or rainfall resources of the project area or region.

Topography and Geology

Potential impacts are anticipated to involve changes to the landforms of the WGSL property and the underlying soils and site geology. Mitigation will involve updates to technical studies and design documents to maintain the soils and geologic stability of the site. Based on the results, an appropriate design will be prepared and reviewed by the Department of Environmental Services (ENV), the DOH, and other regulatory agencies as required by law.

Surface Water

The proposed project will involve a review of the existing drainage system and its capacity to handle the planned area of expansion. Design, engineering and construction will be reviewed by regulatory agencies. Adverse effects to surface water are not anticipated.

Groundwater and Hydrology

There is potential for leachate entering brackish groundwater from the landfill. Mitigation to address this issue is currently provided through the existing Leachate Collection and Removal System (LCRS) design. As required, the LCRS system design will be modified to ensure against the potential for adverse effects to groundwater and hydrogeological resources of the site.

Natural Hazards

Adverse effects from the proposed project are not anticipated for the following:

Flood Zone - Drainage controls to handle storms have been implemented for the existing site. Future controls will be designed by the City and WMH to be consistent with the requirements for the State and City & County of Honolulu.

Hurricanes - Work procedures practiced within the existing area of landfilling will be practiced within the area of lateral expansion. The measures are designed to reduce the potential for loss of soils, MSW, and ash due to a hurricane or related heavy storm.

Seismic Activity (Earthquakes) - Seismic risk at the project site is minimal. The design of both the current sanitary landfill and the proposed area of lateral expansion will meet the EPA Subtitle D (40 CFR Part 258) standard for stability. No further mitigation measures with regard to seismic activity are required or recommended.

Air Quality

Air quality is not anticipated to be adversely affected by the project. The following were evaluated:

Dust - Airborne dust will be the primary air pollutant. To reduce and mitigate the potential for the release of fugitive dust preventative measures will be practiced by the operator in accordance with the provisions of HAR, Chapter 11-60.1-33, Fugitive Dust. The generation of adverse dust levels from controlled blasting is not anticipated. This is based on the limited yield of the charge, subsurface placement, and nature of the controlled blasting which is designed to fracture rock and not displace earthen material.

Odor - Odors associated with the proposed project include vehicular odor, odors from the hauling of waste to the landfill, and odors as a result of landfill gas emissions.

Vehicular Odors and Exhausts - Exhaust emissions are mitigated by compliance of the landfill operator, commercial, and private vehicle operators with HAR, Chapter 60-1, Air Pollution Control, Subpart 1.34, Motor Vehicles. The site operator will also ensure that all vehicles and equipment associated with landfill operations are properly muffled and maintained in good operating condition.

Odors from Waste Hauling - Potential sources of odor include the delivery of refuse vehicles containing putrescible waste, sewage solids that cannot be processed by wastewater treatment plants, and other types of waste. Odor management will involve: (1) refuse vehicle processing and control; and (2) use of an odor neutralizing system.

Solid sewage sludge from the Sand Island Wastewater Treatment Plant (SIWWTP) that was previously disposed of at the WGSL is currently undergoing treatment in a waste digester recently installed at the ~~Sand Island Wastewater Treatment Plant (~~SIWWTP~~)~~. It is anticipated that as this system is brought to full operational capacity that the requirement for disposal of treated sludge solids will further decrease, eventually removing this source of odorous waste from the landfill.

Stabilized, dewatered sludge from the Honouliuli, Wai'anae, Kailua Regional, and Kahuku Wastewater Treatment Plants, as well as from private sources, is landfilled at WGSL. The City is in the process of seeking beneficial uses for the stabilized, dewatering sludge from the Honouliuli WWTP.

Landfill Gas Associated Odor - The generation of landfill gas is controlled by use of a landfill gas collection and control system (GCCS) that was installed in 2005. The system is operating in accordance with requirements and no adverse effects due to the performance of the system to address landfill gas associated odor are anticipated.

Landfill Associated Gases - Landfill gases at WGSL are monitored in compliance with RCRA Subtitle D regulations, HAR Chapter 11-58, and the WGSL Solid Waste Permit (No.LF-0054-02). The monitoring regularly assesses the landfill and requires an appropriate response to address any exceedances in allowable standards. DOH may also establish other requirements. No adverse effects from landfill associated gases including methane, hydrogen, and other potential emissions are anticipated.

Acoustic Characteristics

The potential for adverse effects as a result of noise generated by the proposed project is not anticipated. The following will be provided:

Construction Vehicles and Equipment - Vehicles and equipment will produce noise. Mitigation of short-term potential construction impacts will involve compliance with the provisions of HAR Chapter 11-43, Community Noise Control. All internal combustion powered vehicles and equipment will be equipped with mufflers or other noise attenuation devices as required.

Construction Activity - Noise associated with construction activities are not anticipated to result in adverse effects to the surrounding area and region. Portions of the work that may affect the adjoining Makaiwa Gulch and the future planned Makaiwa Hills development will be buffered by a ridge separating the two gulches. Other practices will be employed by WMH in coordination with the developers of Makaiwa Hills.

Rock Crushing - Rocks and boulders too large for use will be reduced in size with a rock crusher. Potential impacts include: generation of noise and dust; and visual impacts that could result if views of rock crushing equipment and machinery are readily visible from across the Farrington Highway and coastal shoreline.

Generation of noise will be within a relatively isolated portion of Waimānalo Gulch. The ridge between Waimānalo Gulch and Makaiwa Gulch will also serve to help to reduce potential noise impacts from the planned future Makaiwa Hills development. Other mitigation including the scheduling of rock crushing during normal landfill operating hours will be provided.

Controlled Blasting - Blasting will involve not more than one blast per day on an infrequent basis consisting of approximately one to three days per week, taking place toward the end of the work day. Potential noise effects are not expected to affect the surrounding community along Farrington Highway.

Flora and Faunal Resources

Flora

The results of the botanical survey indicate no special concerns or legal constraints related to botanical resources at Waimānalo Gulch (AECOS Consultants, Inc., 2007). No adverse effects to the flora resources at the WGSL are anticipated.

Fauna

Native and migratory birds were not observed at the property. There are no unique habitats. Similar areas occur all along the leeward side of Oahu. (Bruner, 2006). No adverse effects to the faunal resources at the WGSL are anticipated.

Scenic and Aesthetic Environment

The majority of the proposed project will not be visible from most vantage points along the Farrington Highway in the Wai‘anae or Kahe Point directions. The existing Kahe Point ridge line provides some screening of views of the landfill, including the proposed expansion area. While some potential viewplane impacts are anticipated, mitigation measures have been proposed to eliminate or reduce the potential for adverse impacts.

The general area that fronts Waimānalo Gulch (i.e. from the Kai Lani subdivision to Ko Olina Beach Club) is expected to be the most impacted because activities can be seen from areas within this “view corridor”. Mitigation to reduce visual impacts has been initially implemented. Further landscaping will be implemented to address the dry conditions of the site that have hindered prior hydromulching and plantings. Landscaping and the further use of irrigation will be used to promote vegetative growth similar to that found on the adjoining hillsides.

Views of refuse and construction vehicles in transit to and from the active areas of landfilling will be addressed with carefully located interior roads using the terrain to screen the vehicles. Carefully placed landscaping elements including trees or other tall vegetation will also be implemented.

Views toward the landfill along Farrington Highway, from the Waiʻanae side of the landfill, will be addressed with landscaping treatment, as appropriate, that will include the use of landscaping elements along the western ridge of the WGSL adjoining the Kahe Power Generating Station. This will require careful placement of landscaping elements to maintain views toward the ridgeline to respect the huakaʻi pō (procession of the night marchers) viewplane.

As much as possible, native trees, shrubs and groundcover will be integrated into the landscaping plan.

1.3.2. Public Services

Traffic and Circulation

The proposed project is not expected to generate additional vehicle trips. However, increased development islandwide may result in an increase in site-generated trips to the landfill since additional refuse vehicles may be required to service these areas.

No adverse impacts to traffic are anticipated or expected, however, the Traffic Impact Report recommends: (1) maintaining roadway widths, (2) turning radii, (3) sight distance, and (4) on- and off-loading areas to prevent vehicles from queuing onto the highway. These recommendations will be maintained by WMH, and the owner of the facility, ENV.

Wastewater

The proposed project is not anticipated to result in potential for negative adverse impacts due to wastewater treatment. The project will not require upgrades to municipal wastewater service lines or to the Honoʻuliʻuli Wastewater Treatment Plant.

Potable/Drinking Water

The proposed project will be served by the existing Board of Water Supply (BWS) main along Farrington Highway. No major new construction involving the use of new water supply will be required for the lateral expansion of the landfill.

Power and Communications

Electrical power is provided from the Hawaiian Electric Company (HECO) by overhead service lines. Communications service is provided by Hawaiian Telecom. Use and operation of the planned area of lateral expansion will be coordinated with HECO to minimize the possibility of a disruption of service. The existing power and communications facilities are expected to be sufficient for the proposed project. No adverse impacts are anticipated.

Police and Fire Protection

The current level of police service provided to the WGSL is expected to be sufficient. ENV and WMH will maintain fire apparatus access throughout the site to ensure that fire fighting vehicles and equipment are capable of mobilizing to all locations. No adverse impacts are anticipated to police and fire protection services and no further mitigation is proposed.

Health Care and Emergency Services

The proposed project will involve the continuation of use of the site and does not represent a major increase in use that would require additional health care or emergency services beyond those presently provided. This use is not expected to require additional health care or emergency services beyond those presently available. No adverse impacts are anticipated

Education and Library Services

The proposed project is not expected to affect existing schools or libraries located in the region.

Parks and Recreation

The proposed project is anticipated to have potential impacts that are similar to existing conditions that include landfill associated odor, windblown litter, and visual impacts. The exception to these potential impacts, however, involves the location of the proposed project further mauka within the Waimānalo Gulch which will help to reduce potential odors directly attributable to the landfill, the control of windblown litter from working cells, and visibility of working activities on the landfill.

Control of Landfill Odor - The potential for odor from vehicles include: vehicles from residential and commercial sources; vehicles that carry treated sewage solids; and private self-haulers. Odors from refuse awaiting disposal involve a temporary condition in that once the refuse is buried and covered, the source of the odor is removed from exposure to the air column. Odors resulting from landfill decomposition are addressed with the LCRS and GCCS.

Control of Windblown Litter - Mitigative measures include:

- Use of permanent, temporary, and portable litter fences.
- Waste is processed and covered with cover material as soon as practicable.
- On-call or standby work crews are deployed concurrent with the acceptance of refuse at the WGSL.

- ENV will enforce existing rules, regulations, and procedural practices to reduce the incidence of windblown litter.
  Management personnel at WGSL also enforce the rule requiring all loads entering the landfill to be secured by use of a tarp, cover, or enclosure.

Visibility of Working Activities on the Landfill - Portions of the existing area of work are visible from various locations along Farrington Highway and the Ko Olina Resort (see Section 5.10. Scenic and Aesthetic Environment. Mitigation involves: (1) the location of the planned area of expansion further mauka and within the Waimānalo Gulch to minimize views into active areas of landfilling; and (2) the use of landscaping with trees and vegetative cover. While not all elements of the proposed project can be totally screened from view, the location of work and the careful placement of landscaping elements are expected to significantly reduce the potential for viewplane and aesthetic impacts.

1.3.3. Socioeconomic and Related Environment

Socioeconomic Characteristics

Public Facilities and Services
Police Protection, Fire Protection, Emergency and Medical Services - Extension of the landfill operations are not anticipated to result in adverse effects. WHM will provide adequate access for fire apparatus. WGSL and the surrounding communities are adequately serviced by EMS services.

Education and Library Services - Expansion of the WGSL Sanitary Landfill will not create the need for additional elementary schools, nor will it affect existing elementary schools differently than they are affected at the present time. No impacts to schools or libraries are anticipated.

Parks and Recreation - An expanded WGSL does not generate any additional demand for area parks. Odor issues and litter issues will be addressed by WMH and ENV. The proposed expansion and continued use of WGSL will have no impact on the use of nearby parks. (SMS Research, 2008).

Other Social Impacts

Positive Social Impacts

Reduced Impact on Other Oʻahu Communities - Moving the current landfill operation to another Oʻahu location would only shift the potential for adverse impacts to another community, still requiring that the issues of litter, traffic, odors, and visual pollution be addressed and managed. (SMS Research, 2008).

Negative Social Impacts

Department of Health Issues - On December 7, 2007, ~~having addressed the two remaining counts identified in a DOH notice of violation (NOV),~~ the City and the DOH signed a settlement agreement which settled all issues arising from and related to the DOH Notice of Violation (NOV). According to WMH and the City, the public and the environment were never at risk at any time over the period of use of the site.

Property Values - The 2002 Socio-Economic Impact Assessment of the WGSL Expansion found single-family homes fit the hypothesis that property values increase with distance from the landfill up to a distance of about three miles. However, the condominium analysis shows a significant correlation of increased value and proximity to the landfill – the opposite result. (SMS Research, 2008)[5].

Diminishing Community Trust - The failure to follow through on commitments by prior City administrations to close WGSL may be having an impact in eroding public trust and increasing cynicism toward City government. There appears to be general agreement among those interviewed that there has been insufficient community involvement (SMS Research, 2008).

Environmental Injustice - Interviewees point out that Leeward Oʻahu is on the receiving end of many of Oʻahu's burdens. Those interviewed argue the use and expansion of

---

[5] See Appendix J, Socioeconomic Impact Assessment, in Volume 2 of ~~2~~3 of this ~~D~~FEIS.

WGSL will only increase the imbalance of those impacts on Leeward Oʻahu. (SMS Research, 2008).

Proponents of keeping the landfill in operation point out that the siting of the landfill occurred long before the siting of several of the other examples noted above and had nothing to do with the demographics of surrounding communities. Furthermore, surrounding communities accommodate Ko Olina, abutting the Second City of Kapolei. This is the fastest growing region on Oʻahu and WGSL does not appear to have stymied its growth. This is not indicative of a community suffering from environmental injustice. (SMS Research, 2008).

Economic Impacts

Employment and Earnings
Construction - Expansion of WGSL is expected to take 10 years to complete. Pending the receipt of final engineering figures, the construction of the expansion has been estimated at $86,000,000 over ten years. (SMS Research, 2008).

Employment - The net positive impact of the WGSL expansion will result in the creation of approximately 651 direct, indirect and induced person-years of employment. (SMS Research, 2008).

Earnings - The proposed project will result in an overall net positive impact on earnings. In total, approximately $63.3 million in earnings will be generated. These earnings will boost the local economy, as many of the dollars will be used to purchase goods and services from other industries. (SMS Research, 2008).

Fiscal Impacts: State of Hawaii
The indirect and induced impact of this project will result in $6.2 million in state tax revenues. In total, the project would result in an estimated positive impact of $10.4 million in state tax revenues. (SMS Research, 2008).

The socioeconomic analysis did not take into account any indirect or induced economic effects of the landfill operation on surrounding businesses. There was insufficient, verifiable information available at the time of the compilation of the report. As noted, the residential sales program at Ko Olina has been successful. If it could have been more successful without the landfill is speculative. (SMS Research, 2008).

Socioeconomic Mitigation Measures

Improving Current Practices

> *Views - WMH should continue to implement the on-site landscaping plans that have already been developed; especially for those areas facing south toward Ko-Olina (SMS Research, 2008).*
>
> *WMH should design and implement landscape screens (e.g., pines, tall hedges) along the berm and the access road that is visible from Farrington Highway, fronting the Kahe Power Plant. As an alternative, WMH might consider entering into a partnership with HECO to plant an effective screen of trees along Farrington Highway which would have the dual purpose of screening the landfill operations and the power plant from passing vehicles (SMS Research, 2008).*

Landscaping plans have been prepared to screen exposed areas and views of landfill operations. Initial plantings have been started and will be augmented with new plantings. The west-facing stability berm along the upper access road shields views from some of the operations, but not all of it. Selected plantings, consistent with the area vegetation will be investigated for use as visual buffer.

> *Odor - WMH and the City should continue to be vigilant in processing the sludge from the sewage treatment plants upon delivery and in taking all means to reduce any odor impacts (SMS Research, 2008).*

Diversion of some of the sludge for processing at the Synagro-WTT facility at SIWWTP and the improved performance of the odor neutralizing mist system appears to have had a significant positive impact. ~~However, WMH will pay continued attention to the performance of the Synagro system.~~

> *Litter - WMH must continue to monitor the egress and ingress of vehicles and continue to aggressively enforce the anti-littering regulations and fines (SMS Research, 2008).*

WMH inspects and monitors trucks entering and leaving the landfill to ensure that loads are secured upon entry and that the trucks are free from debris before exiting. Citizens and others who deliver trash without adequately secured loads generate windblown litter. Public education will be implemented by ENV and WMH to supplement the inspections.

> *ENV and WMH should maintain a direct communication link with the HPD; in the case of littering, it will lead to faster, more effective response (SMS Research, 2008). Additionally, this communication linkage should expand to the community most affected by the potential loss of refuse from vehicles traveling along public thoroughfares.*

1. WMH and ENV will seek the participation of the HPD as a participant in the WGSL Oversight Advisory Committee.
2. WMH and ENV will notify the community through the WMH newsletter and the ENV website, opala.org, of the steps that the public can take to help with reporting highway littering.

Improving Community Involvement and Communications

Community Involvement

> *The City must effectively use the Oversight Advisory Committee (SMS Research, 2008).*

A first step to improved use of the Oversight Advisory Committee is described above. Other measures include:

1. Maintain and expand outreach, education, and coordination of landfill operations with the area neighborhood boards.
2. WMH will continue to extend and to expand visits to the landfill.
3. WMH will continue its outreach efforts with the adjoining (1) Ko Olina Community Association (KOCA) and the various homeowner/owner associations within Ko Olina; and (2) adjoining homeowners and residents in the area including Nānākuli and the planned Makaiwa Hills project.

> *The City should continue to contribute to a community benefits package for as long as the landfill exists (SMS Research, 2008).*

The value of the community benefits have been identified as $2.7 million in 2007 and ~~will be~~ $2.0 million in 2008. The experience gained from current work by the City will be applied in the form of future modifications to improve the system.

> *The representation on the Committee that determines the benefits package should include all directly affected communities (SMS Research, 2008).*

Identification of specific benefits that will be distributed and the parties that will be responsible for representing the communities involved remain on-going. Future information, including the names of participants involved will be provided by the City by website on opala.org or other agency website.

Website

> *WMH/ENV should use its web-sites aggressively as educational and communication tools (SMS Research, 2008).*

The ENV website, opala.org will be used for the dissemination of future information including site tours (currently offered), the status of new technology undergoing evaluation, and other matters involving refuse management.

Improving the Commitment to Alternative Solutions to Landfilling

Alternatives to Landfills

> *The City should continue to invest in Research and Development, and where feasible, implement alternative technologies that will result in a reduction in the City's dependency on a landfill (SMS Research, 2008).*

The City is actively involved in the investigation of feasible alternatives to landfilling. While no current alternative can completely remove the need for a landfill the City remains committed to research and utilization of methods as they prove feasible for taxpayers and the environment.

Alternative Locations

> *The City should continue to seek an alternative site to WGSL as the primary landfill location on O'ahu (SMS Research, 2008).*

Prior to closure of the proposed project the City will initiate the search for O‘ahu's next landfill site. Participation in this effort should be initiated within the next 10 years.

Land Use and Ownership

Regional and Local Land Uses

The region of ‘Ewa surrounding the WGSL is composed of a mix of multiple land uses including residential, resort, recreational, business, commercial, and industrial uses. Other land uses including businesses, parks, schools, and other facilities also operate in the region. Ko Olina and the Makaiwa Hills development lie closest to the WGSL.

Potential Impacts and Mitigation Measures

The potential for impacts are expected to be at a localized or community level. WGSL is expected to result in potential land use impacts similar to those associated with the current use of the site. These potential impacts include:

- The generation of nuisance odors during delivery and landfilling of refuse.
- Windblown litter from the landfill becoming airborne and litter from improperly secured loads from refuse delivery trucks and private self-haulers.
- Traffic impacts associated with the transit of vehicles entering and leaving WGSL.
- The tracking of mud and sediments onto Farrington Highway from vehicles exiting the landfill.
- The migration of fugitive dust from landfill operations including earthwork and vehicles transiting to and from the site.
- The modification or loss of mauka view planes toward the WGSL.

A number of mitigation measures as described in this document have been identified to address the potential impacts described above. These measures will continue to require ongoing coordination with surrounding community and landownership interests.

Effort by the City Administration to establish an Oversight Advisory Committee for Waimānalo Gulch was initiated in July 2006. While the Oversight Advisory Committee will continue, on-going efforts by ENV and WMH will be maintained and extended to coordinate the operation of WGSL with the surrounding community. The mitigation measures that will be implemented are described in Section 7, 7.1.~~5~~6. Socioeconomic Mitigation Measures.

Historic and Archaeological Resources

An Archaeological Inventory Survey (AIS) of the proposed project site was conducted by Cultural Surveys Hawai‘i (CSH) in 2007 and 2008. The purpose of the AIS was to document all historic properties within the 92.5 acre area of the proposed project known as the Area of Potential Effect (APE). The inspection of the site identified one historic property: State Inventory of Historic Properties (SIHP) # 50-80-12-6903. The site is of pre-contact origin, and consists of three large upright boulders potentially utilized as trail or boundary markers.

According to CSH the consultation effort determined no clear consensus regarding the function of the three stone uprights. However, all of the cultural consultants indicated that the stones were significant and that they were likely used by traditional Native Hawaiian cultural practitioners in the past. All cultural consultants also felt the stones should be preserved in place if at all possible because their significance and function are likely tied to their current location. If preservation in place is not an option, most were in favor of temporary relocation to Battery Arizona, with movement of the stones back to as near as possible to their original location once the landfill is closed. (CSH, 2008).

Potential Impacts and Mitigation Measures

The proposed project will require excavation, mass grading, controlled blasting, and earthwork to develop landfill cells and other structural features. The development of a modified landfill design was considered by WMH and ENV as a means of providing further protection to the stone uprights. This consideration would avoid the location of the uprights along a steep slope to maintain and preserve the condition of the existing site. However, according to WMH the uprights are located along a ridgeline that would remain susceptible to vibration.

Based on concern that construction could jeopardize the area of the site and potentially undermine the stability of the underlying surface of the stone uprights, or the uprights themselves, WMH and ENV have determined that the three upright stones comprising SIHP # 50-80-12-6903 cannot reasonably be preserved in place. Accordingly, a project effect determination of “effect with agreed upon mitigation commitments” is proposed.

Mitigation to preserve the site is recommended in the form of relocation of the three SIHP # 50-80-12-6903 upright stones to the Battery Arizona site, located in the southwestern portion of the WGSL. The proposed relocation would ensure and maintain the safety of the stones during construction activities, and make the stones more accessible to interested parties.

Based on the results of the cultural consultation, however, cultural informants would prefer to see the stones eventually returned to near their original resting places once the landfill is no longer active, with interpretive signage based on further background research and making public access available. WMH and ENV will further consider this alternative in consultation with the SHPD and community cultural informants. (CSH, 2008).

Cultural Impact Assessment

A Cultural Impact Assessment (CIA) of the proposed project site was conducted by Cultural Surveys Hawai‘i (CSH) in 2007 and 2008. The purpose of the CIA is to consider the effects the proposed project may have on traditional cultural practices and resources.

In addition to previous use activities, the importation of landfill material since 1987 has most likely further eliminated any historic properties and plant resources related to Hawaiian cultural practices and beliefs that may have been present at the project site. The presence of the landfill over the last fifteen years has already precluded any traditionally established access to *mauka* areas through Waimānalo Gulch. (CSH, 2008).

The ʻili of Waimānalo has been described by community participants in the CIA as a sacred area of great cultural importance. Community participants express great concern about the Huakaʻi Pō Kāne (Night Marchers). According to kūpuna, the trail of the Night Marchers in this area runs from mauka to makai. Hawaiian cultural belief is that these trails are significant and must not be impeded for fear of retribution from spirits of the departed. (CSH, 2008).

Based on the information gathered for the CIA the proposed project will affect traditional Native Hawaiian stone uprights (SIHP # 50-80-12-6903) (CSH, 2008).

Potential Impacts and Mitigation Measures

The proposed project may potentially affect cultural resources found at the planned area of lateral expansion. The following measures are designed to mitigate or reduce the potential for impacts:

1. Per Section 7.3.8. Potential Impacts and Mitigation Measures, ENV and WMH propose that the stone uprights be relocated based on the preparation of an Archaeological Monitoring Plan (AMP) with guidance from the SHPD and community informants identified by SHPD and CSH. The AMP will include a preservation plan for future cultural access.

2. Lands makai of Waimānalo Gulch have been bisected by Farrington Highway along the coastline. Although it may not be possible to completely recover this traditional mauka/makai relationship, there are three important cultural properties that can be addressed with culturally sensitive treatment: (1) cultural site SIHP # 50-80-12-6903; (2) the legend of the huakaʻi pō; and (3) a series of six natural caves and rock overhangs. These features are an important part of the Hawaiian landscape and their appropriate treatment will be provided.

3. ENV and WMH will consult with community informants to mitigate or reduce the potential for visual blockage of the west and east ridgelines of the Waimānalo Gulch.

4. Six natural caves and rock overhangs in the northwestern portion of the project area were examined and documented (Dalton and Hammatt 2008). No significant cultural material was observed or discovered. Although burials were not encountered it is always possible they may be discovered. In the unlikely event of a discovery work in the immediate area will cease and the SHPD will be notified. Instructions and guidance for future steps will be obtained from the SHPD.

5. Although the land has been dramatically altered, there remains a possibility that burials and other archaeological sites may be present in and around the proposed project area. ENV and WMH will comply with the requirements for archaeological and cultural protection and preservation in Chapter 6E, HRS, and other applicable laws and regulations.

6. ENV and WMH will continue to consult with the community regarding archaeological, cultural, and other environmental matters involving the operation of the existing WGSL and the proposed lateral expansion project.

1.4. Secondary and Cumulative Impacts

The proposed WGSL Lateral Expansion project is planned to be initiated upon the exhaustion of space in the final Cell E-4 of the existing approved area of landfilling. In this regard, the potential for secondary and cumulative impacts, in many instances, can be considered similar to the impacts from use of the existing area of landfilling.

Potential secondary and cumulative impacts considered for this project include the following:

1.4.1. Potential Environmental Impacts

Climate and Rainfall

Secondary or cumulative impacts are not anticipated or expected. While the proposed scope and scale of the project are not sufficient to influence these resources, greenhouse gases (GHG) such as methane and carbon dioxide generated from the landfill could be a potential contributing factor to global warming. An investigation of alternatives to the use of landfills in Section 9 and Appendix K, found that WGSL in combination with the use of landfill gas for the generation of electricity, and the use of the site for the disposal of H-POWER ash, are expected to contribute to fewer GHG emissions than use of the site solely as a landfill with no provision or support for the recovery of energy.

Topography, Geology and Soils
Secondary or cumulative impacts based on the continued use of WGSL are not anticipated or expected. The site has been in operation for approximately 18 to 19 years and has been subject to ongoing technical studies and evaluations by independent technical consultants for the topographic, geologic and soils resources of the site to ascertain the performance and environmental safety of the facility. During this period the technical studies that have been completed have been used to improve the capacity, capability, and safe use of the site for a landfill.

The evaluation of WGSL through the preparation of technical studies and reports will continue to be used for further improvements and modifications, as required, through the mitigative measures provided in this EIS document.

Surface Water, Groundwater, and Hydrology
Secondary or cumulative impacts to surface water, groundwater, and hydrological resources at the WGSL and region are not anticipated.

The proposed practices, procedures and mitigative measures provided in this EIS have been designed to maintain the use of the site for a landfill for a period of not less than 15 years. Long term monitoring and inspection of the site by WMH will be further provided through a EPA required post closure plan for not less than 30 years following the closure of the site. These measures, which are designed to mitigate against potential primary impacts associated with stormwater erosion and discharges of refuse and leachate to the surface water, groundwater, and hydrologic resources of the site and the surrounding region, would serve as the principal means of avoiding the occurrence of secondary or cumulative impacts.

Natural Hazards

Potential secondary or cumulative impacts associated with floods, hurricanes, earthquakes, and tsunami have been considered in the design and operating practices applied to the site. Adverse impacts are not anticipated. Safe engineering and design standards have been incorporated in the construction of the existing area of landfilling and will be applied to the proposed area of lateral expansion. The standards applied to the site are designed to maintain a reasonable level of long term safety and reduce or prevent secondary effects due to natural hazards from floods, earthquakes, or tsunami.

Air Quality

The potential for secondary or cumulative effects from landfill gas emissions and operational use of the site involving earthwork and deliveries of refuse exists at the site without the long term use of the mitigative measures provided in this EIS document, and the operational practices that are employed by WMH. Potential long term effects can include the migration of landfill gas, dust, and nuisance odors associated with the landfill and refuse deliveries.

Mitigation to address these concerns will serve to avoid potential secondary and cumulative impacts through on-going monitoring and operational practices that maintain the existing environmental safety of the site, such that it would avoid the opportunity for other larger impacts to occur. In some cases, these measures have already been implemented: a landfill gas collection and control system has been constructed and is operating to reduce uncontrolled releases of landfill associated gases; and a waste digester at the Sand Island Wastewater Treatment Plant has been constructed and in recent months has demonstrated improved performance with fewer deliveries of odor generating sewage solids.

Acoustic Characteristics

While the potential for primary noise impacts associated with construction and operation activities are not anticipated, mitigative measures are provided in Section 5.8. Acoustic Characteristics. Potential for secondary and cumulative impacts with regard to the planned Makaiwa Hills subdivision, located next to the WGSL along its eastern boundary, are similarly not anticipated. Construction and earthwork within the landfill will be inhibited by the ridgeline separating the two properties. Mitigation to address the potential for secondary and cumulative impacts will be the same as those designed to address the primary impacts. This will include proper maintenance of all equipment with appropriate sound attenuation as required in accordance with federal, state and City & County of Honolulu regulations, the scheduling of rock crushing during normal landfill operating hours to avoid possible disturbance to surrounding neighbors, and other measures as identified in Section 5.8.

Flora and Fauna Resources

Potential for secondary or cumulative adverse impacts to flora and fauna (including invertebrate) resources at the site are not anticipated. The proposed project will be limited to the use of the City owned property. No expansion outside of the property boundary is planned or proposed. While the planned use of the site will require the removal of vegetation to establish the lateral landfill expansion area, this constitutes a short term effect of a scope and scale that is limited to the Waimanalo Gulch landfill property. In the longer term, upon completion of work the site will be restored with vegetation similar to that found on the adjoining hill sides. Whenever possible, native species will be used.

Scenic and Aesthetic Resources

The potential secondary or cumulative impact of the planned use of the site will involve modification of the surface contours within the Waimānalo Gulch, that may be considered as a continuation of the present land use, but within the lateral expansion area. This modification is a necessary part of the project to establish landfill cells, stability slopes, berms, and installation of supporting facilities to allow for a landfill that meets the required federal, state, and City & County of Honolulu regulations for a properly designed and safe facility. While use of the site for landfilling will involve the alteration of the viewplane, mitigative measures as provided in Section 5.10.2. Potential Impacts and Mitigation Measures (Scenic and Aesthetic Environment) are proposed to reduce the impacts.

Over the long term, during the operational use of the site vegetative practices and landscaping will serve to minimize the appearance of the landfill. The site will be allowed to revegetate to match the surrounding, undeveloped hillsides once the capacity of the facility has been reached, and during the planned 30 year period of landfill maintenance and monitoring.

1.4.2. Potential Public Service Impacts

Traffic and Circulation

Potential for secondary or cumulative impacts associated with traffic and circulation are not anticipated. The proposed project will constitute a continuation of use of the site for landfilling which was started in the early 1990s. According to the traffic impact report performed for the project, the WGSL is not expected to itself generate major new transportation demands along Farrington Highway, but that the demand for use of the area roadways would most likely be from increasing development in the area. In order to maintain safe operating conditions for the users of the WGSL and the public transiting along Farrington Highway, WMH will periodically evaluate traffic to assess the need for further traffic controls to maintain public safety.

Wastewater and Potable/Drinking Water

Potential for secondary or cumulative impacts are not anticipated. The site is currently provided with adequate service for wastewater and water. No new or future demands that would exacerbate the current or long term provision of these services are anticipated.

Power and Communications

Potential for secondary or cumulative impacts are not anticipated. The proposed project is adequately served and it is anticipated that future requirements would not result in the demand for services beyond those provided by the existing utility companies.

Police, Fire, Health Care, and Emergency Services

Potential for secondary or cumulative impacts are not anticipated. The proposed project is adequately served and it is anticipated that future requirements would not result in the demand for services beyond those provided.

Education and Library Services

Potential for secondary or cumulative impacts to education or library services are not anticipated.

Parks and Recreation

The potential for secondary or cumulative impacts to parks and recreational facilities are not anticipated. The mitigative measures as provided in Section 6.10.2. Potential Impact and Mitigation Measures (Parks and Recreation), will address the migration of landfill associated odor, windblown litter migrating to area beaches and parks, and visual impacts.

Other potential secondary effects from impacts to air, water, or soils that might otherwise affect the use of parks and recreational facilities in the area will be subject to the mitigative measures as provided in Sections 5.2. Topography, 5.3. Geology, 5.4. Surface Water, 5.5. Groundwater and Hydrology, and 5.7. Air Quality.

1.4.3. Potential Socioeconomic and Related Environmental Impacts

Socioeconomic Characteristics

Potential secondary or cumulative impacts to the socioeconomic resources of the area and region are possible without implementation of the mitigative measures provided in this EIS document, and the operational and management practices employed by WMH for the proposed project. These impacts involve potential financial losses to area businesses, and resort and residential sales from landfill associated nuisances and environmental impacts as outlined in Section 7.1.3. Community Issues and Concerns, ~~and~~ Section 7.1.4. Socioeconomic Impacts; and Section 7.1.5. Addendum to Socioeconomic Impacts.

If directly attributed to the landfill: (1) the immediate secondary potential impact could involve the loss of income, employment, sales, and tax revenues from the lowering of economic demand for the area; and (2) the cumulative potential impact could involve the long term loss of the capacity of the region to attract future business, residential, and other related economic growth.

The mitigative measures as provided in this EIS to address the socioeconomic resources of the area and region have been proposed to mitigate or reduce the potential for primary impacts that could lead to the potential secondary or cumulative impacts described above. These mitigation measures are provided in Section 7.1. ~~5~~6. Socioeconomic Mitigation Measures, and in other sections of this EIS to maintain the environmental quality of the site and region.

Land Use and Ownership

The proposed project is anticipated to result in the potential for secondary and cumulative land use impacts similar to those associated with the current use of the site. These potential impacts would be an outgrowth of those identified in Section 7.2.3. Potential Impacts and Mitigation Measures (Land Use and Ownership), summarized as:

- The generation of nuisance odors.
- Windblown litter from the landfill becoming airborne and litter from improperly secured loads from refuse trucks and private self-haulers.
- Traffic impacts associated with the transit of vehicles entering and leaving WGSL.
- The tracking of mud and sediments onto Farrington Highway.
- The migration of fugitive dust from landfill operations.
- The modification or loss of mauka view planes toward the WGSL.

These direct impacts could potentially lead to secondary and cumulative impacts that would include the loss or impaired use of land and properties in the affected area. Mitigation to address these concerns is identified and addressed in Section 7.1.~~5~~6. Socioeconomic Mitigation Measures, and in the following Sections to address the specific points above:

- 4.2.3. Environmental Controls, Litter, to address windblown litter.
- 4.4. Dust and Mud, to address tracking of mud and migration of fugitive dust.
- 5.7.3. Potential Impacts and Mitigation Measures (Air Quality), for odor control.
- 5.10.2. Potential Impacts and Mitigation Measures (Scenic and Aesthetic Environment), to address impacts to view planes toward the WGSL.

Historic and Archaeological Resources

There is potential for secondary impacts to historic and archaeological resources that may be present in the area of lateral expansion. Mitigation to address this possibility has been provided in Section 7.3.8. Potential Impacts and Mitigation Measures (Historic and Archaeological Resources), and in Section 7.4.7. Summary and Conclusions, Potential Impacts and Mitigation Measures (Cultural Impact Assessment).

Cultural Impact Assessment

Secondary and cumulative impacts associated with the use of the site involve the potential for the discovery of other cultural resources, artifacts, or burials that may be present at the project site. This potential however, was considered and served as one important reason for the completion of the Archaeological Inventory Survey (AIS) and Cultural Impact Assessment (CIA) for this project.

Mitigation to address the potential for impacts to archaeological and cultural resources will be coordinated between WMH, ENV, and the SHPD and community informants to develop an appropriate plan for treatment for the stone uprights (SIHP # 50-80-12-6903), huakaʻi pō (procession of the night marchers), and six caves and overhangs. The plan will consider the provision of access by cultural practitioners.

In the unlikely event of the discovery of a burial, work in the immediate area will cease until appropriate coordination with the SHPD has been completed. As required, the applicable provisions of law including HRS, Chapter 6E, and HAR, Chapter 13-300 (regarding burials) to maintain the protection of archaeological and cultural resources will be provided by WMH and ENV.

1.5. Consistency with Land Use Plans, Policies, and Controls

1.5.1. Hawai‘i State Plan

The proposed project maintains consistency with the provisions of the State Plan in the following:

> *Section 226-6(b) To achieve the general economic objectives, it shall be the policy of this State to:* (14) Promote and protect intangible resources in Hawaii, such as scenic beauty and the aloha spirit, which are vital to a healthy economy."

The proposed project provides for the safe and effective disposal of municipal refuse for all the communities of O‘ahu. This waste, if not properly managed, could affect O‘ahu's islandwide "…scenic beauty and the aloha spirit, which are vital to a healthy economy." (See Sections 4 through 6 of this document).

> *Section 226-11(b) To achieve the land-based, shoreline, and marine resources objectives, it shall be the policy of this State to: (1) Exercise an overall conservation ethic in the use of Hawaii's natural resources.*

The proposed project is based on the use of an existing City owned facility and is an effort to conserve the limited and precious land resources of O‘ahu. Conservation practices are supported through the promotion of recycling and the generation of energy through H-POWER. Future plans also call for the use of landfill gas to one day be used in the generation of electricity.

> *Section 226-11(b) (2) Ensure compatibility between land-based and water-based activities and natural resources and ecological systems; (3) Take into account the physical attributes of areas when planning and designing activities and facilities; (4) Manage natural resources and environs to encourage their beneficial and multiple use without generating costly or irreparable environmental damage; and (5) Consider multiple uses in watershed areas, provided such uses do not detrimentally affect water quality and recharge functions; and (6) Encourage the protection of rare or endangered plant and animal species and habitats native to Hawai'I; and (8) Pursue compatible relationships among activities, facilities, and natural resources.*

Factors taken into account in the assessment of WGSL include: a relatively dry climate; the absence of drinking/potable groundwater resources that could be adversely affected by a landfill; and the absence of known threatened or endangered species. Protection against potential "costly or irreparable environmental damage", will involve the use of mitigative measures and practices as described in this EIS document.

There is limited space available for facilities such as a landfill. The subject EIS proposes mitigative measures and other practices that reflect the City and WMH's commitment for a well run facility that avoids or minimizes the potential for adverse effects.

> *Section 226-12 (b) To achieve the scenic, natural beauty, and historic resources objective, it shall be the policy of this State to: (I) Promote the preservation and restoration of significant natural and historic resources; (3) Promote the preservation of views and vistas to enhance the visual and aesthetic enjoyment of mountains, ocean, scenic landscapes, and other natural features; (4) Protect those special areas, structures, and elements that are an integral and functional part of Hawaii's ethnic and cultural heritage; and (5) Encourage the design of developments and activities that complement the natural beauty of the islands.*

The preservation and restoration of natural and historic resources has or is currently being addressed through the conduct of special studies of flora, fauna, archaeological, and cultural resources, and through the development of mitigative measures. According to special studies, no known threatened or endangered species were observed at the site. An existing archaeological site was found in the form of three stone uprights along the southwestern edge of the landfill property. To address this discovery coordination for an appropriate treatment plan is in progress. The City intends to work with the SHPD and community to provide appropriate treatment. All required provisions of Chapter 6E, HRS, and other provisions of law governing archaeological preservation and protection will be complied with.

View impacts involve mauka views toward the landfill property. While it is not possible to shield from view the location and features of the entirety of the WGSL, the potential for visual impacts during operation of the landfill will be minimized and mitigated with vegetative controls including the use of hydromulching, and plantings of grass, dryland shrubs, and trees, as provided in the project's landscaping plan.

> *Section 226-14 Objective and policies for facility systems-in general.*
> *(a) Planning for the State's facility systems in general shall be directed towards achievement of the objective of water, transportation, waste disposal, and energy and telecommunication systems that support statewide social, economic, and physical objectives. (b) To achieve the general facility systems objective, it shall be the policy of this State to: (1) Accommodate the needs of Hawaii's people through coordination of facility systems and capital improvement priorities in consonance with state and county plans.*

The proposed project represents a major capital project necessary for the disposal of municipal solid waste and refuse on O‘ahu. The project will serve all of O‘ahu's residents and visitors and is an essential part of the City's refuse management system.

> *Section 226-14 (b)(2) Encourage flexibility in the design and development of facility systems to promote prudent use of resources and accommodate changing public demands and priorities.*

The proposed project will allow flexibility in the development and adoption of future City initiatives that will reduce dependency on landfills: (1) The future adoption of new technologies will require sufficient time for operational viability; (2) There are no existing refuse technologies that do not themselves result in the generation of some refuse that cannot be further recovered, recycled, or otherwise reused. For these forms of waste, a landfill is the most viable method of disposal; (3) Any effort to reduce the volume of refuse being landfilled would benefit O‘ahu through an extension of the life of the landfill. Landfill capacity that is not used would forestall the need to seek a new landfill location; (4) The landfill serves as a public resource in the event of a natural disaster such as a hurricane, earthquake or tsunami. A location for the disposal of cleanup and demolition debris would be required to meet public health and safety requirements during recovery.

> *Section 226-14 (b)(3) Ensure that required facility systems can be supported within resource capacities and at reasonable cost to the user.*

The proposed project represents the effort to expand an existing public facility that is owned by the City & County of Honolulu. The expansion will be supported within the existing resource capacity of the site and at reasonable taxpayer cost.

> *Section 226-15 Objectives and policies for facility systems-solid and liquid wastes. (a) Planning for the State's facility systems with regard to solid and liquid wastes shall be directed towards the achievement of the following objectives: (1) Maintenance of basic public health and sanitation standards relating to treatment and disposal of solid and liquid wastes. (b) To achieve solid and liquid waste objectives, it shall be the policy of this State to: (2) Promote re-use and recycling to reduce solid and liquid wastes and employ a conservation ethic, and (3) Promote research to develop more efficient and economical treatment and disposal of solid and liquid wastes.*

The proposed project will facilitate the maintenance of public health and sanitation standards with regard to the disposal of MSW and refuse. Although the proposed project does not in itself involve recycling, the City, through its Solid Waste Integrated Management Plan identifies recycling and materials recovery efforts to reduce O‘ahu's overall dependency on the need for landfills.

The City has promoted the investigation and adoption of technology based methods that have proven to be efficient and economic in the reduction and treatment of solid waste. Examples include a solids digester facility and recent efforts to upgrade H-POWER.

> *Section 226-104 (b) Priority guidelines for regional growth distribution and land resource utilization: (2) Make available marginal or non-essential agricultural lands for appropriate urban uses while maintaining agricultural lands of importance in the agricultural district.*

The proposed project involves the use of agricultural land that has not been classified by the Agricultural Lands of Importance to the State of Hawai‘i (ALISH) system. The non-essential agricultural nature of the land can be considered as a use that would allow for the maintenance of other, more important agricultural lands.

> *Section 226-104 (b)(9) Direct future urban development away from critical environmental areas or impose mitigating measures so that negative impacts on the environment would be minimized; (12) Utilize Hawai'i's limited land resources wisely, providing adequate land to accommodate projected population and economic growth needs while ensuring the protection of the environment and the availability of the shoreline, conservation lands, and other limited resources for future generations; and (13) Protect and enhance Hawaii's shoreline, open spaces, and scenic resources.*

The proposed project has been evaluated with regard to the potential for adverse effects to critical environmental features or habitat. There are no known threatened or endangered species present and as appropriate, mitigative measures are proposed to minimize, mitigate, or otherwise reduce the potential for adverse environmental impacts.

The WGSL has the potential to continue to support O‘ahu's refuse disposal requirements for the next approximately 15 years. This use would support and preempt the use of other locations until such time that the present site has reached capacity.

As noted, this EIS document identifies the appropriate application of mitigative measures and practices to avoid the potential for adverse environmental impacts as a result of development for the area of lateral expansion.

1.5.2. State Functional Plans

The proposed project is considered to be relevant and consistent with the State Energy and Recreation Functional Plans.

1.5.3. State Land Use Law

The proposed project is located within the State Agricultural District. Because the project is in the State Agricultural District, a State Special Use Permit or State Land Use District Boundary Amendment must be obtained for the proposed expansion.

1.5.4. Special Management Area

According to the City SMA Boundary Map for the Ewa area, the proposed project site is located outside of the SMA and is therefore not subject to SMA regulation.

1.5.5. Coastal Zone Management Program

The following is an assessment of the project with respect to the CZMP objectives and policies set forth in HRS Section 205(A)-2.

1. Recreational resources

The proposed facility is not located on the coastline or shoreline and does not involve the use of coastal resources. The site is not in a location suitable for the development of new shoreline recreational opportunities or to dedicable shoreline areas with recreational value. However, with the eventual reclamation of the site, future recreational park opportunities may one day become available.

2. Historic resources

Archaeological investigation of the site has resulted in the discovery of three stone uprights in early 2007. To address the uprights: (1) the SHPD was notified to ascertain further actions or requirements to ensure no disturbance; and (2) notification and coordination with appropriate parties as determined by SHPD that includes the Office of Hawaiian Affairs (OHA) and SHPD-designated cultural informants from the area. The process of coordination to develop an appropriate treatment plan to preserve the uprights is in progress.

3. Scenic and open space resources

The majority of the proposed project will not be visible from most vantage points along the Farrington Highway in the Wai‘anae or Kahe Point directions. The existing Kahe Point ridge line provides screening of views of the landfill, including the proposed expansion area.

The general area that fronts Waimānalo Gulch from the Kai Lani subdivision to Ko Olina Beach Club will be the most potentially impacted. Mitigation to reduce visual impacts has been initially implemented and will be modified for the proposed project. The existing site has a 400-foot-wide vegetative buffer strip along the eastern portion of the site with a north-south separation of 800 to 1,000 feet. The existing landfill has been hydromulched to begin the growth of grasses. The landscaping effort, once established, will resemble vegetation on adjoining hillsides. In time, plant species in the surrounding areas are expected to spread into the closed areas of the landfill through natural seeding.

4. Coastal ecosystems

The proposed project is not expected to have any adverse effects on coastal or marine coastal ecosystems. The location of the project is mauka of the shoreline and the Farrington Highway.

5. Economic uses

Although the proposed project is not a coastal dependent facility, the location of the project site was based on selection criteria and governmental regulations that establish the suitability of the site for use as a landfill. This land use is not expected to affect the location or expansion of future coastal dependent developments.

6. Coastal hazards

The potential for hazards from storm wave, tsunami, hurricane, wind, flood erosion, subsidence, and point and nonpoint source pollution are addressed through adherence to the landfill site operating manual and all required regulatory permits. Coastal flooding is not anticipated based on the location of the project inland and upgradient of the Farrington Highway.

7. Managing development

WGSL is in the State Agricultural District. The zoning is AG-2, General Agricultural. Land uses are subject to regulation by the State and City. All improvement activities will comply with State and City & County of Honolulu environmental rules and regulations.

8. Public participation

Public involvement will consist of public notification of the project as provided in the Office of Environmental Quality Control (OEQC) Bulletin. See Section 13, Organizations, Agencies, and Public Parties Consulted in the Environmental Impact Statement Process. All written public comments to ~~this~~ the DEIS will be provided with a written response and as appropriate, mitigation measures will be developed to address issues and concerns. As needed, additional information has been provided in this FEIS to address concerns and issues raised.

9. Beach protection

The proposed project is not located along the shoreline or beach. No structures are proposed seaward of the shoreline. Control of erosion will be based on conformance to standards of the City regulating the control of erosion.

10. Marine resources

The proposed project does not involve or utilize marine resources.

1.5.6. City & County of Honolulu General Plan

The proposed project is consistent with the following General Plan objectives and policies:

> *"I. Population*
> *Objective B: To plan for future population growth; Policy 1: Allocate efficiently the money and resources of the City and County in order to meet the needs of Oahu's anticipated future population; and Policy 2: Provide adequate support facilities to accommodate future growth in the number of visitors to Oahu."*

Although the proposed project does not directly influence future population growth, it represents an important public facility serving the island of O‘ahu by providing a location and means for the disposal of municipal refuse. In this regard the project is a necessary use of resources to meet future population needs and growth in the number of visitors.

> *"III. Natural Environment*
> *Objective A: To protect and preserve the natural environment; Policy 1: Protect Oahu's natural environment, especially the shoreline, valleys, and ridges, from incompatible development; Policy 2: Seek the restoration of environmentally damaged areas and natural resources; and Policy 4: Require development projects to give due consideration to natural features such as slope, flood and erosion hazards, water- recharge areas, distinctive land forms, and existing vegetation."*

The proposed project will require an expansion of use and require transformation of the existing site into space that will be used for landfilling. With the eventual closure of the site, the land is expected to be reclaimed for other purposes that may be considered more compatible with the area surroundings, such as park space that will constitute a public purpose and benefit.

> *"V. Transportation & Utilities*
> *Objective B: To meet the needs of the people of Oahu for an adequate supply of water and for environmentally sound systems of waste disposal; Policy 3: Encourage the development of new technology which will reduce the cost of providing water and the cost of waste disposal; Policy 4: Encourage a lowering of the per-capita consumption of water and the per-capita production of waste; Policy 5: Provide safe, efficient, and environmentally sensitive waste-collection and waste-disposal services; Policy 6: Support programs to recover resources from solid-waste and recycle wastewater; and Policy 7: Require the safe disposal of hazardous waste."*

The proposed project is designed to serve as an environmentally sound method for the disposal of municipal solid waste and ash. New technology based solutions will continue to be evaluated by the City. At this time however, there are no new technologies with proven feasibility of performance or that would completely eliminate the generation of waste by-products that would require disposal (see **Appendix K**).

The recovery of resources from solid waste is already occurring through the recycling of waste materials into energy through the City's H-POWER facility. Plans for the expansion of the H-POWER have been proposed by the City. It is possible in the future that as new and emerging technologies demonstrate feasibility of application for the City that such technologies will be adopted. At this time, however, there are no alternatives that could by itself address the need for landfilling.

The WGSL does not accept hazardous waste.

> *"VIII. Public Safety*
> *Objective B: To protect the people of Oahu and their property against natural disasters and other emergencies, traffic and fire hazards, and unsafe conditions. Policy 2: Require all developments in areas subject to floods and tsunamis to be located and constructed in a manner that will not create any health or safety hazard; and Policy 8: Provide adequate search and rescue and disaster response services."*

In the event of a public emergency involving hurricane, tsunami, or earthquake, WGSL will serve as a repository for disaster debris. This use will promote public safety through the disposal of debris that could otherwise accumulate in populated areas.

1.5.7. City & County of Honolulu ‘Ewa Development Plan (‘Ewa Sustainable Communities Plan)

The proposed project will be evaluated for consistency with the updated ‘Ewa Development Plan (DP), as appropriate, during the preparation of the project EIS, and upon completion of the ‘‘Ewa DP five-year review. The project site is depicted on the ‘Ewa DP within the Preservation District on the plan’s illustrative Open Space and Phasing Maps. The ‘Ewa DP discusses the analysis and recommendations of the Solid Waste Integrated Management (SWIM) Plan, prepared by the Department of Public Works and last adopted by the Honolulu City Council in 1995. The Ewa DP states that the SWIM Plan identified the Waimānalo Gulch as having potential for expansion; however, siting and/or expansion of sanitary landfills should be analyzed and approved based on islandwide studies and siting evaluations (such as the Chapter 343, HRS, EIS process which is the subject of this document).

The Development Plan Public Facilities Map also depicts a symbol for the existing landfill facility, but does not delineate the boundaries of the landfill.

1.5.8. City & County of Honolulu Zoning Law

The project site is zoned AG-2 General Agricultural District. According to the Land Use Ordinance, the landfill is a "public use" and is permitted in the AG-2 General Agricultural District.

1.6. Unresolved Issues

1.6.1. Preservation of Stone Uprights

The final disposition of the three stone uprights discovered at WGSL are in the process of review and coordination with the SHPD, Office of Hawaiian Affairs, and SHPD's designated cultural informants to identify and define an appropriate course of preservation.

The location of the stone uprights has the potential to affect the planned construction of the site depending on the need for site adjustments to accommodate the area containing the uprights. This effect is expected to be known only after the SHPD decision regarding the preservation plan for the uprights. As applicable, this decision will be factored into the final design and engineering, and construction drawings that will be prepared for the proposed project.

1.6.2. Final Engineering Construction Details

The detailed final landfill phasing and engineering plans will be prepared by WMH. Although the final phasing plans are not yet complete, the area of use for active landfill cells is approximately ~37 acres, within the planned 92.5 acres of lateral expansion. The remaining areas of the 92.5 acre not planned for landfill cells will be used for stockpiling of landfill cover material, utilities including access roadways and drainage controls, landscaping, and related landfill associated purposes.

1.6.3 Release of Crushed Rock from the Site

The proposed project will result in the generation of recovered soil, cobbles and boulders from excavation and grading of the site. Material that is suitable use as cover material will be stockpiled and used for landfill cover. A decision regarding the release or possible sale of any excess material has not yet been determined. The City & County of Honolulu, however, retains the ownership rights to any excavated materials. Since August 1, 1991, the City has received royalties for any excavated and processed material removed from the WGSL.

1.6.4. EPA Notice of Violation (NOV)

Because the EPA's NOV is currently under discussion amongst the EPA, the City and Waste Management, no final determination as to the alleged violations has been made. There is no relationship between the EPA NOV and the City's sewer systems.

1.6.5. Elevated Temperatures

Landfill gas temperatures at the WGSL exceed the EPA specified maximum temperature due to atypical chemical and biological processes that are unique to the site. WMH has shown that the elevated temperatures have not caused a fire. Notification of the operating characteristics of the WGSL have been reported to the EPA to ensure sufficient monitoring and operating standards are carried out to maintain safety and security of the site, and to propose the granting of an alternate operating standard. WMH is currently awaiting a response from the EPA and will coordinate appropriate measures to maintain compliance with all regulations as required by law.

1.6.6. Appeals of Decisions to Extend SUP to November 1, 2009

Colleen Hanabusa and the Ko Olina Community Association (KOCA) filed two appeals challenging the Planning Commission's and the Land Use Commission's approvals of an amendment to the SUP to extend the deadline for waste acceptance at WGSL. The appeals were consolidated on June 25, 2008. Oral argument was heard on October 1, 2008, and the Circuit Court dismissed the appeal challenging the Planning Commission's decision and affirmed the LUC's decision. (See Section 11.6. Appeals of Decisions to Extend SUP, for detail).

1.7. Summary of EISPN Comments and Responses

A table summarizing the written comments received from the EISPN, the responses prepared, and the DEIS sections referencing the responses, as appropriate, is provided in Table 1-~~1~~2, Summary of Draft EIS Comments and Responses to the WGSL EISPN.

1.8. Summary of DEIS Comments and Responses

A table summarizing the written comments received from the DEIS, the responses prepared, and the FEIS sections referencing the responses, as appropriate, is provided in Table 1-3, Summary of Final EIS Comments and Responses to the WGSL DEIS.

Table 1-2
Summary of Draft EIS Comments and Responses to the WGSL EISPN

Table 1-~~1~~2: Summary of Draft EIS Comments and Responses to the Waimanalo Gulch Sanitary Landfill Expansion Environmental Impact Statement Preparation Notice (EISPN)

Note: *See Section 15. Comments and Responses to the EISPN for the comment and response letters.

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
1.	Boisse P. Correa, Chief of Police	11/28/2006	
	Honolulu Police Department		
	City & County of Honolulu		
1.1	This project should have no unanticipated impact on the facilities or operations of the Honolulu Police Department.		See response letter. Section 6.5. Police Protection. The proposed project should have no unanticipated impact on the Police Department.
2.	Lester K. C. Chang, Director	11/30/2007	
	Department of Parks and Recreation		
	City & County of Honolulu		
2.1	The Department of Parks and Recreation has no comment and as the proposed expansion will have no impact on any program or facility of this department, you are invited to remove us as a consulted party to the balance of the EIS process.		See response letter. Section 6.10. Parks and Recreation. The proposed project will have no impact on any program or facility of DPR. DPR has requested to be removed as a consulted party to the EIS process.
3.	Denis R. Lau, P.E., Chief	11/30/2007	
	Department of Health - Clean Water Branch		
	State of Hawaii		
3.1	The Draft Environmental Impact Statement should address the impacts to state waters and controlling pollutants in storm water runoff in accordance with Hawaii Administrative Rules (HAR), Chapters 11-54, 11-55 and 11-58.1.		See response letter. Section 4.6. Stormwater Management, Section 5.4. Surface Water, describes the measures to address compliance with HAR 11-54, 11-55, and 11-58.1.
3.2	Construction activities related to the expansion requires National Pollutant Discharge Elimination System (NPDES) general permit coverage for storm water associated with construction activity. A Notice of Intent (NOI) form for NPDES general permit coverage should be submitted at least 30 days before the commencement of construction activities.		See response letter. Section 12. Permits and Regulatory Approvals That May be Required. A permit application for the NOI Form C, Construction Stormwater permit application will be prepared and filed.
3.3	Any other discharge from the project, including, but not limited to, treated effluent from leaking underground storage tank remedial activities, hydrotesting water, and construction dewatering effluent, requires separate NPDES general permit coverages. Please see Item 2 above for information regarding the submittal of NOI.		Section 12. Permits and Regulatory Approvals That May be Required. Construction activities for the proposed project that generate storm and non-stormwater discharges to state waters will be subject to the NPDES regulations. Should the proposed project be approved, the appropriate NPDES permit applications will be prepared and filed for the area of expansion. A list of the permit applications that may be required will be provided in the DEIS.
3.4	The existing portion of the facility currently has coverage under the NPDES general permit for discharges of storm water associated with industrial activity. This coverage expires on November 6, 2007, and a renewal NOI must be submitted before the expiration date. A reminder will be sent to you next year. When the expansion project is completed, the Storm Water Pollution Control Plan for the facility must be revised to address the expanded area and submitted to our office.		Section 12. Permits and Regulatory Approvals That May be Required. The NPDES NOI Form B permit application will be filed and will contain the project's revised Storm Water Pollution Control Plan for the proposed area of expansion.
3.5	In accordance with HAR, Section 11-55-38, the applicant for an NPDES permit is required to either submit a copy of the new NOT or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the DOH that the project, activity, or site covered by the NOT or application has been or is being reviewed by SHPD. If applicable, please submit a copy of the request for review by SHPD or SHPD's determination letter for the project.		See response letter. "Information concerning compliance with SHPD regulatory requirements will be provided in the DEIS. Documents that will be submitted to the SHPD for review will include an archaeological study of the planned area of expansion, and copies of the NPDES permit applications, as applicable." Section 12. Permits and Regulatory Approvals That May be Required, and Section 7.3. Historic and Archaeological Resources, provides information concerning compliance with SHPD regulatory requirements and includes an archaeological study of the planned area of expansion.
3.6	Any discharges related to project construction or operation activities, with or without a Section 401 Water Quality Certification or NPDES permit coverage, shall comply with the applicable State Water Quality Standards as specified in HAR, Chapter 11-54.		See response letter. Section 12. Permits and Regulatory Approvals That May be Required. The requirement that all project construction activities must comply with HAR, Chapter 11-54, Water Quality Standards, is noted and will be complied with should the proposed project be approved.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
3.6 The Hawaii Revised Statutes, Subsection 342D-50(a), requires that "[No] person, including any public body, shall discharge any water pollutants into state waters, or cause or allow any water pollutant to enter state waters except in compliance with this chapter, rules adopted pursuant to this Chapter, or a permit or variance issued by the director."		See response letter. Section 12. Permits and Regulatory Approvals That May be Required. The City and its operator, Waste Management of Hawaii, will comply with the requirements the subject section.
4. Patricia Hamamoto, Superintendent	12/8/2006	
Department of Education, State of Hawaii		
4.1 No comment at this time.		NA
5. S. B. Teramoto, Board Vice President	12/11/2006	
AOAO at The Coconut Plantation		
5.1 The Waimanalo Gulch Landfill continues to adversely impact the surrounding areas of Ko Olina with odors, dust and a constant stream of trucks. The Association of Apartment Owners at The Coconut Plantation, whom I am representing, are very concerned with the open issues of garbage still being piled higher than a permit allows and the level of leachate - liquid seepage from garbage is not totally monitored. We have seen flying trash and plastic bags that litter the roadways, parks, nearby residences and eventually polluting our ocean.		See response letter. The height of the existing landfill was coordinated with the State Department of Health (DOH) through a request for a height modification submitted in February 2006. On February 20, 2008, the DOH approved the height modification request based on thorough stability analyses. Leachate generated from the operation of the existing area of landfill is currently being monitored in accordance with DOH requirements. Litter management practices for the proposed site are provided in Section 4.2.3. Environmental Controls, Litter.
5.2 This landfill has reached its safe limit for its size and proximity to the ocean. It has previously been determined that the area between the gulch and the waterfront can only handle the load point that is now being reached.		See response letter. Section 4. Project Description; Section 5.2. Topography; Section 5.3. Geology; Section 5.4. Suface Water; and Section 5.5. Gorundwater and Hydrology, discuss the ability of the site to support the planned lateral expansion of the landfill and includes a description of the proposed area of use and its capacity.
5.3 Another concern is the run-off of storm water that comes from the landfill. This run-off is detrimental to our reefs, which are of great importance to the tourism business, here on the Leeward Coast. The artificial reef created by the warm water discharge pipe at the power station is the best snorkeling on the Leeward Coast of the Island and the life blood for numerous charter operations for both Ko Olina Marina and Waianae Harbor. All around this small section (about 500 yards to the right of the gulch), the reefs are dying as the coral heads and fish are smothered by the mud and contaminates that are allowed to flow into our ocean. To expand the landfill beyond current limits is guaranteed to adversely effect the ocean environment here for decades. ...It is imperative to have the environmental study incorporate how compliance enforcement is to be adhered to. So far it appears we have been failed by the watch dog organizations. It is our position that the Waimanalo Landfill be closed		See response letter. Section 4. Project Description; Section 4.6. Stormwater Management. Describes the stormwater management controls of the existing and planned lateral landfill expansion. This includes a discussion of the potential for impacts to nearshore waters as well as mitigative measures, as appropriate, to ensure protection of the ocean coastal resources. Section 5.10. Scenic and Aesthetic Environment addresses mitigation for visual impacts. Section 5.7. Air Quality addresses mitigation of landfill associated odors. Section 4.2.3. Environmental Controls, Litter, addresses windblown litter control. Section 4.4. Dust and Mud addresses dust control.
6. Orlando "Dan" Davidson, Executive Director	12/12/2006	
Hawaii Housing Finance and Development Corporation		
State of Hawaii		
6.1 We have no housing-related comments to offer.		NA
7. Eugene C. Lee, P.E., Director	12/12/2006	
Dept. of Design and Construction		
City & County of Honolulu		
7.1 Department has no comments to offer at this time.		NA
8. Steve Kelly, Manager - Entitlements & Infrastructure	12/13/2006	
Makaiwa Hills, LLC		

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
8.1 Makaiwa Hills LLC ("MH LLC") is the fee owner of approximately 1,700 acres of property ("Property") located on the eastern boundary of the Waimanalo Gulch Landfill ("Waimanalo Gulch"). As part of the Environmental Impact Statement ("EIS") Public Scoping process, MH LLC submitted a letter dated August 29,2006, which outlined concerns regarding blasting activity that had been occurring near the western portion of the Property. MH LLC expressed concern that the aforementioned blasting activity, as well as any future activity could threaten the Property's structural integrity.		See response letter. Section 5.8. Acoustic Characteristics. Controlled blasting is discussed and appropriate controls are described to prevent against the potential for adverse impacts. Section 4. Project Description and Section 5.3. Geology. The potential for geologic structural and related potential impacts and planned mitigation measures are discussed.
8.2 Structural integrity of the slope along Waimānalo Gulch's eastern boundary line.		See response letter. Section 4.1. Construction Activities, Section 5.3. Geology. The specific locations and details associated with some of the items will not be fully known or finalized at the time the EIS is processed. The intention of ENV and WMH is to closely coordinate the work activities required to mitigate and minimize any potential for impacts. As much as possible, the DEIS will describe the structural integrity of the site, operational practices, and other practices that will be used to ensure a well run and operated facility.
8.3 Proposed operations near Waimānalo Gulch's eastern boundary line.		See response to Item 8.2.
8.4 Proposed access points for any expansion of Waimanalo Gulch near the eastern boundary.		See response to Item 8.2.
8.5 The eventual height of Waimānalo Gulch along its eastern boundary.		See response to Item 8.2.
8.6 The distance from the top of slope to the Waimanalo Gulch eastern property line.		See response to Item 8.2.
8.7 Blast distances from Waimanalo Gulch's eastern property line.		See response to Item 8.2.
9. Deborah Kim Morikawa, Director	12/14/2006	
Department of Community Services		
City & County of Honolulu		
9.1 The subject project will have no impact on the projects and programs of the Department of Community Services.		NA
9.2 However, we believe it is worth noting in the Draft and Final EIS that the City and County of Honolulu will be allocating a $2 million community benefits package to offset the impact of the Waimanalo Gulch landfill. The intent is that $1 million will go to the Department of Parks and Recreation for parks improvements to the areas most directly affected by the landfill. The rest of the money will be used by the Department of Community Services to provide grants and services that will address problems or concerns identified by residents.		See response letter. Section 7.1.3.2. Community Issues and Concerns Regarding WGSL. The City has allocated a $2 million community benefits package in fiscal year (FY) 2007 to communities in the vicinity of the Waimanalo Gulch landfill. The Administration proposes additional funding to continue the community benefits program to Leeward Communities in the next FY.
10. Genevieve Salmonson, Director	12/15/2006	
Office of Environmental Quality Control		
State of Hawaii		
10.1 Notice of the Nānākuli EISPN was published in our May 23rd, 2006 Environmental Notice. In the draft EIS fully discuss the relation between the currently proposed expansion of Waimānalo Gulch and Nanakuli B.		See response letter. Section 9.6. Alternative Sites for a Municipal Landfill. Nānākuli B landfill is considered an alternative to the proposed project but is not considered viable by the ENV.
10.2 In February 2006 the State DOH issued a Notice and Finding of Violation and Order against Waste Management of Hawaii and the City & County of Honolulu for 18 alleged violations of solid waste management laws, regulations, and permit conditions at Waimanalo Gulch Landfill. When and how will these alleged violations be corrected? What assurance does the public have that these alleged violations will not occur in the expansion area?		Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. All alleged violations in the NVO have been resolved.
10.3 A list of acronyms and abbreviations used in the text would be helpful for the reviewer. Please include such a list in the draft EIS.		See response letter. Table of Contents. A list of acronyms is included in the EIS document.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
10.4 A list of agencies and community groups to be consulted during the EIS process was not included in the EISPN. Include this list in the EIS.		See response letter. Section 13. Organizations, Agencies, and Public Parties Consulted in the Environmental Impact Statement Process, provides this list.
10.5 In the DEIS permits list (or chart) be sure indicate the status of each.		See response letter. Section 12. Permits and Regulatory Approvals That May be Required. The DEIS includes the status of the permits and approval that may be required.
10.6 The text accompanying this figure indicates that the Kahe power plant lies to the east of the landfill, while in the figure it lies to the west. Please correct this in the draft EIS.		See response letter. Section 4.1.1. Project Location, Section 7.2.1. Regional Land Uses, Section 7.2.2. Properties within Proximity to the Proposed Project. The location of the HECO power plant is west of the WGSL and is acknowledged.
11. Keith S. Shide, Principal Executive	12/18/2006	
Board of Water Supply		
City & County of Honolulu		
11.1 We have no objections to the proposed project.		NA
12. Kenneth G. Silva, Fire Chief	12/19/2006	
Honolulu Fire Department		
City & County of Honolulu		
12.1 The Honolulu Fire Depaertment has no additional comments. Please refer to our letter dated June 29, 2001, to acting Director, Timothy E. Steinberger.		See response letter. Section 6.6. Fire Protection. The 6/29/01 letter references the provision of fire apparatus access. Fire apparatus access will be provided for the project duration. Waste Management of Hawaii, will notify the Fire Department if there be any issues with maintaining access.
13. James Hodge **Hawaiian Waste Systems, LLC**	12/20/2006	
13.1 Identification of appropriate waste; acceptable versus unacceptable waste: Because Roosevelt Landfill is a RCRA Subtitle D facility, it does not accept any hazardous or "dangerous" wastes as defined by the Resource Conservation and Recovery Act. Thus, multiple layers of protection against the inclusion of hazardous waste in Hawaiian waste bales will be in effect in HWS' process... HWS' screening process will be reviewed and regulated by the State of Hawaii Department of Health, USDA and the Klickitat County Health Department, all subject to US EPA Subtitle D regulations.		See reponse letter.
13.2 Locations for staging, handling and processing of waste for subsequent shipment/export: Oahu has a number of suitable locations for waste processing facilities that could be easily developed... HWS has identified a location for waste transshipment and is currently proceeding with its development.		See reponse letter.
13.3 The range of (financial) costs associated with transshipment: It is estimated that the cost of transshipment will be dramatically less than other "new technology" alternatives that have been examined by the City of Honolulu, and competitive (considering relative capital investment) with traditional alternatives such as new landfills or incinerators."		See reponse letter.
13.4 Potential environmental costs for the City and County of Honolulu: Waste transshipment will have a positive environmental impact on essential sanitary services in the City and County of Honolulu. The City and County has tried unsuccessfully to site new landfills or secure alternative technologies. Waimanalo Gulch Sanitary Landfill is no longer located in an optimal area due to urban infill. Because of these issues, Honolulu is in desperate need of disposal alternatives. HWS' export system presents an alternative that is environmentally secure over a short or long-term period...		See reponse letter.
13.5 Potential environmental costs for the mainland U.S. facility receiving the waste: Roosevelt Landfill was designed and engineered to be one of the world's most environmentally secure landfills... Allied Waste, the second largest solid waste company in the United States and owner/operator of Roosevelt Landfill, provides complete indemnification to its solid waste customers by taking title to all solid waste entering the facility.		See response letter. The engineering and operating standards of the Roosevelt Landfill, approximately 2,500 miles or more from Honolulu, are acknowledged.

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
13.6	Transshipment leading to Oahu 's dependency on resources out of its control: Waste export has become such an integral part of solid waste management in the United States that Hawaii is now the only US state that does not export or import any waste... We encourage the EIS process to review the prevalence and commonality of regional landfilling throughout the mainland US.		See reponse letter.
13.7	The receiving state will assume the long term environmental management issues and problems associated with accepting Oahu's refuse: Klickitat County, host municipality of the Roosevelt Landfill, conceived of and developed the facility via a public procurement process as an economic development initiative... The Klickitat County Commissioners have been kept apprised of HWS' export project in Honolulu, and have sent letters to officials in Hawaii supporting the concept and inviting them to visit Roosevelt... Roosevelt Landfill's capacity - permitted for 5 million tons annually and 220 million tons overall, with room for expansion - is such that waste from Honolulu would not significantly impact its ability to meet current and future domestic waste disposal needs.		See reponse letter.
14.	**Clyde W. Nāmu'o, Administrator**	12/21/2006	
	Office of Hawaiian Affairs		
	State of Hawaii		
14.1	Although we appreciate that an Environmental Impact Statement (EIS) is being prepared for this project, we point out that the purpose of Hawaii's EIS law is not to justify the environmental effects of government actions after economic and technical decisions have been made. Rather, the purpose is to "ensure that environmental concerns are given appropriate consideration in decision making along with economic and technical consideration." HAR § 11-200-1. In line with this purpose is the requirement that "the agency shall assess at the earliest practicable time the significance of potential impacts of its actions, including the overall, cumulative impact in light of related actions in the region and further actions contemplated." HAR § 11-200-5.		See response letter. This comment is acknowledged.
14.2	This EISPN appears to address the isolated issue of expanding a landfill, and not the comprehensive issue of sustainable waste management on O'ahu... Without guidance of a comprehensive waste management plan for the island, the cumulative impacts of a single landfill cannot be analyzed.		See response letter. Section 1. Executive Summary, indicates the EIS is being developed in conjunction with the preparation of the Solid Waste Integrated Management (SWIM) Plan. While the SWIM Plan will provide the policy guidance and direction for the future handling of Oahu's solid waste through a number of projects and facilities that include Waimanalo Gulch. Cumulative Impacts are also discussed.
14.3	... it appears that this EIS is being prepared merely to discuss and possibly mitigate environmental effects, rather than to serve as an "informational document" to guide the County's decision-making...this use of the EIS process misses the point of the EIS law to encourage discussion of environmental issues before important decisions are made...the County must comprehensively analyze innovative and environmentally friendly waste disposal methods that are appropriate for our island state.		See response letter. Section 9. Alternatives to the Proposed Action, Section 7.1.5.3. Improving the Commitment to Alternative Solutions to Landfilling. ENV has been actively involved in the exploration of alternative methods and technologies to waste reduction and disposal and will continue to do so.

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
14.4	We request that the forthcoming EIS include a detailed analysis of the reasons behind the current SUP condition to close the landfill by 2008. We also request that the EIS clearly state the changed circumstances or other reasons that prevent the applicant from honoring its commitment to close Waimanalo Gulch Landfill. The EISPN at page 1-3 notes that the Mayor's Advisory Committee, which was formed in December 2003 to recommend different landfill sites, chose to consider Waimanalo Gulch, which was then ranked the highest among the choices. Please discuss the ranking criteria used, as well as the why Waimanalo Gulch was still considered, despite the goal of the Committee to recommend a different site. Please also discuss what good faith efforts were made to find other suitable landfill sites, and how the applicant attempted to comply with the LUC's purpose and intent behind conditioning the SUP on closure by 2008.		See response letter. Section 2. Project Background. Describes the events, including the SUP, and the current status of the WGSL closure date. 2.2.2. Council Resolution 04-348, CD1, FD1, Selecting a Site for a New City Landfill. Describes further detail re selection of Waimanalo Gulch despite the goal of the Mayors Advisory Cmte. on Landfill Site Selection to select another site. Section 9. Alternatives to the Proposed Action. Describes the work of the Committee. Section 7.1.5.3. Improving the Commitment to Alternative Solutions to Landfilling. Documents prior activities by ENV to consider alternatives to landfilling.
14.5	We also request that the EIS address the various health concerns that have been raised by the Department of Health, and how these problems will be addressed and prevented in the future. In addition, please provide detailed analysis of how impacts to the surrounding community will be mitigated, including proposed benefits packages.		See response letter. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health provides info. on the DOH Notice of Violation and Order which occurred after it had been self-reported by Waste Management of Hawai'i, Inc. The great majority of the alleged violations were addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. All alleged violations (environmental and health concerns) in the NVO have been resolved.
15.	**Laverne Higa, P.E., Director and Chief Engineer**	12/22/2006	
	Department of Facility Maintenance		
	City & County of Honolulu		
15.1	No comments to offer at this time. Expansion of the landfill will have negligible impact on our facilities and operations.		NA
16.	**Rida Cabanilla, State Representative**	12/22/2006	
	House of Representatives		
	State of Hawaii		
	Please consider the sentiments of those that took possession of property nearby the landfill with the understanding that their ownership would not be subjected to particular operations of the landfill, let alone another expansion of it beyond May 1, 2008... It is the duty and obligation of Legislators and the Judiciary to oversee that agreements tended to, are adhered to within their respective jurisdictions. In the capacity of being a State Representative, I urge those making the decision on the expansion to include approximately 92.5 acres be rendered inappropriate and dismissed... Your favorable consideration to explore other means to mitigate the disposal/storage of waste is greatly appreciated...		See response letter. The EISPN, Section 1, Project Background, identifies the option of closing WGSL as not now available to the City. Section 9. Alternatives to the Proposed Action, identifies alternatives to the continued long-term use of the landfill investigated by the City. Section 7.1.5.3. Improving the Commitment to Alternative Solutions to Landfilling, identfies prior efforts by the City to promote alternative technology and waste reduction.
17.	**Ralph F. Harris, President**	12/23/2006	
	Ko Olina Fairways - Association of Apartment Owners		
17.1	Our community and our neighbors in abutting communities have relied on the pending closure of the Landfill. We have invested enormous time and effort since the incomplete and flawed DEIS and SEIS effort of 1999 and 2002 ended with a commitment from the City government and the Mayor to close the site to Municipal Waste in 2008. For the City to change directors in the Department of Environmental Services and then re-launch a plan to continue using the Waimanalo Dump past the closure date is an insult to our island community and an example of a government system out of control.		See response letter.

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
17.2	Yes we attended the community meeting sponsored by your department at Nanakuli High School and although you have made this resurrection attempt with consultant facilitators there was not one person supporting the City's effort! In fact, Kumu Kamaki Kanahele said it all at the meeting with the same emotion and disbelief that most of us believe in seeing the City's total disregard and disrespect of previous community input facing the flawed efforts of the past and through meetings too numerous to recall.		See response letter.
17.3	The best I can say is that homeowners in our association are dumbfounded by this re-assessment of the problem after (please count them) EIGHT (8) years [l999-2006] wherein the City does not have a solid waste alternate site but does have a plan and commitment to the community to close Waimanalo Gulch in Kapolei! When you look at the time line over the past eight (8) years the City could have located and prepared the alternate site for business well before the closure date in 2008 for Waimanalo Gulch in Kapolei.		See response letter. Section 7.1.5.3. Improving the Commitment to Alternative Solutions to Landfilling, also identfies prior efforts by the City to promote alternative technology and waste reduction.
17.4	We are opposed to this restart of the EIS preparation process for the subject site and recommend that the alternative site or alternative waste disposal methods are developed and close Waimanalo Gulch at Kapolei on time in May 2008.		See response letter. Section 9. Alternatives to the Proposed Action, identifies alternatives to the continued long-term use of the landfill investigated by the City.
17.5	We agree with the comments of Cynthia Rezentes and Senator Colleen Hanabusa and others published in the EIS Preparation report regarding the many detailed issues and comments that have not been resolved and will need to be a part of the new EIS process. We find that in the face of litigation and mismanagement of the facility that the City continues to shape the decision making process to match a predetermined objective.		See response letter. Comment is acknowledged.
17.6	Our association will be actively involved in every effort to close the Waimanalo Gulch Landfill located in Kapolei as we believe there is a conflict in land use, there are pending legal issues involving $2.8 million dollars in fines to the City that are directed at the poorly operated facility and that this location is not acceptable.		See response letter. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. All alleged violations in the NVO have been resolved.
17.7	The State and the City have designated Kapolei and West Oahu as growth areas with designated mass transit needs and increasing populations. Please drive the roads and highways in Kapolei and see for yourself the litter and filth that travels here daily by truck.		See response letter. The presence of the existing Waimanalo Gulch has made possible economic growth and development through the use of a site for the safe and efficient disposal of municipal refuse. The landfill has supported economic growth and development of not only the Ewa region, but islandwide for all the communities of Oahu. Section 4.2.3. Environmental Controls, Litter, addresses windblown litter control. Section 4.4. Dust and Mud addresses dust control. Section 6.1. Traffic and Circulation addresses traffic control.
18.	**David J. Reantaso**	12/26/2006	
18.1	I would like to take the opportunity to voice my concerns about the proposed expansion of the Waimanalo Gulch Sanitary Landfill... These include environmental hazards - ground water contamination, underground methane fires, potential ocean runoff, and air pollution. Other reasons include the wasting of the City and County of Honolulu natural and financial resources.		See response letter. Section 4.2. Facility Operations, identifies on-site environmental controls. Section 4 Project Description, identifies other project site environmental controls including control of methane, fires, and stormwater runoff. Section 4.7. Regulation of Air Quality, discusses regulatory requirements of WGSL. Section 5.7. Air Quality, discusses air quality at the site and identifies proposed mitigation measures.
18.2	Many private entities offer recycling solutions that would not be harmful to our delicate ecosystem and also offer financially profitability. By not seriously exploring these alternative technologies, the leadership of the City and County of Honolulu will do a disservice to our community.		See response letter. Section 9. Alternatives to the Proposed Action, identifies alternatives to the continued long-term use of the landfill investigated by the City. Recycling was considered as an alternative.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
18.3 If nothing else, close it for monetary reasons. We have already had large fines levied - fines that to this day have not been paid. The fines that will have to be eventually paid - will be paid with our increasingly harder to come by tax dollars. The City's leadership has promised to close Waimanalo Gulch Sanitary Landfill twice. It's time to keep that promise. The permit for expansion should not be granted.		See response letter. -The immediate closure of the Waimanalo Gulch Sanitary Landfill without a feasible alternative is not a reasonable nor prudent action that can be taken. -Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. All alleged violations in the NVO have been resolved. -The reason for the City's current EIS involve a number of actions that have transpired since completion of the last EIS in December 2002. Documentation of the prior commitment to close Waimanalo Gulch was provided in the EISPN, Section 1, Project Background.
19. Robert H. Kaialau III	12/26/2006	
19.1 The validity of the following mandates for closure is as pertinent today as when they were issued: • The State of Hawaii Special Use Permit calls for the closure of the landfill by May 1, 2008... • The planned completion and final closure of the last cell is projected for the end of 5 years from the start of use of the last 14.9-acre expansion area on December 24, 2002. • Summary report and Council Resolution 04-348... • Council Bill 37 (2005)... ...Section 5 of the Bill further directed the City to submit to the Council by December 31, 2006, its plan to comply with the ordinance, noted that at a minimum, the City administration shall include in the plan the strategies for, and costs of compliance.		See response letter. Concerning Resolution 04-348, CD1, FD1, and Bill 37 (2005). Resolution 04-348 called for the selection of Waimanalo Gulch as the city's landfill. The reasons for the selection were provided in the EISPN, Section 1.2.2. Council Resolution 04-348, CD1, FD1, Selecting a Site for a New City Landfill. Bill 37 was vetoed by the Mayor and did not become law per the EISPN, Section 1.2.3.
19.2 Any action to further expand the existing Waimanalo Gulch Sanitary Landfill satisfies the description in the Hawaii Administrative Rules, Title 11, Chapter 200 §11-200-12 - Significance Criteria as ". . . an action . . . determined to have a significant effect on the environment...		See response letter. Section 14, Significant Criteria, discusses the requirements of the project and the Significance Criteria in HAR 11-200-12 and the relationship to the proposed project.
19.3 The pending expansion permit application is in direct contradiction to all commitments made to date of the City's intent to systematically reduce and eventually cease operation of the existing Waimanalo Gulch Sanitary Landfill.		See response letter. Section 2. Project Background, provides the events leading to the current decision to seek the expansion of the WGSL.
19.4 ...Of the 18 counts of violation identified in the Department of Health - Notice and Finding of Violation dated January 31, 2006 (Docket No, 05-SHW-SWS-004); five violations related directly to excess leachate levels, and the operators failure to measure and report as required by the existing permit. Adverse effects on groundwater and aquifers are widely documented, not to mention the direct contamination witnessed on Farrington Highway fronting the landfill site caused by runoff resulting from over saturation during heavy rains...		See response letter. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. All alleged violations in the NVO have been resolved. Section 4.6. Stormwater Management and Section 5.4. Surface Water, describes stormwater management controls and stormwater mitigation measures.
19.5 The existing Solid Waste Management Permit Number LF-0054-02 requires the current facility operator to provide a written plan and relative record keeping documenting the actions taken to minimize free litter through out the landfill facility as well as preventing the occurrence of litter, dust and odors beyond the facility's property line... The failure of the facility operator to insure these mandates are met is well documented by the Department of Health inspectors as well the public. Citation of these violations can also be found in the Jan 2006 Notice and Finding document.		See response letter. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health, above, describes the resolution of the DOH violation notice. Section 4.2.3. Environmental Controls, Litter, addresses windblown litter control and Section 4.4. Dust and Mud, addresses dust control for the proposed project.

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
19.6	Large trucks and loose debris from the facility are an on-going problem. As mentioned above, litter that makes it way beyond the facility's property line attach to automobile windshields and antennas often-endangering drivers. Daily, large trucks exiting the facility speed across the two westbound lanes of traffic in an effort to beat on-coming traffic as they make their way to the east bound lanes headed toward Honolulu often creating near miss traffic accidents. Trucks, waiting to enter the landfill facility are often forced to line-up along the westbound shoulder of Farrington Highway are documented regularly. While waiting to enter the facility, these trucks often leak and seep sludge and other toxic, odorous liquid.		See response letter. Section 7.1.5.1. Improving Current Practices, provides mitigation practices against littering off-site and on-site at the landfill. Section 7.1.3.2. Community Issues and Concerns Regarding WGSL, provides mitigation practices for active litter management including vehicular queuing and measures to reduce and prevent such occurrences. Section 6.1. Traffic and Circulation, addresses traffic controls and the result of a traffic study. Section 4.2.7. Waste Unloading and Compaction, addresses procedures during waste unloading.
19.7	The City and County of Honolulu's administration...continue to operate in direct contradiction to every written plan - accepted and proposed mandating that the existing landfill facility located at Waimanalo Gulch on the Leeward Coast of Oahu be closed. Postponing the solicitation and selection of alternative waste processing technologies, refusal to consider transshipment of waste off-island and the failure to complete the long over-due Solid Waste Integrated Management Plan are the short list of examples. In turn, the City and County has done little to identify and expedite the selection and implementation of any number of available alternative waste processing technologies...		See response letter. Section 7.1.5.3. Improving the Commitment to Alternative Solutions to Landfilling, identfies prior efforts by the City to promote alternative technology and waste reduction. Section 9. Alternatives to the Proposed Action, addresses the alternatives that were considered by the City to eliminate or reduce the need for landfilling.
19.8	The General Plan for the City and County of Honolulu...sets forth the following policy statement found in Chapter 5: Transportation and Utilities, Objective B... To meet the needs of the people of Oahu for an adequate supply of water and for environmentally sound systems of waste disposal....		See response letter. Section 8.6. 8.6. City & County of Honolulu General Plan, discusses Chapter 5, Objective B, Policy 3, 4, 5, 6, and 7.
19.9	As documented in the preparation notice, when the Waimanalo Gulch Sanitary Landfill was designated in 1989, "there was limited to [sic] growth in the Ewa region. Today, almost 20 years later, the City of Kapolei and the surrounding region known as the Ewa Plain are the most rapidly growing areas on the Island of Oahu...because of the administration's indurate response to the Honolulu City Council's request that the SWIM plan be completed in a timely manner; it is incumbent on all permit granting agencies to be influenced by the subsequent Environmental Impact Statement and related State Special Use Permit (SUP) Amendment application to deny any further expansion of the existing Waimanalo Gulch Sanitary Landfill facility.		See response letter. Section 7. Socioeconomic and Related Enviroment, Potential Impacts and Mitigation Measures, discusses the growth of the Ewa region and the relationship of this growth to the subject project. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue that was the single remaining violation. All alleged violations in the NVO have been resolved. Section 2.3.2. U.S. Environmental Protection Agency, discusses the EPA Notice of Violation (NOV) that is currently under discussion amongst the EPA, the City and Waste Management. Until the negotiations are concluded, there can be no final determination as to the validity of the alleged violations.
20.	**Carroll E. Cox** **EnviroWatch, Inc.**	12/26/2006	
20.1	I wish to express our strong opposition to the planned expansion of the Waimanalo Gulch Sanitary Landfill, TMK 9-2-03. This opposition is based a [sic] number of concerns related to earlier management practices and the overall operation of the Waimanalo Gulch Sanitary Landfill, which has resulted in an Issuance of Notice and Finding of Violation Docket NO. 05-SHW-SWS-004 consisting of eighteen counts and two hundred and twelve documented incidences supporting the Notice and Finding of Violation.		See response letter. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue that was the single remaining violation. All alleged violations in the NVO have been resolved.
20.2	We are [sic] also believe that the City and County of Honolulu's Department of Environmental Services continues to permit the operation of the Waimanalo Gulch Sanitary Landfill in breach of the original contract between the contractor...which is corroborated by the eighteen counts and two hundred and twelve documented incidences supporting the Notice and Finding of Violation. And, we are concerned that the current facility's permit and permit application is inadequate and does not address the concerns of [sic] regarding the Surface Water Management System Design and Final Cover Design.		See response letter. The contract between the City and Waste Management of Hawaii is a public document. The City has monitored the performance of Waste Management under this contract and has taken appropriate action to protect the public interest. As noted above, all alleged violations in the NVO have been resolved. Section 4.6. Stormwater Management and Section 5.4. Surface Water, describes stormwater management controls and stormwater mitigation measures. Section 4.1. Construction Activities, describes other features of the proposed design including the final cover design.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
20.3 The City and County of Honolulu has failed to meet all of the conditions required by the Land Use Commission. We do not have a curbside recycling program. We are failing to divert a large portion of the municipal and solid waste from the Waimanalo Gulch Sanitary Landfill. This is confirmed in the City and County of Honolulu's routine practice of closing the H-Power Plant in excess of one hundred days per year and diverting the municipal and solid waste to the Waimanalo Gulch Sanitary Landfill... we are concerned that the City and County of Honolulu has failed to utilize alternative methods of managing Municipal Solid Waste.		See response letter. The City has an on-going green waste curbside recycling program and sought public input in April/May 2007 for a curbside mixed recycling program that is now ongoing. The City has actively sought to increase the use of alternative technologies to reduce dependency on landfilling. In 2007 the City released a request for proposals (RFP) to investigate technology based alternatives, and in early 2008 related a request for proposals for waste transshipment. Section 7.1.5.3. Improving the Commitment to Alternative Solutions to Landfilling, identfies prior efforts by the City to promote alternative technology and waste reduction.
21. **Ken Williams, Vice President - Resort Operations**	12/26/2007	
Ko Olina Community Association		
21.1 The EISPN fails to address the inadequacies of the 2002 FEIS, and the continued litigation concerning that document. ... it appears from the EISPN that the planned process fails to adequately consider the social and economic impacts of the landfill.		See response letter. Section 7. Socioeconomic and Related Enviroment, Potential Impacts and Mitigation Measures, discusses and considers the social and economic impacts of the proposed project.
21.2 The Draft and Final EIS must incorporate the City's Solid Waste Masterplan, which was supposed to be completed by the City in December 2006.		See response letter. The last Solid Waste Integrated Management (SWIM) Plan was completed by the City in 2004. As much as possible the preparation of the subject DEIS is being coordinated with the SWIM Plan. However, the plan is currently under draft and will be coordinated with the DOH and other appropriate parties for approval.
21.3 The EISPN fails to address the Department of Health Notice of Violations, citing a multitude of violations with the operation of the Waimanalo Gulch Landfill...		See response letter. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue that was the single remaining violation. All alleged violations in the NVO have been resolved. Section 2.3.2. U.S. Environmental Protection Agency, discusses the EPA Notice of Violation (NOV) that is currently under discussion amongst the EPA, the City and Waste Management. Until the negotiations are concluded, there can be no final determination as to the validity of the alleged violations.
21.4 Given these violations and the concerns raised by them, the EIS must disclose the impacts that would be caused by the structural failure of the Waimanalo Gulch Landfill. Whether by structural deficiency or, as recently experienced, earthquake, because of the landfill's formation within a gulch at the sole entrance to the Leeward Coast, a failure of the landfill sliding across Farrington Highway would have a significant impact that must be disclosed and discussed.		See response letter. Sections 4.1. Construction Activities, 5.2. Topography, 5.3. Geology, 5.4. Surface Water, 5.5. Groundwater and Hydrology, and 5.6. Natural Hazards, describes major factors considered, potential impacts, and mitigation measures to maintain pubilc health and safety of the facility and site.
21.5 The EIS must address the well documented and continued escape of waste from the Landfill site. This includes an analysis of the fact that HECO had identified the area as one of the windiest locations on the island and how the proposed expansion to higher elevations will create greater problems for waste being blown off the landfill. These disclosures must also identify where this escaping trash is landing and its impact on the land and, more importantly the ocean. The escaping waste goes much further than the "valley rim" as implied by the EISPN.		See response letter. Sections 4.2.3. Environmental Controls, and 7.1.5.1. Improving Current Practices, describes potential impacts and mitigation measures to address litter control.
21.6 The background section fails to identify the specific, sworn statements made by the City at the 2003 Planning Commission Meetings and State Land Use Commission meetings regarding the promised closure of Waimanalo Gulch Landfill, and which resulted in the specific language regarding the Landfill's closure in 2008 being included in both the Planning Commission and Land Use Commission Decision and Orders.		See response letter. Section 2, Project Background, acknowledges the commitments made by the prior administration to close Waimānalo Gulch by 2008.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
21.7 The EISPN fails to recognize that the Committee agreed that the "double blind methodology" was to be advisory only to the group, and was not to be used as a means of "ranking" the potential sites. Furthermore, it is inaccurate to state that the results of the methodology caused "a division in the Committee" or a change in the decision making process. Finally, despite the language in Council Resolution 04-348, the EISPN should accurately reflect that the Office of Informational Practices did not rule that the Committee's report was "void due to violations of the sunshine law." OIP does not have the legal authority to void such action or report. From the Council's actions in passing Council Resolution 04-348 and Bill 37 (2005), it is clear that the Council's position on the City's policy for its solid waste is to close Waimanalo Gulch Landfill.		See response letter. "The City acknowledges your comments. The final decision making by the Mayor's Advisory Committee was within the purview of its individual members to consider, reject, or ignore the results of the double blind process as it considered the optimal site for a landfill. As was noted in the Report of the Mayor's Advisory Committee (Blue Ribbon Committee) on Landfill Site Selection, December 1, 2003, four of the members of the Committee resigned prior to the taking of a vote to move from consensus decision making to voting. The reasons for the resignations are clearly stated in the Report, as is the results of the voting that led to the removal of the Waimānalo Gulch landfill site." "We acknowledge that information concerning the results of Resolution 04-038 and Bill 37 are documented in the EISPN."
21.8 There are many inaccuracies in Section 4.11 of the EISPN. They include the following: ○ A more complete disclosure of the visibility of the Landfill is required. ... the visual impact is much more than a "gray-hued ash fill that resembles a quarry." ○ Vehicles driving on the hillside and higher elevation portions of the landfill can be seen from the ground and from driving along Farrington Highway. It is not only "From sea" that these impacts are visible. ○ Landfill operations vehicles CAN be visible - not "may be visible." ○ The queuing of vehicles, DO make the presence of the landfill apparent - not "may" and this does not make the landfill "momentarily apparent." The continued visibility of trucks, machinery and flying waste make the landfill continually apparent to all who live, visit, or drive through the area. ○ ..waste being blown off the landfill consists of more than just plastic bags and end up in more places than just the valley rim. Significant amounts of this waste has blown into adjacent properties and into the ocean.		See response letter. Section 5.10. Scenic and Aesthetic Environment, discusses the potential for visual impacts including existing conditions and identifies mitigation measures. Section 4.2.3. Environmental Controls, Litter, identifies controls to address windblown litter. Section 4.4. Dust and Mud, identifies measures for dust control.
21.9 The EISPN mentioned the hydromulching that has attempted to "landscape" the Landfill. However, it fails to address the less than adequate success of these efforts, and the visible canyons and rivulets created along the face of the landfill during heavy rains as the water erodes the dirt slope of the landfill.		See response letter. Section 5.10. Scenic and Aesthetic Environment, identifies the potential for visual impacts and identifies mitigation measures that will include new landscaping plans. Section 4.6. Stormwater Management and Section 5.4. Surface Water, describes stormwater management controls and stormwater mitigation measures to maintain compliance with applicable regulations and to protect against erosion..
21.10 The EIS must disclose the fact that because of the operator's failure to handle leachate problems at the landfill, large amounts of leachate were pumped in trucks and taken to the Waianae Waste Water Treatment Plant. The amount of that leachate must be disclosed and its true impacts must be investigated...		See response letter. Leachate accepted by the Waianae Wastewater Treatment Plant was, and continues to be, in accordance with regulatory requirements to ensure public health and safety. Leachate management and monitoring will be part of the Solid Waste Operating Permit application. According to ENV, the operator of the Waianae Wastewater Treatment Plant, the leachate accepted by the plant for processing has had very little or no impact on the wastewater effluent quality.
21.11 The EISPN fails to address the significant changes that has occurred in the potential of shipping waste to other landfills since the last EIS. In examining this alternative, the EIS must acknowledge and identify the multitudes of other cities and municipalities throughout the country that truck or ship their waste to other cities and states. Furthermore, the EIS must examine the recent changes in the Federal Rules allowing for the shipping of waste specifically from Hawaii to the mainland.		See response letter. Section 9. Alternatives to the Proposed Action, identifies alternatives to continued use of the landfill including waste transshipment and regjulations allowing for waste transshipment.
21.12 ...the EIS must recognize that ash and MSW landfills do not need to be located together. The impacts from these two types of waste are significantly different and given Honolulu's situation and history, the EIS must examine possible solutions where MSW and ash can be landfilled in different locations. This will increase the potential for possible locations for future landfill sites.		See response letter. Section 9.6.2. City & County Requirements for a Landfill, discusses the consideration of using more than one landfill for MSW and ash and residue.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
21.13 the EIS must encompass the multitude of comments - formal and informal - that have been received by the City and Waste Management over the last nearly six years, since the City started the attempts to expand the operations at Waimanalo Gulch Landfill. The operational problems at the Landfill, including those cited by the Department of Health in its Notice of Violation, must be directly addressed, as those have shown a clear failure of operations and proved that the concerns and complaints over the last six years were well founded.		See response letter. Section 2.3.1. State Department of Health, discusses the settlement agreement to the DOH notice of violation and order. Section 15. Comments and Responses to the EISPN, provides the comments and responses to comments to the EISPN.
22. Robert D. Harris	12/26/2006	
Sierra Club, O'ahu Group		
22.1 This analysis should look [sic] a review of pursuing other alternative [sic], including the use of other sites and implementing comprehensive waste reduction and recycling strategies...		See response letter. Section 9. Alternatives to the Proposed Action, identifies alternatives to the continued long-term use of the landfill investigated by the City.
22.2 Any analysis should consider the connection between continued use of the landfill and the social issues of discrimination, poverty, and the general distribution of environmental risks.		See response letter. Section 7.1.4.2. Other Social Impacts, discusses the concept of environmental injustice.
22.3 Residents in surrounding areas have long complained about odors, plastic bag litter, and other nuisances and environmental hazards from Waimanalo Gulch Landfill. Future housing may be built in the immediate vicinity of the landfill, including the proposed Makaiwa Hills development of nearly 5000 units by Campbell Estate/Makaiwa Hills LLC. A detailed analysis of all anticipated and potential impacts of the Waimanalo Gulch Sanitary Landfill on this housing should be included in the DEIS and FEIS.		See response letter. Section 5.8. Acoustic Characteristics, 5.8.2. Potential Impacts and Mitigation Measures, identifies the potential for noise impacts. Section 7.2.1. Regional Land Uses; 7.2.3. Potential Impacts and Mitigation Measures, identifies the potential land use impacts on surrounding land uses that include Makaiwa Hills, LLC.
22.4 Present and future volume of truck traffic, the levels of odor, gas emissions, fugitive dust and debris, and runoff from the existing land fill has affected the water, air and life quality of nearby residential and commercial properties, and the extent to which the proposed expansion of the landfill itself, will further affect these parameters...Palehua and Hono'uli'uli areas surrounding the Waimanalo Gulch landfill are home to a number of rare and endangered plants, mollusks and birds. Sections of these land areas are recognized as critical habitat for what is may be the last remaining population of the O'ahu elepai'o...thorough studies must be undertaken to determine the presence of any native and endemic animals and plants, both listed and non-listed, within the boundaries of the project and in areas immediately adjacent to it, particularly those mauka of the project that are contiguous with the Palehua and Hono'uli'uli land areas. ... A plan for restoration of the native forest cover should be developed...		See response letter. Section 1. Executive Summary, describes cumulative impacts. Section 6.1. Traffic and Circulation, describes the situation involving traffic as well as mitigation as appropriate. Section 4.2. Facility Operations, Section 4.3. Onsite Roads, Section 4.4. Dust and Mud, Section 4.5. Safety Procedures and Recordkeeping, Section 4.6. Stormwater Management, Section 5.4. Surface Water, Section 5.7. Air Quality, discusses odor, landfill associated gas, fugitive dust, and runoff in terms of operational practices and procedures, potential impacts, and proposed mitigative measures. Section 5.9. Flora & Fauna Resources, discusses the flora and fauna resources of the site, potential impacts, and proposed mitigative measures.
22.5 ...include sufficient baseline data for meaningful analysis of the adverse impact of runoff and other anthropogenic inputs related to existing and proposed landfill activities...should include... discussing how water flows through the project area into local aquifers, ephemeral water sources and... impact nearshore ocean waters...should spell out in detail any mitigation plan...should include an edaphic study that fully discusses the highly permeable and fragile nature of the soils and the effectiveness of any leachete [sic] collection system... should include any calculations or models used to support any conclusion regarding runoff and drainage into local aquifers and erosion of soils...reveal the cumulative impact of all runoff and leaching ...includes pesticides/ biocides..., fertilizers, sedimentation, heavy metals, grease, and other urban runoff ...should study the ...water pollution associated with similar ... landfill developments and discuss the degradation ...caused by similar projects...not glibly assume that mitigation measures would take care of all nonpoint source...problems.		See response letter. Section 4.6. Stormwater Management and Section 5.4. Surface Water, identies the stormwater controls used at the site, potential for impacts, and proposed mitigation measures. Section 5.5. Groundwater and Hydrology, provides information regarding the WGSL from licensed geologists, hydrogeologists, and other professionals.
22.6 The EIS should use both of the two most useful methodologies of Visual Impact Analysis: 1) Given a structure at point "x," where will it be seen from; and 2) From point "y," what can you see of the development?		See response letter. Section 5.10. Scenic and Aesthetic Environment, discusses the potential for impacts and proposed mitigation measures.

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
22.7	The operators of Waimanalo Gulch Sanitary Landfill was recently fined $2.8 million for various environmental violations. Please discuss steps taken to remedy these violations and ensure that future violations do not occur. Please fully discuss how the public can be assured that any proposed mitigation measures will be performed and will be effective. Please describe the county and state government's monitoring and enforcement programs... staffing levels at the State Health Department's Solid Waste Branch, the City and County's Department of Environmental Services, and the City and County's Planning and Permitting Department sufficient to ensure that promises are kept...		See response letter. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. All alleged violations in the NVO have been resolved Section 2.3.2. U.S. Environmental Protection Agency. The Environmental Protection Agency's (EPA) Notice of Violation (NOV) concerning the landfill's gas collection system is currently under discussion amongst the EPA, the City and Waste Management. WMH and the City are in coordination with the EPA to resolve the EPA NOV.
22.8	The EIS should mention and fully discuss many key provisions in the Hawaii State Plan...		See response letter. Section 8.1. Hawai'i State Plan, describes the sections referenced.
23.	**Cynthia K. L. Rezentes**	12/26/2006	
23.1	This EISPN falls short of accurately representing past statements made about the location of this proposed expansion. In the 1984 EIS, approximately 56+/- acres were identified as being available for a landfill with the rest of the property being labeled as having slopes (8 - 18%) which limit the useful area to be used for landfills. The topography has not changed but it is being proposed that the area is now useful for landfills...		See response letter. Section 4. Project Description, identifies the proposed area of the project and the planned construction activities for use of the site.
23.2	There should also be included how this proposed EIS addresses the State Land Use Commission Decision and Order which calls for the closure of the WGSL in May 2008 (which implies no further waste will be accepted at WGSL). This was the date presented by the previous City and County of Honolulu administration.		See response letter. Section 2.1. Project Background, describes the date of expiration of the SUP permit footprint.
23.3	Considering the current facility is still out of compliance with the last EIS/permit which allowed for the expansion of the facility by another 21 acres and a height limitation which has been exceeded, the document should include how the current violations will be mitigated prior to the request for further expansion of the active landfill site.		See response letter. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue that was the single remaining violation. All alleged violations in the NVO have been resolved.
23.4	The discussion on water flow and direction is inadequate... it does not address any affects on the near shore waters...Most of that leachate was disposed of at the Wai'anae Wastewater Treatment Plant. What were the affects of the leachate being added to normal processes with disposal in off-shore waters?		See response letter. According to OEQC, "The EISPN does not give full detail of the proposal but defines the scope of analysis that will be covered in the subsequent environmental impact statement." (A Guidebook for the Hawaii State Environmental Review Process, June 2004). The EISPN is not intended to itself serve as the full disclosure document as required by Chapter 343, HRS. Section 4.6. Stormwater Management, Section 5.4. Surface Water, and Section 5.5. Groundwater and Hydrology, provides information on stormwater, surface, and groundwater characteristics, potential for impacts, and mitigation measures, as appropriate. "The leachate that is accepted by the operator of the Waianae Wastewater Treatment Plant was, and continues to be, in accordance with regulatory requirements to ensure public health and safety. Leachate management and monitoring will be part of the Solid Waste Operating Permit application. As noted in a memorandum to ENV from the operators of the Waianae Wastewater Treatment Plant, the leachate accepted by the plant for processing has had very little or no impact on the wastewater effluent quality that is being discharged to the ocean outfall (see attached memorandum dated October 2, 2007)."
23.5	There does not appear to be any discussion regarding the noise ... and how it might impact the Makaiwa Hills development... housing built near the boundary where the landfill will be operating in the near future...discussion should also extend to litter and odor mitigation...		See response letter. Section 5.8. Acoustic Characteristics, 5.8.2. Potential Impacts and Mitigation Measures, identifies the potential for noise impacts. Section 7.2.1. Regional Land Uses; 7.2.3. Potential Impacts and Mitigation Measures, identifies the potential land use impacts on surrounding land uses that include Makaiwa Hills.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
23.6 While there is a discussion regarding the visual impacts of the landfill from the makai side of the landfill, there is no discussion regarding the visual impact of the landfill from the Wai'anae direction. Currently, the landfill construction of the cells for the permitted expansion is visible over the ridgeline from the Wai'anae direction...		See response letter. Section 5.10. Scenic and Aesthetic Environment, provide further discussion of visual impacts from both the landfill as well as from selected points along Farrington Highway and other locations. Landscaping will be provided to improve the aesthetics of the site.
23.7 ...discussion about the responsibility of the operator to keep mud and dirt on the landfill property and not allow it to be deposited on Farrington Highway...		See response letter. Section 4.4. Dust and Mud, describes practices to reduce the incidence of dust and mud tracking onto the highway.
23.8 The City's SWIMP has Waimanalo Gulch Sanitary Landfill as a critical integral part of the plan. Unfortunately, the plan is now significantly behind schedule. The new plan should not only include the landfill but also include a serious discussion about alternatives to landfills and therefore, could have an impact on whether or not the expansion should be for the amount of time being proposed or be reduced or eliminated.		See response letter. An update of the Solid Waste Integrated Management (SWIM) Plan is on-going by the City. As much as possible the preparation of the SWIM Plan is being coordinated as the DEIS is being prepared. Section 9. Alternatives to the Proposed Action, discusses the alternatives that were considered by the City.
23.9 The EISPN...fails to state that the time to pursue other alternatives actually started from 2002, when the City committed to the communities that other methods would be pursued and no landfills would be needed after 2008. A more comprehensive discussion should be included as to actions already taken and why there was a failure to find any alternatives that could have been implemented to make the five year target.		See response letter. Section 7.1.5.3. Improving the Commitment to Alternative Solutions to Landfilling, identifies prior efforts taken by the City regarding alternatives to landfilling.
23.10 There is no discussion regarding the contract commitments to both H-POWER and Waste Management, Inc. This is significant to making an informed decision as to whether an expansion of the landfill is required if the City believes it is needed, the real length of time that makes sense for the proposal of an expansion.		See response letter. Although no discussion of the contractual agreements between the City and the operators of the H-POWER and Waimanalo Gulch landfill was provided in the EISPN, the contracts are public documents. Section 9.7. Preferred Alternative, discusses the role of recycling, H-POWER, and transshipment as a mix of options reducing the volume of material requiring landfilling.
23.11 The proposed EIS for this expansion of WGSL needs to be as comprehensive as today's knowledge base allows us to have considering the consequences of the action proposed will continue to have effects on our residents for many years to come. The EISPN should do no less and should address all issues brought up in the scoping meetings and via written comments. The submittal of these comments should not be construed as support for the expansion of Waimanalo Gulch Sanitary Landfill but should be viewed as open concerns that continue to not be fully addressed and should be in both the EISPN and EIS.		See response letter. "We have directed our consultant to address the issues raised during the EISPN public comment period as required under Chapter 343, HRS. As you are aware, these issues have been documented and will be discussed in the DEIS."
24. Colleen Hanabusa, Senator	12/26/2006	
President of the Senate		
Hawaii State Senate		
24.1 I incorporate by reference my comments set forth in a letter of August 30, 2006 which is found in the EISPN Appendix A. The EISPN fails to address the comments made therein and the Draft and/or Final EIS must do so to comply with the laws.		See response letter.
24.2 Project Background...Section fails to address whether the FSEIS prepared in December 2002 was a "shibai." Clearly it was inadequate and remains a subject to challenge in the Courts. Though a discussion is made about the Landfill Site Selection Process, the EISPN does not address how the preparer of the this [sic] document, as well as the consultant for the Landfill Site Selection Process can conclude that the service life of WGSL is fifteen (15) more years. This is especially troubling when the preparer of the EISPN was also the consultant to the site selection committee and the criteria was NO EXCAVATION.		See response letter. "We offer the following clarification to the above: (1) we acknowledge that your lawsuit concerning the 2002 Final Supplemental Environmental Impact Statement remains the subject of litigation. We do note however that Section 1 contains important information that establishes why the City must act at this time to provide a solid waste refuse facility for use by all the communities of Oahu; (2) The service life of the landfill as presented to the Mayor's Advisory Committee in 2004 was twenty (20) years. The capacity for the current project will be discussed in the Draft EIS (DEIS);

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
There should be a concern as whether this consultant is in a conflict of interest given the differing reports. Moreover, there must be a clear statement as to who is paying for the preparation of the various documents and studies required in the EIS process. If, for example, Waste Management is paying then the Final EIS will not truly be that of the City and/or the Department of Environmental Services which should have the general public's interest as its primary goal		(3) The no excavation remark that you cite comes from the Waimānalo Gulch Expansion, Potential Landfill Site Data Sheets, prepared for the Mayor's Advisory Committee on Landfill Siting, October 2003. The specific reference is to information provided for Criteria No. 23, Landfill Capacity or Site Life. According to the data sheet, "The volume was calculated assuming a 100 foot buffer around the site boundary, 30 acres for infrastructure facilities, no excavation, and filling to the natural grade." The rationale for not incorporating excavation as a factor involved: A. It was not in the consultant's scope of work to do field studies including drilling borings to obtain subsurface information. This is typically the case when doing preliminary siting studies both due to difficulty in gaining access to the property and the high cost of doing field studies. Without these studies, it is not possible to determine excavation depths or difficulty with any degree of certainty. Therefore, it is typical to assume minimal or no excavation in order to compare site capacities; B. Criteria No. 23, therefore, was established to provide an estimate of capacity only based on: an area adjusted with an approximately 100 foot buffer around the perimeter of the site; the use of 30 acres for infrastructure to operate the facility; no detailed engineering calculations incorporating soils conditions to produce information on excavation; and filling of the site to the natural grade of the terrain of the finished site. It is incorrect to conclude or imply on the basis of information from the data sheet alone that in the course of developing a landfill site that no excavation would be required. (4) The City ENV and Waste Management of Hawaii, Inc., are financing the preparation of the EIS. The interest of the general public, and the responsibility for and integrity of the document rests with the City & County of Honolulu." <u>Section 9.6.3.6. Landfill Capacity</u>, provides a discussion of landfill capacity requirements for the City.
24.3 The public needs to know whether any representation made by a Mayor and/or City Council is binding on subsequent administrations. This is especially critical when looking at the Decision and Order of the State of Hawai'i Land Use Commission ("LUC Order") and State of Hawai'i Department of Health's Notice of Violations and Order ("DOH NVO"). The culpability, remedial action and cause of these violations must be discussed.		See response letter. "Representations of officials may become law and be binding when appropriately enacted into law, or through other acts that have the force and effect of law. Subsequent Mayors and/or City Councils may, however, change prior law through appropriate legal processes." <u>Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health</u>. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue that was the single remaining violation. All alleged violations in the NVO have been resolved.
24.4 A detailed discussion is necessary as to the consequence of the LUC Order and the DOH NVO for the decision maker to have sufficient information to fully consider the proposed action. In that the Operator was selected in 1999; and there have obviously been problems with the manner in which they have performed, there should be a discussion as to whether that contract will be honored or should be honored. The Contract must be made public and the legal rights of all parties addressed.		See response letter. "Please refer to our comment above regarding the NVO. The contract between the City and Waste Management of Hawaii is a public document. The City has monitored the performance of Waste Management under this contract and has taken appropriate action to protect the public interest. As a result, significant improvements to landfill operations have occurred. The City intends to continue to administer the contract to ensure that the rights and responsibilities of the parties involved are addressed and the public interest is protected."
24.5 This introductory section is presented as if this issue is new. The expansion of the WGSL and the larger issue of disposal of municipal solid waste on this island are far from a new issue. This section also begs the issue of the problems with the operations and the operator of the WGSL.		See response letter. "The use of Waimanalo Gulch is not new and as indicated in the EISPN the site has been in use since 1989, approximately 19 years ago. The NVO will be discussed in the DEIS." <u>Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health</u>, provides information on the resolution of the NVO.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
24.6 ...Project Description...Section of the EISPN is in most parts verbatim from the FSEIS of December 2002. It would appear that given the difference in the slope and other physical characteristics of the expansion that this critical point should have been discussed versus a rehashing of the prior FSEIS... There must be a more detailed discussion as to the slope differential for WGSL in the proposed expansion area.		See response letter. "According the Office of Environmental Quality Control (OEQC), "The EISPN does not give full detail of the proposal but defines the scope of analysis that will be covered in the subsequent environmental impact statement." (A Guidebook for the Hawaii State Environmental Review Process, June 2004). In this regard the EISPN is not intended to itself serve as the full disclosure document as required by Chapter 343, Hawaii Revised Statutes (HRS). The proposed grades and use of the site including details and information will be provided as a part of the DEIS." Section 4. Project Description, provides additional information on the use of the site.
24.7 The expansion will clearly be where the land is steepest and will require excavation. It is, therefore, curious that this EISPN fails to address the amount of native soil and rock which will have to be removed...		See response letter. "The anticipated amount of soils excavation that will be necessary will be described in the DEIS. As indicated in the EISPN, "Information concerning these construction details and discussion of potential impacts and recommended mitigation measures relating to construction associated noise, odor, airborne litter, and storm water erosion will be provided in the DEIS." Section 4. Project Description, provides information on construction of the proposed project. Section 4.1.3. Waste Stream, Soil Excavation, and Soil Usage, provides information on soils usage. Section 4.2. Facility Operations, Section 4.2.3. Environmental Controls, Section 4.3. Onsite Roads, Section 4.4. Dust and Mud, Section 4.5. Safety Procedures and Recordkeeping, Section 4.6. Stormwater Management, Section 5.4. Surface Water, Section 5.7. Air Quality, discusses odor, litter, landfill associated gas, fugitive dust, and runoff in terms of operational practices and procedures, potential impacts, and proposed mitigative measures.
24.8 There needs to be a discussion as to the extent of that construction activity; its impact on the neighbors; and more importantly where will the materials go. The cost of such an activity must be calculated to do a true cost benefit analysis. The rights to the native soil (rock, etc.) must also be addressed. It is believed that with the present operation, the contractor who does the excavation is permitted to sell the rock and soil and keep the funds. If this is the case, the practice must change and the benefit should be to the taxpayers.		See response letter. "The extent of construction, its potential impact on adjoining property owners, and where and how the excavated materials will be utilized will be a part of the DEIS. The owner of the property, the City & County of Honolulu, retains the ownership rights to the excavated materials. Since August 1, 1991, the City has received royalties for any excavated and processed material removed for Waimanalo Gulch Sanitary Landfill." Section 4.1.3. Waste Stream, Soil Excavation, and Soil Usage, provides information on soils usage.
24.9 There needs to be an honest discussion as to whether the expansion of WGSL will require almost a 2 to 1 removal of the native soils. That is to say for 2 cubic feet of air space, 1 cubic feet of native soils will have to be removed. If that is not the case then the assumptions made in the Waste Management contract of 1999 require additional discussion.		See response letter. "The final design of the proposed project, including the height and elevation of the expansion area of the landfill and use of excavated materials, will follow the general guidelines set forth in the 1999 contract. The final design will be based on the use of sound engineering practices and compliance with environmental protection and regulatory requirements."
24.10 Given the recent decisions by the Hawai'i Supreme Court, it is necessary to discuss the concept of public trust... Note that the leachate was disposed of, for most part, in the Waianae Sewage Treatment Plant.		See response letter. "There has been no violation of the public trust. Leachate that is accepted by the plant operator for disposal at the Waianae Wastewater Treatment Plant was, and continues to be in accordance with regulatory requirements to ensure public health and safety. Leachate management and monitoring will be a part of the Solid Waste Management Permit application."
24.11 ...there is inadequate discussion of the leachate...requires a discussion as to the how the build up of the leachate affected or could affect the integrity of liner and the stability of the landfill. It must also be addressed in light of the expansion and the stress it will have upon the liner and the stability of the landfill.		See response letter. "An explanation of the leachate that is generated by the landfill will be provided in the DEIS. A discussion concerning the leachate collection and removal system design, including liner integrity and landfill stability, associated with the generation of leachate will be provided." Section 4.1.4. Geologic Considerations, Section 4.1.5. Liner and Final Cover Systems, Section 4.1.6. Final Cover, provides information on the liner integrity, landfill design, and the Leachate Collection and Removal System.
24.12 It is unacceptable for government to rely upon Waste Management's consultants or experts for stability calculations. This is not acting in the best interest of the public.		See response letter. "The consultants involved with the design of the Waimanalo Gulch Sanitary Landfill do work for both public and private organizations, are registered professional engineers, and are recognized experts in landfill design and stability analysis. Their work has been peer-reviewed by outside experts to ensure the work meets professional engineering standards. All of the work completed is available for public review including all analyses completed during the design."

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
24.13 The recent construction of the rock berm wall ...requires discussion as to why it was constructed and how it is necessary for the structural integrity of the landfill. The berm wall is not to be used as a retaining wall and/or the basis for height expansions in the existing landfill.		See response letter. "The stability berm that is referred to was reviewed and approved by the DOH for construction under the current Solid Waste Management Permit. The purpose of the berm is to ensure that the ash monofil area of the landfill meets or exceeds regulatory and engineering design standards."
24.14 ...the height limitations in certain parts of the WGSL have been exceeded. Yet, to date, not [sic] hearings have been held on the height expansion. There needs to be a discussion as to capacity and how the City and Waste Management continue to operate the WGSL and address the violations set forth in the DOH NVO.		See response letter. "Our request to seek a height modification was submitted to DOH in February 2006. The height modification was approved by DOH on February 20, 2008. A discussion of the capacity of the site and the NVO will be provided in the DEIS." Section 4.1.3. Waste Stream, Soil Excavation, and Soil Usage, provides the preliminary design volumes and capacities of the site. Section 2.3. Environmental Compliance Violations, 2.3.1. State Department of Health, provides information on the settlement of the NVO.
24.15 Prior EISs have not acknowledged the cultural significance of the pathway to Palehua which Waimanalo Gulch served as. Also lacking is a discussion as to the environmental impact to the natural preserves for various native birds which Waimanalo Gulch serves as a habitat.		See response letter. "We have forwarded this information to Cultural Surveys of Hawaii, our archaeological and cultural consultant, which is preparing the Cultural Impact Assessment report for further investigation. Their findings will be provided in the DEIS. The potential for impacts to habitat for native flora and fauna will also be provided in the DEIS." Section 7.3. Historic and Archaeological Resources, and Section 7.4. Cultural Impact Assessment, summarizes the archaeological, historic,and cultural resources of the proposed project site including potential impacts and proposed mitigation measures. The Archaeological Inventory Survey and Cultural Impact Assessment studies are provided as appendices to the DEIS. Section 5.9. Flora and Faunal Resources, provides the results of studies of the site with regard to flora and faunal resources.
24.16 The visual impact of WGSL has not been adequately addressed especially with the construction of the rock berm wall. How is this area going to be restored to its original state with a rock berm wall?		See response letter. "An assessment of the potential visual impacts of the proposed project will be provided in the DEIS. This will include the investigation of views from both the landfill as well as from selected points along Farrington Highway and other locations. Landscaping will be provided to improve the aesthetics of the site. However, given the nature of use of the site involving landfilling, it will not be possible to return the site to its original condition." Section 5.10. Scenic and Aesthetic Environment, describes the potential impacts and proposed mitigative measures.
24.17 Odors continue for those who live by the WGSL.		See response letter. Section 4.2.3. Environmental Controls, and Section 5.7. Air Quality, discusses odor including mitigative measures and practice to control odor.
24.18 The role that Ko Olina plays as it relates to the economic growth for West Oahu is significant. While no one would consider placement of a landfill near Waikiki, the City does not hesitate to continue a landfill operations directly across the street from KO Olina.		See response letter. The City does not discount the importance of economic growth wherever it is occurring on the Island of Oahu. While there are no viable landfill sites near Waikiki we do note that places such as Ala Moana Park and the Kakaako Waterfront Park once served as landfills, and that various parts of Windward Oahu once supported landfills.
24.19 a discussion must be had as to what can be done if such a natural disaster caused the landfill to slip onto Farrington Highway. This discussion must look to the fact that expansion will be at steepest part of the footprint of the parcel of land and the stress it will place on the existing landfill. The people of the Waianae Coast have only one way in and one way out.		See response letter. Section 4.1. Construction Activities, and Section 4.8. Emergency Preparedness describes the facility planning to address the potential for disasters. Section 5.6. Natural Hazards, discusses the potential impacts and mitigation measures associated with floods, hurricanes, seismic activity (earthquakes), and tsunami.
24.20 There is no discussion as to how the expansion of WGSL continues to dump on and places the burden on the Waianae Coast. There needs to be a discussion of the concept of environmental justice.		See response letter. Section 7.1.4.2. Other Social Impacts, provides a discussion of "environmental injustice" involving the disproportionate burden of locating WGSL along the Wai'anae Coast.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
24.21 The Legislature is presently developing a plan on Sustainability for the year 2050. It is without any basis that the EISPN arrives at the conclusion that the expansion of WGSL is in conformance with the General Plan. The analysis which led to this conclusion is needed.		See response letter. "The sustainability for our island State is important. The use of Waimanalo Gulch promotes sustainability through the use of an on-island facility that has remaining but unused capacity. Without Waimanalo Gulch, new land, a precious resource, would need to be prematurely used when there is remaining capacity at this existing public facility." "The basis for the conformity of the proposed project with the General Plan is stated in the EISPN. It is noted that the Waimanalo Gulch Sanitary Landfill is in accordance with the Ewa Sustainable Communities Plan (Development Plan), and that this proposed project can only be implemented if it is in accordance with the General Plan."
24.22 The discussion of the Land Use Policies of the area cannot be made without a discussion of the LUC's D&O on the SUP. The D&O states that no later than May 1, 2008, the area shall be "restricted from accepting any additional waste material and be closed in accordance with an approved closure plan." This is the controlling Land Use Order on the site of the proposed expansion.		See response letter. "Necessary approvals, including those of the Land Use Commission and others, will be sought to allow for the proposed project. Further discussion of this item will be provided in the DEIS." Section 2.1. Project Background, and Section 3.3. 3.3. Need for the Proposed Project, identifies and provides a discussion of the LUC SUP order.
24.23 The issue of the protection of the aquifer requires further discussion. The EPA has a map which includes WGSL in the aquifer area. The Board of Water Supply has a map of convenience as it addresses WGSL. These maps must be explained.		See response letter. "The DEIS will identify the agencies with jurisdiction for the establishment of the Groundwater Protection Zone (GPZ) and Underground Injection Control (UIC) Line. A discussion of the relationship between the proposed project and the regulation of the GPZ, UIC, and other water resource requirements will be provided." Section 9.6.3.5. Local Exclusionary Criteria, Groundwater Restrictions, describes and explains the GPZ and UIC zones that are used in the DEIS. Section 5.4. Surface Water, and Section 5.5. Groundwater and Hydrology, provides information on other water resources of the site.
24.24 Alternatives to the Proposed Action. "This discussion in the FSEIS and other documents has been inadequate and continues to be so. After all these years, the City must have a better response on alternative technologies, transshipment and other sites than what is provided. Again, it appears that it is simply easier to continue to the existing landfill; and therefore all attempts to address alternatives in good faith will never be a reality. In that a private landfill is also proposed, the City's position on the landfill and how it will impact on the flow of trash needs discussion.		See response letter. "Alternative technology, transshipment, and other on-island landfill sites will be discussed in the DEIS. The City acknowledges a proposed private landfill in Nānākuli. However, the Waimānalo Gulch Sanitary Landfill is considered the most viable site for O'ahu's future landfill needs for the next approximately 15 years, or until an alternative becomes available that would completely replace the need for a landfill on island." Section 9. Alternatives to the Proposed Action, provides the alternatives that were considered by the City.
24.25 The State Land Use Commission is a State agency not within the City & County of Honolulu. There is also a requirement to secure the DOH permits.		See response letter. "The reference to the State Land Use Commission is based on their participation in the decision making for the State Special Use Permit administered by the City Department of Planning and Permitting. Department of Health administered permit applications including the Solid Waste Management Permit application will be filed for this project."
24.26 it is critical that the decision maker and the general pubic are made to understand why the promises of government need not be kept. There must also be a discussion as to how much money the City and County makes in the landfill business.		See response letter. "The DEIS will include a discussion of the past history of events related to the future of the landfill, and provide information as to how the decision to propose expansion of the landfill, rather than closure, was reached." "The City combines tip fee revenue from City transfer stations and the landfill. The revenue for FY06 was $14,051,214 as reported in the City and County of Honolulu Operating Budget, Detailed Statement of Revenues and Surplus, Solid Waste Special Fund (250) Disposal Charges." "A small portion of the tip fee revenue is attributed to commercial accounts disposal at transfer stations. Most of the tip fee revenue is generated by commercial accounts disposal at the landfill. In accordance with Chapter 9, Section 9-4.2, Revised Ordinances of Honolulu (ROH), only businesses, and federal and state agencies accounts are charged a landfill tip fee. Homeowners and eleemosynary organizations pay no fees." Section 2. Project Background, provides the events leading to the consideration of WGSL for the preferred alternative.
24.27 What is also lacking is the fact that in a few years, the status of H Power will also be an issue. If the City decides to re purchase H Power, then that cost must be made known and its impact on the cost of solid waste disposal.		See response letter. Section 9. Alternatives to the Proposed Project, Section 9.7. Preferred Alternative, identifies H-POWER and transshipment as a viable alternative to reduce waste requiring landfilling.

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
24.28	If a private landfill operation is permitted and the transshipment of rubbish is also approved, then the impact of such action must also be discussed in terms of the environmental impacts to the public.		See response letter. "As noted, the City acknowledges a proposed private landfill in Nānākuli but considers the Waimānalo Gulch Sanitary Landfill a more viable alternative. The consideration of the Nānākuli site and waste transshipment will be provided in the DEIS." Section 9. Alternatives to the Proposed Project, Section 9.6. Alternative Sites for a Municipal Landfill, provides an evaluation of alternative sites that include Nanakuli. Section 9.4. Transshipment of Waste Off-Island, provides an evaluation of waste transshipment.
25.	**Colleen Hanabusa, Senator**	8/30/2006	
	Hawaii State Senate		
25.1	Standard To Be Met...The condition to all EISs is that it be compiled in "good faith" and sets forth sufficient information. The past practice of the City has shown that EISs have not been compiled in good faith and nor does it provide sufficient information. At the very minimum the City must take its past EISs and explain the discrepancies that have been found and set forth whatever infomation it now relies upon to justify its change in position.		See response letter. "We appreciate your references to our legal responsibilities under the Hawaii EIS law. Please also refer to Section 1 of the EISPN that contains information that establishes why the City must act at this time to provide a solid waste refuse facility for use by all the communities of O'ahu."
25.2	At the outset, the City must explain why it has changed its position from an expansion of only 5 years to now an additional 15 years. ...A discussion should be had as to whether the City can be bound by its statements under oath like a person.		See response letter. "Prior representations concerning the closure of Waimanalo Gulch have been identified in the EISPN. This information will also be provided in the DEIS." Section 2. Project Background, provides the basis for the City's decision to proceed with the EIS for the project.
25.3	An EIS is "meaningless" if it is self-serving and rationalizes an outcome. The contract between Waste Management, Inc. and the City for the operation of WGSL was entered into in 1999 for 15 years. This was two years before the first Draft EIS in 2000; and three years before the FSEIS. At the very minimum, this shows the decision to expand WGSL was a done deal in 1999. Also explain what was done after the City entered into it in 1999. Also explain what was done after the City said the expansion would be for only 5 years. Was the contract amended?"		See response letter. "The contract amendment dated May 1, 1999, provided for the expansion of the Waimānalo Gulch site. Subsequently, the prior administration decided on a five-year limit for the use of the site. The contract was not amended to a shorter term because the exact date of termination could not have been determined. Although the contract was not amended, the City retains control of the contract and can terminate it at any time when it is in the best interest of the City. As provided in Contract Special Provision 29, the contract can be terminated, "... in whole or in part, whenever the Director shall determine that termination of the contract, in whole or in part, is in the best interest of the City.""
25.4	HRS §343-2 defines an EIS as one that discloses, among other items, the "alternatives to the action and their environmental effects."...HAR §11-200-17 addresses...alternatives as follows: describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected...Money is not the paramount criteria in arriving at a decision which is environmentally sound...HAR §11-200-17 F. 5 states that...the discussion of alternatives shall include, where relevant, those alternatives not within the existing authority of the agency...		See response letter. "An examination of alternatives that include other potential landfill sites, waste transshipment, and technology based solutions, will be provided in the DEIS. This will include the consideration of factors that do not involve funding as the major criteria for evaluation." Section 9. Alternatives to the Proposed Action, identifies the alternatives that were consdiered by the City.
25.5	Ordinance 9-1/1(a)(6)(b)(1) states that by the year 2000, at least 75 percent of the solid waste generated shall be recycled, reused, composted, or otherwise diverted from incineration or placement in the landfill. What is the status and what is the consequence of this non-compliance?		See response letter. "The City acknowledges that it was not possible to increase recycling, reuse, composting and waste diversion to a level that could support up to a 75 percent reduction by 2002. At the same time, ENV is committed to pursuing all reasonable and feasible options that can contribute to reducing our dependency on the use of landfilling. Recent actions involve the establishment of pilot programs for waste recycling and a major decision to expand the capacity of H-POWER to promote recycling through the generation of energy from municipal refuse. We will continue to pursue these and other options with the City Council as well as O'ahu's communities."

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
25.6 A major source of "odor" for the landfill is sludge. What is the City's treatment of sludge and for what period of time will it continue to be dumped in the landfill.		See response letter. "Major improvements in the City's handling of sludge at the Sand Island Wastewater Treatment Plant have occurred since the initial start up of the recently constructed waste digester. These improvements have significantly reduced odors and the requirement for the disposal of untreated sewage sludge. We expect that as the facility becomes fully operational that further improvements will result."
25.7 "HAR §11-200-17 D requires the Draft SEIS to "contain a separate and distinct section that includes a statement of purpose and need for a proposed action." ...There is an application for a private landfill pending and also the fact that the Department of Agriculture will now permit the transshipment of MSW. These points must be addressed in discussing any need of the expansion, especially in light of the prior statements that there will be no need for landfills in 5 years."		See response letter. "We appreciate your citation of prior case law concerning the purpose and need for the EIS. The application for the private landfill in Nānākuli and the potential for transshipment as methods to eliminate the need for the proposed Waimanalo Gulch Sanitary Landfill lateral expansion will be provided in the DEIS." Section 9. Alternatives to the Proposed Action, identifies the consideration of the Nanakuli site for a landfill as well as waste transshipment off-island.
25.8 The City must address the discrepancies in all the draft EISs along with the reports provided by RM Towill to the Blue Ribbon Commission which was tasked with siting the new landfill. The criteria was no excavation. RM Towill determined that WGSL had a life of 20 more years with the criteria. This is in direct conflict with other EISs also prepared by RM Towill. What does the City intend to do about this obvious misrepresentation? How does the City explain this discrepancy.		See response letter. "The no excavation remark that you cite comes from the Waimānalo Gulch Expansion, Potential Landfill Site Data Sheets, prepared for the Mayor's Advisory Committee on Landfill Siting, October 2003. The specific reference is to information provided for Criteria No. 23, Landfill Capacity or Site Life. According to the data sheet, "The volume was calculated assuming a 100 foot buffer around the site boundary, 30 acres for infrastructure facilities, no excavation, and filling to the natural grade." Criteria No. 23, therefore, was established to provide an estimate of capacity only based on: an area adjusted with an approximately 100 foot buffer around the perimeter of the site; the use of 30 acres for infrastructure to operate the facility; no detailed engineering calculations incorporating soils conditions to produce information on excavation; and filling of the site to the natural grade of the terrain of the finished site. It is incorrect to conclude on the basis of information from the data sheet alone that in the course of developing a landfill site that no excavation "The 2002 Final Supplemental EIS for the Waimānalo Gulch Expansion, as well as other prior Waimānalo Gulch EIS documents, were prepared by our consultants based on civil engineering design studies supported by geotechnical investigations and/or soils evaluations that are referenced in the EIS documents. The engineering information for the 2002 EIS was provided by Waste Management of Hawai'i, Inc., who utilized licensed professionals to conduct the studies. The factors that can result in different capacities or life of the site would include refinements to the planned design of the site, knowledge of how the soils conditions or topographic changes would affect the design, or adjustments to the site to accommodate new infrastructure or stability features in order to maintain safety or improve the efficient use of the site. There are other factors that can affect capacity or life of the site that will be provided in the DEIS for the proposed project." Section 4.1.2. Features of Construction of Lateral Expansion, provides information on soil usage for the WGSL. Section 9.6.3.6. Landfill Capacity, provides a discussion of landfill capacity requirements for the City.
The extreme slope of WGSL for the proposed expansion and the newly constructed rock berm are related. What is the stability of the expansion? How much native soil will have to be removed? Where will it be removed to? Will the excavated materials be sold?		See response letter. "A discussion of the anticipated excavation requirements for the proposed project will be provided in the DEIS. This will include an estimate on how much soil will need to be excavated, and the stability of the site. The soils removed from the site that will be used for cover material will be stored on site. A decision regarding the release or possible sale of any cover material cannot be made at this time based on the status of the project within the EIS process. The owner of the property, the City & County of Honolulu, however, retains the ownership rights to the excavated materials. Since August 1, 1991, the City has received royalties for any excavated and processed material removed for the Waimānalo Gulch Sanitary Landfill." See reference above and Section 4.1.2. and Section 9.6.3.6.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
25.9 In light of the concern over the stability of slope as evidenced by the construction of the rock berm wall, how will the community be assured about its stability? How is the integrity of the liner tested? Will the berm wall act as the retaining wall to justify and increase the slope?		See response letter. "The DEIS will provide information concerning engineering design standards and practices that ensure the stability of the site. The most recent test of the site's stability involved the recent earthquake event of October 15, 2006, when a magnitude 6.7 earthquake occurred about 10 miles north-northwest of Kailua-Kona. According to our site operator, Waste Management of Hawai'i, Inc., an inspection following the earthquake indicated there was no failure or damage to the landfill and its supporting infrastructure as a result." "The stability berm that is referred to was reviewed and approved by the DOH for construction under the current Solid Waste Management Permit. The purpose of the berm is to ensure that the ash monofill area of the landfill meets or exceeds regulatory and engineering design standards, including those for soil retention." Section 5.3. Geology, Section 5.3.3. Potential Impacts and Mitigation Measures, provides the geologic basis for the design of the proposed project. Section 4. Project Description, Section 4.1.5. Liner and Final Cover Systems, decribes the design features of the liner system.
25.10 The Notice and Finding of Violation ("Notice and Finding") and Order dated January 31, 2006, of the Department of Health ("DOH") as to the operations of WGSL must be addressed... There are also additional violations that were not included in the DOH Order, such as the applicant's failure to submit a revised Closure and Post-Closure Plan no later than May 1, 2005, which was finally submitted on February 22, 2006 and the operators unauthorized night work preparing a new cell for receiving waste.		See response letter. "The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved."
25.11 The recent Hokulia case makes clear the State's public trust for the waters of our State. How has this trust obligation been met.		See response letter. "A discussion of state waters and efforts that have been taken by the City and Waste Management to ensure the protection of this important resource will be provided in the DEIS." Section 4.6. Stormwater Management, and Section 5.4. Surface Water, provides information on the requirements of the project in relation to DOH administration of state water quality.
25.12 The EIS cannot merely address the proposed expansion. It must address the cumulative effects of the operation of WGSL since the 1980s in addition to the proposed expansion on the Coast, including the disposal of leachate off site at the Waianae Wastewater Treatment plant.		See response letter. "A discussion of cumulative effects as a result of the proposed project will be provided in the DEIS." Section 1. Executive Summary, provides a discussion of cumulative effects.
25.13 The EIS must address the concept of environmental justice and how the City's use of this landfill and others in the Waianae Coast affect the community.		See response letter. "A discussion of environmental justice and its relationship to the proposed project will be provided in the DEIS." Section 7.1.4.2. Other Social Impacts, discusses the concept of environmental injustice.
25.14 These are the concerns and issues which must be addressed in the EIS. It continues to remain my position that WGSL must close...		See response letter. "We acknowledge your opposition to the proposed project and have included you as a consulting party to the EIS process for this project."
26. Henry Eng, FAICP, Director	12/26/2006	
Department of Planning and Permitting		
City & County of Honolulu		
26.1 Pg. 1-1, paragraphs 2 and 3: Condition 12 of the Land Use Commission's Decision and Order date June 9, 2003 states...not beyond May 1, 2008, the 200-acre property shall be restricted from accepting any additional waste material and be closed in accordance with an approved closure plan. We interpret the above condition to mean that the landfill cannot accept all forms of waste, including H-POWER ash, residue, and unacceptable wastes. On paragraph 3, we suggest the word 'accepted' be used instead of 'approved'.		See response letter. "This recommendation is noted. However, in reviewing the OEQC's requirements for the preparation of EIS documents, the term "approved" is correct in usage."

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
26.2 Pg. 1-2, paragraph 1 : The date the Special Use Permit amendment is approved is the date the Land Use Commission's Order is effective, June 9, 2003. The footnote should be revised accordingly. Also, please delete the word 'municipal' in the last sentence.		See response letter. "This recommendation is noted and will be addressed in the DEIS." Section 2.2. Events Affecting the Decision to Expand Waimanalo Gulch, provides this correction.
26.3 Pg. 1-13, paragraphs 1 and 2: The site should be consistently described as being located in Waimanalo Gulch, Honouliuli, Ewa, Oahu. Please make the necessary changes to all references on location. When the landfill received its Special Use Permit (SUP) approval on April 20, 1987, the approved landfill area was 60.5 acres. On October 31, 1989, the Land Use Commission (LUC) approved a 26-acre addition to the original approved area to include support areas of the area approved for landfilling. Thus, at the time when the landfill began initial operations, the landfill and support areas was limited to 86.5 acres and should not be described as being 200 acres.		See response letter. "This recommendation is noted and will be addressed in the DEIS." Note: reference has been revised to Waimanalo Gulch, Oahu, Hawaii. Section 3.1. Project Location and Area of Use, provides clarification between area of the approved landfill and the proposed project.
26.4 Pg. 2-3, paragraph 1: Please indicate what uses are proposed for the 100-foot buffer. Also, will there be any part of the 200-acre property left undisturbed or as it was prior to landfilling operations? If so, please describe and map these areas.		See response letter. "The area of buffer is intended to remain free of actual landfilling and placement of waste. Other locations encompassed by the 92.5 acres where uses are known at this time will be provided in the DEIS. Some of the proposed uses include landscaping, access roads, grading, environmental monitoring and stockpiling of excavated materials that will be reused on-site for cover material." Section 4.1. Project Description, provides the uses of the proposed project area that are known at this time.
26.5 Pg. 2-4, paragraph 4: Condition 12 of the LUC Decision and Order of June 9, 2003, applies to the entire 107.5-acre approved area, not just the 21-acre expansion area.		See response letter. This recommendation is noted and will be addressed in the DEIS. Section 3.3. Need for the Proposed Project, describes the entire approved area as 107.5 acres.
26.6 Pg. 2-1 5, paragraph 1: The Draft Environmental Impact Statement (DEIS) should indicate that portions of the 92.5-acre proposed expansion area was graded, for what purpose, when, and whether these areas are still being disturbed for landfill operations.		See response letter. "This recommendation is noted and will be addressed in the DEIS." Section 4.1.1. Project Location, describes the limited area within the proposed project area that was graded to maintain safety of the existing Cell E-4.
26.7 Pg. 3-1, Section 3.2.: This section should state whether regulated hazardous waste is accepted, examples of unacceptable waste and all types of residue, the quantity and frequency of sewer sludge and related sewage residue accepted, and whether delivery of wastes after normal business hours also include other processes involving spreading, compacting, covering, relocation, or other waste disposal landfilling processes normally associated with operations during regular business hours.		See response letter. "The types of waste that are accepted at the landfill will be provided in the DEIS. Processed sewage solids deliveries have recently been reduced in volume and frequency with the operation of the Synagro waste digester at the Sand Island Wastewater Treatment Plant. Other landfill associated practices will be described in the DEIS." Section 4.2. Facility Operations, identifies the types of waste that are accepted including unacceptable waste that is not. This section also describes other practices associated with operations.
26.8 Pg. 3-4, Section 3.3.: Detailed information on irrigation for landscaping/revegetation should be provided in the DEIS.		See response letter. "The DEIS will provide further information on landscaping as well as irrigation usage for the proposed project. Other points of information concerning use of the site and operational practices will be included." Section 6.3. Potable Water, describes water use for irrigation and dust control. Section 4.2. Facility Operations
26.9 The DEIS should describe existing and proposed cell construction, reclamation, revegetation, closure, monitoring, and reuse across the entire 200-acre property and what will be/have been disposed in each cell, the order in which each cell has been/will be completed and reclaimed/revegetated/reused.		See response letter. "The DEIS will provide information on operational practices and site development that will include the proposed location of cells, infrastructure, and landscaping for the proposed project. Other points of detail including the order of use of the cells, or the waste content of the cells, or the final reuse across the 200 acre site have not yet been fully determined. As much as possible, the information that is available for the proposed project will be provided." Section 4. Project Description, provides information on the use of the site for the existing and proposed area of use.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
26.10 The DEIS should disclose how the expansion area will be integrated into its overall phasing of operations, from cell construction to reuse, and whether phasing such operations would outweigh the benefits, if any, of maintaining portions of its operations at the makai portion of the property, i.e., support services and ash monofils. Discussions regarding whether impacts to the community and the environment could be minimized by closing/reclaiming/reusing the completed portions of the existing landfill closest to Farrington Highway and relocating its operations further into the gulch should be included in the DEIS. This could include relocation of the scale house, maintenance operations, and other noxious activities since much of the 92-acre expansion area is located at the northern portion of the property.		See response letter. "Preliminary site and engineering plans of the relationship of the proposed project to the existing area of use will be provided in the DEIS. The specific phasing plan has not yet been developed. However, the project phasing will be designed to minimize the potential for environmental impacts due to operation of the landfill." <u>Section 4. Project Description</u>, provides operational information on the proposed project including the preliminary construction drawing layout of the site.
26.11 Details should be provided as to what drainage and berming techniques will be applied at the property's mauka boundary since the gulch extends further mauka of the property line.		See response letter. "A discussion of drainage and geotechnical soils stability controls that will be implemented for the proposed project will be provided in the DEIS." <u>Section 4.6. Stormwater Management, Section 5.4. Surface Water</u>, and <u>Section 5.5. Groundwater and Hydrology</u>, identifies the considerations that were factored for the design of the site.
26.12 The DEIS should include a timeline showing all permit processing timeframes, start of construction within the expansion area, projected closure and reclamation of completed cells within the entire 200-acre property.		See response letter. "The schedule for the proposed lateral expansion of the site will commence upon approval of all required permits and land use approvals. The status of these approvals will be provided in the DEIS." "The rate of use of the proposed landfill cannot be precisely projected. This is because the capacity available will continue to be influenced by (1) the rate at which refuse is disposed of due to economic and population conditions, and (2) the rate at which refuse diversion efforts are successful." <u>Section 12. Permits and Regulatory Approvals That May be Required</u>, identifies the permits required and the proposed filing status of each.
26.13 The DEIS should include a visual analysis of the landfill from current conditions to closure and reclamation by cells/monofils from public vantage points such as Ko Olina, Farrington Highway, Makaiwa Hills, and Honokai Hale.		See response letter. "A visual analysis will be undertaken to assess the potential for adverse viewplane impacts associated with the proposed expansion of the site. This information will be provided in the DEIS." <u>Section 5.10. Scenic and Aesthetic Environment</u>, provides the visual assessment of the site including discussion regarding potential impacts and proposed mitigation measures.
26.14 A detailed landscape plan showing screening along Farrington Highway and proposed vegetation/topographic features on completed cells/monofils/other waste disposal site on the 200-acre property.		See response letter. Proposed mitigative measures that will include landscaping will be provided in the DEIS. <u>Section 5.10. Scenic and Aesthetic Environment</u>, provides a landscaping plan and other elements to mitigate the potential for visual impacts.
26.15 Initial construction activities for the expansion of the existing landfill may require grubbing, grading and stockpiling permits. Furthermore, a grading permit may be required for the final cover that will be placed prior to landfill closure.		See response letter. "The permits that may be required for the expansion of the site will be provided in the DEIS." <u>Section 12. Permits and Regulatory Approvals That May be Required</u>, identifies the permits required and the proposed filing status of each.
26.16 A drainage report may be required at a later date.		See response letter. "This is acknowledged. Information concerning stormwater drainage will be provided in the DEIS." <u>Section 4.6. Stormwater Management</u>, and <u>Section 5.4. Surface Water</u>, provides information that has been completed on drainage and stormwater control.
26.17 The DEIS should include a current (imaged in 2007) high resolution aerial photo of the entire 200-acre property.		See response letter. "A current aerial photograph will be provided in the DEIS." <u>Section 3. Introduction</u>, see Figure 3-3.
27. Robert Au	12/26/2006	
27.1 A fire that originated from the landfill burned down one of our homes, and we will now have to go through the new building permit procedures to have it established again.		See response letter. "We are not aware of a fire from the landfill causing the loss of the home that you describe. We ask that you contact us concerning this matter so that it can be properly investigated. Please contact Ms. Wilma Namumnart, of our office at 692-5358."

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
27.2	We feel that the health qualities of living in this area are compromised, and that property values have been suppressed because of the current environment that the landfill has created.		See response letter. "A number of environmental factors will be investigated as part of the Draft EIS (DEIS). This will include air, hydrology and geology, flora and fauna, and socioeconomic factors associated with use of the site for the proposed project. Potential for adverse environmental effects will be researched and as appropriate, mitigation measures will be recommended to minimize or ameliorate the potential for impacts." Section 5.5. Groundwater and Hydrology, Section 5.7. Air Quality, Section 5.9. Flora and Faunal Resources, Section 7.1. Socioeconomic Characteristics, provides the infomration indicated in the response letter.
27.3	...A study should be done on the impact of Hawaii Electric's Kahe Power Plant and Waimanalo Gulch Landfill on the fresh water table in this area and the long term effects to our island.Kahe valley (Waimanalo Gulch) has a 10 year flood plane [sic] prior to the creation of this landfill. There is a stream bed with a bridge under this landfill which is a good indication what can happen at this location. We are very concern [sic] about this potential...		See response letter. "Although the City does not operate the Kahe Point Power Generating Station, the DEIS for the proposed Waimanalo Gulch Sanitary Landfill Expansion project will provide water quality and hydrogeological information on surface and ground water resources that may be affected by the use of the landfill. This research will be undertaken by a licensed professional. Data collected from the course of the study will be included as part of the DEIS." "Information concerning storm water drainage and planned drainage control features to ensure short- and long-term protection of the land and nearshore waters will also be provided." Section 5.4. Surface Water, Section 5.5. Groundwater and Hydrology, Section 4.6. Stormwater Management, Section 4.1. Construction Activities, and Section 4.2. Facility Operations, describes the site resources in relation to the proposed project, including potential impacts and mitigation measures.
27.4	It was presented to the public as a solid waste Waimanalo Gulch landfill, at a certain size, and set time limitation for it [sic] existence. The City has expanded and change [sic] these factors twice, and are now trying to do it again...It is time that agreements are honored, and not changed at the City's convenience.		See response letter. "Please refer to Section 1 of the EISPN that provided important information that establishes why the City must act at this time to provide a solid waste refuse facility for use by all the communities of Oahu."
27.5	The landfill is part of a historical sight [sic]. Fort Arizona is located on top of a mountain ridge at Kahe Point adjacent to and part of "Waimanalo Gulch Landfill"...Currently, to get to it, one has to drive through the landfill.		See response letter. "Your recognition of the Battery Arizona site is noted. For clarification, we note that the Battery Arizona bunker complex lies within the landfill property, however, the location of the turret is within the adjacent Hawaiian Electric Company property. An examination of this site as well as other potentially important historical sites and features will be further described in the DEIS. As appropriate, mitigation measures will be recommended to ensure against adverse effects." Section 7.3. Historic and Archaeological Resources, provides a description of the archaeological and historic resources found on site, and includes discussion concerning potential impacts and proposed mitigation measures.
28.	**Ernest Y. W. Lau, Public Works Administrator**	12/27/2006	
	Department of Accounting and General Services		
	State of Hawaii		
28.1	Thank you for the opportunity to review the information regarding the subject project. We support the City and County of Honolulu's efforts in resolving the issues related to the island of Oahu's municipal refuse. We have no additional comments to offer at this time.		NA
29.	**Barry Fukunaga. P.E., Director of Transportation**	12/28/2006	
	Department of Transportation		
	State of Hawaii		
29.1	The EISPN discussed alternative actions involving transporting refuse to another landfill facility outside of Hawaii. If one of the alternatives involves possible use of facilities at the State harbors, particularly Honolulu or Kalaeloa Barbers Point Harbor, to collect and stage refuse before shipping, further EIS evaluation should fully analyze the impacts to handling refuse at the harbors, including the congestion already being experienced at the harbors.		See response letter. "The investigation of alternatives in the Draft EIS (DEIS) will include waste transshipment and the potential for impacts to harbor facilities under jurisdiction of the Department of Transportation (DOT). We appreciate there is congestion already present at the harbors and will note this in the DEIS. The full assessment of traffic impacts, however, should be investigated by the party or parties responsible for the transshipment of waste from Oahu for the specific locations where it is proposed." Section 9.4.6. Potential Issues with Waste Transshipment, identifies congestion as a potential issue.

Commenting Party/Itemized Comments	Date of Letter	DEIS Section Reference and Comments*
29.2 The EISPN stated that a traffic assessment report is being prepared. The report should address traffic conditions and ingress/egress at the landfill facility. Prior situations or events involving vehicle movements at the access on Farrington Highway should be reviewed, especially for incidents or conditions where improvements at and around the entry intersection may be needed. The report should also cover having sufficient on-site queue area for vehicle waiting lines to avoid any back ups at or onto the highway.		See response letter. "We confirm the traffic assessment will investigate traffic conditions and ingress/egress at the facility, review vehicular movement along Farrington Highway from and to the facility, and provide recommendations concerning vehicle queuing to avoid congestion at or onto the highway." Section 6.1. Traffic and Circulation, presents the findings of the traffic assessment and includes proposed mitigation measures.
30. Laura H. Thielen, Director	12/29/2006	
Office of Planning		
State of Hawaii		
30.1 The State has an affirmative duty to project Hawaii's nearshore waters. Please discuss how stormwater and wastewater generated by the project will be prevented from reducing the quality of nearshore water.		See response letter. "The Draft EIS (DEIS) will provide information on environmental management of stormwater and wastewater associated with the proposed project. Potential for impacts and proposed mitigation measures will be described to prevent degradation of nearshore state waters." Section 4.6. Stormwater Management and Section 6.2. Wastewater, provides information on stormwater controls and wastewater facilities to protect water quality.
30.2 Water resource protection is a critical State issue. The proposed project is within a designated Water Management Area. Please include information on the drinking water and non-potable water sources that will be utilized for the project.		See responses letter. "Information relating to water supply, public health, and cultural/historic resources is under investigation and will be provided as a part of the DEIS." Section 5.5.2. Site Groundwater and Hydrogeology, Section 5.5.3. Project Site in Relation to Protected Groundwater Areas, describes the water resources underlying the proposed project site. Section 6.3 Potable Water, identifies the Board of Water Supply as the source of potable water for the project.
30.3 If the project will have a potential to generate hazardous materials or result in the possible contamination of the air, soil, or water, please discuss how public health and safety will be protected.		Section 4.2.4. Material Acceptance, hazardous waste is considered an unacceptable material not for disposal in the landfill. Section 4.7. Regulation of Air Quality, Section 5.7. Air Quality, Section 5.3.2. Soils, Section 4.6. Stormwater Management, Section 5.4. Surface Water, and Section 5.5. Groundwater and Hydrology, describes the potential for adverse effects including generation of potentially hazardous materials, and proposed mitigation measures.
30.4 Please include an inventory survey of cultural and historic sites, with monitoring and preservation plans approved by the State Historic Preservation Division. Please discuss how access for Native Hawaiians for traditional and customary practices will be preserved to include visual landmarks if applicable.		Section 7.3. Historic and Archaeological Resources and Section 7.4. Cultural Impact Assessment, provide the results of the Arch. Inventory Survey and Cultural Impact Assesements conducted for the project including potential impacts and proposed mitigation measures. The sections will also describe the status of approval of any monitoring and preservation plans proposed.
30.5 Please include an inventory of flora and fauna on the project site and any required protections. Consider in the design of your field observations including both wet and dry season surveys to capture the fullest range of flora and fauna. Please include a description of recreational uses on or near the project site. In addition, a description of scenic resources should also be included.		Section 5.9. Flora and Faunal Resources, provides the results of botanical and faunal studies conducted for the proposed project. Section 6.10. Parks and Recreation, provides a description of recreational uses in the area. Section 5.10. Scenic and Aesthetic Environment, provides a description of te scenic and aesthetic environment of the site, including potential for impacts and mitigation measures. The design of vegetative treatments considering dry and wet seasonal changes are provided.
30.6 The State oversees protection of natural, cultural, and economic resources within the coastal zone. Please discuss how the proposed project will balance the competing values of economic development and preservation of coastal resources, including protection from hurricane, storm surge, flood hazard, volcano, and soil erosion as applicable.		Section 8.5. Hawai'i Coastal Zone Management Program, provides a discussion of the proposed project in relation to the objectives of the Hawai'i CZM Program.
31. Russell Y. Tsuji, Administrator	1/23/2007	
Department of Land and Natural Resources		
Land Division		
State of Hawaii		

Commenting Party/Itemized Comments		Date of Letter	DEIS Section Reference and Comments*
31.1	...the Department of Land and Natural Resources has no comment to offer on the subject matter.		NA
32.	**Lawrence T. Yamamoto, Director**	1/23/2007	
	Natural Resources Conservation Service		
	United States Department of Agriculture		
32.1	We have reviewed the above mentioned document and have no comment at this time.		NA
33.	**Melvin N. Kaku, Director**	1/23/2007	
	Department of Transportation Services		
	City & County of Honolulu		
33.1	The Draft EIS should identify which roadways will be providing access to the project site during construction of the landfill expansion.		See response lettter. Section 6.1. Traffic and Circulation, identifies Farrington Highway as the major roadway providing access to the site.
33.2	Comments should be requested from the State Department of Transportation (SDOT) because access to the landfill is from Farrington Highway, which is under SDOT jurisdiction.		See response letter. "Comments for the subject project have been requested from the State Department of Transportation who, in addition to the Department of Transportation Services, will continue to be consulted parties for the duration of the EIS process." Section 15. Comments and Responses to the EISPN, see comment letter from DOT, December 28, 2006.
34.	**Steven Y.K. Chang, P.E., Chief**	2/9/2007	
	Solid and Hazardous Waste Branch		
	Department of Health		
	State of Hawaii		
34.1	It is noted on page 2-5 that a 100-foot buffer will be maintained between landfill activities and the property line will be maintained. We note that the Makaiwa Hills residential development is proposed on land adjacent to the landfill. Ideally, buffers would be able to contain the impacts of landfill activities, such as odor and windblown litter, entirely within facility boundaries. We are concerned that the proposed buffers are not sufficient to minimize impacts on housing and/or associated land uses.		See response letter. "The area of buffer is intended to remain free of actual landfilling and placement of waste. As required, other measures to reduce the potential impacts of nuisance concerns including odor and windblown litter will be described in the Draft EIS (DEIS)." Section 4.2.3. Environmental Controls, provides information on management of litter, including windblown litter, and odor. Section 7.2. Land Use and Ownership, provides information on mitigation measures related to nearby properties to the landfill.
34.2	The SWS also notes that the proposed landfill expansion requires a solid waste management permit, and will address all other issues through the permit application process.		See response letter. "We acknowledge that a solid waste management permit application will be required for the proposed project and look forward to further working with you to address the requirements of the Solid and Hazardous Waste Branch." Section 12. Permits and Regulatory Approvals That May be Required, identifies the Solid Waste Management Permit.

Table 1-3

Summary of Final EIS Comments and Responses to the WGSL DEIS

Table 1-3: Summary of Final EIS Comments and Responses to the Waimanalo Gulch Sanitary Landfill Expansion DEIS

Note: This table contains a summary of the comments provided in Section 16-Comments and Responses to the DEIS.
See Section 16 for the specific comments received and responses provided.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
1. Alvin K. Tomita, Acting Fire Chief	6/2/2008	
Honolulu Fire Department		
City & County of Honolulu		
1.1 The Honolulu Fire Department reviewed the materials provided and has no objections to the project.		We acknowledge that you have no objections to the proposed project.
2. George W. Niotta	6//2008	
2.1 Will there be no additional trucks taking trash to the dump? Will the [Kapolei] streets be less torn up by the increased traffic?		The answer to your question regarding additional trucks hauling refuse to the Waimānalo Gulch Sanitary Landfill Lateral Expansion site was addressed by the Traffic Impact Report, which is a part of the subject DEIS. According to the DEIS, Section 6.1.1. Traffic Impact Report, the existing and projected "with project" conditions indicated that "The critical traffic movements at the intersection of Farrington Highway with the WGSL (Waimānalo Gulch Sanitary Landfill) access road are expected to continue operating at LOS (level of service) "B" and LOS "C" during the AM and PM peak periods, respectively. The total traffic volumes entering the intersection are expected to increase by less than 1% during both peak hours of traffic with proposed expansion. These increases in the total traffic volumes are in the range of daily volume fluctuations along Farrington Highway and represent a minimal increase in the overall traffic volumes." The amount of increased vehicles entering the proposed landfill equate to approximately 11 southbound vehicles during the morning peak period (between 6:15 am and 7:15 am) and 31 southbound vehicles during the afternoon peak period (between 3:45 PM and 4:45 PM). This increase in traffic, while minimal, represents the provision of an important public service for Kapolei and all the island communities of O'ahu, by making possible the collection and disposal of municipal refuse.
2.2 I realize the City & County has made up its mind to expand the dump, but at least be honest-- "no adverse environmental impact" is definitely not true or honest.		The project DEIS represents major effort by the City and Waste Management of Hawai'i to identify potential adverse environmental impacts and appropriate mitigation measures to reduce or otherwise minimize the effects of the proposed project. No less than eight independent special studies and several engineering studies have been commissioned and are referenced in the subject DEIS. We urge you to review these documents and the mitigation measures that have been proposed to address the potential for environmental impacts.
3. Eugene C. Lee, P.E., Director	6/9/2008	
Department of Design and Construction		
City & County of Honolulu		
3.1 The Department of Design and Construction has no comments to offer at this time.		We acknowledge that you have no comments concerning the subject project.
4. Boisse P. Correa, Chief of Police	6/10/2008	
Honolulu Police Department		
City & County of Honolulu		
4.1 This project should have no significant impact on the facilities or operations of the Honolulu Police Department.		We acknowledge that the proposed project should have no significant impact on the facilities or operations of the Honolulu Police Department.
5. Craig I. Nishimura, P.E., Director	6/13/2008	
Department of Facility Maintenance		
City & County of Honolulu		
5.1 We have no comments to offer as the facility does not impact us.		We acknowledge that you have no comments to offer and that the proposed project will not impact your Department.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
6. Yoshinori Imagawa	6/28/2008	
6.1 The company that runs the Waimanalo Gulch Landfill has had serious, repeated violations and fines in the past. There is no reason to believe that these violations or more troubling violations won't occur in the future.		It is acknowledged that prior violations involving the State Department of Health (DOH) and the Environmental Protection Agency (EPA) have occurred in the past at the Waimānalo Gulch Sanitary Landfill. On December 7, 2007, a settlement agreement was reached with the DOH which settled all issues arising from and related to the notice of violation. At the present time the City and Waste Management of Hawaiʻi are fully cooperating and working with the EPA to address elevated underground temperatures at the landfill which are higher than anticipated, but which are not indicative of underground combustion conditions such as a fire. A detailed discussion of this item was provided in the DEIS, in Sections 2.3.2. U.S. Environmental Protection Agency and 5.7.3. Potential Impacts and Mitigation Measures (Air Quality). It is important to note that throughout the events involving the DOH and EPA that self-reporting procedures have remained in place to notify governmental regulatory agencies of the operating practices and procedures applied at the landfill. At no time was the health and safety of the public at risk, and we anticipate that based on these procedures, that sufficient safeguards will continue to maintain public health and safety.
6.2 It is unfair and unjust to approve the expansion of Waimanalo Gulch Landtill without first implementing curbside recycling inclusive of, but not limited to, green compostable waste, glass, paper, newspaper, aluminum and cardboard. Diversion and waste to energy programs must occur prior to, or in conjunction with any expansion.		The City believes that curbside recycling, waste diversion, and refuse to energy are all important programs that will contribute to reducing our islandwide dependency on landfilling. However, these programs, including a number of other alternatives cited in the project DEIS, will not by themselves completely eliminate the need for a municipal sanitary landfill. For refuse that cannot be further recycled or otherwise reused, a landfill must continue to remain a key element of the City's refuse management system even as it continues to explore, examine, and implement the waste diversion and refuse to energy systems that you identify.
7. Orlando Davidson, Executive Officer	7/3/2008	
Land Use Commission Department of Business, Economic Development & Tourism		
State of Hawaii		
7.1 We confirm that the site of the lateral expansion of the WGSL is designated within the State Land Use Agricultural District.		We acknowledge your comment.
7.2 In accordance with section 1 1-200-1 7(e), Hawaii Administrative Rules (HAR), a project description, including, among other things, a historic perspective, should be provided. We acknowledge the background of the WGSL provided in Section 2 of the DEIS, including reference to the recent action of the Land Use Commission (LUC) that extended the deadline to accept solid waste at the WGSL from May 1,2008, to November 1,2009. In the interest of full disclosure, please also include the appeals filed by the KO Olina Community Association (KOCA) and Colleen Hanabusa to the decisions of the City and County of Honolulu Planning Commission (Planning Commission) and the LUC in regard to the deadline extension.		This comment is acknowledged regarding the inclusion of the appeals filed. See Section 2.5. Historical Background of the State Special Use Permit, of the Final EIS (FEIS) for this project.
We understand that with the lateral expansion of the WGSL on the unused 92.5-acre portion of the 200-acre site, a minimum life of approximately 15 years for the landfill is projected. We further understand that prior to the closure of the expansion area, the City and County will initiate the search for the next landfill. We request that greater specification be provided regarding the municipal solid waste plans and policies of the City and County, including alternative technology and waste reduction strategies and programs, beyond the projected life of the WGSL.		The City's Draft Integrated Solid Waste Management Plan was completed in June 2008 after the publication of the subject DEIS. We will provide further information concerning the municipal solid waste plans and policies contained in the draft document in the forthcoming FEIS for this project.
7.3 In accordance with section 1 1-200-17(f), HAR, a separate and distinct section on alternatives which could attain the objectives of the action, including alternatives requiring actions of a significantly different nature, should be provided. At the LUC's March 6 and 7,2008, meeting on the deadline extension to accept solid waste at the WGSL, several commissioners noted that a district		This comment is acknowledged and will be addressed in the FEIS by indicating that both the filing of a new SUP application and/or a new Land Use District Boundary Amendment (LUDBA) application will constitute a viable means of addressing the use of the site for a municipal landfill. We add that the use of the site for landfilling purposes has been adequately and sufficiently addressed through the SUP filed for this project since 1989, when the site was opened for use.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
boundary amendment may be a more appropriate mechanism by which to seek the expansion of the WGSL rather than by an amendment to the existing special use permit (SUP). Accordingly, we request that the alternative of reclassifying the WGSL site fiom the Agricultural District to the Urban District be thoroughly addressed.		See Section 8.3. State Land Use Law, and Section 12. Permits and Regulatory Approvals That May Be Required, in the FEIS regarding the filing of a new SUP application and/or LUDBA application for this project.
7.4 In accordance with section 1 1-200- 17(h), HAR, the status of each identified approval should be described. Therefore, we request that to the extent possible the projected submittal dates (i.e., by month/year) of the various permit applications be provided.		The projected submittal dates for the land use entitlements and other pending permissions for the proposed project are not known at this time due to the pending EIS process that is currently underway. We can report, however, that as soon as practicable that these applications will be prepared and filed with the appropriate governmental agencies upon the conclusion of the current EIS process.
7.5 In accordance with section 1 1-200-1 7(i), HAR, the probable impact of the proposed action on the environment should be included. Review of the DEIS indicates that no inventory and assessment of arthropods on the 92.5-acre expansion area was conducted. Although the location of the subject property may not require that a comprehensive arthropod study be conducted, we request that this matter be addressed in the interest of full environmental disclosure. Additionally, a discussion on the existing civil defense conditions and potential impacts and proposed mitigation measures should be included.		This comment regarding arthropods is being investigated and will be addressed in the forthcoming project's FEIS in Section 5.9.4. Invertebrates, and Section 5.9.5. Potential Impacts and Mitigation Measures. The City Department of Emergency Management has been consulted concerning any civil defense related coordination that may be required. At this time the Department of Emergency Management has indicated no additional concerns or issues relating to the WGSL other than to note that the nearby location of the Battery Arizona site will not be used for public shelter given the condition of the facility. See attached Memorandum dated September 29, 2008.
7.6 In accordance with section 1 1-200-1 7(n), HAR, a separate and distinct section that summarizes unresolved issues should be included. To the extent that no decision has been rendered on the appeals filed by KOCA and Colleen Hanabusa to the decisions of the Planning Commission and the LUC in regard to the deadline extension, we request that they be identified as unresolved issues at this time.		This request is acknowledged. See Section 11. Unresolved Issues, of the FEIS which provides further information regarding this issue.
7.7 As you know, by Findings of Fact, Conclusions of Law, and Decision and Order Adopting with Modifications, the City and County of Honolulu Planning Commission's Recommendation to Approve Amendment to Special Use Permit issued on March 14, 2008, the LUC extended the deadline to accept solid waste at the landfill from May 1, 2008, to November 1,2009, subject to, among other things, the requirement that the Applicant report to the LUC every six months on the actions taken to alleviate the further use of the WGSL. We acknowledge that the DEIS (p. 9-36) references the expansion of the H-POWER garbage-to-energy plant that was approved by the Mayor on January 18, 2008. However, we request that this discussion provide greater specificity to include, but not be limited to, the nature of the expansion, the capacity of the expansion, the life of the expansion, and its role in alleviating the further use of the WGSL. We also request that the discussion on the transshipment of waste and curbside recycling be updated with the latest efforts of the City and County to implement such alternatives to refuse disposal at the WGSL.		While the specific operational details of the planned H-POWER expansion project will be provided in the EIS documentation prepared for that project, we can provide information concerning the City's consideration of Waste to Energy (WTE) facilities in relation to handling the refuse needs of the Island of O'ahu. This information is provided in Section 2.6.2. Waste to Energy (WTE) Capacity, in the FEIS. Section 2.6.4. Waste Transshipment to the Mainland, in the FEIS, describes current efforts and the relationship between waste transshipment and the City's refuse management system. The DEIS has provided information on the latest efforts of the City in promoting recycling to reduce dependency on landfilling. See Sections: 9.5.6. Expanded Recycling; 9.5.6.1. Improvements to Recycling Infrastructure; and, 9.5.6.2. Recycling to Energy.
7.8 Condition No. 5 of the LUC's Decision and Order Approving Amendment to Special Use Permit (D&O Approving Amendment) issued on June 9,2003, specified that the WGSL would be operational only between the hours of 7:OO a.m. and 4:30 p.m. daily. Clarification should be provided as to whether the current operational hours of the WGSL are proposed to be changed with its expansion.		The operational hours of 7:00 AM to 4:30 PM are not planned to be changed.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
7.9 Condition No. 19 of the LUC's D&O Approving Amendment also specified that the City and County shall implement by executive order or ordinance measures for, among other things, wood recovery, metal recovery, gypsum recovery, and enhanced enforcement of landfill bans. Clarification should be provided as to the efforts of the City and County to comply with this condition.		In order to sustain a successful material recovery operation, the amount of material available at landfill was reestablished in the 2006 Waste Composition study. The total metals in the landfill waste stream have decreased. Gypsum board has decreased to less than one percent of the total waste or approximately 1,500 tons. In the area of wood, amounts have decreased to a little over ten percent, with treated wood making up over half of the amount of wood available. While it is possible to attempt to recover metals, gypsum board, and wood, the amounts being landfilled are not sufficient to sustain a cost-effective program. Actions that the City is currently supporting include the State Beverage Deposit law and focusing on enhanced enforcement of landfill bans. City staff are assigned intermittently to the landfill and H-POWER to ensure compliance with bans. If any vehicle is in violation of the bans, they receive a 'first warning.' If the vehicle returns with a banned material the hauling company is warned that if deliveries continue the company will not be allowed to dispose of waste at the landfill. Waste hauling companies that have been issued warnings have complied.
7.10 In the DEIS, there are several references to the term potable water. We request that it be replaced by the term drinking water. We have been advised that although potable water has generally been used to mean drinking water, the Department of Health (DOH) uses the latter term specifically to indicate water for human consumption that is derived from surface water and/or groundwater and is regulated by the DOH pursuant to chapter 11-20, HAR.		We acknowledge your request and will augment the use of the term potable water as "potable/drinking water" in the forthcoming FEIS.
7.11 We request that the EIS explicitly reference the applicable category of action within chapter 343, Hawaii Revised Statutes, and chapter 11-200, HAR, that triggered its preparation.		We acknowledge your request. See Section 3.2. Purpose of the Draft Final Environmental Impact Statement, providing this information.
7.12 On page 8-12, the DEIS states that an SUP for the expansion of the WGSL must be obtained through the City and County of Honolulu. Notwithstanding the LUC's concerns about the appropriateness of an SUP in this matter, clarification should be provided as to whether the Department of Environmental Services intends to seek an amendment to the existing SUP or an entirely new SUP. Please be advised that in either case the LUC will have jurisdiction over the application in the event the Planning Commission recommends its approval. As such, Section 12 and other applicable sections within the DEIS should be revised accordingly. Finally, as part of the SUP process, the WGSL expansion is required to meet the SUP guidelines in determining an "unusual and reasonable" use in the Agricultural District pursuant to section 15-15-95, HAR. We believe that given the purpose of the EIS, it would be appropriate to specifically address said guidelines in the document.		At this time the City has not yet determined if it will file a new SUP and/or LUDBA for the proposed project. Section 12, Permits and Regulatory Approvals That May be Required, will be revised accordingly in the FEIS. As noted, while the preparation of a SUP and/or LUDBA has not been determined at this time, we acknowledge that the content of an SUP application when it is filed should meet the SUP guidelines and applicable regulations of law, and do not necessarily agree that this determination should be a part of the EIS process under Chapter 343, HRS.
8. Maribel M. Saelid	7/4/2008	
8.1 The company that runs the Waimanalo Gulch Landfill has had serious, repeated violations and fines in the past. There is no reason to believe that these violations or more troubling violations won't occur in the future.		It is acknowledged that prior violations involving the State Department of Health (DOH) and the Environmental Protection Agency (EPA) have occurred in the past at the Waimānalo Gulch Sanitary Landfill. On December 7, 2007, a settlement agreement was reached with the DOH which settled all issues arising from and related to the notice of violation. At the present time the City and Waste Management of Hawai'i are fully cooperating and working with the EPA to address elevated underground temperatures at the landfill which are higher than anticipated, but which are not indicative of underground combustion conditions such as a fire. A detailed discussion of this item was provided in the DEIS, in Sections 2.3.2. U.S. Environmental Protection Agency and 5.7.3. Potential Impacts and Mitigation Measures (Air Quality). It is important to note that throughout the events involving the DOH and EPA that self-reporting procedures have remained in place to notify governmental regulatory agencies of the operating practices and procedures applied at the landfill. At no time was the health and safety of the public at risk, and we anticipate that based on these procedures, that sufficient safeguards will continue to maintain public health and safety.

Commenting Party/Itemized Comments		Date of Letter	FEIS Section Reference and Comments*
8.2	It is unfair and unjust to approve the expansion of Waimanalo Gulch Landtill without first implementing curbside recycling inclusive of, but not limited to, green compostable waste, glass, paper, newspaper, aluminum and cardboard. Diversion and waste to energy programs must occur prior to, or in conjunction with any expansion.		The City believes that curbside recycling, waste diversion, and refuse to energy are all important programs that will contribute to reducing our islandwide dependency on landfilling. However, these programs, including a number of other alternatives cited in the project DEIS, will not by themselves completely eliminate the need for a municipal sanitary landfill. For refuse that cannot be further recycled or otherwise reused, a landfill must continue to remain a key element of the City's refuse management system even as the City continues to explore, examine, and implement the waste diversion and refuse to energy systems that you identify.
9.	Kelvin H. Sunada, Manager	7/6/2008	
	Environmental Planning Office, Department of Health		
	State of Hawaii		
9.1	Any project and its potential impacts to State waters must meet the following criteria: Antidegradation policy (HAR, Section 11-54-1.1), Designated uses (HAR, Section 11-54-3), Water quality criteria (HAR, Sections 11-54-4 through 11-54-8).		This comment cites the water quality regulations of Hawaiʻi Administrative Rules, Section 11-54, Water Quality Standards, that apply to all projects in the State of Hawaiʻi.
9.2	You are required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for discharges of wastewater, including storm water runoff, into State surface waters (HAR, Chapter 11-55). For the following types of discharges into Class A or Class 2 State waters, you may apply for NPDES general permit coverage by submitting a Notice of Intent (NOI) form: Storm water associated with construction activities, Discharge of Hydrotesting water, Discharge of dewatering effluent. You must submit a separate NOI form for each type of discharge at least 30 calendar days prior to the start of the discharge activity, except when applying for coverage for discharges of storm water associated with construction activity. For this type of discharge, the NOI must be submitted 30 calendar days before to the start of construction activities.		This comment cites Hawaiʻi Administrative Rules, Section 11-55, Water Pollution Control, governing the requirements of the NPDES permit program in the State of Hawaiʻi. The ocean waters off of the proposed project site are designated as Class "A." This designation will require the filing of the NOI Form C, Construction Stormwater permit application which has been identified in Section 12, Permits and Regulatory Approvals That May Be Required.
9.3	For types of wastewater not listed in Item 2 above or wastewater discharging into Class 1 or Class AA waters, you must obtain an NPDES individual permit. An application for an NPDES individual permit must be submitted at least 180 calendar days before the commencement of the discharge.		Please refer to our comment above.
9.4	You must also submit a copy of the NOT or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the CWB that SHPD has or is in the process of evaluating your project.		We acknowledge the requirement that the SHPD be provided with a copy of the NOI Form C permit application for the proposed project.
9.5	At least 30 calendar days prior to the completion of the expansion, you must modify your NOI for storm water associated with industrial activity and Storm Water Pollution Control Plan to include the area of expansion and submit these documents to the CWB along with a $500 filing fee.		We acknowledge this requirement for the approved existing NPDES NOI Form B permit for the Waimānalo Gulch Sanitary Landfill.
9.6	Please note that all discharges related to the project construction or operation activities, whether or not NPDES permit coverage and/or Section 401 Water Quality Certification are required, must comply with the State's Water Quality Standards.		We acknowledge your requirement.
9.7	The draft DEIS states that a landfill gas to energy system may be installed. If so, the installation of this system may require a modification to the existing Title V permit.		We acknowledge your requirement.
9.8	We recommend that the contractors operate under a dust control management plan. The plan does not require the Department of Health approval, however it will help with identifying and minimizing the dust problems from the proposed project.		We acknowledge the recommendation and note that the provision for dust control has been provided in the Operations Plan for the Waimānalo Gulch Sanitary Landfill, as submitted to the DOH.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
10. Peter Rappa, Environmental Review Coordinator	7/7/2008	
University of Hawaii - Manoa		
Environmental Center		
10.1 Trying to determine the total picture of solid waste generation and disposal by looking at the various components is confusing. It doesn't seem to add up. Adding a discussion in Section 3 on the total amount of garbage collected, what goes into the landfill, what goes to H-POWER, what goes to green waste, and what is recycled would be helpful in understanding the magnitude of the problems and will aid in weighing the alternative waste strategies.		The Final EIS, Section 9.2.2. Composition of Waste Stream, will include tables to provide the information requested. The new tables will identify the amount of waste taken to Waimānalo Gulch and H-POWER, as well as an estimate of the amount of materials recycled. Tables will also be provided identifying the sector from which the waste was collected (residential and commercial), and the amount collected by the City and other waste haulers.
10.2 In [the Environmental Compliance Violations] section, the DOH and EPA violation notices are listed. While the DEIS adequately discusses the measures that have been taken to address the violations, there is no discussion on why these violations occurred in the first place. Without a mention of this, the discussion of the retroactive measures taken to correct the violations seems incomplete.		Both the City and Waste Management of Hawaiʻi acknowledge that the alleged violations have occurred because of delays in implementing and reporting operational activities at the landfill. All of the allegations that were brought to light based on the operator's self-reporting practices were either corrected or were in the immediate process of being corrected (e.g., addressing the atypical temperatures at the landfill with the EPA) when the notices of violations were issued in early 2006. The primary corrective step that has been taken since that time has been to improve the timeliness of correcting and then reporting the required information to the DOH and EPA. The DEIS identifies the steps taken to help prevent a future occurrence in Section 2.3. Environmental Compliance Violations and Section 2.4. Summary of Current Status.
10.3 The first full paragraph on page 3-6 contains the line "As an annual acreage, approximately 800 tons per day . . . . or delivered." What has acreage to do with tonnage of solid waste? Was this a mistake or is there some formula for equating amount of waste delivered with the amount of land used?		Thank you for pointing out this typographical error. The correct entry that will be provided in the Final EIS will read, "As an annual average, approximately 800 tons per day…".
10.4 The final line in the section of the DEIS dealing with final covering of the landfill states that the "site may request the DOH permit alternative cover in lieu of the Subtitle D prescriptive cover described above." What are other types of covering contemplated? Does the City and County have anything else in mind? If so, shouldn't they be discussed in the DEIS? Does Subtitle D allow for alternative covers for the landfill?		RCRA, Subtitle D, allows for the use of alternative cover. The alternative cover that is being considered involves a thicker soil cover to handle the root systems of the types of trees being considered at the landfill. The tree types being contemplated will be similar to those found on the surrounding terrain. Native or other trees with a long tap root will not be used. Also, boulders may be added to enhance the appearance of the site.
10.5 How much waste is usually excluded per day under the Unacceptable Waste Exclusion Program?		This waste amounts to less than 1 percent of the refuse disposed of at the landfill.
10.6 In the management of unacceptable waste, hazardous waste is stored in a temporary storage area for 90 days after the accumulation of 220 pounds or more. What happens to the hazardous waste after the 90 day period expires? Why wait 90 days after it reaches 220 pounds, why not just dispose of it then?		Waste identified as "hazardous" is collected for temporary holding in a specially designated site that is designed to contain the waste and prevent exposure paths to the environment. A typical hazardous waste item for example, is a car battery. The reason for the safe storage of this type of waste prior to removal to an approved disposal facility is to minimize the number of trips involving the transport of these types of materials.
10.7 What does the groundwater and gas monitoring consist of? Are they devices that are placed in the ground that detect gas and record the data on graph paper? Are they gauges that are periodically read? How is monitoring carried out?		The groundwater and gas monitoring systems consist of the use of subsurface wells for the collection of samples. Sampling of these wells are by trained third party personnel who collect the samples according to industry standard practices that involve chain of custody, quality assurance/quality control procedures, and other protocols that govern the length of time and conditions under which a sample is collected prior to analysis. The samples are submitted to a laboratory certified by the State DOH. The results of all analyses, including the supporting documentation establishing that the samples were collected properly are provided in a report that is submitted to the DOH.
10.8 In Section 4.6.1 the DEIS mentions that the landfill stormwater management system is designed and constructed to manage runoff from a 25-year, 24-hour storm. What about a 100-year storm? How did the site fare during the January 2007 rain events?		The 25-year storm was used as an industry safety standard that was compliant with the City & County of Honolulu. The handling of stormwater for a 100- year storm event would involve considerable retention and drainage system sizing requirements that are not considered feasible or reasonable for the WGSL. The performance of the WGSL during the January 2007 rain events were satisfactory and provided for the sufficient control and treatment of stormwater runoff.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
10.9 In the section on landfill gas temperatures, it is mentioned that WGSL has temperatures exceeding the EPA specified maximum temperature. Other approved mainland landfills with temperatures exceeding EPA limits are then listed. Absent from this discussion is a mention of the actual temperatures found at WGSL.		The wells with temperatures above the EPA's standard operating temperature of 131° Fahrenheit average approximately 165° F. One well has had an isolated temperature reading of 184° F, which is the highest recorded temperature of any well at the landfill. This information has been submitted to the EPA. See Section 5.7.3. Potential Impacts and Mitigation Measures, of the FEIS relating to landfill gas emissions, relating to a discussion on the LFG (landfill gas) Collection System, providing this information.
10.10 The DEIS states that hydromulching has not been very successful on top of the filled areas due to dry conditions at the site. The DEIS continues by stating that landscaping and the further use of irrigation will promote vegetative growth similar to that found on the adjoining hillsides. Can you provide more details on why there has been little success with revegetation, and how new action plans will remedy this?		The initial difficulty with vegetative growth involved the dry and low rainfall conditions of the Leeward side of O'ahu. The sporadic level of rainfall received at the site was simply not conducive to growth. The new plan will address this constraint by selectively targeting smaller portions of the site with as many "targets" as can be provided while meeting the water conservation requirements of the Board of Water Supply. An important feature of the plan is to more efficiently use irrigation while recognizing that the contours of the landfill are subject to change as various portions of the site are filled. Landscaping will therefore follow the filling of the cells. In order to do so, the new system will employ a central trunk water line that will run across the slope of the landfill and use perforated feed lines that run from the central trunk line. We expect that this will constitute an improvement over the prior practice of using rigid perforated water hoses that were prone to breakage whenever it was necessary to move or relocate the water hoses.
10.11 In this section the DEIS states "For several years, Hawai'i residents have responded to polls on the major issues facing the community by pointing to the economy and education as the most important issues for the State (Figure 7-1). Environmental issues . . . do not achieve the same salience." Figure 7-1 illustrates the relative expressed importance of the economy, education, traffic, housing, and drugs, but the issue of then environment does not appear at all. Is this because Hawai'i residents were not given thenoption of choosing the environment as an issue (a structured poll), or because it was mentioned so infrequently that it would not show up on the graph?		The question that was posed to those interviewed was open-ended allowing them to select the environment if they chose to do so. While SMS Research has noted that the environment is becoming of increasing concern to Hawaii residents it does not come up in numbers that exceed one to five percent of the population.
10.12 The DEIS states that the value of the community benefits were identified as $2.7 million in 2007 and $2.0 million in 2008. While the specific benefits that will be distributed in the future have not yet been determined, can you provide more detail on the benefit packages provided in previous years?		The community benefits initiative is a new program that was started by the current City Administration. Prior to 2007, there were no community benefits initiatives associated with the project.
10.13 There are a number of technology driven options examined in the first half of the lengthy discussion of alternatives. Each of these is evaluated as an all or nothing choice. There is no reason why several options might be considered in tandem that could address the need for the City and County to address it solid waste situation. Some of these methods taken together could lead to the closure or at least lead to a drastic reduction in the use of the landfill. There is also incomplete information about the cost of each of these options. Could not reasonable estimates of cost be found so that the options could be compared?		The alternative technologies to landfilling provided in the DEIS have been used in sizes smaller than noted. The size used in the DEIS was as specified by the City to define the project types that would be considered in its Invitation for Bid (IFB) for alternative technology. The Final EIS will provide discussion of the use of multiple smaller technologies. See Section 9.6. Alternative Technologies to Refuse Disposal, subsection 9.6.1. Introduction. Concerning the cost of the technologies, many of the alternatives evaluated have not had a full scale project built. Some have. To compare the cost of these two disparate conditions would result in an inaccurate and unfair evaluation. In addition, site specific factors must be reflected in the cost of a facility and those need to be estimated based on preliminary engineering data that was unavailable for most of the technologies.
11. Colleen Hanabusa, Senator, 21st District	7/7/2008	
The Senate		
State of Hawaii		
11.1 Section 2 Project Background -- This section begins with the incorrect conclusion that WGSL is 'essential and necessary' for the City and County of Honolulu ('City'). WGSL is deemed to be essential and necessary only because no action has been taken by the City in truly exploring alternatives to landfilling on this island.		The City is responsible for providing for the disposal of waste materials. Currently the primary disposal methods in use are recycling, landfilling and incineration. As explained in the DEIS, WGSL is the only currently permitted municipal solid waste ("MSW") landfill on Oahu. Any alternative landfill location other than Waimanalo Gulch will take time to select, acquire and permit. H–POWER handles the majority of the MSW that is disposed on the island. Waimanalo Gulch provides disposal capacity for the ash and residue from H–POWER and is a permitting requirement for H–POWER to operate. Since the Waimanalo Gulch is the only currently permitted MSW landfill and since H-POWER is required to take ash and residue to a permitted landfill, the Waimanalo Gulch Sanitary Landfill ("WGSL") is "essential and necessary."

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.2 An honest discussion is lacking in the DEIS as to why the City delayed in bringing the expansion to the public. News media reports of comments by the Planning Commission of the City and County (‘PC’) and the Land Use Commission (‘LUC’) evidence that these decision makers were also not pleased with what could be construed as a deliberate delay to request the extension. This expansion request will also be construed as leaving decision makers no alternative but to grant an extension.		On June 9, 2003, the LUC issued its Decision and Order Approving Amendment to Special Use Permit (“2003 LUC Decision”). The City was ordered by the LUC to select a new site by June 1, 2004. The Mayor’s Advisory Committee on Landfill Siting (“Mayor’s Advisory Committee”) was formed in June 2003 by Mayor Harris to make a recommendation to the City Council as to a new site for the landfill. The Committee issued a list of 4 sites for City Council consideration on December 1, 2003, in accordance with Condition No. 1 of the 2003 LUC Decision. The City Council conducted an independent evaluation of the selection process used by the Committee, and determined that it was unable to make a decision by the LUC’s June 1, 2004 deadline. The City was granted a 6-month extension, to December 1, 2004, to make a decision on a new landfill site. The City also sought the LUC’s clarification as to whether Waimanalo Gulch could be considered by the City Council as the future landfill site. The LUC stated that such a decision was not within its jurisdiction. Accordingly, Waimanalo Gulch was then considered as a potential landfill site by the City Council. The City Council selected Waimanalo Gulch as the future landfill site on December 1, 2004. The current City administration took office in January 2005 and immediately began a review of the options for MSW disposal. This process took about a year to conclude. By early 2006, the City decided to proceed with the environmental review process for the future use of Waimanalo Gulch. In February 2006, the City Council passed Council Bill 37 (2005), CD2, which would have closed WGSL by May 1, 2008. Bill 37 was vetoed and the environmental review process for expansion of WGSL began in 2006. The EIS Preparation Notice was published in The Environmental Notice in November 2006. Stone uprights were identified in the proposed expansion area in the Spring of 2007. Due to a staff shortage at SHPD, the evaluation of the cultural significance of the stones was delayed. Because a cultural impact assessment is required in an EIS, completion of the EIS was delayed. Additionally, the City has been in the process of seeking to increase waste-to-energy capacity as an alternative to landfilling and to transship refuse to be landfilled on the mainland. In both cases, the results to date have been reflected in the DEIS. Because it was clear that given the delays related to evaluation of the stone uprights the City would be unable to complete the EIS and receive the proper permits before the May 1, 2008 deadline for cessation of waste acceptance at WGSL, the City sought a 2-year extension based on the fact that there was additional unused capacity. Ultimately, an 18-month extension was granted.
11.3 Blue Ribbon Commission - Much of this DEIS is based upon the Mayor's Advisory Committee on Landfill Site Selection (‘Blue Ribbon Commission’). What the DEIS fails to address is that this Blue Ribbon Commission, having been staffed by R.M. Towill provided the members with inadequate information or incorrect information to fulfill their task.		The process followed by the Mayor’s Advisory Committee is detailed in the EIS. The Mayor’s Advisory Committee’s recommendations were made based on its own selection of criteria it considered important to the selection of an alternative landfill site. R. M. Towill supported by Pacific Waste Consulting Group, SMS Research, Cultural Surveys Hawai‘i, and the City gathered the information requested of it by the Committee. Site specific information was sought in a number of instances, but access to some of the potential sites was either denied or delayed (until late in the LUC timetable) by the landowners of four of the five sites. As a result assumptions that were shared with the Committee were made to enable a reasonable comparative analysis. Although there was significant technical data about WGSL available, in order to put all of the sites on an equal level for comparison, the “no excavation” assumption and other assumptions were used for the evaluation. These assumptions were documented in the data sheets that were provided to the Committee.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.4 Though much is made about violations of the Sunshine law, what is lacking is an honest discussion of the flawed information which was provided to the Blue Ribbon Commission. Response by the City that R.M. Towill is not expected to know what the conditions of the land is absolutely laughable. The entity which has prepared all EISs in recent history and who is well aware of the Contract entered into to extend the management contract with Waste Management Hawaii, Inc. (‘WMI’) for the landfill operations at WGSL, cannot argue ignorance. It is of significance that the City finally admits that one of the criteria to assess the sites was no excavation. How R.M. Towill or the City could present WGSL expansion for 20 years with no excavation is akin to bad faith. The City and R.M. Towill was definitely on notice and failed to inform the Blue Ribbon Commission of this fact.		This comment regarding the City's contract with Waste Management of Hawaii, Inc. (“Waste Management”), and the comment regarding "no excavation", are similar to comments made in earlier letters from you dated August 30, 2006 and December 26, 2006. We offer the following response, which is consistent with earlier responses: The contract amendment dated May 1, 1999, provided for the expansion of the Waimanalo Gulch site. Subsequently, the prior administration decided on a five-year limit for the use of the site. The contract was not amended to a shorter term because the exact date of termination could not have been determined. Although the contract was not amended, the City retains control of the contract and can terminate it at any time when it is in the best interest of the City. As provided in Contract Special Provision 29, the contract can be terminated, “… in whole or in part, whenever the Director shall determine that termination of the contract, in whole or in part, is in the best interest of the City.” (Letter to Colleen Hanabusa from ENV, May 12, 2008) Waste Management, consultants, and the City all understand this provision. The contract is a publicly available document. Regarding "no excavation": The no excavation remark that you cite comes from the Waimanalo Gulch Expansion, Potential Landfill Site Data Sheets, prepared for the Mayor's Advisory Committee on Landfill Siting, October 2003. The specific reference is to information provided for Criteria No. 23, Landfill Capacity or Site Life. According to the data sheet, "The volume was calculated assuming a 100 foot buffer around the site boundary, 30 acres for infrastructure facilities, no excavation, and filling to the natural grade." The rationale for not incorporating excavation as a factor involved the following: A. It was not in the consultant’s scope of work to do field studies including drilling borings to obtain subsurface information. This is typically the case when doing preliminary siting studies due to difficulty in gaining access to the property, the extensive time required for such studies, and the high cost of doing field studies. Without these studies, it is not possible to determine excavation depths or difficulty with any degree of certainty. Therefore, it is typical to assume minimal or no excavation in order to compare site capacities; B. Criteria No. 23, therefore, was established to provide an estimate of capacity only based on: an area adjusted with an approximately 100 foot buffer around the perimeter of the site; the use of 30 acres for infrastructure to operate the facility; no detailed engineering calculations incorporating soils conditions to produce information on excavation; and filling of the site to the natural grade of the terrain of the finished site. It is incorrect to conclude or imply on the basis of information from the data sheet alone that in the course of developing a landfill site that no excavation would be required. See Letter to Colleen Hanabusa from ENV, May 12, 2008.
11.5 The Contract between WMI and City should be made a part of the Appendices for the Final Supplement EIS to be accurate and complete.		The contract between the City and Waste Management is a matter of public record and is publicly available for those who may wish to view it. The absence of the contract in the Appendices will not affect the accuracy, nor completeness, of the EIS.
11.6 In addition, the Appendix which is found in Volume 3 of 3 fails to include those pages which address the criteria as well as how the alternative sites were evaluated by R.M. Towill. This should definitely be included for all to review.		The full Report of the Mayor’s Advisory Committee (Blue Ribbon Committee) on Landfill Site Selection dated December 1, 2003, which addressed the 31 criteria used by the Mayor’s Advisory Committee as well as how alternative sites were evaluated, is attached as an exhibit to Appendix K of the DEIS, and located on the City’s website at http://www.opala.org/solid_waste/archive/Mayor%27s_Advisory_Committee_on_Landfill_Siting.html. Additionally, a description of the criteria and evaluation process is located on pages 9-51 to 9-73 of the DEIS.
11.7 Under Section 4 of this letter, there will be a discussion of the costs. Cost which was a criteria for the Blue Ribbon Commission had very minimal expenses for WGSL because of the lack of excavation. This is again shown to be an incorrect statement.		Costs are addressed below in responses to comments 35 and 36.
11.8 DOH Violations - The so called alleged efforts of the City to address the Department of Health's Notice of Violations (‘NOV’) and how to prevent them in the future need more details. This is especially true in light of the subsequent allegations of mismanagement and the recent lawsuit regarding the City's rebate of tipping fees to Schnitzer steel.		As a result of the NOV, and new regulations and requirements, additional provisions were included in the revised landfill operating permit. Furthermore, the Department of Health, State of Hawaii (“DOH”), has greatly increased the frequency of its site inspections and review of the required operating documents.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
What is of significance is the issue of what is the City doing to monitor what is being placed in the landfill. It is also important that irrespective of whether the violations were 'settled;' there is still lacking information as to how and where the asbestos was buried. This is hidden in the violations regarding the reporting to the DOH.		Finally, City staff is in constant contact with Waste Management and addresses issues that may arise on a daily basis. City staff does an initial screening of what is being placed in the landfill when the delivery vehicle is at the scale house. Waste Management does further screening as the waste is disposed of at the working face of the landfill. The City co-authors or receives copies of all reports submitted to DOH. The allegations in the Schnitzer Steel lawsuit – to which the City is not a party – have yet to be proven, and in any event, Schnitzer Steel provides annual certification that the recycling residue in question meets all legal requirements for landfill disposal. Asbestos is handled in accordance with Part II, section C, of operating permit dated February 20, 2008, which is publicly available.
11.9 The exceedance of grade is a critical issue as to future monitoring and there needs to be a more detailed discussion as to how this will be avoided in the future.		After extensive review and a stability analysis, DOH approved the grade modification to WGSL. A ground survey is performed on a bi-monthly basis to compare existing grades with approved grades. DOH is responsible for enforcement at the site and determines the frequency of its inspections. See also Section 2.3.1. State Department of Health of the FEIS, for further discussion.
11.10 EPA Violations - It is unacceptable to merely address these violations as "resolution pending." In light of this Department and the City's battles with the EPA on the sewer systems, it is important to cover in this DEIS the relationship between the two, if any.		The primary violation in the EPA Finding and Notice of Violation ("EPA NOV") was the late installation of the gas collection system, which was self-reported. It was installed and operational by November 2005. Subsequently, the EPA issued its NOV in April 2006. Thus, what led to the initial violation was corrected. In addition, EPA alleged that the WGSL continues to operate in violation of EPA regulations because the WGSL's wellhead gas temperatures exceed 131°F in some of the landfill gas wells. Waste Management continues to monitor and evaluate the potential causes of the elevated gas temperatures and has provided documentation to EPA and DOH to demonstrate that the Landfill can be safely operated at these higher temperatures. Waste Management will continue to coordinate appropriate measures to maintain compliance with all regulations as required by law. There is no relationship between this EPA NOV and the City's sewer systems. See also Section 2.3.2. U.S. Environmental Protection Agency, of the FEIS.
11.11 More importantly, what is lacking is a discussion as to what the City has done in terms of contract evaluations and performance evaluations of its operator, WMI. Given the nature of their violations and the magnitude, the DEIS is required to provide this information to the public.		To evaluate operations performance, the City hired a third-party engineering consultant to evaluate landfill operations. They concluded that Waste Management was performing at a satisfactory level. Waste Management also contracted with another third- party engineering consultant to evaluate the effect landfill operations may have on neighboring areas and has shared data with the City. The City's staff meets weekly with Waste Management's staff to discuss landfill operations. In addition, the City's Refuse Disposal Engineer is in daily contact with Waste Management's General Manager regarding operations at WGSL. See also Section 2.4. Summary of Current Status, of the FEIS.
11.12 Section 3 Introduction - This introduction is lacking in that it fails to set forth that this is a project which was promised to be closed by the prior administration and this Mayor as well.		The City acknowledges that prior commitments were made by previous administration officials to close WGSL by 2008. See also pages 2-2 and 2-3 of the DEIS. This position was overridden by the subsequent City Council selection of WGSL as the location of the City's future landfill as described in section 2 of the DEIS. The City is unaware of any commitment by the current administration to close WGSL.
11.13 Moreover, in that the City has chosen to address the requirements of a DEIS in this section of its document, it should be clear as to exactly what is required, such as: Department of Health Rules ('HAR') § 11-200-14 through 23 are the requirements in the preparation of Draft and Final Environmental Impact Statements. The 'General Provisions' highlight the expectation of the EIS process. . . . An EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self serving recitation of benefits and a rationalization of the proposed action. Agencies shall ensure that statements are prepared at the earliest opportunity in the planning and decision making process. This shall assure an early open forum for discussion of adverse effects and available alternatives, and that the decision makers will be enlightened to any environmental consequences of the proposed action.		The DEIS was prepared in accordance with Hawaii Revised Statutes ("HRS") Chapter 343 and Title 11, Chapter 200, of the Hawaii Administrative Rules ("HAR"). The environmental review process allows for public input, such as your letter, which benefits the integrity of the review.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.14 Clearly, this DEIS is a self serving recitation and a rationalization of what the City wants to do. The Rules require that these statements be prepared at the earliest opportunity and it is evident that the City chose to wait until the last possible moment. The argument which the City will raise is the discovery of stone outcroppings. However, the City chose to file this DEIS without a determination by the EPA on the violations at WGSL. When it has been convenient, the City has chosen to act so that there is no time for any viable alternative.		See the response at pages 1-2 of this letter regarding the EIS process and timeline. A cultural impact assessment is a necessary component of an EIS in accordance with Hawaii law. This assessment could not be completed until the cultural stone uprights were evaluated. This evaluation and the cultural impact assessment have been completed, however, the final preservation plan for the stone uprights is currently being developed, and has therefore, been identified as an unresolved issue in Section 11 of the DEIS. The City, Waste Management and SHPD will work to ensure that an appropriate preservation plan is put into place. Resolution of the EPA NOV is not required to complete this DEIS. The EIS is an informational document and provides the current status of the EPA NOV. It cannot predict the resolution of the EPA NOV. The City did not wait for completion of the negotiations with EPA to complete the EIS as doing so would have further compressed the schedule. The EPA operates on its own schedule.
11.15 Figure 3-2 in this section depicts expansion which will exceed the present SUP boundary. This means that the expansion is expected on the lower portion of WGSL nearest Farrington Highway which will make the landfill more visible to the residents. This expansion will take all of the 200 acres at WGSL minus a 100 foot barrier around the perimeter of the property boundary.		The extent of proposed landfill expansion area is shown in Figure 3-2, Figure 4-6, Figure 5-1 and Figure 5-3 of the DEIS, and these figures show that expansion will occur mauka and northeast of the currently permitted area. The area south of Ash Cells 1 and 8, which you referred to as the “lower portion of WGSL nearest Farrington Highway,” is currently permitted for facilities, but not for landfilling. That area is already a part of the permitted footprint and is expected to continue to be used for facilities. The lower portions of the expansion area, as depicted on Figure 3-2 will be used for accessory uses, not landfilling. See also Figure 4-6 (Approximate Final Grading Plan and Proposed Stockpile Location). Surface treatments including landscaping will be done to improve the appearance of the site.
11.16 Section 4 Project Description - It is interesting that the City refuses to acknowledge that WGSL is located near Ko Olina. Ko Olina has a community and is marked as the Second Resort destination for the Island of Oahu. In these difficult economic times, it would be significance to know that location of the landfill to a major economic engine for the City and the State of Hawai`i.		The DEIS clearly shows the location of Ko Olina and its proximity to WGSL in Figures 7-3, 7-4, and 7-5. Section 7.2., Land Use and Ownership, clearly acknowledges the presence and importance of Ko Olina as one of several regional land uses in proximity to WGSL.
11.17 Given that there has been a contested case hearing recently completed on the WGSL, it is of interest that the sworn to testimony of the City officials are not included in some form or another.		The transcript of the Contested Case Hearing is a publicly available document. It is not necessary to recite or attach the transcript to the EIS. However, where your comment misstates testimony, the corrections are noted below.
11.18 For example: Frank Doyle testified that he was Chief of the Division of Refuse when WGSL was initially selected. He confirmed that the original Environmental Impact Statement (‘EIS’) stated that only 59 or 60 acres was suitable for landfill use. (For ease of reference, the "Tr." refers to the transcript in the Contested Case Hearing held on December 7, 2007, followed by the page numbers Tr. 215 and 217).		Mr. Doyle testified that the first EIS contained a reference that WGSL contained “59, 60 [acres], somewhere in that area” of land good for landfilling. See Transcript at 217. Please also refer to comment 29 below.
11.19 You, [sic] Mr. Takamura testified that to expand WGSL under the 17 year contract with WMI, 8 million cubic yards of native soil will have to be removed to create 15 million cubic yards of airspace (landfill). (Tr. 67-68).		Dr. Takamura testified that it sounded familiar that 8 million cubic yards of native soil will have to be removed to create 15 million cubic yards of airspace. See Transcript at 68.
11.20 WGSL is up the side of a mountain. In the present expansion of WGSL by the 14.9 acres, WMI encountered blue rock and has been blasting to expand WGSL. (Tr. 177-178). Paul Burns, former manager of WMI for WGSL, testified that grading has been done at WGSL which is outside the permitted 14.9 acres and is where blue rock has been encountered. (Tr. 149). It is for sloping of rock faces and drainage. (Tr. 150). In the E-3, E-4 area as much as 700,000 cubic yards of blue rock was removed. (Tr. 152-153).		Mr. Burns testified that drainage, grading and sloping of rock faces for safety reasons has occurred outside of the 14.9 acre expansion area designated for landfilling. See Transcript at 150. Mr. Burns also testified that rock “probably in the 700,000 cubic yard range” was removed from Cells E-3 and E-4. See id. at 152-53.
11.21 At the landfill, leachate is created. Leachate is ‘the decomposition of organic matter . . .produces CO2; if it's anaerobic, it produces methane, and the other end product is water. There's also water in — loose water with the material we grab or dispose of, so when it decomposes and breaks down, water seeps to the bottom . . . where the liner is and it collects there. . .’ (Tr. 71).		Dr. Takamura testified as follows: In the decomposition of organic matter, I guess the biological activity produces CO2; if it’s anaerobic it produces methane; and the other end product is water. There’s also water in -- loose water with the material we grab or dispose of, so when it decomposes and breaks down, water seeps to the bottom of the -- where the liner is and it collects there and it goes to the low point, and that’s what we term “leachate.” See Transcript at 70-71.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.22 Count I of the NOV is entitled 'Exceedance of Permitted Grades' and is relevant to the representation of the capacity at WGSL. (Id. at 2). In Count I and as testified to by Burns, permitted capacity in the ash monofill area was filled and exceeded in 2004 by 100,000 tons. (Tr. 168). In addition, 129,200 cubic yards of Municipal Solid Waste ('MSW') was placed above permitted grades. This computes to about 91,000-100,000 tons. (Tr. 168-169). When the DOH learned of these violations, it had originally told WMI to re-grade the ash monofill area and remove the excess MSW to the back portion of the landfill. (Tr. 248). An alternative provided to WMI was to construct the berms to address the stability issue. (Tr. 250).		Paragraph 9 of Count I of the DOH Notice and Finding of Violation (NOV) provides, "In a letter dated February 3, 2005, Waste Management states 'approximately 100,000 tons of ash delivered from the H-POWER facility has been placed above the current permitted grades of the ash monofill'. The February 3, 2005 letter further states that the placement of ash occurred during 2004." Mr. Burns testified that he was unable to answer whether 100,000 tons of ash had been placed above current permitted grades in the ash monofill because that was before he arrived in Hawaii. See Transcript at 167-68. Paragraph 11 of Count I of the DOH NOV provides, "With a submission dated February 22, 2005, showing 2005 topography and master plan final grades, Waste Management noted that 139,485 cubic yards of ash and 129,240 cubic yards of MSW were placed beyond the permitted grades." As to paragraph 11 of Count I of the DOH NOV, Mr. Burns testified that 130,000 cubic yards was "about 91,000 tons, about there, 90-something thousand?". See Transcript at 168-169. Gary Siu of DOH testified that DOH asked Waste Management and/or the City to regrade the ash on the Waianae side, and to remove the overfilled area in the MSW area and take it to areas with capacity. See Transcript at 248. Regarding the berm, Gary Siu testified, "The construction of the ash -- the berm to stabilize the ash was done -- because when they told us that they overfilled it, I believe there's a letter signed by Larry Lau putting some options in front of them, and the option they chose was to build a stability berm." See Transcript at 250.
11.23 A 'toe berm' was constructed at the 'toe' of the ash monofill when Takamura was Director to address the overall stability of the WGSL. (Tr. 56 and 58).		Dr. Takamura stated that Colleen Hanabusa should ask the engineers about the purpose of the toe berm. See Transcript at 56. He testified that he understood that his approval was needed for the construction of the toe berm because "[i]t's part of the operations of the Waimanalo Gulch landfill." See id. at 57. Dr. Takamura further testified that the toe berm was already being constructed prior to a meeting with DOH regarding the NOV. See id. at 58. He believed that there had been discussions about stability prior to his meeting with DOH. See id.
11.24 Takamura testified that stability issues are common when you touch a slope and WGSL is up the slope of the mountainside. (Tr. 60). Burns conceded the stability concerns and described WGSL as a canyon and once the valley is filled (the gulch) then when the expansion is upward, there is an effect throughout the whole facility. It is similar to stacking on the top and the effect will be there for the lower area. (Tr.159- 160).		It is unclear what "Burns conceded the stability concerns" means. Specifically, Mr. Burns testified, "As you mentioned earlier, we've got a canyon fill or a valley fill, and that valley, it's a 'V' shape, in very simplistic terms a 'V'-shaped gulch and it's not flat, it kind of points uphill; so, whatever you do on the upper reaches has an effect, pretty much through the whole facility..." See Transcript at 158-59. In response to the question "[B]ecause of what I consider the stacking -- just a layman person's perspective -- stacking of the MSW and the landfill that you -- that the decision was made that at the ash monofill, the bottom area, that the height should be reduced for stability?," Mr. Burns testified, "They all kind of go together." See id. at 159.
11.25 Due to the topography of WGSL, there are three stability berms. One is for the ash monofill area and called the 'toe berm.' The others are the E-1 berm and the West berm. (Tr. 151). The E-1 berm was constructed in late 2005 to 2006 and the West berm in 2006-2007. (Tr. 164). All three berms were constructed with blue rock from primarily the E-3 cells. (Tr. 177-178). The West berm was constructed to stabilize the landfill as the east side (E cells) are being filled. As the east side fills the forces push the to the west side. (Tr. 254). These berms were stability berms which were a result of WMI overfilling WGSL. (Tr. 267).		Mr. Burns testified that he believed the E-1 berm was built in late 2005, maybe into 2006. See Transcript at 164. Mr. Burns also testified that the western berm was constructed with blue rock, that the toe berm was constructed with blue rock which primarily came out of Cell E-3, and that he was unsure where the material to construct the E-1 berm came from. See Transcript at 177-78. Mr. Siu testified, "As you fill the east side, the force is pushing on the west side." See id. at 254. In response to the question, "So, the stability berm is the ones that came in 2005?," Mr. Siu stated, "That's correct. And they're not a part of a permit application; they're part of a response to overfilling the landfill and potentially making a site unstable, which is what their analysis showed." See id. at 267. Regarding Mr. Siu's comment, the City clarifies that only the ash toe berm was added to address an isolated low factor of safety in some portions of the ash monofill caused by overfill. The E-1 berm and West berm were a part of the initial design for the 14.9-acre expansion of WGSL, and were not added at a later date to address an unanticipated low factor of safety. It should also be noted that Mr. Siu testified that he was not an expert on stability analysis and did not conduct his own stability analysis of WGSL. See id. at 260-261.
11.26 There needs to be a description of safety factors. For example the testimony has been: Safety factor at WGSL is calculated at 1.5; however anything above it is acceptable. (Tr. 172). The example given is that in the E-1 area the safety factor is less than 1.5; however the addition of the berm brings it up to 1.5. (Tr. 173). The safety factor affects the grades at the landfill.		Mr. Burns testified that Hawaii has a minimum safety factor of 1.5, and that anything above 1.5 is acceptable. See Transcript at 171-77. Mr. Burns provided a hypothetical example, "So, if we do a design without, say--for example, without a stability berm, in the E-1 area we may have a factor of safety below 1.5; it could be 1.4. You add that stability berm in place, it -- you know, it boosts your factor of safety to the 1.5. It just gives you that extra level of insurance." Id. at 173.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
For example if the factor was 2.0, the grades would need to be lowered. (Tr. 185). The stability factor at the ash monofill area before the toe berm was 1.29. (Tr. 248). A related issue is that WMI had used the wrong liner in that the 'textured liner' was not used and a 'smooth' liner was which called into question the resistance to movement of the landfill. There were at least two cells in the middle of the landfill with smooth liners. (Tr. 134).		Mr. Burns testified that if 2.0 was the factor of safety, it may affect WGSL's final grades or future designs. Id. at 185. He testified, "They would need to be lower, probably," and "There's some areas it would have no effect on; other areas it may have some effect." Id. at 185-86. Mr. Siu testified that he thought the factor of safety was 1.29 with the overfill in the ash area. Id. at 247-48. As to the liner issue, Mr. Burns testified as follows: So, during -- in 2001, while we were doing the design of the 14.9 acre expansion, we realized there were some cells constructed in the middle that were done with a different lining system. They were specified to be a -- what we call a "textured liner"; it's a real course, rough thing with a high-friction surface on it. There were a couple of cells that were built with smooth. Why? I can't answer; I wasn't there at the time. But the due diligence of that analysis brought that to light. So, what that means is, instead of having a real course friction angle in some of these cells, it's smooth, so it's not quite as resistant to movement. However, looking at it in the light of the whole project, I want to make sure that everybody knows the landfill was stable, there was no -- ever any sense or -- that the facility was going to slide. So, I want to make sure everybody is clear. Even though that friction value was lower in some areas, the whole site was stable and there was never any problems from that perspective. Id. at 134.
11.27 There are two types of safety factors, static and seismic. (Tr. 257). Seismic is when movement is anticipated and is calculated into the analysis. (Tr. 258).		Mr. Siu testified that the seismic safety factor is different from the static safety factor. See Transcript at 257. As to the seismic safety factor, Mr. Siu testified, "There's a number of ways to do seismic. You can do it by using what they call a pseudostatic; and that is, you try to analyze in such a way that there would be no movement, and then you would, again, have a factor of safety. The other way, which this facility is using is, they're using a deformation type of analysis, and there's a determination made as to how much deformation you will -- is appropriate to accept." Id. at 257-58.
11.28 In a report by EA Engineering, Science and Technology, Inc., the stability factor of 2 is what is proposed with the explanation that safety factors between 1.5 to 1.9 is acceptable when it does not 'pose and imminent threat to human health or the environment.' The proximity to Farrington Highway and Kai Lani subdivision suggest imminent threat and supports the increase to 2.0. Exhibit H at 6.		The EA Engineering Science and Technology, Inc. ("EA") Report introduced at the Contested Case Hearing was never authenticated by EA and was not signed by a licensed professional. Licensed and qualified professionals at DOH and experts retained to assist them will evaluate details of the landfill design. The safety factors, and other analytical approaches used by Waste Management to design the expansion, will be subject to extensive scrutiny to ensure the analysis is appropriate considering all conditions at this site.
11.29 What is clearly relevant to the general public and not set forth in this DEIS is the issue of the stability of the landfill and the requirement for the berms. It is very relevant especially when viewed in light of the first EIS which said only 59-60 acres were suitable for landfill. This is also important when viewed in light of the criteria of the Blue Ribbon Commission which included the statement that they would fill to "natural grade." (Criteria No. 23). The transcript of the Contested Case Hearing should be made a part of the Final Supplemental EIS as well.		The Revised Environmental Impact Statement accepted by the Director of Land Utilization on October 17, 1985 (the "first" EIS), stated that WGSL contained about 80+ acres of usable land. See Revised Environmental Impact Statement dated May 7, 1984, at S-5, S-7. The usable area was estimated based on the engineering knowledge, operational processes and regulatory environment at that time, all of which have changed since 1984. The usable area for a landfill is subject to continuing evaluation and change over time, as the science and engineering of landfills evolve. WGSL is an example. The preliminary design of the usable footprint is disclosed in Section 4 of the DEIS. The first EIS also mentioned that 57± acres will be used for the landfill. See id. at 2-1. One part of one of the 31 criteria used by the Mayor's Advisory Committee to provide a basis for comparative analysis of the sites was filling to natural grade. The Committee never assumed that any of the four sites, or an expansion at WGSL, would be designed as a landfill to the "natural grade." The final design of the selected site would consider the site specific conditions and would have to be approved by DOH. Regarding your suggestion that the transcript of the Contested Case Hearing should be made a part of the Final EIS, please refer to the response to comment 17 above.
11.30 Given the concern of the stability of the landfill and the recent earthquake on the Big Island, a discussion must be had as to what can be done if such a natural disaster caused the landfill to slip onto Farrington Highway. This discussion must look to the fact that expansion will be at the steepest part of the footprint of the parcel of land and the stress it will place on the existing landfill. The people of the Waianae Coast have only one way in and one way out.		The design of the Waimanalo Gulch expansion considers the seismic and other factors appropriate to the island and to the area of the site. Detailed stability analyses were completed during the project design. The design of the current SUP area and the proposed area of expansion will meet the EPA Subtitle D (40 CFR Part 258) standard for stability. The design of the expansion will be subject to review by appropriate City and State agencies when they evaluate the permit documents. See also Section 5.6.5., Potential Impacts and Mitigation Measures, pertaining to Seismic Activity (Earthquakes), of the FEIS.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.31 Stability of the Landfill must be analyzed in light of Figure 3-2 which shows the expansion throughout the 200 acres of land. It will be a total landfill with the exception of a 100 foot buffer.		As noted in the DEIS, the areas that will be used for MSW and ash cells do not encompass the entire 200 acres. Comments related to stability were responded to earlier in this letter.
11.32 Though mentioned earlier, the fact that City states in this section that it has a program to control the 'Contaminated Materials,' this is without basis. It is also without basis that the 'all documentation of asbestos disposal' is present on site. In fact, that is one of violations that WMI could not determine where the asbestos was disposed of. The asbestos disposal plan may set forth a plan; however, from the NOV we know that WMI did not follow that plan. It is unacceptable to simply state a plan and have no enforcement as to whether it will be followed.		Any waste that is not MSW is considered "special waste," subject to profiling as described in the Operations Plan, which is publicly available at WGSL. The description of the Operations Plan in the EIS, including the Asbestos Acceptance Plan, was developed to address proper waste practices and procedures. The Operations Plan addresses all safety regulations including those in the NOV. Accordingly, the policies and practices outlined in the EIS and detailed in the Operations Plans are more than adequate because they address the issues identified in the NOV. Moreover, the Operations Plan was reviewed by DOH during its evaluation of the grade modification permit application. This permit was approved on February 20, 2008. DOH has been actively reviewing and inspecting landfill operations. Questions now and in the future about the documentation of asbestos disposal will be handled as outlined in the Operations Plan.
11.33 As well, statements that their storm water or water drainage are managed is incorrect. Again, the NOV is on point and the amount of leachate which had to be pumped and dumped into the Waianae Sewage Treatment plant needs to be addressed.		Leachate is not allowed to co-mingle with stormwater runoff. Stormwater runoff is managed pursuant to the Surface Water Plan, and is unrelated to leachate management. While Count XV of the NOV related to a failure to submit the annual surface water (stormwater) plan, the leachate management issues are wholly separate from surface water and stormwater management issues. Again, the Operations Plan was developed to address proper waste handling practices and procedures, and includes extensive stormwater monitoring and surface water management. Leachate level issues related to pump and equipment failures were corrected as part of the NOV resolution. The leachate that is accepted by the operator of the Waianae Wastewater Treatment Plant was, and continues to be, handled in accordance with regulatory requirements to ensure public health and safety. Leachate is collected at the site, analyzed regularly through independent laboratory tests, and taken to the Waianae Sewage Treatment Plan where it is properly treated. The amount of leachate varies and the need to pump and dispose of it is monitored regularly. The monitoring reports are part of the documentation reviewed by the DOH inspectors and are publicly available. Pumping the leachate from the site and disposing of it at the Waianae Wastewater Treatment Plant are DOH-approved waste disposal practices. As noted in a memorandum to ENV from the operators of the Waianae Wastewater Treatment Plant, the leachate accepted by the plant for processing has had very little or no impact on the wastewater effluent quality that is being discharged to the ocean outfall. See October 2, 2007 memorandum from the Division of Environmental Quality to Frank Doyle, which was included as a part of section 15 of the DEIS. Leachate management and monitoring will be a part of the Solid Waste Operating Permit application.
11.34 Figure 4.9 seems contrary to the representations made to the Ko Olina community. Assuming that the color chart sets forth the sequence of the closure, then the area in the back of the landfill will be closed before the areas closest to Farrington Highway. This means that landfill operations will be visible from Farrington throughout the extended life of the landfill.		It is unclear what representations are being referred to regarding visibility of the landfill. The closure sequence depicted in Figure 4.9 does not reflect the cessation of actual landfilling operations, but rather the anticipated final cover of those areas. Final cover or closure cannot be installed until the landfill operations associated with the expansion area in the back of WGSL have been completed. The present plan is to continue filling along the west side of the landfill as the final phase of filling. These operations will start at the west stability berm and continue to the area of the ash monofil. It is important to recognize that the face of the ash disposal area has largely been covered with an interim soil cover, and portions have been planted with natural vegetation. As that vegetation matures and becomes fully established, and as the operator places rocks on the face to emulate the nearby undisturbed ground, even the ash monofill will be much less distinguishable from the surrounding land. Additional landscaping to the front area of WGSL is planned. See also Section 4.10. Closure of Lateral Expansion Area, of the FEIS.
11.35 Cost of the Landfill - Another issue which was a criteria in the Blue Ribbon Commission's consideration was costs. At Section 4.11 a discussion of costs showed $60,800,000 for the cots of the excavation and other costs for a total cost of $99,400,000 in 2008 dollars. How are these costs arrived at?		Engineers did a design cost analysis for the WGSL and calculated costs for anticipated excavation, grading, landfill liners, access roads, a leachate collection system, a drainage system, and other accessory requirements.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.36 In addition, the costs of the berms should be included in that these structural changes enable the City to now petition for an extension.		The cost of the existing toe berm is not a part of the anticipated future costs of the expansion project, which are described in Section 4.11. As noted above in response to comment 25, the existing E-1 berm and West berm were a part of the initial design of WGSL and were not included in the estimated costs of future improvements. However, as noted in the response to No. 38, below, the cost of extending a portion of the west berm up the canyon is included in the proposed expansion project.
11.37 In addition, the reference in the DEIS is to the figure $86 million as the cost. The discrepancy must be addressed.		The estimated figure of $86 million dollars was identified on Page 7-30 of the DEIS by SMS Research through consultation with Waste Management, as costs associated with the construction of the site over a 10-year period. The estimated figure of $99.4 million dollars, also prepared by Waste Management, is provided in the DEIS in Section 4.11, Project Schedule and Cost, and represents operating and construction costs that would be incurred over a 15-year period. Thus, the two figures represent two different periods of time and different activities, and are not comparable.
11.38 There also needs to be a discussion as to whether additional berms will be required or are anticipated at the site.		At this time, while additional berms are not anticipated, the proposed expansion design includes extending the west berm up the canyon. The final design, however, will be determined during permitting after completion of the EIS process. See also Section 11.2. Final Engineering and Construction Details, of the DEIS.
11.39 In discussing costs, the City has said it makes a profit of $4 million a year at WGSL. If this is the case, for a 15 year expansion the operational cost will increase by at least $6.63 million a year. Why is this then economical?		The EIS does not address the City's profit at the landfill. It is unclear what representations are being referred to regarding $4 million annual profit. The City is responsible for providing safe and adequate waste disposal, and these costs will exist at any landfill site, regardless of the amount of income it receives because of landfill operations.
11.40 Section 5 Environmental Setting - Given the recent decisions by the Hawaii Supreme Court, it is necessary to discuss the concept of public trust. This is especially true when looking at the waters of this State. What occurred with the operations of WGSL and the leachate is inexcusable and a violation of that public trust. Note that the leachate was disposed of, for most part, in the Waianae Sewage Treatment Plant.		There has been no violation of the public trust. Pursuant to the public trust doctrine, the state holds certain resources in trust for the benefit of its citizens, establishing the right of the public to fully enjoy them for commerce, navigation, fishing, bathing, and related activities. It is unclear, however, how the principles of the public trust doctrine are applicable to operations of WGSL and the disposal of leachate at the Waianae Wastewater Treatment Plant. Leachate from the landfill is disposed of and processed through secondary treatment at the Waianae Wastewater Treatment Plant, consistent with all regulatory requirements. The content of the leachate is sampled and analyzed regularly through independent laboratory tests. Monitoring data show that the leachate has not changed the water quality near the outfall. See October 2, 2007 memorandum from the Division of Environmental Quality to Frank Doyle, which was included as a part of section 15 of the DEIS. Any suggestion that the disposal of leachate at the Waianae Wastewater Treatment Plant is harming the waters of the State is without basis.
11.41 In this light, there is inadequate discussion of the leachate. This is especially troubling given the DOH NVO. This requires a discussion as to the how the build up of the leachate affected or could affect the integrity of liner and the stability of the landfill. It must also be addressed in light of the expansion and the stress it will have upon the liner and the stability of the landfill.		The amount of leachate the landfill is expected to produce is based on rainfall and operating experience. The methods used to collect and transport it to the points from which it is extracted and the ultimate disposal of the material are all part of the landfill design and the Operations Plan approved by DOH. The impact of the leachate on liner integrity and landfill stability are design considerations. As noted earlier, the design of the landfill will be subjected to DOH scrutiny to ensure they are consistent with conditions at this site, and with current practice and applicable regulations. The amount of detail in the EIS is adequate as the details of the leachate and site operations will be evaluated with the permit documents by DOH. The depth of leachate is not necessarily related to the integrity of the liner. The impact of various leachate levels on stability was evaluated and reported to DOH. The design and overall factor of safety includes all anticipated operating conditions, including level of leachate.
11.42 Geology - According to Figure 5.2, the proposed expansion will be primarily in the rRK soil type. This means rock over a large percentage of the surface. In addition, the description of the soil associated with rRK is 'sticky and very plastic.' This means that there will be a 'high shrink-swell potential when moisture laden.' The impact of this type of soil must be discussed when stability of the landfill will be an issue as it goes up the slope.		Soils and geotechnical analyses were performed to meet safety and regulatory requirements. The various factors affecting stability have been and will be taken into account as stability issues are reviewed and analyzed. In addition, DOH and any retained experts will review the analysis. See also Section 5.3.3. Potential Impacts and Mitigation Measures, of the FEIS, relating to soils which addresses this issue.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.43 There must be a more detailed discussion as to the slope differential for WGSL in the proposed expansion area. It is admitted to that the upper portion of WGSL where the expansion will take place will be steep with the rRK type soil. How will excavation be safely accomplished in that region must be discussed along with the storage or removal of the excavated 'native soil.		The stability of all cut slopes has been analyzed and will be reviewed by registered professionals during construction. All slopes will be excavated to meet required factors of safety and work will be done in accordance with all OSHA requirements. The DOH engineers and staff are expected to review all aspects of the construction during the permit review and while construction is in progress. See also Section 5.3.3. Potential Impacts and Mitigation Measures, of the FEIS, relating to soils which addresses this issue.
11.44 The rights to the native soil (rock, etc.) must also be addressed. It is believed that with the present operation, the contractor who does the excavation is permitted to sell the rock and soil and keep the funds. If this is the case, the practice must change and the benefit should be to the taxpayers. If the 'sale' of the rock is part of the contract with WMI, these amounts must be calculated.		The City retains the ownership rights to the excavated materials. On May 30, 1991, the City received bids for the material excavated, processed, and removed from Waimanalo Gulch Sanitary Landfill. Since August 1, 1991, the City has received royalties for any excavated and processed material removed from WGSL. Until the final design has been approved, it is difficult to determine the volume of excess materials that could be removed from the site.
11.45 The DEIS concludes that 'adverse impacts are not anticipated' as a result of the lateral expansion. There needs to be a definition of 'adverse impacts' and how the DEIS concludes that such impacts are 'not anticipated.' Clearly the City and its operator have stated these similar conclusions in prior EISs and the NOV has shown to the contrary. For example how else will height violations be noted other than a 'fly by.' What type of monitoring device will be utilized to establish that the landfill is stable other than mathematical computations performed by WMI's experts? Part of the costs of the operation of the landfill should include a fund which the DOH utilizes to hire its own experts to monitor the landfill activities.		Adverse impacts to topography, geology, or soils are not anticipated with appropriate mitigation measures. Adverse impacts are detrimental impacts, and include adverse ecological effects, aesthetic effects, historic effects, cultural effects, economic effects, social effects, health effects, whether primary, secondary or cumulative. See HAR § 11-200-2. The height violation, while it exceeded the DOH permit, did not result in an adverse impact to stability. The landfill was stable at all times even when the grade exceedance occurred. The earlier permitted grades were lowered causing in part the grade exceedance. The issue was more complicated than just exceeding a permitted grade height, as the comment portrays. The exceedance was self-reported, since it was known at the time that the grade height was lowered as a precaution. A ground survey is performed by a licensed professional surveyor on a bi-monthly basis to compare existing grades with approved grades. The current operating permit requires seismic monitoring. Inclinometers are being considered for WGSL to aid in identifying movement should it occur. While there is no device that would determine whether a landfill is stable or not, the stability analyses are based on "state of practice," and they, along with the selected factor of safety, are based on experience with similar slopes and extensive analysis of both stable and unstable slopes by the U.S. Army Corps of Engineers and the U.S. Bureau of Land Reclamation. In the case of WGSL, Waste Management has undertaken steps beyond standard practice, and outside experts have reviewed the work performed by its consultants. Additionally, DOH has reviewed the stability analyses and consulted with outside experts. Every ton that goes into the landfill is assessed a fee which is paid to the State to assist with funding their administrative and enforcement activities. DOH already employs inspectors who visit the landfill at frequent intervals.
11.46 Regional Hydrology - This discussion in the DEIS is of interest in that it is in direct contradiction to the UIC line which is what is relied upon in the siting of the landfill. Discussion is necessary as to how the UIC line has been arrived at when it is clear that WGSL does sit over and is a part of the 'Makaiwa Aquifer System.' Given the past mismanagement of WGSL by WMI, it is critical that we understand the assumptions which have been made in the past, in particular the UIC line and landfill operations over an aquifer. There is an EPA map on the water systems which differs from that of the DOH. There needs to be a discussion as to difference and how the UIC lines have conveniently been drawn around existing landfill areas throughout the State. Read in conjunction with the discussion in Section 7 as to the natural springs and water sources in the area, there should be an analysis done as to why the UIC line carves out WGSL; and more importantly the long term impact of the landfill over an aquifer.		The UIC line designations are handled by DOH and other state agencies. Neither ENV nor Waste Management was involved in the determination of the UIC line at WGSL. If location or validity of such lines is in question, it is an issue that must be addressed pursuant to applicable federal or state law and procedure. The UIC line was determined pursuant to state and local law and jurisdiction. The City accepts current laws and regulations as validly enacted and promulgated. The location of the UIC line is one example. We are not aware of the EPA map to which you refer, and cannot prepare a response to a vague reference to an EPA map.
11.47 Air Quality - There needs to a discussion in Air Quality of the EPA violations against the WGSL. Though the matter has not been resolved, for the DEIS to be accurate, the violations should be set forth as well as the anticipated remedy for the problems. Also, to the extent that the EPA violations overlap with the NOV, that discussion should also be found in the EIS.		The matter involving the installation of the gas collection system has been addressed. A gas monitoring and collection system was installed in 2005, and has been operating successfully. It is regulated through the terms of WGSL's air permit. The DOH NOV does not overlap with the EPA violations.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.48 Under this section, a passing discussion is made of the impact of the 'sludge' and how it is no longer being disposed of at WGSL. The accuracy of the statement is challenged as to when it was 'no longer being disposed of at WGSL.' How much sludge is or has been disposed of at WGSL must be discussed. In addition, it is unclear as to whether the pellets have been authorized for sale. If not, then are these pellets being disposed of in WGSL? It is believed that the statement is incorrect as to whether the sludge is no longer at WGSL.		The DEIS does not state that sludge is no longer being disposed of at WGSL. The DEIS emphasizes a change in processing sludge from the Sand Island Wastewater Treatment Plant ("SIWWTP") and the reduction of sludge disposed of at WGSL from the SIWWTP due to this change in processing. The sludge from the SIWWTP previously disposed of at WGSL is currently undergoing treatment in a waste digester at the SIWWTP where the sludge is turned into fertilizer pellets. The process of drying sludge into fertilizer pellets began in March 2007. In June 2007, due to a fire, operations at SIWWTP pelletizing facility ceased until September 2007. During that time 763 tons of de-watered sludge from SIWWTP was landfilled at WGSL. For the entire 2007 year, approximately 3,122 tons of stabilized, de-watered sludge (pelletized and nonpelletized) from the SIWWTP were disposed of at WGSL. At present, all of the de-watered sludge from SIWWTP is turned into fertilizer pellets, and on average, 85% of the pellets is being used for golf course construction and soil manufacturing. The remaining amount of pellets, approximately 15% on average, is disposed at WGSL. All regulatory requirements have been met to allow beneficial use of the pellets. As the process matures and marketability increases, we anticipate a decrease in the amount of pellets that are landfilled at WGSL. Due to unforeseen circumstances, however, such as the June 2007 fire at the pelletizing facility at SIWWTP, there may times when stabilized, de-watered sludge from SIWWTP will need to be landfilled at WGSL. Besides some of the fertilizer pellets from the SIWWTP, stabilized, de-watered sludge from the Honouliuli, Waianae, Kailua Regional, and Kahuku Wastewater Treatment Plants, as well as sludge from private (non-City) sources is still being landfilled at WGSL. For the entire 2007 year, the following approximate amounts of stabilized, de-watered sludge were disposed of at WGSL from the following City waste water treatment plants ("WWTP"): Honouliuli WWTP - 4,192 tons; Kailua Regional - 766 tons; Waianae WWTP - 277 tons; and Kahuku WWTP - 1 ton. Besides the significant reduction of sludge from the SIWWTP being landfilled, the City is in the process of seeking beneficial uses for the stabilized, de-watered sludge from the Honouliuli Wastewater Treatment Plant. See also Section 4.2. Facility Operations, 4.2.1. Waste Accepted at Landfill, of the FEIS.
11.49 Methane Gas - Part of the NOV was a violation as to methane gas. The concern is whether the methane gas is smoldering or burning at WGSL. There needs to be a discussion as to how this is monitored and also that methane gas fires are found in landfill operations and WGSL should be no different. If in fact there is such a fire smoldering, what is the anticipated impact on the community and the stability of the landfill. Though there is an attempt to say that landfill permitted temperatures are higher in other states, the issue is the impact on this landfill which is located so very close to a resort and homes.		Extensive studies at WGSL have shown that there is no subsurface fire occurring now or in the past at the landfill. Information demonstrating that there is no fire has been sent to the EPA and DOH. See also the following sections already provided as a part of the DEIS: Section 4.6.1. Explosive Gas, for monitoring requirements related to explosive gases such as methane; and Section 5.7.3. Potential Impacts and Mitigation Measures, relating to air quality addressing the monitoring practices, procedures, and regulations that are in place to mitigate against any potential for impacts associated with the atypical elevated temperatures at WGSL.
11.50 Blasting - As expected, due to the soil type in the expansion, excavation must occur with the assistance of blasting of the rocks. It is significant that the blasting is anticipated to be no more than one per day and no more than one to three times per week. If this is the average, then over a 15 year period these are a significant number of blasting activity. The discussions surround the noise and not as to the stability or structural impact on the landfill and the surrounding area. Related is the discussion on the culturally significant outcroppings which the City claims cannot safely remain in place. If the concern is over the impact of the blasting, then the blasting must have impact throughout the existing landfill. There needs to a discussion as to this fact, along with what impact it will have upon the structural berms presently built.		Controlled blasting will not be required for the entire anticipated life of the landfill, and is required only until the construction of the final cell. Controlled blasting does not impact the stability of the WGSL or any of its berms as it will be used only for loosening the rock from the slope. The energy output from controlled blasting is designed to be well below that produced by the design earthquake considered in the stability analysis performed to evaluate the safety of the landfill. See also Section 5.8.2. Potential Impacts and Mitigation Measures, of the FEIS, relating to acoustic characteristics. With respect to the cultural stone uprights, the City has proposed relocation prior to any excavation or controlled blasting at the proposed new expansion area for landfill cells as described on pages 7-81 through 7-87 of the DEIS (Section 7.3.8. Potential Impacts and Mitigation Measures, relating to historic and archaeological resources). The City, Waste Management and SHPD will work to ensure that an appropriate preservation plan is put in place.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.51 Pueo and Other Birds and/or Animals - It is unfortunate that the DEIS simply dispenses with these animals and birds due to the lack of sighting on a 'survey.' There needs to be a clear description as to how many surveys were taken and when. I have personally seen the Pueo on many occasions fly from WGSL to the area near Lanikuhonua and Kai Lani. It is questioned as to how thorough this survey is. There is a reference to a survey in 1999 and it must be clarified if the DEIS is relying upon this older study. The area is also designated as a habitat for the Elepaio. It appears that the DEIS is disagreeing with this designation. An explanation is needed as to this conclusion.		The DEIS, Section 5.9.3., Fauna, clearly indicated that two separate surveys were performed: In 2006, Phil Bruner, Ph.D., prepared the report, Survey of the Avifauna and Feral Mammals for the Proposed Waimanalo Gulch Landfill Expansion Project, O'ahu (Appendix F). The purpose was to provide the findings of a bird and mammal field survey. The same area of the site was previously surveyed in 1999 (Bruner, 1999) and data from this earlier survey is provided in the current study for comparison purposes. References to literature and unpublished reports since 1999 are included. According to the 2006 Report, the Pueo or Hawaiian Owl may forage in the area which is consistent with your observation. The area designated as critical habitat for the Elepaio by the U.S. Fish and Wildlife Services is located approximately 2 miles from the WGSL. No impacts to the habitat of the Elepaio are anticipated.
11.52 Aesthetics - As a person who has lived both at Kai Lani and now the Ko Olina Kai, I have no idea as to how the City can say that the lower portions of the landfill have a 'naturalized' look. It is not natural at all and neither is the view of trucks going up and down the landfill.		As parts of the landfill are closed, surface treatments including landscaping will be done to change the appearance of the site so that it blends in with the surrounding terrain. The excavation plan includes stockpiling of rocks with a "natural" look. The rocks will be placed on the surface after closing of the landfill. The trucks are a part of the operation and the view of trucks cannot be completely mitigated. We have included additional landscaping along the Kahe Point side of the landfill in order to mitigate views from the Waianae side of the landfill. Just as the view of a natural coastline cannot be mitigated or naturalized once hotel or resort development has occurred, the view of a natural gulch or ravine will be impacted by the presence of a landfill. Nevertheless, efforts to mitigate the impact will be ongoing.
11.53 The visual impact of WGSL has not been adequately addressed especially with the construction of the rock berm wall. How is this area going to be restored to its original state with a rock berm wall.		The view of the rock berms will be mitigated by the planting of trees. As they mature, the appearance of the berms will be mitigated by the vegetation. However, given the nature of the use of the site involving landfilling, it will not be possible to return the site to its original condition. The landscaping plans are included in the DEIS as Figures 5-19 through 5-21.
11.54 Section 6 Public Services, Potential Impacts And Mitigation Measures - Traffic - The DEIS is deficient in that it does not present the numbers of vehicles which travel to WGSL clearly in the body of its statement. It concludes by saying it is not anticipated to add more to the existing pattern. However, what is needed is a discussion as to what is the load and the description of the types of vehicles which will be used to dispose of the MSW or Ash at the WGSL. With the anticipated growth in the not only the second city of Kapolei but at Ko Olina, this discussion must address the actual numbers and the anticipated impact with the increase number of vehicles due to the growth in the area.		A traffic study, which includes vehicle counts, is directly cited in the body of the DEIS. As indicated in Section 6.1.1. Traffic Impact Report, "At the intersection with the existing landfill access road, Farrington Highway carries 2,046 vehicles eastbound and 859 vehicles westbound during the AM peak period. During the PM peak period, the overall traffic volume is higher with 1,131 vehicles traveling eastbound and 2,079 vehicles traveling westbound. The critical movement on the Farrington Highway approaches of the intersection is the eastbound left-turn traffic movement which operates at LOS "B" during both peak periods." "The WGSL access road approach of the intersection carries 11 vehicles southbound during the AM peak hour of traffic. During the PM peak hour of traffic, the traffic volume is slightly higher with 31 vehicles traveling southbound. The entirety of the report is attached as Appendix I to the DEIS. In general, with the construction of the third boiler at H-POWER, the number of vehicles delivering MSW to WGSL is expected to decrease, and the number of vehicles delivering ash and residue from H-POWER will increase. The overall result will be fewer vehicles arriving and departing from WGSL. The access road approach of the intersection operates at LOS "C" during both peak periods. Traffic queues occasionally formed on this approach of the intersection with average queue lengths of 2-3 vehicles observed during both peak periods."
11.55 Wastewater System - There needs to be discussion as how the existing system will be adequate when it clearly was not adequate for the limited expansion as noted in the NOV. The City must honestly discuss the shortcomings of WMI, the operator, who has failed to operate WGSL in a professional manner.		Wastewater facilities on page 6-10 of the DEIS refers to the toilets and other facilities for the workers at the landfill. Those facilities are currently in place and adequate. The need will not change with the expansion. No violations regarding the wastewater facilities were included in the NOV.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.56 Odors and Windblown Trash - The fact that those who live by WGSL continue to experience the odors is not adequately addressed by the DEIS. Like the 'surveys' mentioned above, there needs to be a discussion as to how the odors are being monitored. Testimony has been received by people who are on the golf course and those who live in Ko Olina as to odors and windblown trash of the landfill. It is important to note that Counts in the NOV addressed the windblown trash and odor issues. Given the fact that violations have been found, the City must ensure that these violations do not occur again, given that it continues to have the same operator.		Odor was not a part of the NOV. Waste Management responds to odor complaints and maintains an odor complaint log. Air quality and odor, as well as mitigative measures, are discussed on pages 5-37 though 5-59 of the DEIS. The wind-blown litter issue has been addressed through litter fences and permanent litter patrol. Litter, as well as mitigative measures, are discussed on page 4-18 of the DEIS. According to Waste Management, less than 5 complaints were received about odor and/or litter within the last 12 months. Not all of those complaints were verified.
11.57 Section 7 Socioeconomic and Related Environment, Potential Impacts and Mitigation Measures - NIMBYism - As expected, the Kailua Neighborhood Board has always been adverse to the closure of the WGSL. This is due to the fact that Ameron Quarry has been viewed as a successor. It is unfortunate that the communities are forced to take positions such as they have. If the City clearly looked at alternatives and did not deal in 'fear' and in its delay tactics, there could have been a long term resolution. It is not acceptable that the City's position is, 'where do you want to put it?' The City is the governmental agency tasked with this obligation and it cannot simply wait, as it has, with the hopes that other agencies will buy in to its mantra that there will be rubbish on the streets if an extension or expansion is not approved.		The City is tasked with the obligation to provide environmentally sound disposal services for solid waste. There is a need for a landfill on Oahu. The City must select the location of its landfill based on objectively established criteria. In accordance with this obligation, and as stated in the DEIS, the City selected WGSL. Other areas of the island have had landfills including, but not limited to, Ala Moana, Kaka'ako, Kailua, Kalihi, Lā'ie, Kāne'ohe, Pearl City, Wahiawā and Waipahu. See also http://www.opala.org/solid_waste/archive/History%20_Garbage_in_paradise.html. Landfills, freeways, prisons and wastewater treatment plants are an unfortunate necessity of modern civilization. The suggestion that politics, policy and fear play a role in landfill selection is undocumented. Politics and policy, however, have a role in timing of decisions. It is always important that decision makers provide the public with opportunities for input, even if such opportunities for input cause decisions to be delayed. However, it is a part of the process expected by the public. WGSL has been selected as the landfill for the benefit of the entire island and was approved by the City Council.
11.58 Economic Considerations - The role that Ko Olina plays as it relates to the economic growth for West Oahu is significant. While no one would consider placement of a landfill near Waikiki, the City does not hesitate to continue a landfill operations directly across the street from Ko Olina.		The City does not discount the importance of economic growth wherever it is occurring on the island of Oahu. While there are no viable landfill sites near Waikiki, places such as Ala Moana Park and the Kakaako Waterfront Park once served as landfills. Various parts of Windward Oahu also supported landfills. As represented in the DEIS, the City remains committed to the proper operation of the WGSL and to appropriate mitigation of potential adverse impacts.
11.59 Discussion on the Landfill impacts on jobs, etc. would exist wherever the landfill is sited. The discussion is lacking as to what could happen if WGSL is expanded as to the development of the Resort.		The DEIS provided a discussion of the economic conditions of the proposed landfill. Further information concerning the potential for adverse effects to surrounding land uses such as the Ko Olina Resort, will be addressed in the Final EIS. See also Section 7.1.5. Addendum to Socioeconomic Impacts, of the FEIS, which provides additional information on the potential for effects on property values in the surrounding region.
11.60 Fairness Issues - There is a discussion as to how some residents believe that Waianae is the dumping ground for the City; and the expansion of WGSL continues to dump on and places the burden on the Waianae Coast. There needs to be a discussion of the concept of environmental justice and how this discussion required under NEPA should be better explored in the DEIS.		Environmental injustice is addressed on pages 7-28 and 7-29 of the DEIS. In summary, the median household income in the immediate areas near WGSL exceeds the island average. The City is required to complete the EIS process pursuant to HRS Chapter 343, which does not require an analysis under NEPA.
11.61 Community Benefits Package - There needs to be an honest discussion on the benefits package. Remember that the Waianae Coast takes more than the City's rubbish. There is always the issue of 'catch up' for the Waianae Coast because it appears that it is last to receive anything. When the concept of a 'community benefits package' is discussed, there needs to be an analysis as to what the community would be entitled to as all others would and what is received in addition to that. The benefit must be in 'addition to' not merely a replacement of.		Basic City services are provided to all areas of the island as funded by the City Council, which must approve the City budget each fiscal year. The suggestion that programs and projects for the Leeward Coast communities are not as well funded as those for other parts of the island is undocumented. The current City administration has recognized that WGSL has a potential impact on the neighboring communities and implemented the community benefits program to provide those communities with funding for programs beyond those provided in the regular operating and capital budgets. This administration was the first to recognize the need for such a benefits program. A Committee comprised of representatives of Leeward Coast communities was established by the Mayor to review funding applications from nonprofit community groups and identify capital projects in their communities, and determine how funds will be utilized. The Committee is diligent is assuring that any program or project they fund will provide services and benefits that are in addition to, and not in lieu of, any provided through the normal City budget process. See also Section 7.1.3.2. Community Issues and Concerns Regarding WGSL, On The Community Benefits Package, in the FEIS.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.62 Historic and Archaeological Findings - Prior EISs have not acknowledged the cultural significance of the Waimanalo Gulch. The DEIS recognized what is described as 'Three upright boulders potentially utilized as trail or boundary markers.' It was agreed to that the stones were significant and likely used by traditional Native Hawaiian practitioners in the past. The consultants believed these stones should be preserved in place; however, the City has deemed this to be "not an option" and will move the structures. Though the cultural practitioners also expressed a concern as to the appearance of the landfill after it was completed and the boulders returned, it remains the position of the City to ignore these concerns and continue with the construction of the landfill. The DEIS must address whether the landfill expansion is at any cost and the cultural significance should be ignored.		The City has an obligation to protect public safety and health by providing waste management services. While City has proposed to preserve the stones by relocating them, the final preservation plan has not yet been determined. Relocation and preservation of the stones are currently options under consideration. The plan would be determined based on further consultation with cultural consultants, SHPD, ENV and Waste Management. The option of relocating the stones back to near their original resting places will be considered.
11.63 The DEIS must address the sentiments of OHA as stated: OHA has made a field visit to the project site and we noted three significant cultural features that were still intact in the project area. We are also aware of the probable existence of others yet to be discovered in the project area. OHA is further saddened that the larger setting that this project sits in is one that has been highly developed and degraded. Therefore, what TCPs [Traditional Cultural Properties] that remain must be protected. The Department of Planning and Permitting, as a county agency, is mandated by Hawai'i Const. Article XII, section 7, "to preserve and protect customary and traditional practices of Native Hawaiians." Ka Pa'akai 0 Ka'Aina v. Land Use Comm'n, 94 Haw. 31, 45 (2000). . . . OHA urges that nothing more be done with this project until full cultural assessment has been made of the project area. (OHA letter of September 21, 2007). At the very minimum, to address OHA's concern, there needs to be a clear statement as to how and what has been done for a 'full cultural assessment' of the project area. In that much of this land has been degraded, it does not give the City the right to continue in its degradation.		A full cultural impact assessment of the area and archaeological inventory survey were performed, attached to the DEIS as Appendices G and H and summarized in section 7 of the DEIS. A discussion of traditional cultural practices is included in the cultural impact assessment. No action will be taken at the site until concurrence with SHPD is obtained.
11.64 Though he has passed, a respected Kumu Hula of the area, John Kaimikaua, told the story of the role of Palehua and its relationship to WGSL. There is a video of his tale and it should be included in the discussion of the cultural significance of WGSL.		We have instructed our cultural and archaeological consultant to further investigate this item. If it is applicable, further information on the cultural significance of the content of the video will be referenced in the Final EIS.
11.65 The stories of the strange events in the initial construction of WGSL are rich. Yet, the DEIS continues in its predeteimined conclusion that the landfill should be expanded.		The stories are documented in the cultural impact assessment. At the same time, the City is pursuing development of the site because there is a need for a landfill to benefit all areas of Oahu.
11.66 Section 8 Relationship to Land Use Plans, Policies and Controls of the Potentially Affected Area - The concepts of the State General Plan have been revisited by the Legislature for the past 3 years. The Legislature has funded the Task Force on Sustainability for the year 2050. The Task Force has adopted it Sustainability Plans for the year 2050. In addition, what is now Act 183, SB 2646 CD1 of the 2008 Session, addresses the concepts of Important Agricultural Lands. The DEIS must engage in the discussion as to what is "important Ag lands" and recognize that it is no longer tied to land classification such as A, B, etc. In this light, does it impact the continued use of WGSL.		The sustainability of our island State is important. The use of WGSL promotes sustainability through the use of an on-island facility that has remaining but unused capacity. Without Waimanalo Gulch, new land, a precious resource, would need to be prematurely used when there is remaining capacity at this existing public facility. The DEIS addresses the proposed project's impacts on Important Agricultural Lands in Section 8.3. The DEIS notes that the proposed project is located within the State Agricultural District, however, the subject site is not classified as one of the three types of agricultural land (i.e., prime, unique, or other important agricultural lands) according to the Agricultural Lands of Importance to the State of Hawaii ("ALISH") system. The subject site is not currently used for agricultural production; is not associated with traditional native Hawaiian agricultural uses; has mostly rocky soil, has a relatively dry climate; and is not near support infrastructure conducive to agricultural productivity.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.67 The discussion of the Land Use Policies of the area cannot be made without a discussion of the LUC's D&O on the SUP, as amended. The D&O now states that no later than November 1, 2009, the area shall be 'restricted from accepting any additional waste material and be closed in accordance with an approved closure plan.' This is the controlling LUC Order on the site of the proposed expansion. In addition, the City is to provide the LUC with updated status every 6 months. As someone who participated in the LUC hearing, it is clear that the LUC has sent a clear message to the City that it will not be caught in the untenable position that there is no alternative in the time remaining.		The EIS process will continue to fairly and accurately describe the events leading to the decision to select WGSL as the City's preferred alternative. Further information regarding this past history of events, including the current order of the LUC, will be provided in the Final EIS in Section 2, Project Background.
11.68 There is also a need to discuss whether the SUP process under HRS 205-6 is the proper mechanism by which to seek this expansion. The DEIS must consider whether a boundary amendment must be sought for this further expansion.		Because the subject property is located within the State Agricultural District, a State Special Use Permit ("SUP") must be obtained. HRS § 205-6 provides that the county Planning Commission "may permit certain unusual and reasonable uses within agricultural and rural districts other than those for which the district is classified." Because the SUP will be for land greater than 15 acres, the approval by the LUC is necessary. In the past, the LUC has granted SUP approvals for landfills, including WGSL. For purposes of the expansion addressed herein, the City may pursue either an SUP or a boundary amendment. This procedural decision does not impact the analysis contained in the EIS.
11.69 Section 9 Alternatives to the Proposed Action - This discussion in the FSEIS (most recent EIS on the property) and other documents has been inadequate in addressing alternatives. After all these years, the City must have a better response on alternative technologies, transshipment and other sites than what is provided. Again, it appears that it is simply easier to continue to have the existing landfill; and therefore all attempts to address alternatives in good faith will never be a reality.		The City has in good faith pursued alternative technologies that are reliable, cost efficient and scalable, and issued an RFP for alternative technologies. In response to the RFP, the only qualified proposals were for existing mass burn technologies. The City is currently pursuing mass burn technology through the expansion of H-POWER. As noted in the DEIS, no alternative can completely eliminate the need for a landfill. WGSL is a strategic component of the City's solid waste management system and the final destination for certain solid wastes including MSW, recycling residue, and H-POWER generated ash, residue and unacceptable waste that cannot be further combusted, shipped, recycled or reused.
11.70 The City has failed to timely develop its Solid Waste Management Plan. In that this is not a reality, documents such as this DEIS is not being judged by the appropriate measure.		The City has an Integrated Solid Waste Management Plan, and an update of that plan was adopted by the City Council in December 1994 through Resolution 94-306, CD1. A new draft update to the City's Integrated Solid Waste Management Plan was sent to DOH on July 1, 2008, for review. The DOH will determine its appropriateness prior to consideration by the City Council. The words "judged by the appropriate measure," are undefined and unclear. The DEIS as well as the Final EIS are prepared according to the standards set forth in HRS Chapter 343, as well as Hawaii Administrative Rules, Title 11, Chapter 200. See also Section 2.6. City Plans Involving the Future Handling of Solid Waste, of the FEIS, relating to the Integrated Solid Waste Management Plan.
11.71 An RFP for transshipment was solicited by the City. It is believed that the company who has been working on transshipping has had its bid challenged. If the City agrees that the bid is too low, then transshipment will not become a reality. The City does not prefer to transship because of the loss of revenue for the City. The DEIS must do a proper analysis of the loss of revenue and recall that cost is not a limiting factor in the discussion of alternatives.		A request for bids ("RFB"), not an RFP, was issued by the City for interim transshipment of MSW. The lowest bidder's bid has been challenged by three procurement protests, and the process to rule on the protests is on-going. If the low bid is ultimately determined to be a non-responsive or non-responsible bid, or the bid is otherwise rejected, then next lowest bid will be considered, consistent with applicable public procurement laws. As evidenced by the fact that an RFB for interim shipping was issued, and funds for this program have been appropriated, the City desires to transship; and if a contract can be awarded after the procurement protests are resolved, the City will transship up to the amount of available funds.
11.72 What is also of concern is the discussion on Plasma Arc and how this technology does not meet the City's requirements. The DEIS does not recognize the technology which is successfully operating in Japan and the GeoPlasma facility to be operational in St. Lucie, Florida. What is just as troubling is the absence of recognition that on May 7, 2008 SB 1720 HD2 was enrolled with the Governor and on May 23, 2008 it was signed into law as Act 104 (2008 Session). This Act relates to the Special Purpose Revenue Bond to Assist Jacoby Development, Inc., a Processing Enterprise. Jacoby Development Inc.-Geoplasma LLC is authorized to issue a SPRB to build a similar facility as Florida's in Hawai`i which will not cost the taxpayers anything. Instead of welcoming such a technology, the City, instead, finds that the technology is not adequate.		A discussion of why the Plasma Arc technology is inadequate at this time is contained in Section 9 of the DEIS. That section identifies the Plasma Arc plant operating in Utanshani Japan and provides a table summarizing the operating results from 2005. It also showed that the plant had not generated power for commercial sale during that time. The plant proposed for St. Lucie, Florida is also identified. Jacoby Development and St. Lucie are still in negotiations and construction of plant has not yet commenced. In addition, the DEIS identifies a plant in Ottawa Canada (owned by Plasco) that began processing MSW on January 26, 2008. The Plasco plant capacity is 85 tons per day of MSW. The operator of the plant posts reports monthly detailing the operating statistics. The following table shows the average amount of waste processed daily through the plasma system at the plant since start of operations. Power was first generated in the plant in February 2008. The results in this table are for the plant in startup, and should improve with time.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
		The plant capacity will not meet the City's minimum requirements even at full capacity operation. The discussion of plasma technology in the EIS will be revised to reflect these later operating results. The EIS will also be revised to reference Act 104 (SB 1720), which became law on May 23, 2008.
11.73 Discussion of alternative landfill sites are also premised on the Blue Ribbon Commission's findings. As stated earlier, the assumptions upon which the Commission made its recommendations are incorrect and must be re done. The landfill capacities and costs are especially problematic given the obvious misinformation provided by R.M. Towill. Look at Table 9-13 to demonstrate the difference in what is presented and what is the reality. This DEIS is placing the costs of WGSL expansion at $86-99 million.		The subject DEIS has documented the work of the Mayor's Advisory Committee and where appropriate has updated the basis for the findings of the Committee with new information to ensure that changed conditions were fairly and accurately considered in this current EIS effort. For example, according to the DEIS, Page 9-70, "Since the Advisory Committee report was completed, additional information has been provided regarding the cost of acquiring the Ameron Quarry and Makaiwa Gulch sites. In the Advisory Committee report, the cost of acquisition was the assessed value for property [tax] purposes. Parties representing Ameron Quarry and Makaiwa Gulch provided information to correct that information in letters appended to a letter from City Councilmember Tam to the State LUC. The information from Ameron Hawai'i and the Estate of James Campbell was subsequently used to maintain the integrity of the analysis. (DEIS, Page 9-70). With regard to the contents of Table 9-13, Revised Evaluation of Criterion 18, Cost of Site Acquisition, it is noted that the table identifies the cost of acquiring the various sites evaluated. Because the City already owns WGSL, the cost of acquisition is represented as $0. The site acquisition costs provided in Table 9-13 are completely different and are not to be confused with the construction and operating cost of $99.4 million for a period of 15 years provided in Section 4.11, Project Schedule and Cost, and the $86 million for construction over a period of 10 years provided on Page 7-30. See also the response to letter item no. 37, above.
11.74 It will always be the position of the people of the Waianae Coast that there should be no more landfills on our community. We have borne the burden for not only the landfills, MSW and construction, but also the power generation facilities, live fire exercises, the homeless, etc. There is a need to look at these alternatives in terms of what is fair and in the context of environmental justice.		The specific term "environmental justice" as defined by the EPA applies to documents prepared under NEPA standards and regulations. The subject DEIS, prepared pursuant to Chapter 343, HRS, however, does provide further discussion of "environmental injustice" in Section 7, Socioeconomic and Related Environment, Potential Impacts and Mitigation Measures. While the subject EIS has been prepared to specifically address the potential for significant environmental effects associated with the proposed project, the consideration for potential impacts associated with other power generation facilities, live fire exercises, and the homeless, while important issues, are not a part of the environmental disclosure of the subject project. Please also refer to the response to comment 60 above.
11.75 What is evident is that the City is not being honest in its discussion on Maili Quarry. This DEIS fails to note that the LUC denied that SUP permit of Sphere to operate a Construction and Demolition Landfill on the site. It is just as improbable that the LUC will grant a MSW landfill on the site. The proximity of this site to Maili Elementary School and its low water table is problematic. In addition, this site did accept AES's ash without a proper permit and without lining its landfill operations. In addition, traffic and access is a major concern. This landfill site is located off of a private road, Paakea which has been the site of major accidents due to the "dip" in the road. The question is whether the City will compute into its costs for the Quarry, the cost of the road and of access.		The Sphere Application was dismissed for a purely procedural reason, namely, because of a lack of jurisdiction. The case was not dismissed based on the merits. What the LUC would do if the City were to seek appropriate permits to operate an MSW landfill at Maili is not known. Maili appears to be a less attractive site for a landfill than Waimanalo Gulch. The Mayor's Advisory Committee also concluded that Maili was the least attractive out of the five sites as shown on table 9-15. The costs of road improvements were reflected in Cost of Development Criterion (number 19) for the Maili Quarry, which was published with the Mayor's Advisory Committee report. It should be noted, that the costs developed for the Mayor's Advisory Committee evaluation were based on the publicly available data and would be recalculated with site specific data if the site were selected by the City Council.
11.76 Nanakuli B is the site of a proposed private landfill. Nanakuli B will cause major traffic problems for the people of the Waianae Coast. The community will fight Nanakuli B because it is the expansion site of PVT Landfill, the only Construction and Demolition Landfill on this island. It cannot be the intent of the City to place two landfills across the street from each other and cause this community to bear this burden for a measly pay off. This DEIS must look into this inequity. The people of the Coast also want PVT closed.		The purpose of this EIS is to disclose the potential environmental effects of the proposed expansion at WGSL, not to close PVT Landfill. Nanakuli B appears to be a less attractive site for an MSW landfill than Waimanalo Gulch. The Mayor's Advisory Committee also concluded that Nanakuli B was the third least attractive out of the five sites as shown on table 9-15.

Commenting Party/Itemized Comments		Date of Letter	FEIS Section Reference and Comments*
11.77	Ameron Quarry is dispensed with because of costs. When the true costs of the expansion of WGSL is computed, the costs of WGSL exceeds that of Ameron.		Ameron Quarry was not "dispensed with because of costs." A review of Table 9-15 shows that Ameron Quarry received a lower score than WGSL across the 31 criteria. Information provided by the operators/owners of both the Ameron Quarry and the Makaiwa Gulch sites was considered. Both had advised the City that the cost of acquisition needed to be increased. Table 9-13 identifies the scoring for all five sites before and after the revision of the cost of acquisition. As can be seen in both Tables 9-13 and 9-14, the relative ranking of the sites with respect to their suitability as a landfill changed, but the clear conclusion that Waimanalo Gulch was the higher ranked site was unchanged.
11.78	What is lacking in this DEIS is the fact that in a few years, the status of H Power will also be an issue. If the City decides to re purchase H Power, then that cost must be made known and its impact on the cost of solid waste disposal. The expansion to a third boiler will have major cost implications.		Please see Section 9, Alternatives Analysis, of the Final EIS regarding the relation of expansion of H-POWER to WGSL. Should H-POWER add a third boiler, a full environmental review will be performed in accordance with applicable laws and regulations of the federal, state, and City & County of Honolulu governments.
11.79	Underlying all of this is the discussion on 'flow control' of the MSW. This DEIS is inadequate in that until the necessary 'flow control' is defined, the alternatives as it may be available by other vendors will not become a reality and what will remain is only the expansion alternative.		The DEIS adequately addresses the City's responsibility to manage solid waste for the City & County of Honolulu. Flow control is important and has been upheld by the U.S. Supreme Court because in order for local governments to properly manage solid waste and promote alternatives to landfilling, they need the ability to direct flow. The City has flow control pursuant to state law, and consistent with that authority, will continue to exercise such control so that it can be assured that various initiatives that minimize the need for landfill capacity can be managed and financed. The City's efforts to decrease the need for landfill disposal include expanded waste-to-energy capacity, interim transshipment of waste while additional H-POWER capacity is being constructed, expanded curbside recycling programs and illegal dumping control.
11.80	Notwithstanding, what is truly lacking in the DEIS is a combination of alternatives. To discuss these choices as a 'zero sum' game does not make this DEIS a true document upon which the decision makers can rely upon.		Please see section 9. Alternatives to the Proposed Action of the Final EIS for a discussion of a combination of alternatives. Alternatives have been discussed, but Oahu will always need a landfill because there will always be waste that cannot be further combusted, shipped, recycled or reused. Any viable alternative cannot completely eliminate the need for a landfill. Thus, a combination of viable alternatives will not eliminate the need for a landfill.
11.81	Section 10 Irreversible and Irretrievable Commitment - Again, the DEIS is a document with a predetermined outcome. It is simpler for the City to expand WGSL than to truly explore alternatives. Promises of how the landfill will operate better and mitigation will be enforced are empty promises in light of the past performances and present performances. The recent lawsuit against Schnitzer Steel shows how there is no monitoring by the WGSL or the City before millions are given for a rebate which allegedly should not have been given. The DEIS is without basis to make such a representation or conclusory statement to the public.		The purpose of the DEIS and the HRS Chapter 343 environmental review process is not to select the ideal landfill site. Rather, Waimanalo Gulch was selected by the Honolulu City Council in December 2004. The history of that process and the outcome of that selection process is presented in section 2 of the DEIS. The DEIS is an informational process prepared in compliance with HRS Chapter 343 and HAR Title 11, Chapter 200, and discloses "the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects." HRS § 343-2. Here the proposed action, consistent with the City Council's decision, is to expand WGSL as Oahu's future landfill site. Notwithstanding the allegations of any pending lawsuit, there are and have been considerable and substantive monitoring efforts, inspections, record keeping and reports regarding operations at WGSL. These requirements and records are being and have been maintained in accordance with WGSL's operating permit issued by the Solid and Hazardous Waste Branch of DOH. All records and reports are generally available publicly at DOH. Please refer to the response to comment 8 above regarding the Schnitzer Steel lawsuit.
11.82	Section 11 Unresolved Issues - Missing in this section is the EPA violations. In addition, it is disconcerting that the DEIS will have as an unresolved issue; the stone uprights.		The EPA violations have been added to the Final EIS at Section 11. Note that the EPA violations were discussed on pages 2-14 through 2-16 of the DEIS.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
Given that these issues are 'unresolved,' this DEIS could have been made public sooner. This is all part of the plan to go before the governmental agencies with no time left and to ask for yet another extension or the expansion.		The EISPN for the proposed project was published in November 2006. The stone uprights were located in the Spring of 2007. Due to a staff shortage at SHPD, evaluation of the cultural significance of the stone uprights was delayed, and the cultural impact assessment could not be completed. Because a cultural impact assessment is required in an EIS, completion of the EIS was delayed. The final preservation plan for the stone uprights has been identified as an unresolved issue in Section 11 of the Final EIS. The City and Waste Management will work with SHPD to ensure that an appropriate preservation plan is put in place.
11.83 Section 12 Permits and Regulatory Approvals that May be Required - The DEIS fails to recognize the State Land Use Commission is a State agency not within the City & County of Honolulu's process. In fact, HRS § 205-6 is the State Land Use Commission statute. This DEIS should address whether a boundary amendment will be required and not a SUP.		This comment will be addressed in a revised Section 12, Permits and Regulatory Approvals That May be Required, in the Final EIS. For purposes of the expansion, the City may pursue either an SUP or a boundary amendment, and both will be identified in the Final EIS. This procedural decision does not impact the analysis contained in the EIS.
11.84 Section 14 Significance Criteria - The DEIS provides its analysis of the significance criteria as set forth in §11-200-12 of the EIS Rules. The Rules provide: A. In considering the significance of potential environmental effects, agencies shall consider the sum of effects on the quality of the environment, and shall evaluate the overall and cumulative effects of an action. B. In determining whether an action may have a significant effect on the environment, the agency shall consider every phase of a proposed action, the expected consequences, both primary and secondary, and the cumulative as well as the short-term and long-term effects of the action. In most instances, an action shall be determined to have a significant effect on the environment if it: 1. Involves an irrevocable commitment to loss or destruction of any natural or cultural resource; 2. Curtails the range of beneficial uses of the environment; 3. Conflicts with the state's long-term environmental policies or goals and guidelines as expressed in chapter 344, HRS, and any revisions thereof and amendments thereto, court decisions, or executive orders; 4. Substantially affects the economic welfare, social welfare, and cultural practices of the community or State; 5. Substantially affects public health; 6. Involves substantial secondary impacts, such as population changes or effects on public facilities; 7. Involves a substantial degradation of environmental quality; 8. Is individually limited but cumulatively has considerable effect upon the environment or involves a commitment for larger actions; 9. Substantially affects a rare, threatened, or endangered species, or its habitat; 10. Detrimentally affects air or water quality or ambient noise levels; 11. Affects or is likely to suffer damage by being located in an environmentally sensitive area such as a flood plain, tsunami zone, beach, erosion-prone area, geologically hazardous land, estuary, fresh water, or coastal waters; 12. Substantially affects scenic vistas and viewplanes identified in county or state plans or studies; or, 13. Requires substantial energy consumption. The DEIS answers each and every criteria in the negative. This provision of the EIS Rules is not applicable in that this section is relevant if there is to be a determination of no impact and therefore an EIS or an Environmental Assessment ('EA') will not be required. Specifically: § 11-200-9 Assessment of Agency Actions and Applicant Actions A. For agency actions, except those actions exempt from the preparation of an environmental assessment pursuant to section 343-5, HRS, or section 11-200-8, the proposing agency shall:		The comment that discussions of secondary and cumulative impacts associated with the project were not provided is incorrect. Secondary and cumulative effects were discussed and addressed in the DEIS in Section 1.4, Secondary and Cumulative Effects. The discussion concerning significance criteria was discussed and addressed in Section 14, Significance Criteria.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
4. Determine, after reviewing the environmental assessment described in paragraph (3), and considering the significance criteria in section 11-200-12, whether the proposed action warrants an anticipated negative declaration or an environmental impact statement preparation notice, provided that for an environmental impact statement preparation notice, the proposing agency shall inform the accepting authority of the proposed action; However, what is missing is paragraph I of the Contents of a Draft EIS: § 11-200-17 provides at: I. The draft EIS shall include a statement of the probable impact of the proposed act on the environment, and impacts of the natural or human environment on the project, which shall include consideration of all phases of the action and consideration of all consequences on the environment; direct and indirect effects shall be included. The interrelationships and cumulative environmental impacts of the proposed action and other related projects shall be discussed in the draft EIS. It should be realized that several actions, in particular those that involve the construction of public facilities or structures (e.g., highways, airports, sewer systems, water resource projects, etc.) may well stimulate or induce secondary effects. These secondary effects may be equally important as, or more important than, primary effects, and shall be thoroughly discussed to fully describe the probable impact of the proposed action on the environment. The population and growth impacts of an action shall be estimated if expected to be significant, and an evaluation made of the effects of any possible change in population patterns or growth upon the resource base, including but not limited to land use, water, and public services, of the area in question. Also, if the proposed action constitutes a direct or indirect source of pollution as determined by any governmental agency, necessary data shall be incorporated into the EIS. The significance of the impacts shall be discussed in terms of subsections (j), (k), (1), and (m). [Emphasis added.]"		
11.85 The section of the EIS rules which applies to the DEIS, has it own definition of 'significant impact' as defined above. What the DEIS is clearly lacking is the discussion of secondary impacts. The recent Supreme Court decision in Sierra Club v. DOT, 105 Haw. 299, 167 P.3d 292 (2007) is on point. This case is also known as the 'Superferry Case' and it clearly has redefined the concept of secondary impacts. It is presumed under the EIS Rules that there is a secondary impact. This DEIS is void of any such discussion.		There are very significant differences between the Superferry case and the City Council's selection of WGSL as the site of Oahu's future landfill. In the Superferry case, there had been no ongoing or existing ferry operations in the state. Here, WGSL has been in operation since 1989, almost 20 years ago. Unlike the Superferry case, secondary impacts of WGSL are and have been known and observable since it began operations in 1989. Thus, the impacts of current operations at WGSL are known and have been observed for years. It is not necessary to predict or assume such impacts. Most of the Ko Olina Resort was planned, developed, marketed and sold while WGSL was in full operation. Most of the town of Kapolei was built and developed while WGSL was in full operation. The land use growth, population growth, and public services in the Kapolei and Ko Olina areas developed while WGSL was in full operation. Thus, secondary impacts on growth, population, and public services are likely related to city policies rather than the presence of a landfill. Secondary and cumulative impacts are discussed and addressed in Section 1.4 of the DEIS.
11.86 The DEIS has incorrectly concluded there is no significant impact under the EIS Rules. Clearly the DEIS has not met its burden to overcome the assumption of significant impacts for a public works project such as this.		There is no "assumption" of significant impacts for the proposed expansion of WGSL. Additionally, the DEIS concluded that when appropriate mitigative measures or other actions are undertaken, that potentially significant adverse impacts can be reduced to acceptable levels that would not constitute an adverse effect.
11.87 Hawaii Law - There will be finding of significant impacts because in order for an EIS to stand the test under Hawaii law, it must be, 1) compiled in good faith; 2) met statutory requirements; and 3) provided sufficient information for the decision maker to make an 'environmentally-informed choice.		The contract between Waste Management and the City is a publicly available document. Amendment No. 5 to the contract, dated May 1, 1999, provided for the expansion of the Waimanalo Gulch site. Subsequently, the prior City administration decided on a five-year limit for the use of the site. The contract was not amended to a shorter term because the exact date of termination could not have been determined. Furthermore, Amendment No. 5, reads, in relevant part:

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
1. The EIS Was Not Compiled In Good Faith. The supplemental EIS's contents must comply with the requirements of an EIS. HAR § 11-200-14. An EIS is "meaningless" if it is self serving and rationalizes an outcome. The Ninth Circuit has identified this concern as 'timing.' Idaho Sporting Congress, Inc. v. Alexander, 222 F.3d 562, 568 (9th Cir. 2000). In Idaho, the ninth Circuit reversed the district court's denial of an injunction and discussed the timing of the agency's action and the fact that the process shall not be used to rationalize or justify decisions already made. In Metcalf v. Daley, 214 F.3dc 1135, 1143 (9th Cir. 2000), the Ninth Circuit found another violation of the timing requirement and looked to the fact that the EIS process had begun after the agency had signed an agreement making the process one that rationalized the decision. This is exactly what has occurred here. There are three specific examples of the bad faith. One is the contract of 1999 which has been entered into by WMI and the City. The DEIS should have included this document in that it is critical in understanding how this outcome has been manipulated. The contract is incorporated by reference herein.		Contractor shall increase the existing Landfill footprint and operate the Landfill for a period of fifteen (15) years from the date of receipt of all permits for the initial operation of the additional landfill area, hereinafter called the Permit Date, or until the landfill is completely filled as determined by mutual agreement of the parties, or closed by regulatory requirement imposed by a state or federal agency, whichever occurs first. (Emphasis added). Thus, the effective term of the contract could have been shortened if closed by regulatory requirement, such as a failure to extend the SUP. Additionally, the City retains control of the contract and can terminate it at any time when it is in the best interest of the City. As provided in Contract Special Provision 29, the contract can be terminated "in whole or in part, whenever the Director shall determine that termination of the contract, in whole or in part, is in the best interest of the City." Please also refer to the response provided to comment no. 4, above.
11.88 The second example is the reliance on the Blue Ribbon Commission and the flawed assumptions. This is especially true when R.M. Towill has been the consultant on almost all of the EISs and the consultant for the Blue Ribbon Commission. An excuse that they are unaware of the topography is absurd.		This comment is similar to prior comments nos. 3 and 4, contained in your letter. Please refer to the responses provided, above.
11.89 The third is the contents of the NOV.		It is unclear how the NOV's contents relate to alleged bad faith in drafting the EIS. The NOV was issued by DOH after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NOV was issued. On December 7, 2007, DOH, the City and Waste Management agreed to a settlement which concluded the NOV process. At that time, there was only a single remaining violation that had not been brought into compliance--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which addressed the grade exceedance issue. Thus all alleged violations have been addressed to the satisfaction of DOH. See section 2.3. The NOV also gave rise to several operational changes at WGSL. The current operating permit substantially increased oversight, monitoring and reporting requirements.
11.90 2. The Statutory Procedural Requirements Were Not Met. The EIS process is governed by HRS § 343. An EIS is: § 343-2 Definitions. As used in this chapter unless the context otherwise requires: .. . 'Environmental impact statement' or 'statement' means an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects. The statute also sets forth what the Rules must contain, at minimum. HRS § 343-6. The legal effects of administrative rules are well settled in this jurisdiction. Administrative Rules are to be followed and given the full effect of law. Williams v. Hawaii Medical Service Association, 71 Haw. 545, 549, 7984 P.2d 442, 444 (1990). The Supreme Court has clearly stated that arbitrary and capricious application of the Rules will not be tolerated. Windward Marine Resorts v. Sullivan, 86 Haw. 171, 948 P.2d 592 (ICA 1997). HAR § 11-200-14 through 23 are the requirements in the preparation of Draft and Final Environmental Impact Statements. The "General Provisions" highlight the expectation of the EIS process.		The consultation process mandated by HRS Chapter 343 and Title 11, Chapter 200, HAR, was followed. The consulted agencies were disclosed in the EISPN and in the DEIS at Section 13. Section 3.4 of the DEIS described the community EIS scoping meetings. Public comments were solicited during these meetings and used to prepare the EISPN and subsequent DEIS. Comment letters regarding the EISPN and responses are included in section 15 of the DEIS.

Commenting Party/Itemized Comments		Date of Letter	FEIS Section Reference and Comments*
	. . . An EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self serving recitation of benefits and a rationalization of the proposed action. Agencies shall ensure that statements are prepared at the earliestopportunity in the planning and decision making process. This shall assure an early open forum for discussion of adverse effects and available alternatives, and that the decision makers will be enlightened to any environmental consequences of the proposed action. HAR § 11-200-14. Title 11, Chapter 200, contain the "Environmental Impact Statement Rules" and the following are examples of Rules which were not met. a. Full consultation did not occur with the DEIS. HAR § 11-200-15 A sets forth the following requirements to satisfy the consultation process. In the preparation of a draft EIS, proposing agencies and applicants shall consult all appropriate agencies noted in section 11-200-10 (10) and other citizen groups, and concerned individuals as noted in sections 11-200-9 and 11-200-9.1. To this end, agencies and applicants shall endeavor to develop a fully acceptable EIS prior to the time the EIS is filed with the office, through a full and complete consultation process, and shall not rely solely upon the review process to expose environmental concerns. This provision is to be read with the foregoing General Provisions and the requirements of HAR § 11-200-22 A, which further emphasize meaningful public participation as follows: Public review shall not substitute for early and open discussion with interested persons and agencies, concerning the environmental impacts of a proposed action. Review of the EIS shall serve to provide the public and other agencies an opportunity to discover the extent to which a proposing agency or applicant has examined environmental concerns and available alternatives. . . These requirements are clear and unambiguous. Hawai'i case law has consistently held that when statutes or rules are clear and unambiguous, they are to be given effect in accordance with their plain and ordinary meaning. IBEW v. Hawaiian Tel., 68 Haw. 316, 323, 713 P.2d 943, 950 (1986); RGIS Inventory v. Hawai'i Civil Rights Comm., 104 Haw. 158, 160, 86 P.2d 449, 451 (2004). Under the Rules, the consultation process should have been implemented as soon as possible to engage the appropriate agencies and the public and not rely solely upon the review process.		
11.91	When the issue of the expansion was brought to the communities, the Mayor prohibited the participation of the elected officials in his meeting. This can hardly be deemed as compliance with the consultation process. In addition, there was no sense that the decision to expand was open for discussion. The discussion was simply, if you don't expand WGSL, then the landfill will go to Nanakuli. This is not a consultation process which is open to the public.		The meeting referred to above was not a part of the EIS consultation process.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
11.92 Moreover, the concerns of the NOV and the acts complained of therein should give rise to major environmental concerns and require thorough discussions. The DEIS merely dismisses it with the fact that a settlement has been reached. The violation and the fines were the largest in the Nation at that time.		The NOV was issued by DOH after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NOV was issued. On December 7, 2007, DOH, the City and Waste Management agreed to a settlement which concluded the NOV process. At that time, there was only a single remaining violation that had not been brought into compliance--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which addressed the grade exceedance issue. Thus, all alleged violations have been addressed to the satisfaction of DOH, and WGSL is currently in compliance with all laws. See section 2.3. of the DEIS. The NOV also gave rise to several operational changes at WGSL. The current operating permit substantially increased oversight, monitoring and reporting requirements.
11.93 b. The FEIS failed to comply with the requirement to address alternatives. HRS § 343-2 defines an EIS as one that discloses, among other items, the 'alternatives to the action and their environmental effects.' HAR §11-200-17, which sets forth the Contents requirement of a Draft EIS, addresses the requirement as to alternatives as follows: F. The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks. Examples of alternatives include: .. (Emphasis added.) HAR § 11-200-17 F. 5 states that 'For any agency actions, the discussion of alternatives shall include, where relevant, those alternatives not within the existing authority of the agency.' In Westlands Water District v. U.S. Dept. of Interior, 376 F.3d 853, 866 (9th Cir. 2004), the Ninth Circuit reaffirmed that alternatives must be rigorously explored and that 'reasonable alternatives' include those not within the jurisdiction of the lead agency. Westlands, supra, at 868. The Ninth Circuit went on to say that '[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate.' Id.. citing to Morongo Band of Mission Indians v. FAA, 161 F.3d 569, 575 (9th Cir. 1998). The alternatives discussed by the City assumed the City would operate the landfill and therefore required the purchase of each site. No consideration was given to private landfills and its ability to operate as an alternative landfill location, or alternatively, a private/public partnership. The DEIS fails to address the how much money the City makes on landfill operations and the need to control 'flow' of MSW.		The DEIS discussed technical and other alternatives, as well as alternative public and private locations for the proposed action. Numerous sites were eliminated because they did not meet state requirements. An EIS is not required to explore alternatives that "are not significantly distinguishable from alternatives actually considered, or which have substantially similar consequences." Westlands Water District v. U.S. Dept. of Interior, 376 F.3d 853, 868 (9th Cir. 2004) (internal citations omitted). The choice of alternatives is "bounded by some notion of feasibility and need not include "remote and speculative alternatives." Id. (internal citations omitted). "The touchstone [of] inquiry is whether an EIS' selection and discussion of alternatives fosters informed decision-making and informed public participation." Id. (internal citations omitted). The DEIS for the proposed project helps to foster informed decision-making and informed public participation, as evidenced by your letter and similar comment letters. There was no assumption that the City would operate the landfill. In fact, the City does not currently operate WGSL--Waste Management, a private company, is the operator of WGSL under contract with the City. The City is tasked with the obligation to provide environmentally sound disposal services for solid waste. In that regard, the City currently works closely with various private entities, such as those operating the landfill, the Synagro bioconversion facility at Sand Island, H-POWER, and the processing of curbside recyclables. Private sites and public sites were considered for a municipal landfill. As explained in the DEIS, numerous sites were eliminated because they did not meet state requirements. Further, WGSL is the only permitted MSW landfill on the island. The City combines tip fee revenue from City transfer stations and the landfill. The revenue for FY06 was $14,051,214 as reported in the City and County of Honolulu Operating Budget, Detailed Statement of Revenues and Surplus, Solid Waste Special Fund (250) Disposal Charges. The revenue for FY07 and FY08 was $10,794,073.00 and $11,332,649.27, respectively. A small portion of the tip fee revenue is attributed to commercial accounts disposal at transfer stations. Most of the tip fee revenue is generated by commercial accounts disposal at the landfill. In accordance with Chapter 9, Section 9-4.2, Revised Ordinances of Honolulu ("ROH"), only businesses, and federal and state agencies' accounts are charged a landfill tip fee. Homeowners and eleemosynary organizations pay no fees. Your comment regarding flow control is addressed in the response to Comment 79.
11.94 The DEIS also fails to adequately address the delay in the Solid Waste Management Plan and the City Ordinance which states that by the year 2000, at least 75 percent of the solid waste generated shall be recycled, reused, composted, or otherwise diverted from incineration or placement in the landfill.		The City has an Integrated Solid Waste Management Plan, and an update of that plan was adopted by the City Council in December 1994 through Resolution 94-306, CD1. A new draft update to the City's Plan was sent to DOH on June 30, 2008, for review. DOH will determine its appropriateness prior to consideration by the City Council. The update to the Plan makes it clear that there will always be a need for a landfill in order to manage waste that cannot be further combusted, shipped, recycled or reused, to mange solid waste during natural disasters, and to provide for other contingencies. Please see section 2.6. City Plans Involving the Future Handling of Solid Waste, of the FEIS. Your citation to the City Ordinance is incorrect. The City Ordinance to which you refer is Section 9-1.1, which provides in relevant part:

Commenting Party/Itemized Comments		Date of Letter	FEIS Section Reference and Comments*
			Sec. 9-1.1 Findings--Determinations--Goals. (b) (1) In addition to the findings and determinations made under this section, the council establishes the following goals: (A) By the end of 2007, at least 65 percent of the solid waste generated within the city be recycled, reused, composted, used for the generation of power, fuel or electricity through a waste-to-energy or other alternative technology facility, or otherwise diverted from placement in a landfill; (B) By the end of 2010, at least 75 percent of the solid waste generated within the city be recycled, reused, composted, used for the generation of power, fuel or electricity through a waste-to-energy or other alternative technology facility, or otherwise diverted from placement in a landfill; and (C) By the end of 2015, at least 90 percent of the solid waste generated within the city be recycled, reused, composted, used for the generation of power, fuel or electricity through a waste-to-energy or other alternative technology facility, or otherwise diverted from placement in a landfill. (2) The percentage goals in this subsection shall be reviewed annually by the department of environmental services, which shall recommend to the council any necessary revisions. For the purpose of these goals, "solid waste" includes source separated waste generated in the city, but not introduced into the disposal system. Please note that these are goals, as opposed to mandates. Additionally, these goals are subject to revision as necessary.
11.95	Moreover as discussed above, there is no discussion of secondary impacts which is necessary in order for an DEIS to be adequate.		Secondary and cumulative effects associated with the subject project was discussed and addressed in Section 1.4, Secondary and Cumulative Effects, of the DEIS.
11.96	c. The purpose and need section limits discussion. HAR § 11-200-17 D requires the Draft EIS to 'contain a separate and distinct section that includes a statement of purpose and need for a proposed action.' It is a similar provision under NEPA, which is looked upon to guide the discussion on alternatives. Westlands, supra, at 866. In Westlands, the Ninth Circuit looked to whether the preparers had 'arbitrarily and capriciously' narrowed the scope of the statement, thereby affecting the discussion on the alternative.		The DEIS was prepared in accordance with HRS Chapter 343 and HAR, Title 11, Chapter 200. The DEIS contains separate and distinct sections regarding the purpose and need for the proposed project, located at Section 3.2 and Section 3.3 respectively. These sections reasonably define the objectives of the project.
11.97	In the preparation of the Draft Supplemental EIS for this proposed expansion, it is critical that the decision maker and the general pubic are made to understand why the promises of government need not be kept. There should also be an explanation as to why the City prepares this DEIS and the Final EIS will be accepted by another City agency. This is especially true when the accepting agency has attached to it, the Planning Commission which is expected to be called upon the make the decision as to whether an SUP should be recommended to the LUC or whether the process requires a boundary amendment.		Representations of officials may become law and be binding when appropriately enacted into law, or through other acts that have the force and effect of law. Subsequent Mayors and/or City Councils may, however, change prior law through appropriate legislative, regulatory or legal processes. The Mayor, in accordance with HAR § 11-200-4.A., is the final authority to accept the EIS: A. Whenever an agency proposes an action, the final authority to accept a statement shall rest with: 1. The governor, or an authorized representative, whenever an action proposes the use of state lands or the use of state funds or, whenever a state agency proposes an action within section 11-200-6(b); or 2. The mayor, or an authorized representative, of the respective county whenever an action proposes only the use of county lands or county funds. The Planning Commission will not be called upon to make any decision as to whether the City should seek a boundary amendment or SUP. For purposes of the expansion addressed herein, the City will decide to pursue either an SUP or a boundary amendment. This procedural decision does not impact the analysis contained in the EIS.
12.	Cynthia K.L. Rezentes	7/7/2008	
12.1	I respectfully oppose any lateral expansion of the current Waimanalo Gulch Sanitary Landfill located at TMK 9-2-3: Portion 72 and Portion 73.		This comment is acknowledged.
12.2	The Special Use Permit allowing a municipal solid waste landfill at this location should be concluded as of November 1,2009 and this landfill closed as per the intent of the State Land Use Commission which approved an 18-month extension to the current permit for this location. The current landfill should be closed per guidelines established by the State Department of Health and under guidelines recommended by EPA 40 CFR 258.		This comment is acknowledged, however, for the reasons cited in the DEIS this option is not available to the City. We note for clarification that the planned area of use will be within an area of the property that has not yet been permitted for use as a municipal sanitary landfill.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
12.3 Any further request for use of this property should be proposed under a completely new and independent application and EIS with the requisite new surface water management plans, stability analysis, groundwater monitoring system, gas collection system, odor management, litter management, etc.		The subject DEIS proposes the use of an area of the City owned property that has not yet been permitted nor used as a municipal sanitary landfill. The landfill infrastructure that is proposed for the subject project is based on utilization and integration with several of the environmental management systems that are already in place and operational. New management systems will be installed as appropriate to ensure proper environmental management and compliance. A new EIS for this project is not considered appropriate given the status of review for the current EIS process that is underway.
12.4 The current landfill has already exceeded the topographical and airspace request per the original EIS at which point said EIS stated that there was a limited amount of the 200 acres of property that was apropos for a landfill. The current landfill has gone beyond that original evaluation and request by not limiting itself to the natural topography but has developed a new topography for the receipt of municipal solid waste. Any further use of the property should be under a new application.		In addition to the comment above, it is noted that the City has requested an amendment to the current area of landfilling from the LUC to allow for use of the airspace that has exceeded the original area designated in the Special Use Permit. On March 14, 2008, the LUC amended Condition No. 12 of the permit as follows: "The 200-care Property shall be restricted from accepting any additional waste material and be closed in accordance with an approved closure plan by November 1, 2009, or until the approved area reaches its permitted capacity, whichever occurs first." While it is acknowledged that an appeal to the LUC regarding this decision is presently on-going, a date for the hearing of the appeal will be at a later date. This process, however, will involve the use of the existing area of landfilling. In contrast, the subject EIS is for the evaluation of uses for an area outside of the presently permitted landfill footprint.
12.5 With the development of a new topography with which to establish the airspace to allow a 15+ year usage of the property should come the onus to do so responsibly and without potentially increasing the complexity of the analysis of the current landfill stability with increasing loads placed above and to the rear of the landfill (at the highest level of original topography). As can be seen in the first attached photograph, the topography of the area that is being proposed to be expanded into is within a steep, narrow area of the gulch with a naturally occurring waterway leading directly towards the base of the current landfill. This configuration places more stresses from a narrower base leading into a broader base and thus should be structured to be able to handle its' own load without impacting the current landfill.		The design of the proposed Waimanalo Gulch expansion considers geotechnical, seismic and other factors appropriate to the island and to the area of the site. Detailed stability analyses by engineering professionals were completed during the project design. The design of the current SUP area and the proposed area of expansion will meet the EPA Subtitle D (40 CFR Part 258) standard for stability. The design of the expansion will be subject to review by appropriate City and State agencies when they evaluate the permit documents.
12.6 In addition to there being a need to completely separate the current landfill from the proposed expansion, there needs to be an explanation of what activities are or should be allowed to take place upon the landfill once the height limits are reached. As can be seen in the second attached photograph, rock crushing, "daily" cover and other activities besides filling of currently open cells with municipal solid waste occurs. What are the impacts of these activities taking place on supposed "full" cells? This should be projected as there will be less "virgin" land area and more area comprised of municipal solid waste the further into the gulch operations move. Where will these activities take place and how does that affect the analysis of the appropriateness of extending further into the gulch?		Sufficient space is expected to be available for the proposed project given that only a portion of the approximately 200 acres will be used for landfilling. Space for associated landfill support activities that include the stockpiling of cover material will be in locations approved by the DOH based on the required load bearing capacity and surface stability. Rock crushing is not currently performed at the landfill. Rock crushing that is planned will not be performed on landfill cells that have reached capacity.
12.7 The analysis of how the expansion of -37 acres of land equates to 15+ years of usage needs to be demonstrated. If one takes the 60.5 acres of landfill space that will be utilized by November of 2009 and does a strict ratio of the acreage proposed to be used for the landfill expansion (not taking into consideration the more complex nature of a narrower gulch to operate within) there should only be about 12 years worth of capacity beyond November 2009. The claims that there would be a minimum of 15 years life should be proven.		The linear comparison suggested is inappropriate since it does not take into account the factors that should be considered in engineering the lateral expansion of the site. These factors include geotechnical soils studies and reports to establish appropriate slopes to maintain safety and stability of the site, and hydrogeologic factors to establish safe excavation depths. Other industry and governmental regulatory standards will also be considered in the final design of the site. The engineering design for the site will be reviewed by the State DOH as part of the Solid Waste Permit for consistency of design.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
12.8 There continue to be numerous questions with regards to when, if ever, the City proposes to close this area to taking trash from the entire island. Where are the plans for what happens as this area is filled more rapidly than ever due to the expanding development being allowed and built on the island?		The City's long range plan will continue to involve the on-going adoption and use of waste reduction and recycling technologies and practices to reduce O'ahu's dependency on landfilling. However, as noted in the subject DEIS, there are no immediate alternatives including transshipment, that can completely eliminate the need for landfills. Each alternative will result in the generation of some form of waste that cannot be further recycled, reduced, combusted or reused. For these waste by-products landfilling remains the most viable and feasible alternative for disposal.
12.9 Until there is a real faith effort made in addressing the solid waste problems faced by the City and County of Honolulu, I will respectfully disagree with any plans to continue doing "business as usual" and continuing to "dump" on the Leeward Coast.		This comment is acknowledged. The City has in good faith pursued alternative technologies to waste reduction that are reliable, cost efficient and scalable, and issued an RFP for alternative technologies. In response to the RFP, the only qualified proposals received to date have been for existing mass burn technologies. The City is currently pursuing mass burn technology through the expansion of H-POWER. No alternative can completely eliminate the need for a landfill. WGSL is a strategic component of the City's solid waste management system and the final destination for certain solid wastes including MSW, recycling residue, and H-POWER generated ash, residue and unacceptable waste that cannot further be combusted, recycled or reused.
13. Henry Eng, FAICP, Director	7/7/2008	
Department of Planning and Permitting		
City & County of Honolulu		
13.1 A rockfall and vibration hazard assessment focusing on potential impacts to existing and proposed residential developments… should be conducted.		See Section 5.3.3. Potential Impacts and Mitigation Measures of the FEIS, relating to soils, for a description of the testing program that will be undertaken to address rockfall and vibration hazards as a result of the use of controlled blasting.
13.2 The Final EIS should include a view impact assessment that describes impacts of the construction and completion of landfill cells and accessory activities until final closure and landscaping from major public vantage points.		See Section 5.10.1. Scenic and Aesthetic Environment, of the FEIS, for further information on the assessment of potential viewplane impacts from major public vantage points.
13.3 The final EIS should clarify if faux rocks are still being considered for the final landscape plan.		Once the expansion is approved, the contractor will perform clearing and grubbing activities each time a new landfill cell is constructed. Surface rocks encountered during this process will be collected and stockpiled for use on the final cap during the closure process. During closure the final cap will be installed and vegetated with a combination of grasses and natural vegetation that is native to the area. These stockpiled rocks will be placed on the final cap after the revegetation process is completed in an attempt to make the final appearance of the landfill blend into the surrounding hillsides. No faux rocks will be needed based on the availability of surface rocks as cell construction moves up through the gulch.
13.4 Initial construction activities for the expansion of the existing landfill may require grubbing, grading, and stockpiling permits. In addition, a grading permit will be required for the final cover that will be placed prior to landfill closure.		This comment is acknowledged and was addressed in the DEIS, Section 12, Permits and Regulatory Approvals That May be Required.
13.5 The discussion on anticipated impacts should consider dust generated by blasting and any required mitigation measures.		This comment is acknowledged. Generally, the type of controlled blasting that is performed at the site has resulted in the minimal generation of dust. However, to further address this concern, personnel performing the blasting will inspect the site for any loose sediments or soils that can constitute a dust source following blasting. As required, the area of the blast will be wetted down to suppress dust. See Section 5.7.3. Potential Impacts and Mitigation Measures of the FEIS, relating to air quality, for a discussion on mitigative measures for dust control from the use of controlled blasting.
13.6 Figure 4-7 on page 4-13 should show the height of HECO transmission lines and the required clearances.		This figure has been revised and is provided in the FEIS.
13.7 Figure 8-1 on page 8-11 should show State Land Use District boundaries with their respective labels. The existing and proposed SUP areas should also be shown.		This figure has been revised and is provided in the FEIS.
13.8 Figure 8-2 on page 8-13 should highlight ALISH categories while de-emphasizing property boundaries. The existing and proposed SUP areas should also be shown.		This figure has been revised and is provided in the FEIS.
13.9 On page 9-80, the section on Makaiwa Hills should be updated to indicate that the project has an accepted EIS and that it is presently undergoing a zone change application process.		We acknowledge the present status of the Makaiwa Gulch project. This comment is addressed in Section 9.7.4.3. Makaiwa Gulch, of the FEIS.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
13.10 There should be a discussion on whether development on the H-Power third boiler would curtail pursuing alternate technologies in the near future or make it economically unfeasible to close the landfill sooner or later.		The proposed expansion of the H-POWER facility is considered to be independent of the selection of other alternative technologies that may help the City & County of Honolulu with its handling of municipal refuse. This means that the City will continue to evaluate refuse management alternatives whenever feasible and advantageous as part of its overall system for refuse management. See also Section 2.6. City Plans Involving the Future Handling of Solid Waste, in the FEIS.
13.11 A more detailed description of accessory activities, such as recycling, grading, rock crushing, stockpiling and their dust and noise impacts on surrounding uses, especially Makaiwa Hills residential development, and their mitigation measures should be provided.		General information is provided in the FEIS to describe the community drop-off center to handle residential refuse recycling and disposal in Section 4.1.2. Features of Construction of Lateral Expansion. Adverse effects to the planned Makaiwa Hills project are not anticipated based on the limited scale of this activity that will be restricted to a small area within the interior of the Waimanalo Gulch site. The potential effects of construction that include grading, rock crushing, and stockpiling, have taken into consideration the Makaiwa Hills development as well as surrounding properties that include Ko Olina and other residences that surround the landfill property. While the detailed operational practices associated with construction will not be determined until such time that the final project plans are prepared following the current EIS effort, Waste Management has already initiated contact with the developer of Makaiwa Hills and fully intends to coordinate its future work activities to minimize and mitigate the potential for adverse effects.
13.12 With respect to vendors' proposals in response to "Project to Construct and Operate Alternative Energy Facility and/or H-POWER Facility," January 16, 2007, there should be a table comparing how each vendor's alternate technology meet or do not meet the six (6) minimum requirements.		The procurement solicitation referred to, Competitive Sealed Proposal No. 047, was cancelled on January 16, 2008 and is no longer under consideration by the City. Accordingly, a comparative table evaluating the proposals against the six minimum requirements was not prepared. However, a description of the City's requirements as they pertain to various alternative technologies has been provided in Section 9 of the DEIS and FEIS documents.
13.13 There should be discussion of the City's waste management plans for the years beyond 2024.		The Integrated Solid Waste Management Plan is presently under preparation and is scheduled for completion in early 2009. Information from a draft of the plan has been provided in the FEIS to describe future activities of the City in managing solid waste for the future. See also Section 2.6. City Plans Involving the Future Handling of Solid Waste.
14. Ken Williams, Vice President - Resort Operations	7/7/2008	
Ko Olina Resort & Marina		
14.1 The subject Draft EIS is flawed due to an inappropriate statement of need for the proposed project in Section 3.3. This statement of need is inappropriate due to the following reasons: -It attempts to use the EIS process to supersede site selection procedures required by the State Land Use Commission and initiated by the City Council and the previous City administration. While an EIS is a decision-making tool, Section 2 clearly documents the intent of the State Land Use Commission to use a formal site selection process. The EIS process cannot equal the level of detailed evaluation, dialogue, deliberation and community input that a process dedicated to selecting a landfill site can achieve. - It attempts to circumvent the State Land Use Commission's intent of establishing a deadline for the site selection process to determine a long-term landfill site. The proposed lateral expansion of the WGSL could defer closure of the WGSL by as much as 15 years or longer. This is contrary to the intent of the State Land Use Commission. Such a lengthy deferral should not be justified by merely reciting failed efforts to select a long-term site.		The subject DEIS has appropriately stated the need for the project which is consistent with Chapter 343, Hawai'i Revised Statutes (HRS), Environmental Impact Statements. According to Section 343-2, Definitions: "Environmental impact statement" or "statement" means an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects. Each of these requirements defining the EIS, including its use for the purpose of environmental disclosure, has been documented for the Waimānalo Gulch Sanitary Landfill as the preferred alternative for the disposal of O'ahu's municipal solid waste and H-POWER ash and residue. It is further noted that the subject DEIS provides for the evaluation of alternatives that include potential landfill sites as well as technology based alternatives and other methods, such as waste transshipment, to address the need for the future disposal of O'ahu's municipal refuse. The DEIS, therefore, provides an important source of information for the LUC in evaluating the reasons why the City considers Waimānalo Gulch as the most viable and feasible alternative for our island. This effort to evaluate and provide environmental disclosure information that is relevant to the decision making process is clearly in the public interest.
14.2 Based on the situation described in Section 2-Project Background, the statement of need should be for an interim solution to dispose solid waste in the event that the City cannot meet the November 1. 2009 deadline. There is a need to determine how future violations of State and federal laws pertaining to landfill operations can be avoided.		This comment is noted. However, for reasons stated in the DEIS, the preferred alternative is for the use of the Waimānalo Gulch Sanitary Landfill Lateral Expansion site until the area has reached capacity, which under the present conditions is estimated to be approximately 15 years.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
		It is acknowledged that prior violations involving the State Department of Health (DOH) and the Environmental Protection Agency (EPA) have occurred in the past at the Waimānalo Gulch Sanitary Landfill. On December 7, 2007, a settlement agreement was reached with the DOH which settled all issues arising from and related to the notice of violation. At the present time the City and Waste Management of Hawaiʻi are fully cooperating and working with the EPA to address elevated underground temperatures at the landfill which are higher than anticipated, but which are not indicative of underground combustion conditions such as a fire. A detailed discussion of this item was provided in the DEIS, in Sections 2.3.2. U.S. Environmental Protection Agency and 5.7.3. Potential Impacts and Mitigation Measures (Air Quality). It is important to note that throughout the events involving the DOH and EPA that self-reporting procedures have remained in place to notify governmental regulatory agencies of the operating practices and procedures applied at the landfill. At no time was the health and safety of the public at risk and we anticipate that based on these procedures that sufficient safeguards will continue to maintain public health and safety.
14.3 Throughout Section 5. 6 and 7 the cumulative impacts of the existing WGSL operation are not consistently nor systematically described in each category of environmental setting, public services and socioeconomic setting... Examples of anticipated impacts that will be cumulative include those on flora, fauna, cultural resources and visual/aesthetic.		The potential for secondary and cumulative impacts have been described separately in both the DEIS and FEIS, in Section 1.4, Secondary and Cumulative Impacts.
14.4 Section 6-Public Services, Potential Impact and Mitigation Measures fail to quantitatively and/or qualitatively discuss impacts in each category. For example, historic statistics on fire and police responses to the WGSL should be provided as a baseline for demands created by current operations. These should be compared to anticipated demands following termination of operations on November 1 2009 and anticipated changes in demand should interim operations be continued at WGSL. Another example is the existing impacts of odors and windblown trash on public and resort facilities from the current operation. These need to be documented by records of complaints, anecdotal reports and prevailing wind conditions as a baseline for assessing termination of operations on November 1 2009 and an interim continuation of operations, including the viability of proposed mitigation measures. The demands on the services of the State Department of Health should also be assessed due to the history of violation at the WGSL.		The Waimanalo Gulch Sanitary Landfill maintains appropriate and responsive relationships with the local fire and police departments, as well as the Department of Health and other relevant city and state agencies. See Section 15, Comments and Responses to the EISPN, which lists the fire and police comment letters regarding their belief that expansion of the WGSL will not adversely affect the level of commitment that these important institutions provide in maintaining public health and safety. The Waimanalo Gulch Sanitary Landfill maintains an active litter and odor control program which is described in the DEIS. See Section 4.2.2. Operational Controls. An odor complaint file is maintained on-site. According to Waste Management, less than 5 complaints were received about odor and/or litter within the last 12 months. Not all of those complaints were verified. Comments from the DOH regarding potential issues associated with the proposed project is a part of the EIS process. A copy of the DOH comments and the responses to their comments are provided in Section 16, Comments and Responses to the DEIS, which a part of the FEIS. Based on the comments received no adverse impacts to DOH services are anticipated.
14.5 Alternatives to the Proposed Action is flawed due to the inappropriate statement of project need, as discussed in item 1, above. Since an interim alternative is not a commitment to a long-term solution, the range of potential alternative sites and methods, or combinations thereof, available for evaluation is greatly expanded.		The statement of need for the project has been properly prepared and is consistent with the requirements for the preparation of a Chapter 343, HRS, compliant EIS. The alternatives evaluated for the proposed project, as well as the preferred alternative, do not involve the consideration of an interim solution.
14.6 Due to the flawed statement of need, the proposed project, assessment of impacts and consideration of alternatives is also flawed. The Draft EIS was crafted around a pre-determined solution to an impasse in selecting a long-term landfill site. As a result, it does not comply with the rigorous decision-making rationale required by Chapter 343, HRS. Therefore, a new DEIS based on a more appropriate statement of need should be prepared.		Please refer to the responses to Items 1, 3, and 5, above, concerning the preparation of the subject document in accordance with the requirements of Chapter 343, HRS. The subject DEIS does not have a predetermined outcome based on the nature of the document which serves the purpose of environmental disclosure. A new DEIS is therefore neither planned nor appropriate for preparation.
15. Ernest W. Lau, Public Works Administrator	7/9/2008	
Department of Accounting and General Services		
State of Hawaii		
We support the City and County of Honolulu's efforts in resolving the issues related to the island of Oahu's municipal refuse. We have no additional comments to offer at this time.		We appreciate your statement of support and acknowledge that you have no additional comments to offer.

16. Abbey Seth Mayer, Director	7/10/2008	
Office of Planning; Department of Business, Economic Development & Tourism		
State of Hawaii		
16.1 The Office of Planning believes that the Draft EIS does adequately disclose potential impacts, alternatives, mitigating measures, and the secondary and cumulative impacts of those areas cross-cutting state concern that we requested be addressed in our comments on the EIS Preparation Notice.		We appreciate your review of the subject document and acknowledge your statement.
16.2 The Office of Planning defers to the State Department of Health on whether impacts relating to public health and safety of the proposed lateral expansion have been adequately disclosesd.		We acknowledge your deferral of potential issues involving public health and safety to the State Department of Health (DOH) and will respond to any concerns identified by the DOH concerning the DEIS in a separate letter.
17. Morris M. Atta, Administrator	7/11/2008	
Department of Land and Natural Resources		
State of Hawaii		
17.1 Engineering Division: Our comments dated December 23, 2006 for the subject, which were incorporated and attached at the Draft Environmental Assessment document, still apply.		We acknowledge that the comments of the Engineering Division dated December 23, 2006, have been incorporated into the DEIS document.
17.2 Division of Forestry and Wildlife, Land Division: We have no comments.		We acknowledge that the Division of Forestry and Wildlife and the Land Division have no comments.
18. Clyde W. Namuo, Administrator	7/11/2008	
Office of Hawaiian Affairs		
State of Hawaii		
18.1 While OHA understands the need and pressures that surround this proposed action, OHA is concerned that this document focuses too narrowly on the isolated issue of expanding a landfill. We wish to see more of a pro-active and far-reaching effort centering on sustainable waste management.1 This DEIS focuses on the 15 - year window of breathing room that the proposed action buys, and does not offer insight into finite planning for waste in Hawai'i. OHA is disappointed that this proposed project is not coordinated in any way reducing the current waste stream into the landfill.2 There is a demonstrated need to explore how other communities are efficiently dealing with their waste streams. An active recycling program, incentives, taxes, alternative technologies and regulations are just of the few low-hanging fruit that should be taken advantage of.		The purpose of the DEIS is to address Chapter 343, HRS, requirements relating to the preparation of an Environmental Impact Statement for the planned lateral expansion of the WGSL. The City's Integrated Solid Waste Management Plan is currently being updated and will provide policy guidance with regard to the overall use and relationship between landfilling and waste reduction strategies such as recycling, alternative waste reduction or elimination technologies, and waste transshipment. Although all options will continue to be pursued by the City, the use of landfilling remains the single most viable option for the disposal of MSW and H-POWER generated ash and residue. According to the DEIS (Section 9.7. Preferred Alternative), "There are several alternative technologies and the transshipment of waste that show promise toward reducing the need for landfills. The generation of MSW that exceeds the processing capacity of H-POWER as well as the generation of ash and residue, however, requires that facilities such as a municipal waste landfill be a part of the City's long term waste management system."
18.2 In November of 2006, OHA commented, "We also recommend that you conceive of the project area as a portion of a larger traditional cultural landscape; and, that the possible presence of one or more Traditional Cultural Properties (TCPs) is considered in your CIA (Cultural Impact Statement)."		The evaluation of the stone uprights as a "TCP" will be based on a review of these features in accordance with the requirements of applicable federal and state law for this designation. This evaluation will be performed by a qualified archaeological and cultural resource consultant and reviewed by the State Historic Preservation Division (SHPD) for applicability.
OHA has made a field visit to the project site and we noted three significant cultural features that were still intact in the project area. We are also aware of the probable existence of others yet to be discovered in the project area. OHA is further saddened that the larger setting that this project sits in is one that has been highly developed and degraded. Therefore, what TCPs that remain must be protected.		We add that while this evaluation will be performed, it has always been the City's intent that the stone uprights be treated in a manner consistent with its future preservation. See our comment below.
We appreciate that a cultural assessment has been made; however, it is important to note that OHA has consistently recommended that the three large upright boulders potentially used as trail markers that constitute State Inventory of Historic Properties (SIHP) site # 50-8012-6903 should be preserved in place. These features would likely be determined to be significant due to information content (criteria D) and traditional cultural significance (criteria E) under the Hawai'i Register of Historic places.		The restatement of OHA's position that the stones be preserved in place is noted. At this time the City is continuing to work with the SHPD and members of the community that have been identified by SHPD as important parties to the process. The final decision regarding the manner of preservation for the uprights will be determined by the SHPD.

Commenting Party/Itemized Comments		Date of Letter	FEIS Section Reference and Comments*
	Not only OHA, but also all the cultural consultants contacted by the applicant recommend the same course of action.4 If the uprights are removed as the applicant first proposes on page 1-22 of the DEIS, then what they mark will be lost as well. There is little point on making them more accessible, as is also proposed, because they are thought to be boundary markers; it is what the stones delineate, not the stones themselves that is more relevant in this place. Access for cultural practitioners should also be considered as is indicated on page 1-31 of the DEIS. OHA objects to the determination made on page 7-82 of the DEIS which states "Considering the use of the site as a landfill, preservation in place (of site # 50-8012-6903) is not thought to be an appropriate mitigation treatment for the stones, considering their cultural sensitivity." Using the very significance of the stones to destroy their relevance is callous and unfair. OHA also finds it odd that this DEIS repeatedly calls to remove site # 50-8012-6903 (see also pages 7-123 and 124) yet then on page 1 1-1 sites the preservation of the stone uprights as an unresolved issue to "develop and define an appropriate course of preservation." Once again, OHA states that due to the admitted cultural significance of site # 50-8012-6903, they should be preserved in place.		
18.3	The DEIS mentions environmental injustice on page 1-15 and indicates that "Leeward O'ahu is on the receiving end of many of O'ahu's burdens." The Environmental Protection Agency (EPA) defines this concept as the "fair treatment for people of all races, cultures, and incomes, regarding the development of environmental laws, regulations, and policies." Table 7-1 of the DEIS shows that Wai'anae county has a resident population of 42, 259 while 'Ewa has 68,696. OHA notes that the Native Hawaiian populations in those two counties are among the highest on O'ahu at 65% and 61 % respectively. We express concern that Native Hawaiian populations are bearing a disproportionate amount of adverse health and environmental effects in this area stemming from what this DEIS on page 1-13 lists as odor, windblown litter, and visual impacts. The DEIS on page 7-21 states that within a 10-mile radius of the project area there are two separate landfills, two existing electrical power plants, a proposed new power generator plant, a deep draft harbor, and an industrial park all of which service the entire island. This is the very definition of environmental injustice. OHA points out there is also a large number of homeless people that have settled there from other areas of the island as well, which this community is now supporting. The DEIS does little to compensate for these inequalities and even states that "condominium analysis shows a significant correlation of increased value and proximity to the landfill." As such, OHA inquires as to whether or not the applicant actually asserts that living next to the landfill is more beneficial in terms of property value, health, and aesthetics.		According to the DEIS, Section 9, Alternatives to the Proposed Action, a major part of the reason for identifying Waimānalo Gulch as the preferred alternative from the standpoint of its physical location, is based on the assessment of: EPA Exclusionary Criteria involving physical features advantageous to the siting of a landfill; alternative sites that are located in areas which have since been developed or which are closed landfills with no further expansion potential; Board of Water Supply and Department of Health considerations that involve the need to protect our groundwater supply; and other factors involving the life of the site. The selection of Waimānalo Gulch as the preferred alternative due to the presence of residents with selected characteristics was never a part of the evaluation process. The correct reference to the presence of public and private facilities is on Page 7-28 of the DEIS. The context for citing this information is that, "A number of interviewees point out that Leeward Oʻahu has been and continues to remain on the receiving end of many of Oʻahu's burdens." The current Administration recognizes this as a major concern of the community and as noted in the DEIS, has provided $2.7 million in 2007 as part of a community benefits package with a further distribution of $2.0 million in 2008. They expect that participation and the benefits provided will continue to evolve as they gain experience in working with the community. (Page 7-20). Other mitigative measures to further address the potential for impacts to the surrounding community have also been identified in Section 7.1.5., Socioeconomic Mitigation Measures.
18.4	The applicant claims on page 1-32 of the DEIS that "The proposed project provides for the safe and effective disposal of municipal refuse for all the communities of O'ahu." However, OHA notes that this landfill has been in violation with both state department of health and federal EPA regulations. Further, the landfill was supposed to have ceased operations in May of this year and not benefited from a 2007 application to amend the Special Use Permit which eventually allowed this landfill to remain in operation. The proposed action will only add further burdens to our beneficiaries in these areas.		It is acknowledged that prior violations involving the State Department of Health (DOH) and the Environmental Protection Agency (EPA) have occurred in the past at the Waimānalo Gulch Sanitary Landfill. On December 7, 2007, a settlement agreement was reached with the DOH which settled all issues arising from and related to the notice of violation. At the present time the City and Waste Management of Hawaiʻi are fully cooperating and working with the EPA to address elevated underground temperatures at the landfill which are higher than anticipated, but which are not indicative of underground combustion conditions such as a fire. A detailed discussion of this item was provided in the DEIS, in Sections 2.3.2. U.S. Environmental Protection Agency and 5.7.3. Potential Impacts and Mitigation Measures (Air Quality). It is important to note that throughout the events involving the DOH and EPA that self-reporting procedures have remained in place to notify governmental regulatory agencies of the operating practices and procedures applied at the landfill. At no time was the health and safety of the public at risk and we anticipate that based on these procedures that sufficient safeguards will continue to maintain public health and safety.

Commenting Party/Itemized Comments	Date of Letter	FEIS Section Reference and Comments*
		The purpose of the recent amendment to the Special Use Permit which allows Waimānalo Gulch Sanitary Landfill to remain in operation is to allow for the necessary disposal of MSW and H-POWER associated ash and residue. Without this capability the City would be left with no viable means of disposing of O‘ahu's refuse. Please refer to the response to Item 3, above, concerning the City's community benefits package.
18.5 There are further impacts as well, such as the potential for run-off from the site to effect water quality in the area, including the velocity of the run-off. The DEIS on page 1-7 directly states that "There is potential for leachate entering brackish groundwater from the landfill." Additional retention basins, leachate and gas systems are needed as well as the accompanying monitoring that they require. After the fact permit modifications should no longer be granted. OHA is also concerned about the effect that the leachate has on the wastewater treatment plant in the area as well as the eventual final outflow that results from it.		The potential for leachate entering brackish groundwater is provided in the DEIS, Section 5.5.5. Potential Impacts and Mitigation Measures. This section acknowledges that potential impacts to groundwater resources involve the possible release or entry of leachate entering brackish groundwater. Mitigation to address this concern is provided by use of a Leachate Collection and Removal System. Other measures associated with the protection of groundwater resources are described. The description and use of retention basins, leachate recovery, and gas control systems that serve to mitigate potential impacts are provided in the DEIS and describe both the existing and proposed future features of the landfill. Further detail can be found in the DEIS sections.
18.6 Additionally, OHA would also like to suggest that the current project area (and future if permitted) be landscaped with drought tolerant native or indigenous species that are common to the area. Any invasive species should also be removed. Doing so would not only serve as practical water-saving landscaping practices, but also serve to further the traditional Hawaiian concept of mālama ‘āina and create a more Hawaiian sense of place. This would also help to reduce the amount of impervious surfaces in the project area, thereby reducing runoff as well. OHA also recommends tree and landscape planting used to shade parking areas and provide shade and cooling to building elements and outdoor use areas. The final plans for this project should include restoration of the native environment.		Existing and future planned landscaping will incorporate the use of drought tolerant species as much as possible as a water conservation measure. As applicable, native species will be used and plantings of trees to provide shade for the parking and building areas of the landfill will be provided. The removal of alien species to completely restore the native environment, however, is not considered feasible. As noted in the DEIS, Appendix E, Botanical Resources Report for Alternative Municipal Refuse Disposal Sites on the Island of O‘ahu, "The results of all botanical surveys and searches of pertinent sources of information indicate that there are no special concerns or legal constraints related to botanical resources on any of the proposed sites. Non-native or introduced species of plants clearly dominate the natural vegetation in all areas proposed for landfill use, and the remnants of native vegetation extant on or near these sites consists of generally sparse growth of a limited number of species that remain relatively common in all undeveloped lowlands around O‘ahu."
19. Clifford Lum, Manager and Chief Engineer	7/14/2008	
Board of Water Supply		
City & County of Honolulu		
19.1 We have no objections to the proposed project.		We acknowledge that you have no objections to the proposed project.
20. Steve Y.K. Chang, P.E., Chief	7/15/2008	
Department of Health, Solid Waste Section		
State of Hawai‘i		
20.1 In our comments on the Waimanalo Gulch Landfill Expansion Preparation Notice, the SWS noted its concern over the designated 100-foot buffer on the boundary with the proposed Makaiwa Hills residential development. In your letter of May 12, 2007 you noted nuisance control measures to be implemented along that border in addition to the 100-foot buffer without actually increasing the size of the buffer zone. We maintain our position that the 100-foot buffer is inadequate to sufficiently ameliorate landfill impacts on the proposed residential development and instead recommend a 750 to 1,000-foot buffer. Such a buffer would be more effective in containing the impacts of landfill activities within the facility boundaries.		The 100-foot buffer was initially suggested to us as a minimal buffer to provide for mitigation of potential nuisances. In some instances an increased area of buffer may be warranted to allow for landscaping and other mitigative control measures. This area of buffer however, should not be arbitrarily assigned given that grading and excavation will be required to establish cells and other structural elements of the landfill. In these instances, while some earthwork will be required within proximity to the 100-foot buffer, the completion of this initial work will make possible two important features: (1) the establishment of proper landfill slopes will make possible the implementation of improved mitigative control measures such as landscaping, such that the area of buffer would exceed the minimum 100-feet, e.g., landscaping is expected to be facilitated on newly excavated soils rather than the existing unworked soils; and (2) the area of landfill use will be maximized thereby promoting the efficient use of the site.
20.2 Table 4-1, page 4-1. The DOH recommends amending this table to reflect expansion and soil usage estimates for MSW and ash cells separately.		The detailed configuration and location of the individual MSW and Ash cells within the expansion area are identified in the DEIS. The soil usage estimates for construction of these cells will be dependant on the final field configuration of the individual MSW and ash disposal cells. While these specific estimates of use are not known at this time, it should be noted that the amount of excavated material produced during the expansion will result in a surplus of available cell construction and daily cover material.

Commenting Party/Itemized Comments		Date of Letter	FEIS Section Reference and Comments*
20.3	Section 5.4.1, page 5-11. Figure 5-3, Surface Water Plan: Figure 5-3 shows the Western Drainage System with the detention basin above the present landfill. The accompanying discussion indicates that this depiction is applicable for the preferred expansion. This is incorrect and would leave a question as to whether or not a detention basin is still being contemplated. The DOH recommends a later version of the Western Drainage System be used that reflects the deletion of the detention pond.		Thank you for noting this error. A correct copy of the surface water control system will be provided in the forthcoming Final EIS for this project. As you have noted the detention basin has been deleted.
21.	Kirk S. Tomita, Senior Environmental Scientist	7/16/2008	
	Hawaiian Electric Company		
21.1	Engineering/Transmission & Distribution Division (Hsun Jou, 543-7527). HECO has existing overhead facilities within the subject property and will require continued access for maintenance purposes. Should it become necessary to relocate HECO's facilities, please immediately submit a request in writing and we will work with you so that construction of the project may proceed as smoothly as possible. Please note that there may be costs associated with any relocation work, and that such costs may be borne by the requestor. Because any redesign or relocation of HECO's facilities may cause lengthy delays, upon determination that HECO facilities will need to be relocated, HECO should be notified immediately in order to minimize any delays in or impacts on the project schedule. We appreciate your efforts to keep us apprised of the planning process. As the project progresses, please continue to keep us informed. We will be better able to evaluate any effects on our system facilities further along in the project's development. We request that development plans show all affected HECO facilities, and address any conflicts between the proposed plans and HECO's existing facilities. Please forward the pre-final development plans to HECO for review.		We acknowledge your comments and need for continued access to overhead facilities. Although the relocation of HECO facilities is not anticipated and will not be required at this time, any future requirements will be coordinated with HECO. The prefinal plans for the proposed project will be submitted to you for review.
21.2	Engineering/Telecommunications Section (Dixson Lau, 543-7543). Section 6.4.1, Power and Communication Facilities (p. 6-12) of the DEIS states, "A separate easement crossing the present landfill access road is also held by HECO for periodic maintenance of the overhead lines." The document is not definitive as to whether this easement is the same easement used by HECO to gain access to its existing telecommunications facility at Kahe Point near Battery Arizona. The easement for this access crosses over Ash Cell 4, Ash Cell 5, MSW Cell 48 and MSW Cell 5. This telecommunications facility provides critical communications interconnectivity for our Kahe Power Plant to the rest of the HECO system. As such, access to the site is required year-round, 24/7. We would appreciate that this concern be addressed in the final EIS. Please keep us informed in the same manner as requested above by our Transmission & Distribution Division. We request that the development plans reflect and highlight any conflicts that will affect access to our Kahe Point telecommunications facility.		We appreciate this point of clarification concerning your easements near Battery Arizona that also cross the Ash and MSW cells. This will be addressed in Section 6.4.1. Power and Communications Facilities, in the FEIS. Project activities that have the potential to affect the Kahe Power Plant facility will also be coordinated with your Engineering Department.
21.3	Engineering/Structural Division (Roy Noda, 543-7067). The planned expansion is further mauka of the existing landfill and near the top of the ridgeline, which will impact our Kahe Power Plant as follows: (i) airborne debris from wind gusts will carry over the ridge and come down on HECO's 138kV Switching Station and other plant facilities; and (ii) the bird population may grow and result in increased nesting and littering problems within the plant facilities.		We acknowledge your comment and will address these concerns in the Final EIS. In general, the control of windblown litter will continue to be addressed as provided in Section 4.2.3. Environmental Controls, subsections on Litter and Cover Soil, in the FEIS. The control of birds will also continue to be provided by promoting the immediate covering of odorous waste with soil cover to discourage foraging. While current efforts have been effective it is recognized that continued diligence will be necessary to maintain the safety of the Kahe Power Plant facility.
21.4	Construction & Maintenance (Paul Nakagawa, 543-7062). We will need continued access to our facilities for maintenance purposes, as covered by our existing easement(s). Should relocation or additional facilities be required, a formal request should be submitted and coordinated through appropriate HECO department(s).		We acknowledge the existing easements and need for access for maintenance purposes. Should any future relocation or additional facilities be required a formal request will be submitted to the appropriate HECO departments by the City or operator.

Section 2
Project Background

2.1. Project Background

The Waimānalo Gulch Sanitary Landfill (WGSL) is an essential and necessary City & County of Honolulu facility that provides municipal and solid waste disposal for all the communities of O‘ahu. Refuse that is disposed of at the landfill includes Municipal Solid Waste (MSW); recycling residue; and, Honolulu Program of Waste Energy Recovery (H-POWER) ash and residue. The landfill has been in operation since 1989 and has capacity remaining with the unused 92.5 acres of the approximately 200 acre site for an estimated minimum life of approximately 15 years[1]. This period of use is expected to increase as the City's recycling efforts and use of proven alternative technologies divert more materials from landfill disposal. However, even with the present adoption of new technology based solutions and increased use of recycling, WGSL will remain a vital and key part of the City's waste management system.

The proposed project to expand the use of the Waimānalo Gulch Sanitary Landfill will extend the use of the site beyond November 1, 2009[2], the date after which the amended State Special Use Permit prohibits its further acceptance of solid waste.

This section provides the background of the project including the events that have influenced and affected the City's determination that an extension of use of the site for landfilling is required. A summary of the current situation, compliance violations, historical background of the State Special Use Permit, future City plans for refuse management, and prior Chapter 343, HRS, documents filed for WGSL are provided.

---

[1] Based on no unforeseen circumstances including natural or other disasters that would require disposal of clean up or recovery related debris. In such an event space at the landfill could be exhausted sooner.

[2] In March 2008, the State Land Use Commission approved the extension of time for the State Special Use Permit extending the use of the current area of landfilling from May 1, 2008 to November 1, 2009.

2.2. Events Affecting the Decision to Expand Waimānalo Gulch

On ~~December 24, 2002~~ January 10, 2003, the Final Supplemental EIS (FSEIS) for a 14.9 acre expansion of the Waimānalo Gulch Sanitary Landfill was ~~approved~~ accepted. The FSEIS supported the expansion of the site from 86.5 acres to 101.4 acres. The final landfilling of the last cell was planned to be completed at the end of 5 years based on statements of the prior city administration, from the initial use of the expansion area to accept waste.

On June 9, 2003, a State Special Use Permit (SUP) application for the expansion area was approved. The SUP application identified the specific area requirement at 21 acres which included the space needed for excavation, storage and stockpiling of daily cover material, and other earthwork necessary to support the landfill. The total expansion area was adjusted to 107.5 acres, and the SUP required that on May 1, 2008, that the landfill would be restricted from accepting any further waste material and be closed in accordance with an approved closure plan[3].

Since the filing of the 21 acre expansion was approved in June 2003, the City filed an SUP Amendment requesting an extension of time for use of the site beyond the May 1, 2008 date. A major reason for the request was the capacity remaining within the 21 acres that could still be used for landfilling. In March 2008, the SUP Extension was approved with a new termination date of November 1, 2009.

Four important events have occurred since approval of the FSEIS and the 2003 SUP ~~Extension~~ Amendment that are relevant to the background of this EIS. Difficult issues were addressed by several important elected and appointed officials regarding Oahu's need and requirement for a landfill. These events, however, also point to the difficulty

---

[3] Docket No. SP87-362, Decision and Order Approving Amendment to Special Use Permit For An Amendment to the Special Use Permit Which Established a Sanitary Landfill on Approximately 86.5 Acres of Land Within the State Land Use Agricultural District at Waimānalo Gulch, Hono‘uli‘uli, Ewa, Oahu, Hawai‘i, TMK No. 9-2-3: Portion 72 and Portion 73 (fka TMK No.: 9-2-3: Portion 2 and Portion 13), June 9, 2003.

and infeasibility of selecting a new landfill site to meet the condition of the SUP Amendment and the honoring of the commitment by the prior administration that the site would be closed in 2008. These events include the proceedings of the Mayor's Advisory Committee on Landfill Site Selection; Council Resolution 04-348; Council Bill 037; and the issuance of two separate notices of violation from the State Department of Health (DOH) and the U.S. Environmental Protection Agency (EPA) over landfill operations at the WGSL.

2.2.1. The Mayor's Advisory Committee on Landfill Site Selection

A Mayor's Advisory Committee (Committee) was formed by the previous City administration to comply with Condition No. 1 of the SUP that required that the Committee recommend a new landfill site to the City Council by December 1, 2003.

The Committee was comprised of 15 members selected by the prior mayor from various communities on O‘ahu. The Committee deliberated between June and December 1, 2003.

A major concern of the Committee during its deliberations involved the prior City administration’s commitment to close the existing Waimānalo Gulch Sanitary Landfill in five years, or by 2008, without regard to the fact that it had remaining capacity. The Committee chose to consider a possible expansion of Waimānalo Gulch in its deliberations. The Committee developed and used a double blind methodology to consider its ranking of the potential sites. This methodology meant that the Committee members were not aware of the identity of the sites being ranked and the consultant also was not allowed to see the identity of the sites as they applied the weighted criteria adopted by the Committee. The result of this process was that the Waimānalo Gulch Expansion was identified as the highest ranked site. This led to a division in the Committee which resulted in the decision-making process being changed from a consensus to a voting basis. This led to the resignation of four of the members of the Committee and a change in the decision making process to decision making by vote. With the resignation of four of the members of the Committee, the Waimānalo Gulch site was unanimously removed from the list of sites under consideration. The final action of the Committee was concluded with the delivery of its report to the City Council on December 1, 2003.[4]

The final Committee recommendation included four potential landfill sites and other recommendations for future consideration by the City and Council. The four sites were: Ameron Quarry; Māʻili Quarry; Makaiwa Gulch; and Nānākuli B. Other Committee recommendations were that: (1) the City Administration and City Council should not zone or permit any site unless a Host Community Benefits package is negotiated with the affected community where a landfill is sited; and, (2) the City is encouraged to land bank sites to reduce the potential for future land use conflicts when another landfill is needed.

2.2.2. Council Resolution 04-348, CD1, FD1, Selecting a Site for a New City Landfill

On December 1, 2004, Resolution 04-348, CD1, FD1, calling for the selection of the Waimānalo Gulch Landfill as the new landfill site was adopted by the City Council. The purpose of the resolution was to address a requirement of the approved SUP Amendment calling for the Council to render a decision on the selection of a new landfill site by December 1, 2004[5].

In preparing for the resolution, the Council's Committee on Public Works and Economic Development (PWED) submitted its <u>Summary Report on its Findings During its Landfill Site Selection Process</u>, November 16, 2004. Potential landfill sites reviewed included Ameron Quarry; Māʻili Quarry; Makaiwa Gulch; Nānākuli B; and Waimānalo Gulch. Information concerning these sites was obtained from the Department of Environmental Services (ENV), the Mayor's Advisory Committee Report, landowners and lessees, other departments and agencies, and the public. As a part of its deliberations the PWED

---

[4] Report of the Mayor's Advisory Committee (Blue Ribbon Committee) on Landfill Site Selection, December 1, 2003, City & County of Honolulu, Prepared by the Committee's Report Subcommittee, Pacific Waste Consulting Group and R.M. Towill Corporation.

[5] On April 1, 2004, the LUC approved an amendment to extend the deadline for the City Council to select a new landfill site from June 1, 2004 to December 1, 2004.

Committee held two public meetings, one in Windward and one in Leeward Oahu, attended by well over a hundred concerned citizens.

The Summary Report did not include recommendations for a specific site, but provided background information for the PWED Committee and Council. It noted that regardless of which site was selected that it would have to go through the EIS process and comply with all Federal and State landfill siting requirements. Environmental concerns raised at that time would need to be addressed during the EIS process.

The notes to the Summary Report indicated that originally,

> *"Waimanalo Gulch was not included as a recommended site in the final report of the Mayor's Blue Ribbon Committee on Landfill Site Selection. The Office of Information Practices then ruled that this final report was void due to violations of the sunshine law which occurred when the Waimanalo Gulch was taken off the recommended list. The PWED Committee, out of respect for the OIP's decision and in order to preserve the open process had included the Waimanalo Gulch as one of the options available for the next landfill site."*

The Summary Report and Council Resolution 04-348, CD1, FD1, adopted following the Report, noted that while the Council must select a landfill site, it recognizes there are promising new methods and processes to reduce the amount of municipal solid waste going into a landfill. The Council resolved that,

> *"…the city must employ sustainability concepts in the handling of its municipal solid waste so that the maximum recyclable materials, energy and alternative products are extracted before any waste is placed in our landfills; and", "…that the council will work with the incoming mayor and his administration to devote all available resources to ensuring the maximum use of recycling and the development of alternative technologies for disposal of municipal solid waste with the intention to effectively eliminate, to the extent possible, the need for a landfill by 2008;" and,*

> *"… in accordance with the conditions set forth by the state land use commission, that the Waimanalo Gulch site is selected as the site for the city's landfill because:*
>
> *(1) The site currently has over 15 years capacity left with further expansion, and this capacity can be further extended should the city be successful in reducing the amount of waste currently entering the landfill through recycling and the use of new technologies;*
>
> *(2) The city already owns the property and the infrastructure is already in place, making the site the most economical and least expensive to develop and maintain as a landfill;*
>
> *(3) Other sites will require a large capital outlay by the city to acquire the land through condemnation and to develop and construct the site and required supporting infrastructure;*
>
> *(4) A landfill management contract is already in place for 15 years;*
>
> *(5) This is the only site where the costs and revenues for a landfill are known factors; and*
>
> *(6) The current landfill operator is committed to implementing necessary improvements to landfill operations to address community concerns regarding visual impact, odors, airborne waste, litter and dust control;"*

The resolution concluded with a request that the City Administration immediately contact the Planning Commission, the State DOH, and the LUC to satisfy any necessary requirements for the use of the selected landfill site; and, the transmittal of the resolution to the State LUC, DOH, the Mayor, the Managing Director, ENV, and the City Planning Commission.

2.2.3. Mayor's Message 037, Calling for a Veto of Bill 37 (2005), CD2

Council Bill 37 (2005), CD2, was prepared by the City Council to address solid waste and ensure compliance with (1) the provisions of Chapter 342G, HRS, relating to solid waste, and (2) the previously approved SUP permit for the use of Waimānalo Gulch Sanitary Landfill until May 1, 2008. The bill passed the third reading of the Council on February 15, 2006. In particular, the Bill 37 provisions noted,

> *"SECTION 2. Section 9-1.1 ("Findings—Determinations—Goals"), Revised Ordinances of Honolulu 1990, is amended by amending subsection (a) to read as follows:*
>
> *(a) The council of the City and County of Honolulu (the "city") makes the findings and determinations set forth in this section:*
> *(7) Waimanalo Gulch Landfill.*
> *(A) After May 1, 2007, it is in the best interests of the city and its residents to permit the disposal into the Waimanalo Gulch landfill of only: (i) processed solid waste; (ii) any other material of a nonhazardous nature that cannot be converted into processed solid waste solely because such a conversion method does not exist; and (iii) any non-hazardous material that must be disposed of to protect the health and safety of the public due to an emergency or disaster declared by the council. After May 1, 2008, it is in the best interests of the city to comply with the state land use commission's special use permit granted to the city, the terms and conditions of which require that no additional waste be deposited at that facility and that the facility be closed in accordance with an approved closure plan.*
>
> *(B) In addition to facilitating the city's compliance with its special use permit granted by the state land use commission, the disposal parameters established in paragraph (A) are needed to: (i) eliminate litter, odor, and vector problems in*

> *the area surrounding the landfill caused by the disposal at the landfill of refuse and other types of municipal solid waste: (ii) alleviate the aesthetics problem to some degree; and (iii) set the city on the path towards: (aa) operating and maintaining disposal facilities capable of reducing the volume and complexity of refuse and other solid waste prior to landfill disposal; (bb) intensifying the effort to recycle or reuse solid waste that cannot be combusted, gasified, or vitrified: and (cc) exploring other means to address solid waste disposal."*

And,

> *"SECTION 4. Section 9-1.7, Revised Ordinances of Honolulu 1990, is amended to read as follows:*
>
> *Sec. 9-1.7 Acceptable and nonacceptable refuse and other solid waste at disposal facilities.*
>
> *(g) After May 1, 2007, the director shall permit the disposal into the Waimanalo Gulch landfill of only:*
> *(1) Processed solid waste;*
> *(2) Any other material of a non-hazardous nature that cannot be converted to processed solid waste solely because such a conversion method does not exist: and*
> *(3) Any non-hazardous material that must be disposed of to protect the health and safety of the public due to an emergency or disaster declared by the council.*
>
> *Material produced from the recycling or processing of refuse or other solid waste may be used to cover processed and other solid waste disposed of at the landfill.*
>
> *(h) After May 1, 2008, the Waimanalo Gulch landfill shall be closed."*

Section 5 of the Bill further directed the City to submit to the Council by December 31, 2006, its plan to comply with the ordinance and noted that at a minimum, the City administration shall include in the plan the strategies for and costs of compliance.

On February 28, 2006, the Mayor having reviewed and evaluated the contents of Bill 37, vetoed it citing that it would "cripple" the City's ability to responsibly carry out its municipal solid waste obligations since the expiration of the SUP permit would mean that the City could no longer legally use the Waimānalo Gulch landfill. Mayor's Message No. 037, dated February 28, 2006, noted:

> *"…given the indisputable facts that (1) the City cannot have a new landfill in operation by May 1,2008, and (2) for the foreseeable future, the City needs a landfill on island,[6] the Bill's requirement that the Waimanalo Gulch landfill be closed after that date exposes the City to an untenable choice in 2008 between (1) continued illegal operation of the landfill, thereby subjecting the City to possible regulatory fines, injunctions, and other lawsuits, or (2) the cessation of any landfill activity, which will mean no collection of municipal solid waste, island-wide. Neither alternative is acceptable to me, nor to you and your constituents. As such, Bill 37, C.D. 2, cannot be allowed to become law."*

And,

> *"…even if a new landfill site is selected this year, the reality of our current situation is that the City will not be able to cease use of the Waimanalo Gulch landfill by May 1, 2008. The planning, permitting and construction of an alternate landfill location will take longer than the two years remaining before that deadline. Other alternatives such as shipping off-island or new technologies have many issues, familiar to the Council, which will not be resolved before May 1, 2008. However reluctantly, the City must therefore seek to extend the permits for operating the Waimanalo Gulch landfill in any event. If Bill 37, C.D. 2, becomes*

---

[6] "We are not aware of any company that has obtained USDA approval to ship waste off-island, nor are we aware of any technology that can eliminate our solid waste without residue that needs disposal." Mayor's Message No. 037, February 28, 2006.

> *law, please understand that the City would be prohibited by its own law from pursuing regulatory approvals to operate the Waimanalo Gulch landfill beyond 2008, even for extensions of a limited duration or scope. Consequently, we will be further hampered in our efforts to resolve this difficult and long-standing matter."*

Mayor's Message No. 037 identified a number of actions taken to address and improve management of the solid waste all of Oahu's citizens and visitors produce, including the search for an alternative site for a new landfill.

> *"In addition to all these efforts, I was personally committed to reexamining the city's options for locating a new municipal landfill to ensure that no viable alternative sites had been overlooked. In both the final report of the Mayor's Blue Ribbon Panel in 2003 and the 2004 updated Solid Waste Integrated Management Plan, five of the eight final sites evaluated were on the Waianae Coast. I have consistently stated that it is patently unfair for the Leeward Coast to be the sole repository for the island's opala.*
>
> *…we reexamined all the potential landfill sites on this island, trying to determine if there were realistic options elsewhere on Oahu. We looked at Kapaa Quarry on the Windward side, and had discussions with Ameron, which operates the quarry there. We looked at Poamoho Gulch on the North Shore. We looked hard at all the possible sites that would enable the City to relocate its municipal landfill operations and thereby bring a measure of fairness to the Leeward Coast. Ultimately, none of those sites was without serious impediments.*
>
> *Regrettably, we are compelled to reaffirm the conclusion reached by the Council in Resolution No. 04-348, C.D. 1, F.D. 1, that the Waimanalo Gulch landfill is the most viable, least expensive alternative for the citizens of Honolulu beyond May 2008."*

In closing, the message noted that while a landfill is of vital necessity on Oahu, that a reduction of this dependency requires the efforts of both the City and the Council.

> *"It is clear that reducing the need for a landfill remains a goal of my Administration and the Council, but we will need your cooperation to advance that goal. I ask your cooperation in working with my Administration to deal with the solid waste disposal challenge in a constructive manner for the benefit of all our constituents."*

The content of Mayor's Message 037 established the reason for the veto of Council Bill 37, and the selection of Waimānalo Gulch. However, the events involving the Mayor's Advisory Committee, Council Resolution 04-348, and the veto, do not obviate the requirements of Hawai‘i's Environmental Impact Statement law and regulation, Chapter 343, Hawai‘i Revised Statutes (HRS), and Chapter 11-200, Hawai‘i Administrative Rules (HAR). The preparation and filing of the subject EIS is intended to address these requirements.

2.3. Environmental Compliance Violations

Notices of violation over the operation of the WGSL were issued by the State DOH on January 31, 2006, and the U.S. Environmental Protection Agency (EPA) on April 4, 2006. <u>While it is acknowledged that this occurred because of delays in implementing the required regulatory controls, procedures were in place to ensure proper notification to the State DOH and EPA regarding the operational performance of the landfill. At no time was the public at any risk due to this delay in implementation.</u>

The following provides a summary of the DOH and EPA notices and current efforts that are underway to address the notices.

2.3.1 State Department of Health

The DOH NOV and Order, Docket No. 05-SHW-SWS-004, cited eighteen alleged violations of state law pursuant to Hawai‘i Revised Statutes (HRS), Section 342H-7, and Hawaii Administrative Rules (HAR), Chapter 11-58.1, Solid Waste Management Control Rules (**Appendix A**). The following is a summary of the eighteen counts:

Count I - Exceedance of permitted grades
Count II - Failure to submit annual operating reports in a timely manner
Count III - Failure to place daily cover on the active face of MSW landfill
Count IV - Failure to place intermediate cover material on the ash monofil
Count V - Exceedance of leachate head on the liner in ash monofill
Count VI - Exceedance of leachate head on liner in MSW Cell E-1 sump
Count VII - Failure to measure leachate levels and to maintain records on leachate levels in cell 4B sump
Count VIII - Failure to measure leachate levels and to maintain records on leachate levels in the ash monofill sump
Count IX - Failure to notify DOH of noncompliance on equipment blockage in MSW Cell 4-B leachate lateral line and inability to measure leachate levels
Count X - Failure to notify DOH on noncompliance in a timely manner on the exceedances of permit grades and submission of the annual operating reports
Count XI - Unauthorized storage of material on the ash monfil
Count XII - Failure to manage and ban the acceptance of special waste
Count XIII - Failure to maintain records and record location of asbestos disposal at the landfill
Count XIV - Failure to cover a dead animal
Count XV - Failure to submit annual surface water management plan
Count XVI - Failure to control the generation of dust from vehicular traffic
Count XVII -Failure to minimize free litter generation in the landfill
Count XVIII - Failure to monitor explosive gases and maintain monitoring records

Of the eighteen counts in the NOV, sixteen were already corrected when the NOV was issued. One of the other two counts (Count VII, failure to measure and maintain records of leachate levels in one sump due to a blockage caused by broken equipment) was resolved through final installation of the required equipment on September 27, 2007.

The remaining count (Count I, exceedance of permitted grades) was addressed through the submission of an application to the DOH for a permit modification to increase the maximum final grades of the ash monofill. The application was submitted in February 2006 and a draft solid waste management permit, authorizing an increase in the height of the ash monofill up to 275 feet above msl, was issued by the DOH in November 2007 with input from WMH and the City. Public comments were solicited and a public hearing on the draft permit modification was held on December 11, 2007. ~~The permit modification was approved by the DOH.~~ After extensive review and a stability analysis, the grade modification was approved by the DOH on February 20, 2008.

On December 7, 2007, WMH, the City and DOH signed a settlement agreement which fully and finally settled all issues arising from and related to the NOV. The settlement agreement mandates corrective actions and new compliance requirements regarding:

1. screening of waste
2. groundwater and leachate monitoring
3. daily cover
4. weekly cover
5. cover of inactive ash and MSW areas
6. leachate collection sump and discharge riser
7. removal of leachate from the landfill
8. grade survey control markers
9. an asbestos management and disposal plan
10. perimeter gas monitoring

In addition, the settlement agreement requires either the (a) payment of $1.5 million in cash to the DOH, or (b) payment of $520,000 in cash to DOH, a contribution of $637,500 to a supplemental environment project fund to benefit the Leeward Coast or other areas on Oahu, and construction of a community solid waste/recyclable drop-off center near the WGSL scale house costing at least $450,000. The settlement agreement concludes the DOH NOV and the associated contested case which was dismissed.

As a result of the NOV and new regulations and requirements, additional provisions have been included in the revised landfill solid waste operating permit. The DOH has greatly increased the frequency of site inspections and review of the required operating documents submitted for the project. For example, a ground survey is performed on a bi-monthly basis to compare existing grades with approved grades. DOH enforces these provisions and determines the frequency of its inspections.

City ENV staff is in constant contact with WMH to address issues that may arise on a daily basis. City staff initially screens the refuse when refuse delivery vehicles arrive at the WGSL scale house. WMH does further screening as the waste is disposed of at the working face of the landfill. The City co-authors or receives copies of all reports submitted to the DOH.

2.3.2. U. S. Environmental Protection Agency

On April 5, 2006, the EPA announced by press release that Waste Management of Hawaiʻi, Inc. (WMA) and the City & County of Honolulu (CCH) were alleged to have violated certain provisions of the Clean Air Act at the WGSL. A summary of the violations indicated the following (**Appendix B**) (EPA Press Release, April 5, 2006, Letter from U. S. EPA, Region IX, and Finding and Notice of Violation, Docket No. R6-06-06):

> *Finding of Violation*
>
> *8. The Waimanalo Gulch Landfill is owned by CCH and operated by WMH,*
>
> *9. The Waimanalo Gulch Landfill commenced modification after May 30, 1991.*
>
> *10. Beginning March 12, 1996, the landfill became subject to NSPS Subpart WWW.*

11. On March 12, l996, the Landfill had a design capacity < 2.5 million megagrams (Mg) and 2.5 million cubic yards (m^3).

12. On June 9, 1996, WMH submitted an Initial Design Capacity Report and Initial NMOC [non methane organic compounds] Emission Rate Report (collectively, "Initial Report") for the Landfill to EPA pursuant to 40 C.F.R. §§ 60.757 (a)(1), 60.757(a)(2) and 60.757 (b).

13. The Initial Report for the Landfill, submitted by WMH to EPA on June 9, 1996, is the first report in which the Landfill had an NMOC emission rate > 50 Mg/yr.

14. WMH or CCH was required to either submit a design plan to EPA within 1 year of June 9, 1996, or by June 9, 1997, or perform Tier 2 measurements that show NMOC emissions < 50 Mg/yr and report such results to EPA by December 19, 1996.

15. WMH and CCH failed to submit a design plan to EPA by June 9, 1997.

16. WMH and CCH failed to submit Tier 2 results to EPA by December 9, 1996.

17. WMH and CCH violated Section 111 of the Act, 40 C.F.R. §§ 60.752 (b)(2)(i) and 60.752 (c) by failing to submit a design plan to EPA by June 9, 1997 or submit Tier 2 recalculations to EPA by December 9, 1996.

18. WMH or CCH was required to install a GCCS [gas collection and control system] for the Landfill within 30 months of June 1996, or by December 9, 1998.

19. WMH and CCH failed to install a GCCS for the Landfill by December 9, 1998.

20. WMH and CCH violated Section 111 of the Act and 40 C.F.R. §§ 60.752(b)(2)(ii) by failing to install a GCCS for the Landfill by December 9, 1998.

21. On August 1, 2005, full operation of a GCCS for the Landfill began. However, the GCCS has not complied with, and does not comply with, the design and operation requirements of 40 C.F.R. § 60.752(b)(2). Therefore, WMH and CCH have been in violation, and are considered to be in violation, until WMH and/or CCH establishes continuous compliance with 40 C.F.R. § 60.752(b)(2).

Enforcement

22. Section 113(a)(3) of the Act provides that whenever EPA finds that any person has violated, or is in violation of, any requirement or prohibition of, inter alia, subchapter I or V of the Act, including, but not limited to, any requirement or prohibition of any rule promulgated under Sections 111 or 502 of the Act, EPA may,

> - *issue an administrative penalty order pursuant to Section 113(d) for civil administrative penalties up to $32,500 per day of violation, or*
> - *issue an order requiring such person to comply with such requirement or prohibition, or*
> - *bring a civil action pursuant to Section 113(b) for injunctive relief and/or civil penalties of not more than $32,500 per day for each violation.*
>
> *42 U.S.C. § 7413(a)(3), as amended by Pub. L. 104-134.*
>
> *Furthermore, for any person who knowingly violates a requirement or prohibition of Sections 111 or 502 of the Act, Section 113(c) provides for criminal penalties or imprisonment, or both. In addition, under Section 306(a), the regulations promulgated thereunder (40 C.F.R. Part 32), and Executive Order 11738, facilities to be used in federal contracts, grants, and loans must be in full compliance with the Act and all regulations promulgated pursuant to it. Violation of the Act may result in the subject facility being declared ineligible for participation in any federal contract, grant, or loan.*

WMH and the City have been working closely with the EPA to resolve the EPA NOV, which resulted from self-reporting of the late installation of a landfill gas collection and control system (installed and operational by November 2005). That system is already in full operation at the landfill, and discussions with the EPA have focused on resolving the monetary fines and a final agreement on a plan to address elevated underground temperatures at the landfill, which are higher than normally expected, but which are not indicative of underground combustion conditions (i.e., fire).

Waste Management continues to monitor and evaluate the potential causes of the elevated gas temperatures and has provided documentation to EPA and DOH to demonstrate that the Landfill can be safely operated at these higher temperatures. Waste Management will continue to coordinate appropriate measures to maintain compliance with all regulations as required by law.

2.4. Summary of Current Status

The situation involving the issuance of the NOVs by the DOH (now resolved and settled) and EPA (resolution pending further discussion) have resulted in efforts by the City and WMH to address the concerns raised and to implement improved management reporting procedures to prevent a similar situation from recurring.

To evaluate operations performance, the City hired a third-party engineering consultant to evaluate landfill operations. They concluded that WMH was performing at a satisfactory level. WMH has also contracted with another third-party engineering consultant to evaluate the effect landfill operations may have on neighboring areas and has shared data with the City. The City’s staff meets weekly with WMH staff to discuss landfill operations. In addition, the City’s Refuse Disposal Engineer is in daily contact with WMH’s General Manager regarding operations at WGSL.

The situation involving the continuing need for landfill space since the veto of Council Bill 37, however, has not changed. The present effort by the City to maximize landfilling space that is remaining within the existing permitted WGSL area is anticipated to extend the usable life of the site by approximately one to two years. While this provides for more efficient use of the site, this capacity will eventually become exhausted.

The shortage of space for the disposal of MSW and ash will be addressed by the City by use of the approximately 92.5 acres of the property that remain unused. The potential capacity of this area is expected to allow for a site life of not less than approximately 15 years based on current rates of waste disposal at approximately 1,400 tons per day. This addition of space will be used for the benefit of all the communities of the island of O‘ahu.

The planned expansion of the landfill will not be considered alone by the City. The City will continue to utilize all feasible alternative technologies to landfilling, adopt recycling/reuse programs, and use of waste transshipment to support extending the useful life of the site. However, while it is possible to extend the life of the lateral expansion of the landfill, it is not possible to entirely eliminate the need for a municipal sanitary landfill. Factors that will continue to influence the complete elimination of the landfill include: (1) the need for a site capable of accepting the disposal of emergency debris generated as a result of a natural or man-induced disaster, e.g., hurricane, tsunami, major industrial or public works accident, or act of terrorism; and (2) there are no alternative waste disposal technologies which do not themselves result in the generation of residual material that cannot be further recycled, reused, or otherwise recovered for other purposes. For these types of waste generated in the City & County of Honolulu a municipal sanitary landfill remains the most viable option for disposal.

2.5. Historical Background of the State Special Use Permit

A. 1987 - Special Permit for the establishment of WGSL granted.

On October 17, 1985, the Director of Land Utilization, City & County of Honolulu (now known as DPP), accepted the Final Revised EIS which discussed probable adverse environmental effects and proposed mitigation measures for the establishment of a landfill at Waimānalo Gulch, Honouliuli, 'Ewa, O'ahu, Hawai'i.

On February 4, 1987, the Planning Commission approved the SUP application to establish WGSL on approximately 60.5 acres of land within the Agricultural District, subject to six conditions. The application was submitted by the Department of Public Works, City & County of Honolulu (now known as the Department of Environmental Services [ENV]).

Because the SUP was for land greater than fifteen acres, on April 20, 1987, the LUC also approved the issuance of the SUP to establish WGSL.

B. 1989 - Amendment to SUP to expand WGSL by 26 acres granted.

On July 26, 1989, the Planning Commission approved an amendment to the SUP to expand WGSL by 26 acres. The amendment had been requested because 26 acres had been inadvertently left out of the original SUP. The additional 26 acres was necessary to allow enough land area for the proposed administration building, weighing station, drainage structures and access roads.

On October 31, 1989, the LUC also approved the SUP amendment to expand the existing approved area by 26 acres.

C. 2003 - Amendment to SUP to expand WGSL by 21 acres granted.

On January 10, 2003, the Department of Planning and Permitting accepted the Final Supplemental EIS (FSEIS), which covered a proposed 21-acre expansion of WGSL.

On March 13, 2003, the Planning Commission granted ENV’s application to expand WGSL by 21 acres, which, at that time, was projected to extend the life of WGSL by 5 years. The proposed expansion included four cells for disposing MSW (E1 through E4), berms, detention and silting basins, drainage channels and access routes. In its Findings of Fact, Conclusions, and Decision dated March 13, 2003 (the "2003 Planning Commission Decision"), the Planning Commission recommended that ENV submit an alternate landfill site, or sites, to the City Council by December 31, 2003. The Planning Commission did not, however, condition its approval on this recommendation.

With its approval of the 21-acre expansion, the Planning Commission imposed two additional conditions. One of the conditions, Condition No. 10, required ENV to stop accepting waste material within 5 years from the date of the SUP amendment approval or the date of the Solid Waste

Management Permit approval, whichever occurred later, but not beyond May 1, 2008.

On June 9, 2003, the LUC issued its Decision and Order Approving Amendment to Special Use Permit (the "2003 LUC Decision"). The 2003 LUC Decision adopted Condition No. 10 of the 2003 Planning Commission Decision as Condition No. 12 of the 2003 LUC Decision:

"Within 5 years from the date of this Special Use Permit Amendment approval or date of the Solid Waste Management Permit approval for this expansion, whichever occurs later but not beyond May 1, 2008, the 200-acre property shall be restricted from accepting any additional waste material and be closed in accordance with an approved closure plan."

Because the LUC issued its 2003 LUC Decision on June 9, 2003, and Solid Waste Management Permit approval (permit renewal No. LF-0054-02) was issued on May 15, 2003, the SUP Permit was set to expire on May 1, 2008.

The LUC also imposed Condition No. 1, among others, requiring the City and County of Honolulu to select a new landfill site by June 1, 2004, or the SUP would immediately expire on that date.

D. Extension of Deadline to Select a New Landfill from June 1, 2004, to December 1, 2004.

On March 25, 2004, ENV filed a Motion to Amend and/or Stay the 2003 LUC Decision. ENV requested (1) an extension of the deadline to select a new landfill site from June 1, 2004 to December 1, 2004 (i.e., an amendment to Condition No. 1 of the 2003 LUC Decision); and (2) clarification from the LUC as to whether WGSL could be considered by the City Council as one of the available landfill sites.

By Order dated May 10, 2004, the LUC granted ENV's Motion in part. The Commission granted the extension of the deadline to select a new landfill site from June 1, 2004 to December 1, 2004, subject to the condition that the City Council submit monthly progress reports to the LUC to include, among other things, updates on the City's efforts to select a new landfill site and to find alternative technologies to reduce or eliminate landfilling.

The LUC did not, however, issue a decision as to whether the WGSL could be considered by the City Council as one of the available landfill sites because such matter "was not within the jurisdiction of [the LUC]." All other conditions of the SUP remained in effect, including Condition No. 12 which required WGSL to stop accepting waste by May 1, 2008.

E. December 2004 - Resolution Adopted by City Council Selecting WGSL as its future landfill site.

On December 1, 2004, the City Council selected WGSL as its future landfill site.

F. 2008 - Extension of Waste Acceptance Deadline to November 1, 2010.

On July 6, 2007, ENV filed an application with DPP to amend Condition No. 10 of the 2003 Planning Commission Decision and Condition No. 12 of the 2003 LUC Decision, by extending the deadline to accept waste at WGSL from May 1, 2008, to May 1, 2010, or until WGSL reaches its permitted capacity, whichever occurred first (the “Application”).

Colleen Hanabusa, Esquire, and Ko Olina Community Association (KOCA) filed petitions to intervene. On November 14, 2007, the Planning Commission held a public hearing at the Mission Memorial Auditorium, City Hall Annex, in Honolulu, Hawai‘i. The Planning Commission granted both requests to intervene. The Planning Commission subsequently closed the public hearing and scheduled the matter for a contested case hearing.

On December 7, 2007, the Planning Commission conducted a contested case hearing on the Application at Kapolei Hale, Conference Rooms A and B, in Kapolei, Hawaiʻi. On January 16, 2008, the Planning Commission granted ENV's Application to amend Condition No. 10 of the 2003 Planning Commission Decision to extend the waste acceptance deadline by two years, or until WGSL reaches its permitted capacity, and issued its Findings of Fact, Conclusions of Law, and Decision and Order (the "2008 Planning Commission Decision"). The Planning Commission recommended that the LUC similarly amend Condition No. 12 of the 2003 LUC Decision.

On January 31, 2008, the LUC received the 2008 Planning Commission Decision and complete record of the Planning Commission's proceedings on the Application. On February 21, 2008, the LUC met to consider the Application. Following the receipt of public testimony, the LUC deferred the matter to its March 6, 2008 meeting. On March 6, 2008, the LUC resumed its meeting on the Application, and recognized Colleen Hanabusa and KOCA as intervenors in the LUC's proceeding based on their intervenor status before the Planning Commission.

On March 7, 2008, the LUC resumed its meeting on the Application. At that meeting, the LUC adopted the Planning Commission's recommendation with an amendment to waste acceptance deadline from May 1, 2010, to November 1, 2009, with an additional condition requiring ENV to report to the LUC every six months on the actions taken to alleviate further use of WGSL. The LUC issued its Findings of Fact, Conclusions of Law, and Decision and Order adopting with Modifications, the City and County of Honolulu Planning Commission's Recommendation to Approve Amendment to Special Use Permit (the "2008 LUC Decision") on March 14, 2008.

Thus, Condition No. 12 of the SUP now reads as follows:

"The 200-acre Property shall be restricted from accepting any additional waste material and be closed in accordance with an approved closure plan by November 1, 2009, or until the approved area reaches its permitted capacity, whichever occurs first."

G. Appeals by Intervenors

On February 12, 2008, Colleen Hanabusa and KOCA (collectively, “Intervenors”) filed a Notice of Appeal to Circuit Court, appealing the 2008 Planning Commission Decision. See Ko Olina Community Association v. Planning Commission, Circuit Court of the First Judicial Circuit, State of Hawaii, Civil No. 08-1-0313 (Agency Appeal). On February 15, 2008, Intervenors filed an Amended Notice of Appeal to Circuit Court, naming the Planning Commission, ENV and DPP as Appellees.

On April 10, 2008, Intervenors filed a Notice of Appeal to Circuit Court, appealing the 2008 LUC Decision. See Ko Olina Community Association v. Land Use Commission, Circuit Court of the First Judicial Circuit, State of Hawaii, Civil No. 08-1-0727 (Agency Appeal). Intervenors named ENV and the LUC as Appellees.

The two appeals were consolidated on June 25, 2008. On October 1, 2008, the Circuit Court heard oral argument from the parties on the consolidated appeals. On October 3, 2008, the court entered its order affirming the LUC’s decision in Civil No. 08-1-0727-04, and dismissing as preliminary and not appealable the Planning Commission’s decision in Civil No. 08-1-0313-02, but maintaining the consolidated appeals and records on appeal. On October 7, 2008, the court entered an amended order correcting two internally inconsistent errors in its October 1, 2008 order. Final judgment had not been entered as of October 8, 2008.

2.6. City Plans Involving the Future Handling of Solid Waste

Policy guidance on the future management of Oʻahu's solid waste for the period beyond the projected life of the WGSL is provided in the City's Integrated Solid Waste Management Plan, which is presently under preparation by R. W. Beck. The schedule for completion of this plan is in early 2009, when it will be reviewed for adoption by the Honolulu City Council. A draft working copy of the plan has identified a number of strategies over the next five year period to help guide solid waste management and development activities (R. W. Beck, 2008). The final plan will identify the City's initiatives for a longer projected period of 20 or more years.

The current status involving the H-POWER expansion and the proposed use of transshipment are included as provided by Pacific Waste Consulting Group, Inc. (PWCG, 2008).

2.6.1. Transfer Stations

The City has completed an evaluation of its transfer stations to identify how current operations could be improved and what would be required to meet future needs at each of the facilities. Between 2009 and 2011, the Keehi, Kawailoa, and Kapaʻa Transfer Stations will be modified to accommodate facility and maintenance upgrades. (R.W. Beck, 2008).

Keehi Transfer Station – In 2009, the City will assess whether to convert this transfer station to a top loading facility. Other planned projects at the Keehi Transfer Station include fuel station renovations which will install an automated electronic card reader system and relocating of the existing fuel station to enable fueling on both sides of the pump. The project is scheduled to be completed by 2010.

Kawailoa Transfer Station – When the next modification of the solid waste permit application is submitted in 2010, the City will consider requesting an increase in the permitted capacity for the transfer station to address anticipated growth on the part of the island served by this transfer station.

The planned site improvements will include paved parking, staging, and circulation areas; an extended tipping area with a new green waste receiving bay; a mulch distribution area; new water main; new sewer main; and a new operations building. The 330-square-foot operations building will consist of an office, a restroom, equipment storage, and circulation space. The upgraded transfer station will receive and transfer green waste separately. The primary traffic pattern will not change at the improved facility. The present mulch distribution area is located at the rear of the site and is not easily accessible to residents. The upgraded mulch distribution area will positively change the traffic pattern for residents picking up mulch at the site. The project is scheduled to be completed by 2011.

Kapaa Transfer Station - Expansion of the Kapaa Transfer Station should not be necessary with the present average daily receipt of MSW at less than one half of its permitted design capacity. However, since its age is approaching 20 years old, the facility now requires major repairs and replacements. The project is scheduled to be completed by 2012.

The City will continue to reevaluate the adequacy of processing capacity of its transfer stations to identify any capacity, operational or infrastructure deficiencies, and where required provide for appropriate upgrades or modifications.

2.6.2. Waste to Energy (WTE) Capacity

The City is in process of working with Covanta Energy to add a third unit to H–POWER. When permitted, the third unit will have a capacity of 300,000 tons per year (TPY) and will be a mass burn facility. The existing H–POWER Units #1 and #2 are refuse derived fuel units in which the waste is processed to remove metals and other difficult to combust materials before incinerating the waste. The new mass burn facility will accept waste without pre-processing and convert it to energy. (PWCG, 2008).

The additional capacity is scheduled for on-line service by 2011. The added capacity is expected to reduce the demand on the existing plant by more efficiently distributing the workload among three rather than two boilers. The lifespan of the H-POWER expansion is expected be in excess of 25 years and will increase the generation of electricity derived from MSW.

The plant is intended to reduce the amount of disposal in the WGSL. It will further reduce the Island of Oahu's greenhouse gas footprint by increasing from five to eight percent the amount of electricity produced from solid waste, a renewable fuel. (PWCG, 2008).

The plant will have an economic life, but it can be upgraded when technical improvements are available. When constructed, it will have emission controls among the best of any energy from waste plant in the country. The plant will be the most modern in operation. As with H–POWER units #1 and #2, future upgrades are expected to keep the plant technologically current and provide needed disposal capacity for the foreseeable future. (PWCG, 2008).

2.6.3. Landfill Capacity

The City is currently processing an EIS for the WGSL. The EIS process is scheduled to be completed by November 2008. Upon acceptance of the EIS, the City will seek all necessary land use permits through a process requiring public hearings.

In 2011, the City will begin the process of identifying a new landfill beyond the capacity of the planned lateral expansion of the WGSL. The reasons for initiating this process early involve: (1) the selection of a new landfill should involve early community consultation and input; (2) a number of factors will need to be considered by the City that involve land use, environmental, and socioeconomic issues; (3) locations that are available on O‘ahu for the siting of a municipal landfill have become increasingly constrained by development pressures that have reduced the availability of alternative locations for a landfill; (4) a municipal sanitary landfill is anticipated to be required for the foreseeable future, e.g., there are no alternative waste disposal technologies which do not themselves result in the generation of residual waste that cannot be further recycled, reused, or otherwise recovered; and (5) the capacity that is provided by a municipal sanitary landfill may be called upon during periods of natural or man-induced disasters.

As much as practicable, the new MSW landfill is intended to avoid areas situated west of Makakilo. A major part of this effort will involve the use of a Landfill Siting Committee in 2011. The Committee will be assigned the responsibility of adopting a similar process used in 2003 to identify the site for a new RCRA Subtitle D MSW landfill. The work of the Committee is anticipated to be completed by 2012. In 2013, the City Council will review the Committee’s findings and take action regarding the Committee’s recommendation(s).

The lifespan of the future planned landfill will be based on the physical characteristics of the site, the projected rate of waste disposal that is needed, and other factors that involve the integration of the landfill as part of the City's waste management system. At present, the lifespan of WGSL is projected for a minimum period of 15 years.

2.6.4. Waste Transshipment to the Mainland

The City plans to award a contract to a service provider for the baling, shipment, unloading, transportation and disposal of City-provided MSW to a mainland landfill. The process of annually transshipping 100,000 tons of MSW is tentatively scheduled for 2009.

To assure flow control by the City, the service provider will be required to provide the City with sufficient space for the placement of a City-owned scale and scale house, as well as associated equipment and vehicle access. The Refuse Division, ENV, will direct select MSW to the scale house as part of its flow control plan for the City. All waste will be delivered to the service provider only after it has been accepted and weighed at the City-owned scale facility.

The City only plans to transship waste to the mainland on an interim basis, until adequate WTE capacity becomes available with the scheduled operation of the third H-POWER boiler, tentatively scheduled for on-line service in 2011. (R. W. Beck, 2008).

Current Status of Transshipment

On June 16, 2008, bids were opened for the City's Request For Bids for interim shipping of MSW to the mainland United States. Three bids were received. Three procurement protests were then filed on behalf of the two higher bidders. The City is working to resolve these protests. They are being evaluated with input from various City agencies. After the City issues final rulings on the protests, the parties will have the right to an appeal. Until any such time that the appeals are resolved, the City is prohibited by State law from awarding any contract. (PWCG, 2008).

~~2.5. Previously Filed Environmental Impact Statement Compliance Documents~~

2.7. Previously Filed Environmental Impact Statement Compliance Documents

Chapter 343, HRS, and Chapter 11-200, HAR, environmental compliance documents have been previously filed for the use of this site. These documents include the: Revised Environmental Impact Statement for the Leeward Sanitary Landfill at Waimanalo Gulch Site and Ohikilolo Site, City & County of Honolulu, March 1984, filed to utilize an area of approximately 60.5 acres for landfilling.

The Revised Draft Supplemental Environmental Impact Statement for the Waimanalo Gulch Sanitary Landfill Expansion, City & County of Honolulu, June 2001, was initially filed to utilize the remaining space of the landfill, but was subsequently revised reducing both the timeframe and the area that would be used in the final published version of this document. See below.

The Final Supplemental Environmental Impact Statement for the Waimanalo Gulch Sanitary Landfill Expansion, City & County of Honolulu, December 2002, was prepared to utilize only a limited area of the landfill that ~~would expire~~ was expected to reach capacity within 5 years, or by 2008. This document was supported by the prior City administration's commitment to begin closure of the site at the end of 5 years.

The Environmental Impact Statement Preparation Notice for the Waimānalo Gulch Sanitary Landfill Expansion, City & County of Honolulu, November 2006, was prepared to utilize the remaining 92.5 acres of the site for a period of not less than 15 years. This document was filed based on the then pending expiration of the SUP on May 1, 2008.

The Draft Environmental Impact Statement for the Waimānalo Gulch Sanitary Landfill Lateral Expansion, City & County of Honolulu, May 2008, was filed for the subject project and published by the OEQC on May 23, 2008. The public and agency comments received from the filing of this document have been used in the preparation of this document.

Section 3
Introduction

3.1. Project Location and Area of Use

Waimānalo Gulch Sanitary Landfill (WGSL) is located in Waimānalo Gulch, on the Island of Oʻahu. The property is owned by the City & County of Honolulu, and under jurisdiction of the Department of Environmental Services (ENV). The landfill is operated for ENV by Waste Management of Hawaiʻi, Inc. (WMH).

The landfill became operational in September 1989 and the property comprises an area of approximately 200 acres (**Figure 3-1, Waimānalo Gulch Landfill Property**). According to records for the project filed with the Department of Planning and Permitting (DPP), approximately 107.5 acres of the site are comprised of used landfill area, operational and maintenance area, internal roadway area, and the current permitted space in use for landfill operations. The remaining acreage of the site comprising 92.5 acres is proposed to be used for the future expansion of the site (**Figure 3-2, Waimānalo Gulch Sanitary Landfill Lateral Expansion Site, Figure 3-3, Waimānalo Gulch Sanitary Landfill Aerial Photograph**). A breakdown of this site acreage is provided in **Table 3-1**, below:

Table 3-1
Existing and Proposed Use of Waimānalo Gulch Property

Acreage	Description
60.5	Used Landfill Area, Scheduled for Closure
20.0	Administrative and Operational Support
6.0	Roadway and Drainage Area Improvements
86.5	Subtotal
21.0	2003 Expansion Area
107.5	Subtotal
92.5	2008 Planned Expansion Area (Approximately ~37 Acres Active Landfill Cells Plus Related Uses, e.g., roads and infrastructure)
200.0	Total Approximate Area of Site

R.M. TOWILL CORPORATION March 2008

The 92.5 acre area is proposed for uses that include construction of landfill cells; earthwork to support construction of an access roadway, drainage controls, berms and stability slopes; and excavation and stockpiling of cover material. The proposed expansion project will be subject to a minimum 100 foot buffer inside of the perimeter of the property boundary to reduce the potential for impacts to neighboring properties. The buffer is intended to remain in an undeveloped condition.

3.2. Purpose of the ~~Draft~~ Final Environmental Impact Statement

This ~~Draft~~ Final Environmental Impact Statement ~~(DEIS)~~ (FEIS) is prepared pursuant to the content requirements of Chapter 343, Hawaiʻi Revised Statutes (HRS), and Chapter 11-200, Hawaiʻi Administrative Rules (HAR), and in compliance with actions that require the preparation of an EIS document. These specific actions involve: (1) the use of state or county lands or funds; and (2) the proposed action involving the construction and operation of a landfill.

According to the regulations:

> Chapter 343, HRS, Environmental Impact Statements:
> "§343-5 Applicability and requirements.
> (a)(1) Propose the use of state or county lands or the use of state or county funds, other than funds to be used for feasibility or planning studies for possible future programs or projects that the agency has not approved, adopted, or funded, or funds to be used for the acquisition of unimproved real property; provided that the agency shall consider environmental factors and available alternatives in its feasibility or planning studies; provided further that an environmental assessment for proposed uses under section [205-2(d)(10)] or [205-4.5(a)(13)] shall only be required pursuant to section 205-5(b);"
>
> "(a)(4) Propose any use within any historic site as designated in the National Register or Hawaii Register, as provided for in the Historic Preservation Act of 1966, Public Law 89-665, or chapter 6E;"

"(a)(9) Propose any: (C) Landfill;"

Chapter 11-200, Environmental Impact Statement Rules:
"Subchapter 5, Applicability
§11-200-5 Agency Actions:"

"B. The applicability of chapter 343, HRS, to specific agency proposed actions is conditioned by the agency's proposed use of state or county lands or funds. Therefore, when an agency proposes to implement an action to use state or county lands or funds, it shall be subject to the provisions of chapter 343, HRS, and this chapter."

"C. Use of state or county funds shall include any form of funding assistance flowing from the State or county, and use of state or county lands includes any use (title, lease, permit, easement, licenses, etc.) or entitlement to those lands."

The Environmental Impact Statement Preparation Notice (EISPN) for this project was published by the State Office of Environmental Quality Control (OEQC) on November 23, 2006. The DEIS was published by OEQC on May 23, 2008.

This ~~DEIS and the forthcoming~~ Final Environmental Impact Statement (FEIS) ~~will~~ provides information and evaluation of the potential for environmental impacts on the natural and built environment associated with the planned 92.5 acre lateral expansion of the WGSL. ~~This DEIS will also inform interested parties of the proposed project and seek public comment on subject areas that should be addressed during the EIS process.~~

3.3. Need for the Proposed Project

The proposed project is required to address the municipal waste disposal needs of the island of O‘ahu. A condition of the approved State Special Use Permit (SUP), Docket

No. SP87-362, had required closure of the site from the acceptance of refuse on or before May 1, 2008. In March 2008, this period of time was extended by the State Land Use Commission for a period of 18 months or November 1, 2009, to allow for use of the remaining capacity within the approved 107.5 acres, contingent on no unexpected events that would prematurely exhaust this capacity[1]. Although the extension of time will allow for more efficient use of the space remaining within the existing area, it will eventually reach capacity.

WGSL receives solid waste from all of O‘ahu. As an annual ~~acreage~~ average, approximately 800 tons[2] per day from municipal solid waste (MSW) and recycling residue, and approximately 600 tons per day from ash and residue, from the Honolulu Program of Waste Energy Recovery (H-POWER), for a total of approximately 1,400 tons daily, is accepted or delivered[3]. Actual annual tonnages can ~~very~~ vary significantly depending on whether H-POWER is operating. The closure of the landfill upon the exhaustion of the existing area of use without a means of disposal of municipal, recycling, and H-POWER refuse is not practical because it would fail to provide for the islandwide sanitary treatment of municipal generated waste essential to the maintenance of public health and safety.

ENV, which is responsible for the disposal and management of refuse in the City & County of Honolulu, proposes to address this requirement by utilizing the remaining 92.5 acres of the existing Waimānalo Gulch for future landfilling. This area of expansion will extend the life of the site for an estimated minimum period of 15 additional years.

---

[1] These unexpected events primarily include a hurricane, tsunami, or earthquake induced event where the landfill would be utilized in an emergency to serve in the cleanup and recovery effort for the disposal of storm and disaster generated debris.

[2] This includes a small amount of recycling residue associated with waste generated from the recycling effort. Department of Environmental Services, August 2006.

[3] Figure is approximate. In FY 2006, WGSL averaged 930 tons per day of MSW and 460 tons per day of ash and residue.

3.4. Community EIS Scoping Meetings

3.4.1. Background

ENV convened a series of four EIS Community Scoping Meetings between July 10 and August 10, 2006 to obtain community input on environmental issues that the public feels should be addressed in preparation of the EIS for the expansion of the Waimānalo Gulch Sanitary Landfill. Waimānalo Gulch is located in proximity to the boundaries of the Nānākuli and ʻEwa regions of Oʻahu, but is used islandwide by all Oʻahu communities for the disposal of municipal refuse. The public scoping meetings were held to obtain input from the communities closest to the landfill, as well as other communities that are important users of the facility. The meetings were held on the following dates and at the following locations:

Mtg. No. 1	July 10, 2006	Nānākuli High and Intermediate School 98-980 Nānākuli Avenue Waiʻanae, Hawaiʻi 96792
Mtg. No. 2	July 11, 2006	Benjamin Parker Elementary School 45-259 Waikalua Road Kāneʻohe, Hawaiʻi 96744
Mtg. No. 3	July 27, 2006	Mission Memorial Auditorium 550 South King Street Honolulu, Hawaiʻi 96813
Mtg. No. 4	August 10, 2006[4]	Kapolei Hale 1000 Uluohia Street Kapolei, Hawaiʻi 96707

---

[4] The date for this meeting was changed from July 26, 2006 which conflicted with the Neighborhood Board No. 34, Makakilo/Kapolei scheduled meeting.

3.4.2. EIS Public Scoping Meeting Agenda

Each of the four scoping meetings was conducted by a meeting facilitator who explained that the purpose of the meetings is to obtain community input on environmental issues the public feels should be addressed in preparation of the project EIS. The same agenda was used for all meetings and included:

A. A statement of purpose for the meeting;
B. A statement by ENV concerning the need for the project and the events that have transpired since 2003 when the last EIS for the expansion of Waimanalo Gulch was approved;
C. Time was allotted during the meeting to hear community concerns on issues or subject areas that they felt should be addressed in the EIS;
D. The facilitator summarized the input provided by the community during the last 15-30 minutes of the meeting; and
E. The facilitator and ENV thanked the community for its attendance and the meeting adjourned.

3.4.3. List of Participants

Participants who signed the attendance sheets for this series of meetings are provided in **Appendix C - EIS Public Scoping Conducted for the Proposed Expansion of the Waimānalo Gulch Sanitary Landfill**.

3.4.4 Summary of Issues and Concerns Raised

A number of issues and concerns were raised by the community during the series of scoping meetings. The following list is a consolidation of all issues and comments received when the comment period ended on August 30, 2006. The comments have been taken into consideration, as appropriate, in the preparation of the subject document and the requirements of Chapter 343, HRS, and Chapter 11-200, HAR.

Note: Issues that are in **bold** are those that were received in writing by August 30, 2006, and are not duplicative of what was already stated by the community during the course of the meetings.

General

- The 2001 EIS should not be used as the basis for this EIS
- EIS needs to clearly illustrate what expansion is taking place
- Need to provide number of years of continuing operation as well as the number of acres the expansion will take
- Need to clarify the location, size of the area and what the current zoning is. Documents need to be very clear and specify the boundaries
- Need to look at mainland sewage sludge studies
- New ash area that is covered in EIS needs to be specified where and size
- Impact of other new proposed private sites such as Nānākuli B – do not need both
- Need to identify impacts to RFP process
- Need to consider federal draft rules for shipping of waste
- Need to look seriously at all sites available around the island
- Need to discuss worst case scenario contingencies including earthquake etc.
- Need to determine how the DEIS will tie-in to the City's comprehensive, Solid Waste Integrated Management Plan (SWIMP) update that the city is supposed to prepare
- There is a need to be aware that other areas of the island have hosted landfill sites in the past until their capacity was reached i.e. Aikahi, Kawaianui Marsh, Kapa`a Quarry etc. – they have not all been on the Leeward side
- The EIS needs to reflect the current status at the landfill not the preferred status
- There was a concern expressed about the ability of a local planning firm to be neutral on this issue with all the political pressure
- Need to include all Federal, state and local laws that affect landfill operations
- Need to address Waste Management's 1999 contract with Mayor Harris
- Need clarity between airspace and landfill
- Need to explain why the community should believe the City at this point and why promises have not been kept
- HPOWER has never failed an EPA test on its ash – need to know why DOH has not approved reuse for concrete etc.

- Need to deal with the reality that because of our tourist economy or per person generation of waste is 7 pounds per day instead of the national average of 4 pounds
- Need to consult the County of Hawai`i who has just completed review of 61 alternatives and chosen 3 proven technologies to address this same issue
- **EIS needs to comply with all EIS rules and statutes – including those that require "good faith"**
- **Must not just address expansion but cumulative impacts since the 1980s**

Closure of Landfill

- EIS needs to focus on closing of Waimānalo Gulch now or as soon as possible – should not just go for life of area but should have a plan to reduce waste stream as quickly as possible to provide for closing sooner rather than later
- Review all alternatives available to reduce the waste stream with the intent of closing the landfill as soon as possible
- Need to consider the fact that many landowners and developers were fully aware of the landfill's existence pre-development of their current homes and projects and moved in anyway
- Landowners in the area maintain that they were told the landfill would close in '08 when they bought and had depended on these representations in making their decisions
- Need for active recycling program that would cut down the need for a landfill; need for a sensible plan that would allow for the earliest possible closure of the landfill
- Need for finite planning – Hawai`i should be at the cutting edge and shouldn't worry about costs to keep it a paradise
- City must explain why we are here – other meetings have been held in the past which promised closure of the landfill by 08 and it is still open
- EIS needs to provide factual/historic information for the issue of the promised closure in 2008 and the issuance of an operating permit that required closure in '08
- **Need a comprehensive closure plan for the existing Waimānalo Gulch landfill site irrespective of the proposed closure date**
- **Need to address the State Land Use Commission Decision and Order calling for closure in 2008**
- **Need to address the conflicting position of the 1984/1985 EIS which stated that only 57+/- of the 200 or so acres owned were feasible for utilization as a landfill due to the slope angles of the hillsides.**
- **Close it and put it somewhere else on the island**

Environmental

- Need to explain what the relationship will be between the newly created topography of the expanded landfill, and the prevailing wind patterns of the area including any impact on ocean currents and near shore water temperatures as well as any impacts the new topography may have on adjacent landowners (including the slope integrity along shared property lines, and heights and distances along these lines)
- Need to review Hawaiian Electric Company's wind study and explain the logic of the increase in height of the landfill in light of the wind energy study
- Need an assessment of the static stability of the landfill both ash and solid waste areas including consideration of past history as well as the dynamic stability of the landfill recognizing the fact that we live in a seismically active area
- Need to address how much of the mountain land space is being shaved for the landfill and discuss blasting or grading setbacks that are necessary
- Need to address environmental impacts of potential hazards
- Need to understand how 20 years of further capacity will be provided without excavation as previously stated – if there is excavation need to address where the soil will go
- Need to review recent State of Hawai`i Supreme Court case (Hōkūli'a) regarding State DOH responsibility for water quality in relation to how it is being affected by the landfill e.g. ocean run off
- If expansion moves forward, storm water retention basins, leachate and gas monitoring systems are needed
- Address future ash monofills
- Need to know chemical composition of ash
- The location of potential hazards such as asbestos within the landfill need to be identified
- **Address unknown effects to the land, water, and air**
- **Need to address odor issues – will the expansion take sludge and if so for how long**
- **How is the liner tested and how secure is it needs to be addressed**
- **The ability of the rock berm to handle the expansion needs to be discussed**
- **Needs to address the need for a surface water management plan**
- **Need fugitive trash plan designed to end this problem**

Infrastructure

- Impact to landfill when H-POWER is down is an issue
- Impact on highway; road blockages, etc.
- Maintenance issues along Farrington Highway with heavy truck use – standards for adequate maintenance of this highway
- Any new access points and their impacts on adjacent property owners

Economic Issues

- Economic impacts
- Costs of closing landfill
- Need a solution to address lost revenues to the city should the solid waste go to a private landfill – tipping fees

Explore Alternatives

- Need to look at all alternatives that are appearing (i.e., Plasma ARC gasification, etc.) and determine how these alternatives fit in with everything else that the City is doing – including how they can reduce the waste stream to allow for the earliest closing possible of the landfill
- Need to explore all viable alternatives
- Need to look at other places, especially Europe, and how they dispose of their waste, the kinds of incentives/taxes/sanctions they use to reshape people's attitudes at the curbside
- Expansion should be limited to a specific time and coupled with a plan to reduce the waste stream
- Need to address things that can be done to reduce the amount of waste that goes to the landfill – curbside recycling, alternative technologies, partnerships with the business community to promote recycling and reuse, etc. Need to get innovative and creative.
- Need to increase HPOWER and explore reuse of ash – HPOWER type facilities could be decentralized and built anywhere
- Need to address trans-shipping of waste
- Need to address providing a funding stream to address alternatives
- Need to speed up action on alternatives
- **Plasma Arc Gasification – Jacoby Inc.**
- **Need to address the implementation of the comprehensive and mandatory island-wide recycling program (proposed to be done by December 2006)**
- **Alternatives looked at must be explained including why they are rejected – the exploration must be rigorous**

Facilities Management

- Need to look at as a facilities management problem and apply technologies correctly (especially as pertains to smells and debris)
- The EIS should address the status of all violations and what has been done regarding violations – need to close violations prior to new EIS and permit
- Hours of operation need to be clear and adhered to – the community recently expressed concerns about night operations taking place and the impact of the lighting on houses and neighborhoods

- Need to address overfilling of landfill site
- Need to look at rubbish control and sludge issues
- Need a specific operational plan for soil cover
- **Explain the contracts between the city and Waste Management Inc and the timing of these contracts.**
- **There should be a clearly identified, separate (physically divided) MSW and ash monofill cells for the expansion**
- **A separate area should be identified for asbestos disposal**
- **A full discussion of all management techniques must be included**
- **Impact of expanded operations on adjacent property owners including line of sight issues**

Monitoring and Enforcement

- Need to provide for air quality monitoring, testing as it corresponds to traffic at the site, and along the route to/from the site
- Need to examine enforcement capability and capacity of DOH – including the lack of resources required for monitoring, enforcement, reporting, and accountability
- Major dirt and dust issues; monitoring doesn't work – need for more data collection
- Need to consider past problems with the landfill (i.e., EPA violations, leachate collection system) and be sure the DEIS identifies ways to assure that they do not happen again
- Need to address and explain the $2.8 million fine that has been imposed on the landfill by the Department of Health and assure that these types of practices/violations do not continue in the expansion
- Need to assure that a system is in place to hold the operator accountable
- Monitoring should be adequate so that after the fact permit modification should not happen – example the permit modification needed for the leachate sump pump system
- Need to monitor methane gas levels
- Need to have rigid standards and adequate monitoring to ensure the health and safety of the community
- Need regular monitoring by the Department of Environmental Services
- Need to address who will be responsible for enforcement of things in the EIS and what guarantees will be made in the EIS
- Need to include status of compliance with current permit – by modifying the permit, are we negating prior violations which should not be allowed
- **Need to assure timely reporting by the operator and public access to these reports – consider webcam on site for monitoring purposes**

Leachate

- Need to also address leachate and its impact to groundwater, runoff to ocean, subsidence and slippage resulting from seismic activity, methane fires, and EPA violations relating to gas collection systems
- Need to look back and forward – what has been/will be done to take care of leachate problems and make sure these do not reoccur in the future
- Need to address leachate pumped out to the sewer treatment plant and what happens to it and what is its effect on the final outflow water quality from the sewer treatment plant
- Need to discuss comprehensively the leachate management system – including possible failure of the geomembrane lining system and how it will be taken care of

Environmental Justice

- Need to address "environmental justice" along the Leeward Coast and as it pertains to this landfill, including the multitude of existing private and proposed sites in the area

Health Impacts

- Need to include discussion of potential health hazards
- Who is liable for the health costs to residents should the landfill cause health problems
- When considering expansion, need to discuss EPA finding regarding gas collection system issues
- Compensation to neighbors for health impacts
- Impact of multiple landfills, both public and private, on air quality needs to be addressed
- Higher standards are needed for dust and debris and possible impacts to health

Community Issues

- The DEIS needs to deal with the lack of sensitivity to cultural sites and issues
- What communities will benefit - who will be selected and how will the compensation benefits committees be set up also needs to be addressed
- Need to include impact of non-closure of Waimānalo Gulch on for-profit businesses in the area or planning to locate in the area
- Smells, trash escape, floating dust, truck traffic and speeding, trash on road, visual blight all need to be addressed
- Landfill should not be going above the ridge lines, which can be seen from Waiʻanae

- **One of the conditions of the permit was to allow for ridgeline and site views being maintained**
- **No trucks should be parked on Farrington Highway waiting for entrance to the facility**
- **Trucks should be cleaned when leaving facility so the there is no mud or dirt dropped on the highway**
- **Route along Farrington Highway should be kept clean of rubbish or dirt generated by the facility**
- **There should be identification of how the Waimānalo Gulch Sanitary Landfill will be maintained facing Farrington Highway, landscaped to reflect surrounding areas, park-like upkeep, greenbelt, setbacks, etc.**

Section 4

Project Description

4.1. Construction Activities

4.1.1. Project Location

Waimānalo Gulch Sanitary Landfill is located in Waimānalo Gulch, O‘ahu. The property is owned by the City & County of Honolulu, and is under the jurisdiction of the Department of Environmental Services (ENV). The landfill is operated for ENV by Waste Management of Hawaii, Inc. (WMH). The operations of the landfill are consistent with or exceed the requirements of EPA Subtitle D, Resource Conservation and Recovery Act (RCRA) and the State of Hawai‘i regulations.

The Waimānalo Gulch Sanitary Landfill (WGSL) is located near the community of Kapolei; approximately 15 miles northwest of Honolulu International Airport; and two miles southeast of Nānākuli. The WGSL property begins at the north side of Farrington Highway just southeast of Kahe Point and extends approximately 1.2 miles inland up Waimānalo Gulch. The site location is identified on **Figure 3-1, Waimānalo Gulch Landfill Property**.

The WGSL property encompasses approximately 200 acres with a dimension of approximately 7,000 feet in length and 820 feet in width along the Farrington Highway frontage widening to approximately 1,900 feet at its widest point. Farrington Highway (FASP No. S-900(4)), is under jurisdiction and management of the State Department of Transportation (DOT), Highways Division. Approximately 92.5 acres of the 200 acre property are proposed for landfill expansion and accessory uses (**Figure 3-2, Waimānalo Gulch Sanitary Landfill Lateral Expansion Site**).

Elevation of the site at the access road off of Farrington Highway is approximately 60 feet above mean sea level (msl). At the northeastern corner of the property the elevation rises to 990 feet above msl. Terrain on the lower end of the site slopes upward at about 8 percent, increasing to approximately 18 percent on the upper end. The current maximum fill elevation is 513 feet above msl. A depiction of the general site topography is provided on **Figure 3-2**.

A small area within the proposed expansion area was graded during the construction of Cell E-4 to maintain slope stability and to allow safe filling of Cell E-4. No waste has been placed in this area nor will further work take place until completion of the EIS process and the State Special Use Permit boundaries are modified or a State Land Use District Boundary Amendment is obtained. This work was performed over a period of approximately 3 months starting in October 2006.

4.1.2. Features of Construction of Lateral Expansion

The proposed project is intended to provide for the future development of landfill cells at WGSL. According to the Engineering Report for Landfill Expansion, Draft, prepared by GeoSyntec Consultants in February 2008, the proposed lateral expansion was designed to: (1) accommodate the expected waste stream; (2) provide a landfill base lining and leachate collection and recovery system to meet the regulatory requirements of RCRA Subtitle D (40 CFR Part 258); (3) meet typical slope stability design criteria at final build out conditions based on industry accepted MSW, ash, and base and side slope line interface shear strength properties; and (4) meet the vertical separation requirement for the overhead power lines used by the Hawaiian Electric Company (HECO) (GeoSyntec Consultants, 2008).

In addition to expanding the active landfill area, the proposed project will involve the development of support infrastructure including drainage, access roadways, landfill gas and leachate collection systems, perimeter monitoring systems, and other related features.

Also proposed are:

- A part of the landfill expansion, a community Drop-Off Center, will be constructed at the landfill. This location may be moved during detailed engineering design but will remain between the front face of the landfill and Farrington Highway. The purpose of the Drop-Off Center will be to allow members of the public to conveniently and safely deliver solid waste and/or recyclables to the Landfill for disposal and/or recycling without entering areas of the landfill where active filling is taking place. The facility will likely consist of 4 or more roll off containers set below grade for easy access and screened from view from Farrington Highway.

Drivers delivering drop off center refuse would go to the scale house for visual inspection to verify that the loads qualify for disposal at the drop off center. The bins containing refuse will be transferred and discharged at the working face of the landfill when they are full. Operational procedures in place for the inspection of loads prior to landfilling will be applied to the drop off center refuse. Loads containing recyclables will be transported to third party recyclers.

- A landfill gas to energy (LFGTE) system may be installed to convert landfill gases to electricity. As with the proposed drop off center, specific details are under development by WMH and ENV. The electricity generated from landfill gas will help to reduce dependency on imported oil used to generate electricity.

4.1.3. Waste Stream, Soil Excavation, and Soil Usage

Preliminary volume estimates for the preferred expansion master plan have been prepared indicating the amount of soils usage and airspace provided by the project (**Table 4-1, Preliminary Estimate of Expansion Quantities (Cells E-5 through E-11)**).

4.1.4. Geologic Considerations

WGSL contains an ephemeral stream, which remains dry except during heavy rainfall. According to GeoSyntec Consultants, the subgrade consists of alternating layers of relatively dense lava flow followed by more fractured and porous clinker seams. The layers dip gradually down toward the coastline. The rock materials appear to be variably weathered throughout the height of the exposed hill slopes. Very little alluvial/colluvial soil deposits were observed. However, a 3- to 5-ft thick dark brown clayey soil deposit was noted at the ground surface along the top of the exposed hill slopes. No significantly-sized lava tubes or cave features at the site were observed by consultant Geolabs Hawai‘i, during a seismic refraction survey in 2000. (GeoSyntec, 2008).

Table 4-1
Preliminary Estimate of Expansion Quantities
Cells E-5 through E-11

Expansion Footprint (Cells)	~37 acres
Footprint of Landfill After Expansion	115.8 acres
Total Expansion Airspace Increase[1]	7,923,980 cubic yards

Soil Usage[2,3]

Cell Excavation	3,103,165 cubic yards
Fill[4]	147,830 cubic yards
Soil Buttress	518,315 cubic yards
Used as part of Liner System (4' thick on floor & 3' thick on side slopes)	263,545 cubic yards
Final Cover Material (3.5 feet over 36.2 acres)	204,410 cubic yards
Estimated Daily Cover Soil	1,567,923 cubic yards
Excess Excavation Material[5]	401,142 cubic yards

Source: Eng. Rpt. for Landfill Expansion, Waimānalo Gulch, Geosyntec Consult., 2008.
Table Notes:

[1] Available gross volume above currently-permitted grading plan for expansion area only.

[2] A positive number means soil available on-site. A negative number means soils required.

[3] Shrinkage and swell factors not included in soil usage calculations.

[4] To meet grade at certain locations; exclude the soil buttress.

[5] As indicated, a soil surplus results. The soil surplus may be influenced with future changes to the landfill slopes that are excavated. Surplus materials may be left in place in stockplile sites or used for other purposes.

The regional groundwater level for this portion of the island is lower than the elevations of the project site. However, some groundwater seepage may be anticipated following rainfall due to percolating groundwater. For the previous landfill cells El through E4, a subdrain system was constructed along the base of the cells to intercept and convey any seeping water. The subdrain system consisted of a High Density Polyethylene (HDPE) perforated pipe encapsulated in a gravel-filled trench. A similar system will be constructed for the expansion cells, if seeps are encountered during construction. (GeoSyntec, 2008).

4.1.5. Liner and Final Cover Systems

The existing liner system design for the existing area is provided in **Figure 4-1** and **4-2**. The liner system for the proposed lateral expansion area is provided in **Figure 4-3**.

The lateral expansion liner system for both ash and MSW cells will consist of the following as indicated from bottom to top (GeoSyntec, 2008):

- Prepared subgrade
- Soil cushion layer
- 40-mil-thick backing HDPE geomembrane (textured on both sides)
- Geosynthetic clay liner (GCL)
- 60-mil-thick primary HDPE geomembrane (textured on both sides)
- Cushion geotextile
- 1 foot of gravel (maximum size of 1 inch)
- Filter geotextile
- 2 feet of Operations layer.

To collect leachate on the landfill base, a perforated, HDPE collection pipe will be placed within the drainage layer. The leachate will drain down the cells toward one or more lined sumps furnished with a riser pipe (WMH, 2008).

Figure 4-4, shows potential locations for the Leachate Collection and Removal System (LCRS) collection pipe and sump for the expansion. These locations may be changed during final design.

4.1.6. Final Cover

Figure 4-5 shows the final cover system currently proposed for the existing and expansion areas, this section may be modified during final design as approved by the Department of Health. As can be observed, the proposed final cover above ash or MSW consists of (from bottom to top) (GeoSyntec, 2008):

Figure 4-5
Proposed Final Cover Details
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

- 2-foot-thick compacted foundation layer 1' (to be consistent with soil usage calculations, GeoSyntec assumed that 6 inches of this material would be intermediate soil cover placed as part of operations)
- 1-foot-thick infiltration (barrier) layer[1]
- 60-mil-thick primary HDPE geomembrane (textured on both sides)
- Drainage geocomposite or gravel layer (as needed)
- 1-foot-thick vegetative (or soil erosion layer) amended to maintain vegetation.

The site may request the DOH permit an alternative cover in lieu of the Subtitle D prescriptive cover described above.

An alternative cover that is being considered involves use of a thicker layer of soil cover to handle the root systems of the types of trees being considered at the landfill. The tree types used will be similar to those found on the surrounding terrain. Trees with a long tap root, such as evergreens, will not be used. Also, boulders may be added to enhance the appearance of the site.

4.1.7. Proposed Landfill Grades

Figure 4-6 shows the proposed grading plan (GeoSyntec, 2008); **Figure 4-7** shows a typical section including the location of the HECO power lines crossing the WGSL property.

4.2. Facility Operations

4.2.1. Waste Accepted at Landfill

Municipal Solid Waste

The WGSL is permitted to receive municipal solid waste (msw) collected by the City & County of Honolulu and private waste haulers. According to Hawaii Administrative Rules (HAR), Title 11, Department of Health (DOH), Chapter 58.1, Solid Waste Management Control, the WGSL is defined as a Municipal Solid Waste Landfill Unit, which can receive various forms of MSW:

---

[1] If ash has a hydraulic conductivity less than or equal to 1 x 10" cm/second, the operator will request HDOH to allow the use of ash in the barrier layer.

	DATE:	30 APRIL 2008

Figure 4-7
WGSL Typical Section
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

> [The]…"MSWLF unit" means a discrete area of land or an excavation that receives household waste, and that is not a land application unit, surface impoundment, injection well, or waste pile, as those terms are defined under 40 CFR section 257.2. A MSWLF unit also may receive other types of RCRA subtitle D wastes, such as commercial solid waste, non-hazardous sludge, conditionally exempt small quantity generator waste, and industrial solid waste. The landfill may be publicly or privately owned. A MSWLF unit may be a new MSWLF unit, an existing MSWLF unit, or a lateral expansion."

Regulatory guidance for the waste that can be accepted at the landfill is provided in the Revised Ordinances of Honolulu (ROH), Chapter 9, Collection and Disposal of Refuse, Subsection 9 1.7, Acceptable and nonacceptable refuse at disposal facilities. According to the ROH:

> "(a) Except as directed by the director or the director's authorized representative and as provided otherwise under the mandatory recycling program for city government established under Section 9-1.11, the division shall accept or cause to be accepted the following solid waste within the disposal system: paper, cardboard, yard trimmings, bottles, cans, plastic, garbage, lumber and tree branches less than five feet long and less than nine inches in diameter. Except during a suspension by the director of the requirements of Section 14-5A.2(a) and/or (b), and as authorized by the director during the suspension, the division shall not accept into the disposal system any commercial cooking oil waste or commercial FOG waste.
>
> (b) The division may conduct an examination of any truckload of refuse or other solid waste delivered or transported to a disposal facility:
>
> (1) At any time that the division has cause to believe that the truckload contains (A) 25 percent or more of those recyclable materials designated by the director or (B) any commercial cooking oil waste or commercial FOG waste; or
>
> (2) Periodically and on a random basis to determine compliance with the prohibition of subsection (a).
>
> (c) The division shall accept the following types of solid waste only at specific disposal sites designated by the chief: large household appliances, tree

trunks, dirt, rock, concrete, reinforcing steel, metal pipe, metal roofing, automobile parts and bed springs.

(d) The division shall not accept deliveries of any refuse or recyclable materials which are not made during hours of operation as posted at each facility.

(e) The chief may divert all or part of the incoming refuse away from a disposal facility, or limit the area to be served by a disposal facility when, in the chief's judgment, such action is necessary to undertake repairs or to maintain the facility, or where the facility lacks the continued capacity to handle the incoming refuse, or so as to prolong the life of the facility.

(f) The director, or the director's authorized representative, may designate from time to time those disposal facilities or private disposal facilities, or a combination thereof, and the methods for the processing and disposal of solid waste generated in the city constituting a part of the disposal system created by this chapter. The director or the director's authorized representative may require that all solid waste, whether transported by the division, licensed collectors, businesses or individuals, be disposed of at specific disposal facilities or private disposal facilities within the disposal system as designated by such person if it is found to be in the best public interest; provided, that agricultural solid waste and source separated waste transported for recycling purposes shall not be subject to the provisions of this section; and provided further, that if regional transfer stations are designated, transportation to the stations shall be considered so as to minimize the operating costs of the collector. The best public interest shall be found if disposal at the designated disposal facility or private disposal facility within the disposal system shall:

(1) Result in reusable materials being recovered from solid waste;

(2) Achieve the solid waste volumes necessary to meet a resource recovery facility's minimum operating requirement;

(3) Lessen the demand for landfill sites; or

(4) Conserve natural resources. (Sec. 9 1.6, R.O. 1978 (1987 Supp. to 1983 Ed.); Am. Ord. 89 113, 89 117, 02-14, 04-10)"

The MSW received at the site is non-hazardous solid waste from residential, commercial and industrial sources. While some construction and demolition (C&D)

waste is accepted, the majority of C&D waste is required to be disposed of at the PVT Landfill.

Ash and Residue

The landfill accepts the disposal of ash and residue from the City's H-POWER facility. The ash and residue is received on a 24 hours per day basis, 7 days per week. Currently, as an annual average, the WGSL receives approximately 600 tpd of H-POWER related waste and approximately 800 tpd of MSW on a 7 days/week basis. It is anticipated that as the City proceeds with the development of new systems and improved methods to handle waste, that these volumes will be adjusted with the amount of ash increasing and MSW volumes decreasing, e.g., an expansion of H-POWER, waste recycling, transshipment, or the development of new alternative technologies to reduce waste.

Other Waste Accepted at Landfill

The WGSL also receives other forms of waste that are managed under special operating procedures. These other wastes include wastewater treatment associated solids sludge, septic tank and cesspool pumpings, and asbestos materials as regulated under RCRA. Wastewater treatment sludge is currently processed and dried for beneficial uses at the Sand Island Wastewater Treatment Plant (SIWWTP). ~~It is expected that while the performance of the dried wastewater derived solids treatment system has improved, that some wastewater derived solids will require disposal at WGSL at this time. The plan is for the solids to eventually be diverted from disposal and to be used for agricultural or other related purposes.~~

The sludge from the SIWWTP, previously disposed of at WGSL is currently undergoing treatment in a waste digester where the sludge is turned into fertilizer pellets. The process of drying sludge into fertilizer pellets began in March 2007.

In June 2007, due to a fire, operations at the SIWWTP pelletizing facility ceased until September 2007. During that time 763 tons of de-watered sludge from SIWWTP was landfilled at WGSL. For the entire 2007 year, approximately 3,122 tons of stabilized, de-watered sludge (pelletized and nonpelletized) from the SIWWTP were disposed of at WGSL. At present, all of the de-watered sludge from SIWWTP is turned into fertilizer pellets, and on average, 85% of the pellets is being used for golf course construction and soil manufacturing. The remaining amount of pellets, approximately 15% on average, is disposed of at the WGSL. All regulatory requirements have been met to allow beneficial use of the pellets. As the process matures and marketability increases, it is anticipated that there will be a decrease in the amount of pellets requiring landfilling. Due to unforeseen circumstances, however, such as the June 2007 fire at the pelletizing facility, there may be times when stabilized, de-watered sludge from SIWWTP will need to be landfilled at WGSL.

Besides some of the fertilizer pellets from the SIWWTP, stabilized, de-watered sludge from the Honouliuli, Wai‘anae, Kailua Regional, and Kahuku Wastewater Treatment Plants, as well as sludge from private (non-City) sources is still being landfilled at WGSL. For the entire 2007 year, the following approximate amounts of stabilized, de-watered sludge were disposed of at WGSL from the following City waste water treatment plants: Honouliuli WWTP - 4,192 tons; Kailua Regional - 766 tons; Waianae WWTP - 277 tons; and Kahuku WWTP - 1 ton. In addition to the significant reduction of sludge from the SIWWTP being landfilled, the City is in the process of seeking beneficial uses for the stabilized, de-watered sludge from the Honouliuli Wastewater Treatment Plant. The ultimate plan is for the solids to eventually be diverted from disposal and to be used for agricultural or other related purposes.

Waste Disposal Summary

The WGSL is the only municipal sanitary landfill on the Island of O‘ahu accepting refuse from the eight districts of ‘Ewa, Wai‘anae, Koolaupoko, Ko‘olauloa, the Primary Urban Center, East Honolulu, Central O‘ahu, and the North Shore. The landfill also accepts overflow refuse from other island landfills (private and military), residual ash and residue from the H-POWER facility, and rubbish that exceeds the H-POWER facility’s capacity.

The following sections are based on the Site Operations Manual, Waimānalo Gulch Sanitary Landfill, Volumes I and II (Waste Management of Hawaiʻi, Inc., October 2007). It should be noted that this manual is updated as required from time to time.

4.2.2. Operational Controls

Hours of Operation

~~The WGSL is open seven days/week~~ WGSL's operational hours are between ~~the hours of~~ 7:00 a.m. and 4:30 p.m. seven days/week, and is closed only on Christmas and New Years Day. In addition to WGSL's operational hours, ~~I~~incinerator ash is received 24 hours/day by special arrangement with the H-POWER facility.

Access Control

The front of the WGSL perimeter is enclosed by a 6 foot chain link fence. Twenty-four hour security further prevents unauthorized access or dumping.

Traffic Control

Signs at the WGSL entrance direct customers from the front gate to the scale house located approximately 500 feet from the entrance at Farrington Highway. Fifteen to 20 vehicles, depending on the mix of vehicles are able to queue in line between the front gate and the scale house. After weighing of refuse hauling vehicles, signs and landfill personnel will direct customers to the designated areas for unloading. Signs are posted to inform customers of on-site speed limits (10 miles per hour (MPH)). Spotters are posted at key locations as needed to direct traffic to the MSW or ash disposal areas, as well as to direct customers to specific locations for unloading at the active disposal face. A public drop off area is planned.

All main access roads used by customers are maintained as all-weather roads by surfacing with rock, asphalt or concrete rubble. Roads are graded and watered as needed to maintain a smooth and dust-free condition.

4.2.3. Environmental Controls

Litter

The WGSL uses portable screens, permanent litter fences, and routine site cleanup operations to prevent wind-blown litter from leaving the landfill premises and creating nuisance conditions in the area. Also of concern is the proximity of the adjoining Kahe Power Generating Station. Wind-blown litter from the landfill could travel from across the Waimanalo Gulch ridgeline and fall onto the power plant switching station and other facilities if not properly managed. The litter control program elements to address these concerns include the following:

- Portable litter screens are typically 12 feet high and 20 feet wide. They are located in downwind locations near the active MSW disposal area as the first line of defense against wind-blown litter. The screens are positioned as necessary as the active area moves across the WGSL site.
- Approximately 600 lineal feet of 6-foot high temporary litter fencing is installed between the ash monofill and the MSW fill area as the second line of defense.
- The chain link fence at the front of the WGSL property provides a final level of physical containment of any litter that leaves the active working area.
- Routine site cleanup and litter collection are the final elements of the litter control program. The WGSL personnel remove litter from portable screens and permanent fences daily, clean haul roads weekly, and pick up litter when present on other areas of the site. In the event of a major wind storm in which excessive litter is created, temporary personnel are brought in on an as-needed basis to collect litter, both on and off the WGSL property. Additional personnel are also made available on an as-needed basis during the time periods when the H-POWER facility shuts down for maintenance and MSW volume increases above normal levels.
- Information is included in the site's daily operating log to document unusual litter problems or control activities. This includes instances when temporary personnel are used to collect or control litter on- or off-site.

Litter control activities are recorded daily and maintained in the WGSL's operating record.

Odor

The odor control program at the WGSL consists of the following elements:

- Identification and special handling of odorous wastes
- Effective application of daily and intermediate cover
- Installation and operation of an odor neutralization system
- Management of landfill gas.

Waste capable of creating off-site odor problems are given special handling. Odorous materials include:

- Sewage sludge (wastewater treatment solids) and grit
- Rendering plant wastes, dead animals, and offal
- Grease trap pumping waste
- Bulk shipments of off-specification foods and food wastes

Waste that is considered odorous is generally handled under the site's special waste program; upon arrival to the scale house, they are designated as odorous loads and directed to a designated part of the active disposal area. Disposal then occurs as follows:

- A bulldozer excavates a trench or pit in a place previously known to contain non-odorous waste. The pit is large enough to contain approximately twice the anticipated volume of the odorous load.
- The odorous load is discharged into the trench or pit.
- The bulldozer immediately covers the odorous material with excavated non-odorous solid waste. The disposed of material is compacted firmly.
- Daily cover soil is placed and compacted above the solid waste.

Daily scale house records reflect the receipt of odorous loads designated for special handling.

Cover Soil

The most effective means of preventing odors from solid waste is the application of cover soil to the disposed MSW. The use of soil cover will also reduce the attraction of the landfill from birds that may be considered a nuisance to area residents and a potential hazard to the nearby Kahe Power Generating Station (also see above for special handling of odorous waste). A minimum of six inches of soil is placed daily over active MSW disposal areas and compacted by a compactor or track-walked by a bulldozer. Intermediate cover, consisting of at least an additional six inches, further controls odors in areas where additional waste will not be added for 30 days or more. Regular inspection and maintenance of cover soil to seal and eliminate cracks and fissures in cover soil is practiced to further control odors from buried solid waste.

Odor Neutralization Systems

Waste Management of Hawai‘i, Inc. (WMH) has an existing spray system installed at the entry of the landfill to dispense odor neutralizing solution. The system is similar to systems that have been installed at numerous other landfills across the mainland U.S. Supplementing this system the odor neutralizer can be deployed from on-site tanker trucks by mixing the solution with water. The tanker trucks can be sent to site specific locations of the landfill to be used on an as-needed basis.

The spray system is normally configured with stations spraying 12-15 gallons per hour of a finely atomized odor neutralizing solution into the air. The chemical neutralizing solution is a proprietary polymeric formulation that combines with sulfuric and nitrogen-based compounds at the molecular level to eliminate odorous properties. The chemical neutralizing solution is non-toxic and has been approved by health authorities for this specific application.

The odor neutralizing spray system is operated on an as-needed basis during normal operating days (seven days/week) and is capable of deploying odor neutralizing solution on a timer during periods when the landfill is closed. The spray system is generally not used during periods of strong southerly winds associated with winter storms to prevent any potential transport of solution spray to populated areas makai of the landfill.

Landfill Gas Control

Landfill odors are frequently associated with the uncontrolled release of landfill gases that are the result of decomposing organic matter. A landfill gas extraction and treatment system was installed in 2005/2006 and upgraded in 2007 and 2008. Additional wells will be installed as waste is placed. The system controls the emission of methane and trace compounds in landfill gas associated with nuisance odors. In addition to minimizing surface emissions, the gas system is intended to prevent offsite migration of landfill gases.

4.2.4. Material Acceptance

Introduction

If the attendant at the WGSL scale house has any concern regarding the acceptability of the material a vehicle is transporting, site supervisors are summoned to the scale house to inspect the load and determine whether or not it will be accepted for disposal. Once the material is determined to be acceptable, the load is weighed, data is entered into the scale house records, and the customer is directed to the appropriate disposal area.

An Unacceptable Waste Exclusion Program is used to prevent the disposal of unacceptable wastes including hazardous waste; PCB contaminated waste, pesticide containers, liquid waste, or improperly packaged asbestos waste.

Special Waste Screening

The following types of special waste require a special waste application. Applications are reviewed and approved by WMH before acceptance for disposal. These materials include:

- Asbestos
- Materials separated from water, such as from car and equipment washes that generate sludge and residue
- Sewage sludge
- Off-specification and outdated products

- Underground storage tank and other related sludge
- Resins and chemical debris
- Petroleum and other contaminated soils (non-liquid)
- Diesel fuel contaminated debris (non-liquid)
- Used oil debris (non-liquid)
- Gasoline, jet fuel, and kerosene contaminated debris (non-liquid)
- Sandblast grit
- Baghouse dust
- Inorganic filter cake
- Dried paint waste from removal, construction and demolition
- Treated utility poles and lumber
- Empty containers
- Treated medical waste

Customers proposing to dispose of special waste at the WGSL must submit a special profile sheet characterizing the waste prior to delivering the material to the landfill. All special waste shipments must be accompanied by a manifest. The manifest is checked by the scale house operator against the approved special waste profile sheet. Undocumented special waste loads are rejected at the scale house from disposal.

4.2.5. Special Procedures for Contaminated Material

The acceptance procedures outlined in this section are used for the following categories of special wastes:

- Soil, debris and other materials contaminated with petroleum or other chemical products as listed above under Special Waste Screening
- PCB-contaminated soils that, due to very low concentration of PCBs, are not regulated by the EPA

For these categories of special waste, the special waste profile sheet and application for disposal must include a Notice of Contaminated Material Approval form. The form meets requirements of the City & County of Honolulu and the DOH. Before these categories of special waste are accepted for disposal, the completed form with the approval document from the City and signature of the individual wishing to dispose of the waste, must be submitted to the WGSL. The WGSL provides a copy of the Notice of Contaminated Material Approval form to the DOH, Solid and Hazardous Waste Branch.

4.2.6. Unacceptable Waste Management Program

Categories of Unacceptable Waste

The WGSL operates an active program to prevent the disposal of the following categories of waste at the landfill:

- Toxic materials, such as insecticides or poisons
- Radioactive materials
- Materials designated as hazardous under 40 CFR Part 261
- PCB wastes as defined in 40 CFR Part 761
- Untreated infectious wastes
- Bulk or non-containerized liquids as provided in HAR 11-58.1-15(i)

Screening and Excluding Procedures

Procedures to prevent disposal of these materials at the WGSL include:

Customer Notification

Customers are informed that the WGSL does not accept hazardous or liquid waste through means of published information and the sign at the entrance to the landfill.

Scale House Monitoring and Inspection

Scale house personnel question every incoming customer as to the source and contents of their load. If any suspicious waste or unusual loads are observed, the scale house attendant will reject such wastes or summon trained site personnel to determine whether or not the waste is acceptable for disposal. The vehicle in question may be directed to the side, the load uncovered, and the contents examined. If hazardous or unacceptable waste is found or observed in a vehicle during a visual inspection at the WGSL scale, landfill personnel will reject the entire load and complete a load rejection form. When possible, educational information on proper disposal of rejected wastes is provided to the customer.

Random Inspections

A minimum of two random load checks are performed daily. The load check spotter will randomly choose the vehicle for the random load check. The vehicle is directed to an area off to the side of the main working area. After the load is dumped, the waste is cordoned off using traffic cones and at least one lane on either side of the area is kept clear of any traffic. A second spotter is present to ensure no traffic is allowed in the area.

The load check spotter fills out a Random Load Check Form, asking the appropriate questions of the vehicle driver and then walks around the waste looking for any unacceptable waste. After the initial walk around, the spotter will signal for a bulldozer to spread out the waste. After the bulldozer has left the area, the load check spotter uses a rake, or other appropriate tool, to inspect the load for prohibited wastes.

If hazardous waste is discovered after a load has been dumped and spread out, the hazardous materials are returned to the vehicle when possible. If the waste cannot be returned to the vehicle, landfill personnel transport the waste to the temporary hazardous material storage area located on-site. The waste is then identified, logged into the waste volume tracking record book, placed in drums or separated onto pallets, labeled, and transported by a licensed hauler for management as required by federal and state regulations.

Landfill Working Face Inspections

Equipment operators and spotters at the WGSL working face visually observe the unloading of refuse to determine the presence of prohibited wastes to prevent it from being landfilled. If suspicious looking materials are discovered, trained personnel are called upon to inspect the material. If the waste is determined to be unacceptable waste, the waste handling and agency notification procedures described below are followed.

Management of Unacceptable Waste

If hazardous or prohibited wastes are detected at the working face and the individual having transported the waste is unknown, WGSL personnel will identify the generator or transporter. If either of these parties can be identified, they are held responsible for removing the unacceptable waste from the landfill for proper disposal. If neither the generator nor the transporter can be identified, the following steps are taken:

- If the hazardous or unacceptable waste is a general household hazardous waste (i.e., paint, solvents, motor oil, insecticides, pesticides, automobile batteries, etc.), trained site personnel will remove these from the working face and transport them to the temporary hazardous waste storage area. This waste is later packed and transported off-site for proper disposal in accordance with federal and state laws.
- If the characteristics of the waste is unknown, or the waste is perceived to be a safety hazard, the following steps are taken:
    - The site supervisor is notified of the situation;
    - The immediate and surrounding areas of the waste is secured to establish a safe zone. Other vehicles are directed to dispose of their waste in another area;
    - The site manager contacts a licensed emergency response contractor to manage the removal and proper disposal of the waste; and
    - All required agencies are notified of the incident.

If household hazardous wastes are discovered at the load check site and cannot immediately be returned to the hauler or generator[2], trained personnel will package, label, mark, and store the waste in a manner consistent with applicable local, state, and federal waste regulations. Waste will be stored in the temporary hazardous waste storage area and will be tracked and stored for a maximum period of 90 days after the accumulation of 220 pounds or more. <u>The safe accumulation of this type of waste prior to transport to an approved disposal facility is to minimize the number of trips involving the transport of hazardous materials.</u>

Hazardous wastes are removed from the site by a licensed hazardous waste hauler with proper manifest documentation. The hazardous waste is then disposed of or treated at a permitted facility.

Agency Notification

In the event that regulated hazardous or PCB waste is discovered during a random load check or at the working face, a written report is sent within 24 hours to the DOH, or the next working day. The report includes the following:

- Date of discovery
- Type and volume of waste
- Generator and transporter, if known
- Environmental or safety issues, if any, and mitigating measures by the WGSL
- Disposition of the waste

Training

WGSL personnel responsible for load checks and inspections receive training on the identification of hazardous wastes, worker safety, and procedures to follow if hazardous wastes are found. This training is included in the landfill's annual employee training program.

---

[2] A possible source of this type of waste is a self-hauler or individual.

4.2.7. Waste Unloading and Compaction

Introduction

After process at the scale house, commercial and industrial haulers follow designated routes, directed by signs, barriers, cones, and traffic spotters, to the working face. At the working face, landfill spotters direct the haulers to unload at a specific area. Landfill personnel responsible for traffic control and directing customers are equipped with two-way radios to facilitate coordinated and safe traffic control.

WGSL personnel observe disposal operations at the working face to ensure safe operations and to monitor for unacceptable materials being disposed of in the landfill. Landfill personnel also prevent customers from salvaging waste, which is prohibited at the WGSL. Random load checks are performed at the working face to prevent such activities.

Waste unloaded at the working face is spread out and compacted by compactors and bulldozers in layers a maximum of two feet thick. Successive layers are compacted to form lifts 12 to 20 feet thick across the working face. Trucks deliver daily cover to the refuse disposal area. The daily cover is applied by bulldozers.

Special Waste Procedures

Specialized procedures are used to manage the categories of special waste described in this section.

Incinerator Ash

The following special procedures are followed for the disposal of incinerator ash:

- Areas where ash is disposed of receive a minimum of six inches of soil cover if the area is not covered with additional ash within a period of seven days.
- Only ash created from the incineration of MSW, industrial, or commercial waste is accepted for disposal. Ash from medical or veterinary waste incinerators is not accepted. Before ash is accepted from any source, the

WGSL will review samples and laboratory data to ensure the ash material has been entirely incinerated and that it does not contain free water that would classify the ash as liquid waste.

Contaminated Materials

Contaminated soils and debris are not only subject to the acceptance protocol for Special Waste Screening Procedures, but the following disposal requirements as well:

- Contaminated soils may be used as daily cover in either the MSW landfill or ash monofill areas. Materials other than soil will be disposed of as general solid waste in either the MSW landfill or ash monofill areas.
- All trucks delivering contaminated material must be covered.
- Disposal of such material will not take place during periods of heavy rain or during sustained wind speeds in excess of 30 miles per hour.
- During dry or windy conditions, a water truck is used to suppress dust while contaminated materials are disposed.
- A Special Waste Disposal Report will be filled out and placed in the operating record for each load of contaminated materials. The report will include the following information:
  - ▫ Type, source, and volume of material
  - ▫ Disposal date
  - ▫ A general description and GPS coordinates to the disposal location including northing, easting, and elevation
  - ▫ Weather conditions at the time of disposal (i.e. wind direction and speed, rainfall, etc.)

Asbestos

Special procedures for asbestos are detailed in the Asbestos Disposal Plan. The plan ensures that national emission standards are met at the WGSL. Once asbestos waste transporters comply with all procedures, they are allowed into the site at a pre-scheduled time. Loads are inspected to ensure all packaging requirements have been met. The asbestos waste transporter then proceeds to a prepared disposal trench and discharges the load. All asbestos waste is covered with MSW and six inches of daily cover. The site's permanent operating record contains all documentation of asbestos disposal. Documentation includes date, time, name(s) of the waste generator and the waste transporter, and the location where the asbestos waste was disposed of.

Dead Animals and Offal

Dead animals and offal (hides, intestines, and other waste from slaughtered animals not subject to human consumption) is not subject to special waste acceptance procedures; however, it will be identified by the transporter at the scale house. Loads containing dead animals and/or offal are disposed of by excavating a pit in the MSW at the working face, dumping the load, and filling the hole back in with MSW. Any areas receiving dead animals and/or offal are covered with daily cover soil at the end of the working day.

Medical Waste

Only medical wastes that have been rendered non-infectious by incineration or sterilization (by autoclaving) are accepted for disposal.

In the event that waste suspected of being non-treated medical waste is discovered at the working face or found in a random load check, the material is moved to a safe location, using care to avoid exposure of WGSL personnel to the waste or to needles potentially inside the bagged waste. Procedures for Management of Unacceptable Wastes are then employed.

Treated medical waste is handled and covered in the same manner as other MSW.

Storage and Disposition of Non-Disposable Waste

The WGSL does not accept the following categories of materials for disposal. These categories are prohibited by DOH solid waste regulations:

- Bulk green waste (should be sent for composting)
- Scrap vehicles (should be sent to a metal recycler)
- Tires (should be sent to a tire recycler)
- White goods (major appliances) (should be sent to a metal recycler)

Bulk green waste loads and scrap vehicles identified at the scale house are turned away from the site. Tires and white goods are occasionally encountered in mixed loads after being dumped at the working face. When these materials are discovered at the working face, WGSL personnel remove them and send them to a designated area on-site for temporary storage. The following guidelines are implemented for such materials:

- Tires are placed in a roll-off bin and stored until the bin is full at which time the bin is transported to an approved tire recycler. Roll-off bins may be covered with a tarp to keep out rain.
- White goods are stored in a designated area until an approved recycler comes to the WGSL to remove them. Appliances are handled and stored in a careful manner to prevent spills or the release of oil, lubricants and/or CFCs.

Records are maintained and placed in the operating record of off-site shipments of tires and white goods.

Inclement Weather Operations

Each year, prior to the start of the rainy season, a wet weather pad area and roadway improvements are implemented based on the filling plan progress and approximate waste volume expected during the season. The wet weather pad and roadway area are covered with crushed concrete and/or asphalt demolition base material, allowing the area to be used when rainy weather does not permit vehicle access to the normal working face, or when mud could be a nuisance if tracked onto Farrington Highway.

Cover Plans

Most soil used for daily and interim cover will come from material excavated during cell construction. However, soil received at the landfill for disposal may also be used. The active MSW disposal area is covered at the end of each day with a minimum of six inches of daily cover soil. Intermediate cover, consisting of a minimum 12 inches, is placed over disposal areas where additional wastes will not be placed for 30 days or more. The intermediate cover is graded to promote surface drainage. When additional waste is placed over these areas, the upper section of the intermediate cover is removed and reused to cover other portions of the landfill requiring cover.

4.2.8. Special Procedures for Ash Monofill

Ash monofill will be disposed of in designated areas of the landfill. Currently, no other materials are permitted in the ash monofill section.

Acceptable Ash Monofill

Only ash created by the incineration of MSW, industrial, or commercial waste is accepted for disposal at the WGSL.

Cover for Ash Monofill

The DOH permits the disposal of ash and requires that it be covered once every seven days with six inches of soil cover material. The area of the site used for the disposal of ash is managed so that any deliveries of ash are regularly smoothed out to prevent the ash from accumulating in tall piles.

Equipment

A minimum of one bulldozer and one bucket loader are available to manage the spreading and covering of ash during peak periods of disposal.

Excavation and/or Removal of Ash

Ash material and cover soil placed in the ash monofill section is left in an undisturbed state as much as practicable. In the event that the ash monofill section requires excavation or the removal of ash, the WGSL must notify the DOH of the proposed action and must wait for approval of the request prior to disturbing placed ash.

Use of Filled Areas

Filled or developed areas of the ash monofill are not used for any other active landfilling purposes. Specifically, these areas are not used for the storage of green waste, tires, white goods, or unacceptable waste removed from the MSW portion of the landfill. Only temporary soil stockpiling may be undertaken on the ash monofill area provided that there is a layer of intermediate soil cover placed over the ash monofill.

4.3. On-Site Roads

All on-site roads used by WGSL customers are maintained as all-weather roads. The roads are paved with rock, gravel, or concrete/asphalt rubble, and are graded and watered as needed to maintain them in a smooth and dust-free condition.

4.4. Dust and Mud

Personnel at the WGSL are responsible for the prevention of excessive fugitive dust blowing from the landfill. Water trucks are used to spray water onto on-site roads and other areas that generate wind-blown dust. The volume and frequency of the water spraying is increased as needed, especially during particularly dry and windy conditions.

During wet weather, measures are implemented to minimize the tracking of mud onto public roads. Wet weather tipping areas are constructed out of rock or asphalt and concrete rubble to minimize the exposure of customer vehicles to excessively muddy conditions. As customers exit the WGSL, their vehicles cross a “rumble strip” which vibrates mud from wheels and tires before exiting the site onto Farrington Highway.

Operations personnel will be responsible for maintaining these features and providing clean up, if it is required.

4.5. Safety Procedures and Record Keeping

4.5.1. Safety Procedures

WMH provides training and strict enforcement of a comprehensive program to ensure safety of customers and employees. On-site roads are clearly marked and an on-site speed limit of 10 miles per hour is enforced. Customers are directed by spotters to specific locations for unloading and traffic is managed to avoid accidents.

Employees are equipped with personal protective gear including reflective vests and hard hats. Safety devices on landfill equipment include seat belts, roll-over protective cabs, audible reverse warning devices, and fire extinguishers.

4.5.2. Record Keeping

Daily Operating (Scale House) Records

Each load of refuse delivered to the WGSL is documented in terms of the customer identity, type of waste, source of waste, and weight. Records of each load are maintained daily and accumulated for monthly and annual reports. Scale house records, including waste manifest forms, are archived and maintained on-site for a minimum of three years.

Daily Log

Any unusual occurrence on-site is documented in a daily log record maintained at the WGSL. Unusual occurrences include incidents of unacceptable waste identified in incoming loads, accidents, severe weather conditions, fires, or other unusual events. Operation personnel are trained to report and document these events. Daily logs are maintained on-site for a minimum of three years.

Records Related to Hazardous Waste Exclusion

The WGSL maintains records of the date, content, and names of employees attending annual training events related to the hazardous waste exclusion program. Any reports or other detail related to waste load inspections or incidents of unacceptable waste discovered at the landfill, in addition to information in the daily log, are placed in the hazardous waste exclusion files of the operating record.

Groundwater and Gas Monitoring Data

All results of groundwater monitoring and explosive gas monitoring at the WGSL are maintained for a minimum of three years in the operating record.

Climatic Data

Daily climatic data, including rainfall, temperature, solar radiation, evaporation, wind speed, and wind direction and humidity, are collected daily and maintained in a data base for evaluation of potential leachate generation.

Closure and Post-closure Plans and Data

The operating record includes copies of the current closure plan and post-closure plan, including records related to any actual closure or partial closure activity. Such records include engineering plans, construction inspection reports and certifications related to closure activities. Additionally, records pertaining to financial assurance for closure and post-closure are maintained, including cost estimates and documentation of financial assurance mechanisms.

Location Restrictions Demonstration

WGSLF will maintain a copy of its solid waste permit application documents containing analyses of the site location in relation to siting criteria listed in HAR 11-58.1-13, including airport safety, floodplains, wetlands, fault areas, seismic impact zone, unstable areas, tidal wave zone and local zoning ordinance consistency.

Access Control Documentation

Daily sign-in sheets for public visitors and other records documenting how the WGSL controls access to the site and prevents unauthorized dumping are maintained.

Liquids Restrictions Documentation

The WGSL does not accept liquid wastes for disposal. Records are maintained of liquid waste loads rejected during the special waste screening process or during load checks. This information may be incorporated in records of the hazardous waste exclusion program.

Training Records

Copies of employee training program agendas and attendance sheets are maintained. Applicable training programs include those related to hazardous waste exclusion, safety, environmental compliance, emergency procedures and other elements of facility operation.

Vector Control Records

Periodic (daily, weekly and monthly) inspection reports are maintained including observations of insects, rodents, birds or other potential disease vectors at the site. In addition, records of special inspections or abatement activities by pest control contractors providing services to the WGSL are maintained.

Litter Control Records

A daily record is kept of litter control activities and maintained in the operating record. The log contains information on the wind conditions each day, the number of litter control personnel on-site, and the volume of litter collected.

Asbestos Disposal Records

The WGSL is required by permit to maintain a record of each load of asbestos waste disposed at the site. Information recorded includes the type of waste, and source and location (preferably by GPS or survey coordinates) of its disposal location in the landfill.

Asbestos disposal records may be incorporated in the records of the hazardous waste exclusion or special waste screening programs.

Emergency Condition Reports

Any emergency incident or condition at WGSLF is required to be documented in an incident report that will be maintained in the operating record. Emergency conditions include fires, hazardous material spills, injury accidents, natural disasters such as floods or violent storms, and any other event that threatens the safety or security of personnel and facilities.

Adequate Storage Procedures

The WGSL is required by permit to maintain records documenting secure storage and handling of any green waste, scrap vehicles, tires or white goods brought to the site. Documentation must show that these materials, which are prohibited from disposal, were stored, managed and removed from the site in accordance with applicable regulations. Records should include documentation of any removal or management of oil, grease, CFCs or other fluids from vehicles and white goods prior to removal from the site to recycling facilities.

4.6. Stormwater Management

4.6.1. Drainage Control System

Stormwater is managed by controlled grading on the surface of the WGSL and a maintained engineered system of drainage ditches, channels, pipes, and basins. The stormwater drainage control system is managed to:

- Prevent run-on of surface water to the active disposal face or uncovered refuse
- Minimize erosion in all sections of the WGSL to address run-off/run-on
- Maintain roads and other ancillary facilities in useable condition under all weather conditions

- Prevent excessive runoff or sedimentation impacts to neighboring properties

The WGSL in areas being used for active disposal of refuse is graded at a slope of 2 to 5 percent away from the disposal area. Earthen berms are constructed upgradient of the active disposal areas if needed to prevent runoff from mixing with the leachate control system and to divert drainage around areas susceptible to erosion. Earthen berms are also constructed downgradient of locations that may be susceptible to erosion.

The landfill stormwater management system is designed and constructed to manage runoff from a 25-year, 24-hour storm. Runoff is collected in a system of surface ditches, channels, pipes and ponds.

Design Criteria

According to GeoSyntec, RCRA Subtitle D requires that the surface water control features at landfills be designed to control both run-on and runoff from the 24-hour, 25-year storm. The 24-hour, 25-year storm at WGSL is 9.2 inches based on information presented by the State of Hawaii (1984) and is used as the basis to evaluate the performance of the sedimentation/detention pond and estimate runoff for the landfill grading plan. (GeoSyntec and WMH, 2008).

Proposed Improvements

There are two surface water control systems are proposed for WGSL (GeoSyntec, 2008):

- Western Bypass Channel. GEI Consultants (GEI) prepared the Western Bypass Channel (off-site stormwater conveyance) for the upper canyon and western areas flows adjacent to the Landfill. The system will capture the upper watershed’s flows and route them around the landfill so that they do not mix with the surface water runoff from the landfill. The water will flow via large diameter pipes and/or concrete-lined channel(s) and discharge at a point south of WGSL's existing sedimentation basin.

- Onsite Stormwater Management System. This system has two components that capture: (i) flows from the western side of the landfill (primarily landfill runoff with minor amounts of run on); and (ii) flows from the eastern side (both landfill runoff and run on). Both flows will discharge stormwater to the existing sedimentation basin.

Figure 4-8 shows the alignment for the landfill's eastern and western systems and general details for the pipe and collection channels for the preferred expansion. Pipes and channels will be sized when construction drawings for the expansion are prepared. (GeoSyntec, 2008).

GeoSyntec evaluated the existing sedimentation basin configuration (i.e., emergency spillway, etc.) for flood control and for water quality requirements in the County of Honolulu Drainage Standards (City and County of Honolulu, 2000). GeoSyntec also used information presented by Shimabukuro et al. (1986) and EarthTech (2006) (e.g., dimensions, riser elevations, infiltration trenches, spillway, etc.). GeoSyntec's evaluation concludes that the existing basin meets the requirements for flood control and for water quality provided upstream run-on is diverted around the basin. (GeoSyntec, 2008).

Surface Water During Operations

During operations, surface water will be controlled by temporary pipes and ditches that will be moved as necessary to address stockpiles, active fill areas, the extent of each cell, and fill sequencing. Since the size of each cell may vary depending on the waste stream at the time, surface water details will be designed as part of preparing the construction drawing package for each cell. (GeoSyntec, 2008).

Proposed Surface Water Plan
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

R.M. TOWILL CORPORATION May 2008

4.6.2. Erosion Controls

Erosion is primarily controlled by the drainage control system to control and reduce the velocity of runoff. The system incorporates diversion berms, temporary letdown piping, and other similar measures. Side slopes are inspected periodically and eroded areas are repaired. Silt fences are installed on slopes subject to erosion on bare slopes. Areas of the WGSL not scheduled to receive additional waste for a year or more are seeded with grass to provide additional erosion control.

4.6.3. Prevention of Pollutant Discharges

Surface water management involves the prevention of discharges of pollutants into the nearby coastal waters to ensure against violating state water quality regulations by:

- Preventing runoff of surface water that has been in contact with waste. Any water that contacts waste is treated as leachate and is not discharged to the sedimentation basin.
- Controlling erosion to prevent loss of cover or washout of refuse
- Retaining and removing silt from surface water before it is discharged from the WGSL

In addition, the WGSL implements a Spill Prevention Control and Countermeasure (SPCC) Plan to prevent the discharge of petroleum products used on-site into surface waters.

4.6.4. Stormwater Quality

The WGSL manages stormwater to ensure that surface water discharged from the site meets the water quality standards set forth in Hawai‘i Administrative Rules, Title 11, Chapter 54. The standards prohibit the following in stormwater:

- Materials that settle to form sludge or bottom deposits
- Floating debris, oil, grease, scum, or other materials

- Substances in amounts sufficient to produce taste in the water, detectable off-flavor in the flesh of fish, or objectionable color, turbidity or other conditions in the receiving waters
- High or low temperatures; biocides; pathogenic organisms; toxic, radioactive, corrosive, or other depleting substances in combination or at levels sufficient to be harmful or toxic to human, animal, plant, or aquatic life, or in amounts sufficient to interfere with any beneficial use of the water
- Substances or conditions, in combination or solo, in concentrations which produce undesirable aquatic life
- Excessive soil particles resulting from erosion

Additional HAR standards governing toxic and hazardous constituents by specified levels of concentration expressed in milligrams or micrograms per liter are also identified.

4.6.5. Annual Update of Surface Water Management Plan

The WGSL prepares and submits to the DOH an annual update to its surface water management plan prior to the first day of September every year. The annual surface water management plan contains the following update information:

- The results of surface water management features and facilities inspections with a description of recommended maintenance and changes;
- Updated drawings of the surface water management system;
- Engineering calculations confirming the capacity of the system; and
- Updates to the WGSL’s SPCC Plan.

4.7. Regulation of Air Quality

Operations at the WGSL are subject to state and federal requirements for air pollution control. Activities conducted in relation to air programs include:

- Asbestos waste management in conformance with federal requirements for hazardous air pollutants (NESHAPS)
- Prohibition of open burning and implementation of programs to detect, prevent, and suppress fires in solid waste loads
- Monitoring for emissions of landfill gas
- Control of dust and odors

The DOH has been delegated authority from the EPA to enforce rules limiting the ambient emissions of non-methane volatile organic compounds (NMOCs) from solid waste landfills (40 CFR Parts 51, 52, and 60, Standards of Performance for New Stationary Sources and Guidelines for Control of Existing Sources: Municipal Solid Waste Landfills). Under this rule, landfills with a design capacity of over 2.5 million metric tons (2.76 million tons) are limited to 50 metric tons (55.1 tons) per year of NMOC emissions. The design capacity of WGSL is approximately 6 million tons and is therefore subject to the federal New Source Performance Standards, 40 CFR Part 60, subpart WWW. WMH monitors the emission of landfill gas from the WGSL.

4.8. Emergency Preparedness

4.8.1. Explosive Gas

Monitoring for the gases methane and hydrogen are conducted at the landfill office building and at the landfill property boundary. Detection of the gases will be through monitors placed within the office building and monitoring of installed permanent gas probes in accordance with RCRA Subtitle D regulations, HAR 11-58.1-15(d), and the WGSL Solid Waste Permit, as regulated by the DOH.

The EPA and DOH require~~s~~ that methane concentrations not exceed 25 percent of the lower explosive limit (LEL) in any inhabited structure or exceed the explosive limit at the landfill property boundary. Hydrogen monitoring is conducted similarly to maintain safe levels below the LEL.

In addition to monitoring structures, both methane and hydrogen concentrations are monitored at the property boundaries. In accordance with Subtitle D and HAR regulations methane cannot exceed a concentration of 5 percent and per the site DOH permit hydrogen cannot exceed a concentration of 4.7 percent. Monitoring conducted to date has not detected either gas at action levels.

If hydrogen or methane is detected, either in a building or at the landfill perimeter, the DOH will be notified and actions such as increasing vacuum on gas extraction wells to pull more gas from the landfill or adding gas extraction wells will be taken.

4.8.2. Fire

WGSL personnel at the scale house and unloading areas are trained to notice smoldering or burning material from incoming waste loads. If smoldering or burning material from an incoming waste load is spotted, WGSL personnel dump the load out in an area located away from the working face, spread it out, and extinguish it. Fire extinguishers are provided in all buildings and vehicles at the site for use in extinguishing small fires, while equipment or water is used to put out larger fires from incoming waste loads. Should a fire occur at the working face, the waste is initially covered with soil to smother the burning material. The material is then excavated and completely extinguished with water.

In the event of a structure fire or large fire in uncovered waste, the Honolulu Fire Department is summoned to assist in putting out the fire.

4.8.3. Emergency Procedures

The WGSL maintains a detailed Emergency Management Manual that provides detailed procedures to be followed by site personnel in the event of an emergency. Specific procedures are established for different types of emergencies, including medical emergencies, fires on and off the site, spills, bomb threats, natural disasters, and general emergencies. The emergency manual outlines chains of command and communication, preparatory activities, response procedures, personnel evacuation procedures, and recovery activities. The manual is updated as needed to respond to personnel changes or site conditions.

Severe Storms

The following measures are taken to protect against excessive erosion, flooding and wind damage before and during severe storms.

WGSL personnel inspect all on-site drainage structures and verify they are in working order prior to the arrival of a forecast storm. Excessive silt in ditches and basins are removed on a regular basis. However, in the event of a storm the ditches and basins will be subject to additional inspection and clearing if it is required. The condition of pipes and discharge structures from basins will be verified. Diversion berms are constructed around the current disposal area as needed to prevent run-on from upgradient areas entering the waste fill, as well as to prevent run-off from the waste fill to downgradient areas of the landfill. Interim cover is placed over exposed waste at the end of the working day prior to the beginning of the forecast storm.

At the discretion of WMH, the site may be closed for business during storm periods. In this event, the working face will be closed and covered with daily cover, graded to discharge runoff to the site surface water drainage system. Temporary diversion berms are constructed as necessary to prevent run-on to any areas of exposed waste.

Facility personnel periodically inspect site drainage systems during prolonged storms involving extensive rain, and correct or repair, as needed, any conditions with potential to cause damage to on- or off-site facilities.

Earthquake

In the event of a significant earthquake, the following procedures are implemented:

- Immediately cease or limit landfill operations
- Promptly conduct a visual survey of the site to identify any slope failures, fires, landfill gas system failures, or other conditions that could threaten worker and/or public safety
- Follow the procedures set forth for Fires, if any fires occur.
- Follow the procedures set forth if any injuries occur.

A significant earthquake is defined as an earthquake having a magnitude 5.0 or greater that originates from a source within a 100 kilometer (60 mile) radius from the site, or an earthquake having a magnitude 7.0 or greater originating anywhere within the major Hawaiian Islands (the triggering event). (WMH, 2008).

In the event telephone systems are inoperable, notification of the appropriate agencies/businesses will be accomplished in the most expedient manner available (cellular phones, person to person, overnight mail, etc.). In the event power is lost, landfill personnel will notify the appropriate local utility companies.

Hazardous Materials Spills

The WGSL has a low potential for spills of hazardous materials; however, incidents are possible in the event of vehicle accidents or malfunctions causing spills of coolant, fuel or lubricants. Actions that will be taken in the event of a spill are described below.

The first step in responding to oil or other substance spill is to keep the material separated from water. This minimizes migration of the spilled substance and exposure to WGSL personnel, customers, and environment. Every effort should be made to prevent spills and emphasize substance containment at the source rather than resort to separation of the material from expanded portions of the environment or downstream waters.

Discovery of a Release

The following actions are taken immediately by the WGSL personnel (discoverer) discovering a release of material from operating equipment, a container, or tank:

- Extinguish any sources of ignition. All potential sources of ignition are removed until the leaked material is identified as non-flammable. Vehicles are shut off. If the ignition source is stationary, an attempt is made to relocate the leaked material away from the ignition source. Movement that would create sparks or static electricity is avoided.
- Attempt to stop the release at its source. The discoverer assesses that no danger to human health exists. Simple procedures, such as turning valves or plugging leaks, are attempted if no health or safety hazard exists and reasonable certainty exists to the origin of the leak. WGSL personnel will not come into contact with an unknown or hazardous substance illegally brought into the landfill.
- Initiate spill notification and reporting procedures. The discoverer will immediately report the incident to a supervisor. If there is an immediate threat to human life (e.g. fire or fumes), an immediate alarm will be sounded to evacuate the building and the fire department will be called. If

an uncontrollable spill has occurred and/or if the spill has migrated beyond the site boundaries, assistance from the fire department will be requested.

Containment of a Release

The following actions are taken immediately by the WGSL personnel to contain the released materials:

- Attempt to stop the release at the source. If the source of the released material has not been found; if special protective equipment is necessary to approach the release area; or if assistance is required to stop the release, the fire department will be called in to halt the discharge at its source. WGSL personnel will be on hand to guide the fire department's efforts.
- Contain leaked material released into the environment. The spill should be contained by absorbent materials and dikes using shovels and brooms. Consult applicable material safety data sheets for material compatibility, safety, and environmental precautions.
- Outside contractors will be obtained, if necessary, to clean up the spill.

Spill Cleanup

The following actions are taken immediately by the WGSL personnel to cleanup the released materials:

- Recover or cleanup released materials. Leaked material is recovered as much as possible and reused where appropriate. Non-reusable material is declared waste. Liquids absorbed by solid materials are shoveled into top, 55-gallon drums; or if the size of the spill warrants, into roll-off container(s). Drum lids are then secured and drums are appropriately labeled (or re-labeled) identifying the substance, date of spill/cleanup, and the facility name and location. Combining non-compatible materials has the potential to cause dangerous chemical and/or physical reactions or may severely limit disposal options. Compatibility information is found on material safety data sheets.

- Cleanup of spill area. Surfaces contaminated by the release are cleaned by an appropriate substance or water. Cleanup water is minimized, contained and properly disposed. Occasionally, porous materials (such as wood or soil) are contaminated; such materials require special handling for disposal.
- Decontaminate tools and equipment. Even if tools and equipment used in the cleanup are dedicated to such cleanup efforts, they are decontaminated before being put back in the spill control kit.
- Arrange for proper disposal of any waste materials. Waste material from the cleanup is categorized, transported, and disposed of according to State and Federal regulations.

Injury Accidents

Site management personnel are identified immediately in the event of an accident. First aid kits are maintained in site offices and vehicles for use as needed. If the extent of an injury requires additional treatment, the local emergency response provider is notified by dialing 911. The individual making the call will inform the operator of the extent and location of the emergency, what first aid measures have been initiated, and the need for any special equipment (i.e. hazardous materials response, confined space rescue, or vehicle extraction).

Persons with major injuries are never to be moved without professional assistance. Major injuries include second or third degree burns; unconsciousness; severe bleeding; obviously broken limbs; and any head, back, or neck injury.

Additional details on procedures for preventing and responding to accidents are contained in the Employee Safety Plan.

Records of all site accidents and first aid treatments given are maintained at the WGSL office. Accident reports are filed with insurance companies and State agencies as required.

After the accident situation has been stabilized, site management arranges for an investigation into the cause of the accident. A complete investigation report should be completed within seven days of the accident. The report includes a review of the actions leading up to the accident, factors that contributed to or mitigated the severity of the accident, and provide recommendations to prevent reoccurrence of such an accident.

4.9. Closure of Existing Landfill Area

The existing area of the landfill will require closure as the planned lateral expansion area is used. Final cover will be placed and final grades will be established. The final cover will be designed and placed in accordance with 40 CFR, Part 258, Subpart F, Criteria for Municipal Solid Waste Landfills, Closure and Post Closure Care, and the approved facility Closure Plan. The final cover will consist of a layer of compacted soil overlain by an impermeable HDPE flexible membrane liner. A vegetative/erosion control layer will be placed over an infiltration barrier in all areas of the landfill. Material for revegetation will come from stockpiled materials suitable for final cover or on-site excavated material will be used.

Final grading will not exceed the maximum permitted elevation of 513 feet. The top deck of the existing area of the landfill will be graded at a minimum 5 percent slope to promote drainage while allowing for future settling at the surface. Final grades for slopes will be designed at an approximate 3:1 maximum ratio (vertical height).

The existing ash fill section will have a high point of approximately 275 feet on the top deck, graded at a minimum 5 percent slope. Final grading for slopes is designed at an approximate 3:1 ratio (vertical height).

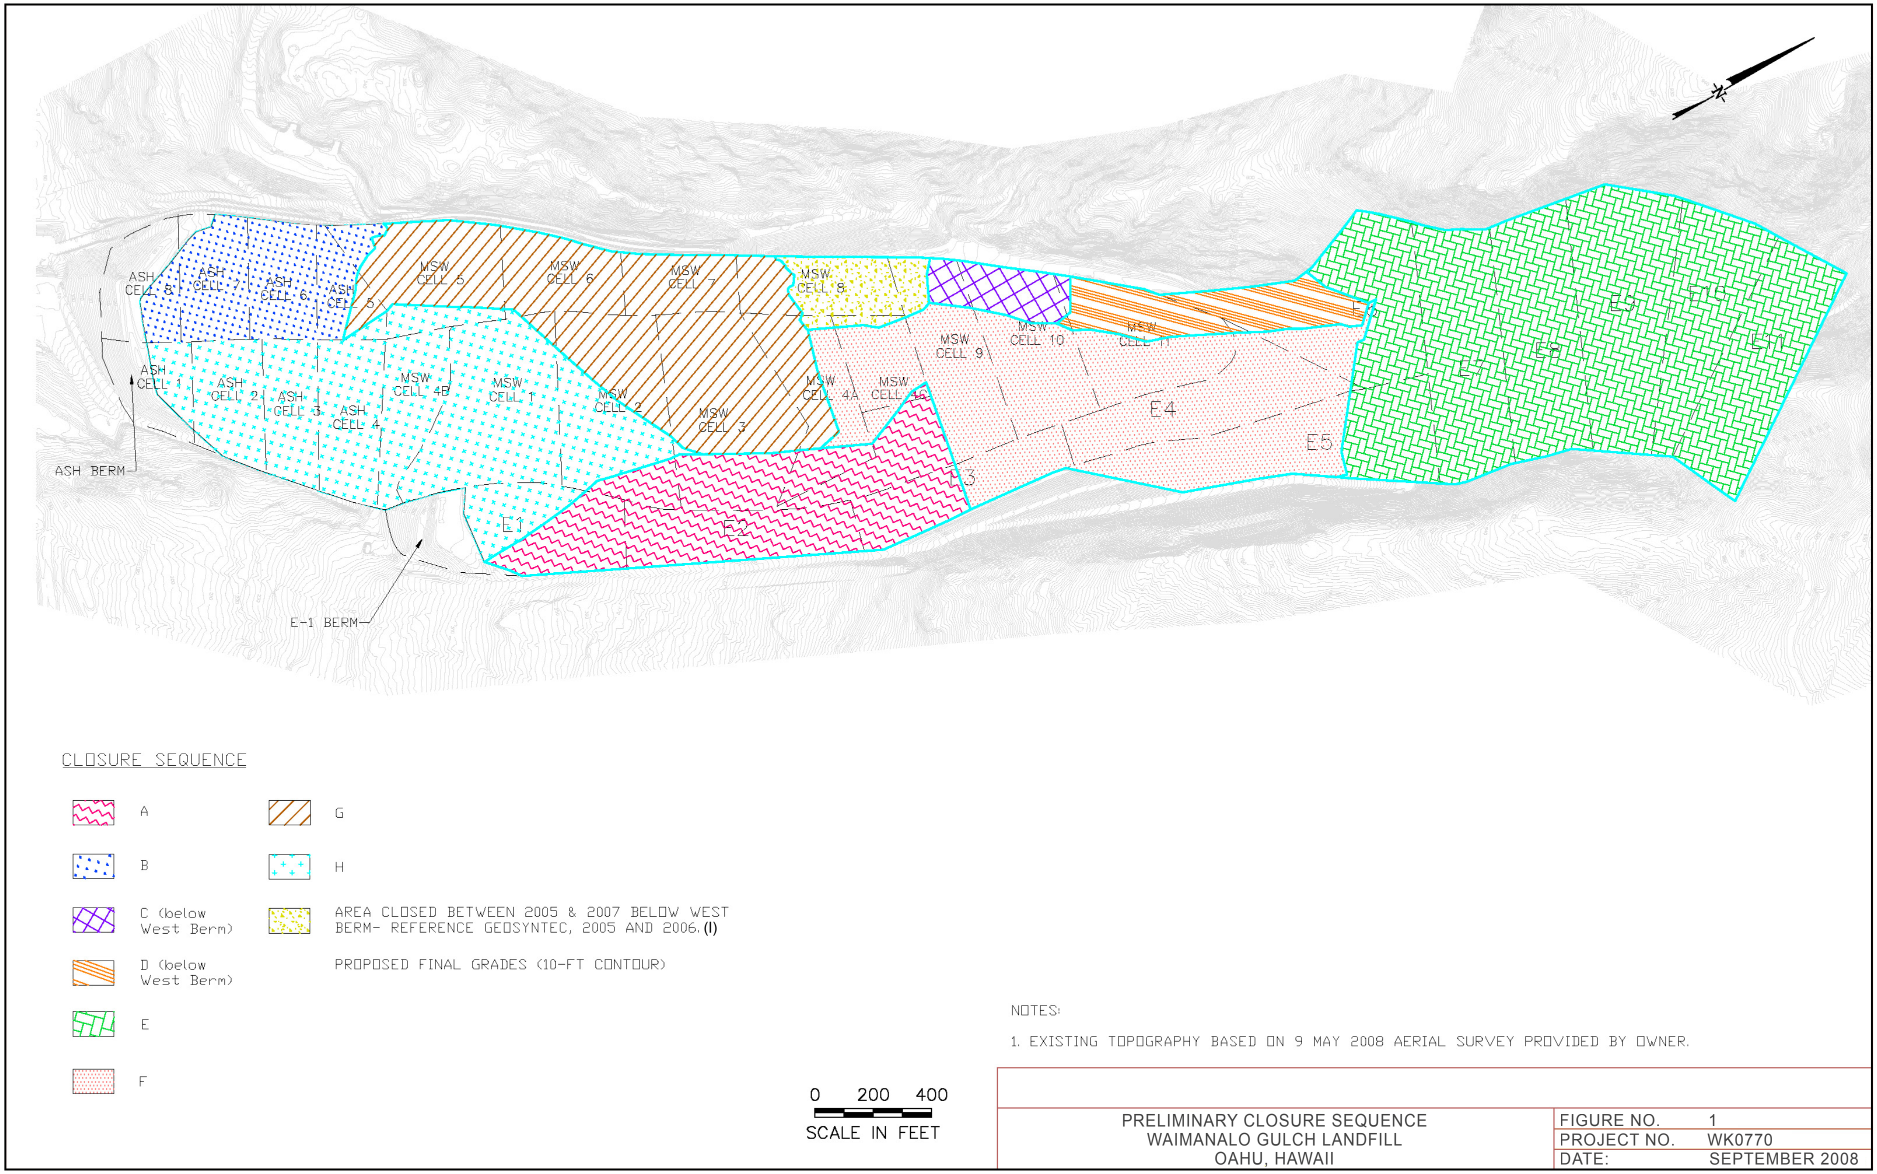
4.10. Closure of Lateral Expansion Area

The closure of the area of lateral expansion will be similar to closure activities for the existing landfill site. Final cover will be placed on cells that have been filled to capacity. The final cover will be designed to minimize infiltration of rainwater and a vegetative/ erosion control layer will be placed over an infiltration barrier in all areas of the closed expansion area. The preliminary closure sequencing plan for WGSL is shown in **Figure 4-9**. The plan will be modified as required to meet operational, safety and landscaping requirements.

Landscaping will be placed according to the location and characteristics of the vegetative/erosion control layer. The present plan is to continue filling along the west side of the landfill as the final phase of filling. These operations will start at the west stability berm and continue to the area of the ash monofil. It is important to recognize that the face of the ash disposal area has largely been covered with an interim soil cover, and portions have been planted with natural vegetation. As that vegetation matures and becomes fully established, and as the operator places rocks on the face to emulate the nearby undisturbed ground, even the ash monofill will be much less distinguishable from the surrounding land. Additional landscaping to the front area of WGSL is planned.

The final vegetative cover will consist of plants similar to those of the surrounding terrain and area. These plant materials are expected to include koa haole and related low lying drought tolerant plant species.

Soils used for final cover will be selected to match the surrounding terrain adjacent to the landfill site. Surface rocks that have been stockpiled during the active working phase will be used on the final cap during the closure process. The final cap will be installed and vegetated with a combination of grasses and natural vegetation that is native to the area. Rocks will be placed on the final cap after the revegetation process is completed to make the final appearance of the landfill blend into the surrounding hillsides.



Source: Waste Management of Hawaii,
Waimanalo Gulch Landfill, Oahu, Hawaii, September 2008

Figure 4-9
Preliminary Closure Sequence
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

Once the site is closed monitoring equipment will be placed to measure leachate and gas generation; vegetative and other natural materials will be established; and the site will be monitored for a period of not less than 30 years.

The completion of closure activities will include the demobilization of construction activities by the contractor. Demobilization will include:

> Restoration or modification to existing utilities such as power lines or water sources associated with the termination of service.
>
> Roadways providing access to the site and surrounding areas shall be cleared of construction equipment, materials, and debris. Any damage to the surrounding roadway system, as a result of closure activities, will be repaired. As required, exposed ground areas will be grassed, seeded, or otherwise replanted with appropriate vegetative material.

4.11. Project Schedule and Cost

The proposed project is scheduled to begin upon approval of the necessary land use entitlements. Each cell of the lateral expansion area will be developed on an as-needed basis. Construction may therefore be limited to work on one cell at a time, except during periods of transition when one cell is being closed and a new cell is being prepared for use, or multiple cells have interdependent excavation features. Closure of the final cell is anticipated to occur at the end of approximately 15 years, upon the exhaustion of the final cell. Follow-up procedures involving post-closure landscaping, vegetation, and landfill monitoring would occur at that time.

The following are estimated costs in 2008 dollars associated with the proposed project:

Total Landfill Associated Costs	
Capping Cost	$27,800,000
Excavation and Liner Cost	$60,800,000
Common Site Costs	$29,200,000
Permitting Costs	$900,000
Total Cost	**$118,700,000**
Costs Associated with Completed Area of Landfill	
Common Costs Associated with Completed Areas	$1,000,000
Current Capping Costs Associated with Completed Areas	$18,300,000
Total Cost	**$19,300,000**
Total Cost Associated with Proposed Project	**$99,400,000**
(Total Landfill Associated Costs - Costs Associated with Completed Area of Landfill)	

Source: Waste Management , Inc., March 2008

Section 5
Environmental Setting
Potential Impacts and Mitigation Measures

5.1. Climate and Rainfall

5.1.1. Climate and Rainfall

WGSL is located in a region of Oʻahu that is relatively arid when compared to the rest of the island due to the "rain-shadow" effect of the Waiʻanae Mountain Range. Average annual rainfall in the lowland area is approximately 20 inches, while stations in nearby mountains experience significantly higher rainfall averages (Hokuloa gauge, elevation 2,200 feet mean sea level [msl], average annual rainfall is 42 inches).

The Waimānalo Gulch area receives approximately 20 to 30 inches of rainfall annually. The Waiʻanae weather station, located near the WGSL offices, sits at an elevation of 10 feet above msl and receives an average of 20 inches of rain per year, with extreme temperature records of 45° Fahrenheit (F) and 96°F. Rainfall increases substantially with elevation, reaching an average of 75 inches at the top of Mt. Kaʻala, 4,003 feet above MSL. According to an on-site rain gauge, located at the weather station, the average rainfall at the WGSL is approximately 15 inches per year.

Winds at the WGSL are predominantly the prevailing Hawaiian tradewinds. These tradewinds are channeled along the Nānākuli coastline by the Waiʻanae and Koʻolau Mountains in a southeast to northwest direction at an average speed of approximately 10 knots. Between October and April, the WGSL experiences southerly winds associated with Kona storms or approaching storm fronts.

Typically, daily temperatures range from the low 60's to upper 70's during the winter season and from the lower 70's to upper 80's during the summer season.

5.1.2. Potential Impacts and Mitigation Measures

The proposed project is not anticipated to result nor constitute a source of impact to the climate or rainfall resources of the project area or region.

Secondary or cumulative impacts are not anticipated or expected. While the proposed scope and scale of the project are not sufficient to influence these resources, greenhouse gases (GHG) such as methane and carbon dioxide generated from the landfill could be a potential contributing factor to global warming. An investigation of alternatives to the use of landfills in Section 9 and Appendix K, found that WGSL in combination with the use of landfill gas for the generation of electricity, and the use of the site for the disposal of H-POWER ash, are expected to contribute to fewer GHG emissions than use of the site solely as a landfill with no provision or support for the recovery of energy.

5.2. Topography

5.2.1. Topography

The regional topography near the WGSL is dominated by the moderate to steep Wai‘anae Range, a northerly trending volcanic mountain complex that is characterized by narrow valleys separated by steeply sloping hills and ridges. The range extends northward from the site approximately 20 miles and is up to approximately 4 miles in width. WGSL is located at the southern toe of this range in a typically steep and narrow valley (gulch). Elevations along the main mountain ridgeline range from about 1,000 to 3,600 feet msl. Elevations drop dramatically away from the main ridgeline. Lateral slopes along the Wai‘anae Range are asymmetrical, with steeper slopes to the west. Typical slopes on the sides of the range drop some 2,600 feet over distances of two miles or less. Near the WGSL, the mountains of the Wai‘anae Range transition to low lying coastal plains. Elevations abruptly diminish from 2,300 feet msl (Pu‘u Manawahua) to sea level in a lateral distance of two miles in the WGSL vicinity (RUST, September 1993).

The WGSL is located in a relatively narrow gulch with a steeply sloping valley floor and sides. At the mouth of the gulch, the elevation of the valley floor is approximately 50 feet msl and rises to 450 feet msl over a distance of 4,800 feet (up to an 18% slope). Relative elevations between the valley floor and the tops of the adjacent ridges range from about 60 feet to 240 feet. Waimānalo Gulch is approximately 1,000 feet wide from ridge to ridge at its widest point, and is about 500 feet wide at its narrowest point (near the confluence of the upstream tributaries). Site elevations vary from a low of about 70 feet msl in the southeast corner to a high of about 940 feet msl in the northern portion of the property. Site topography of the landfill property is shown on **Figure 5-1, WGSL Topography**.

5.2.2. Potential Impacts and Mitigation Measures

Adverse impacts to topography, geology, or soils are not anticipated. See Section 5.3., Geology, Subsection 5.3.3, Potential Impacts and Mitigation Measures, which addresses the potential for adverse effects to topography, geology, and soils at the project site.

5.3. Geology

5.3.1. Geologic Setting

The island of Oʻahu represents the eroded remnants of two shield volcanoes, Waiʻanae and Koʻolau. The Koʻolau volcano was active after the Waiʻanae volcano became dormant, and its flows backed against the Waiʻanae volcano shield to form the Schofield Plateau. After a long quiescent period during which erosion cut canyons several thousand feet deep, another series of lava flows, the Honolulu Volcanic Series, formed cinder and cones primarily along the southeastern portion of the island.

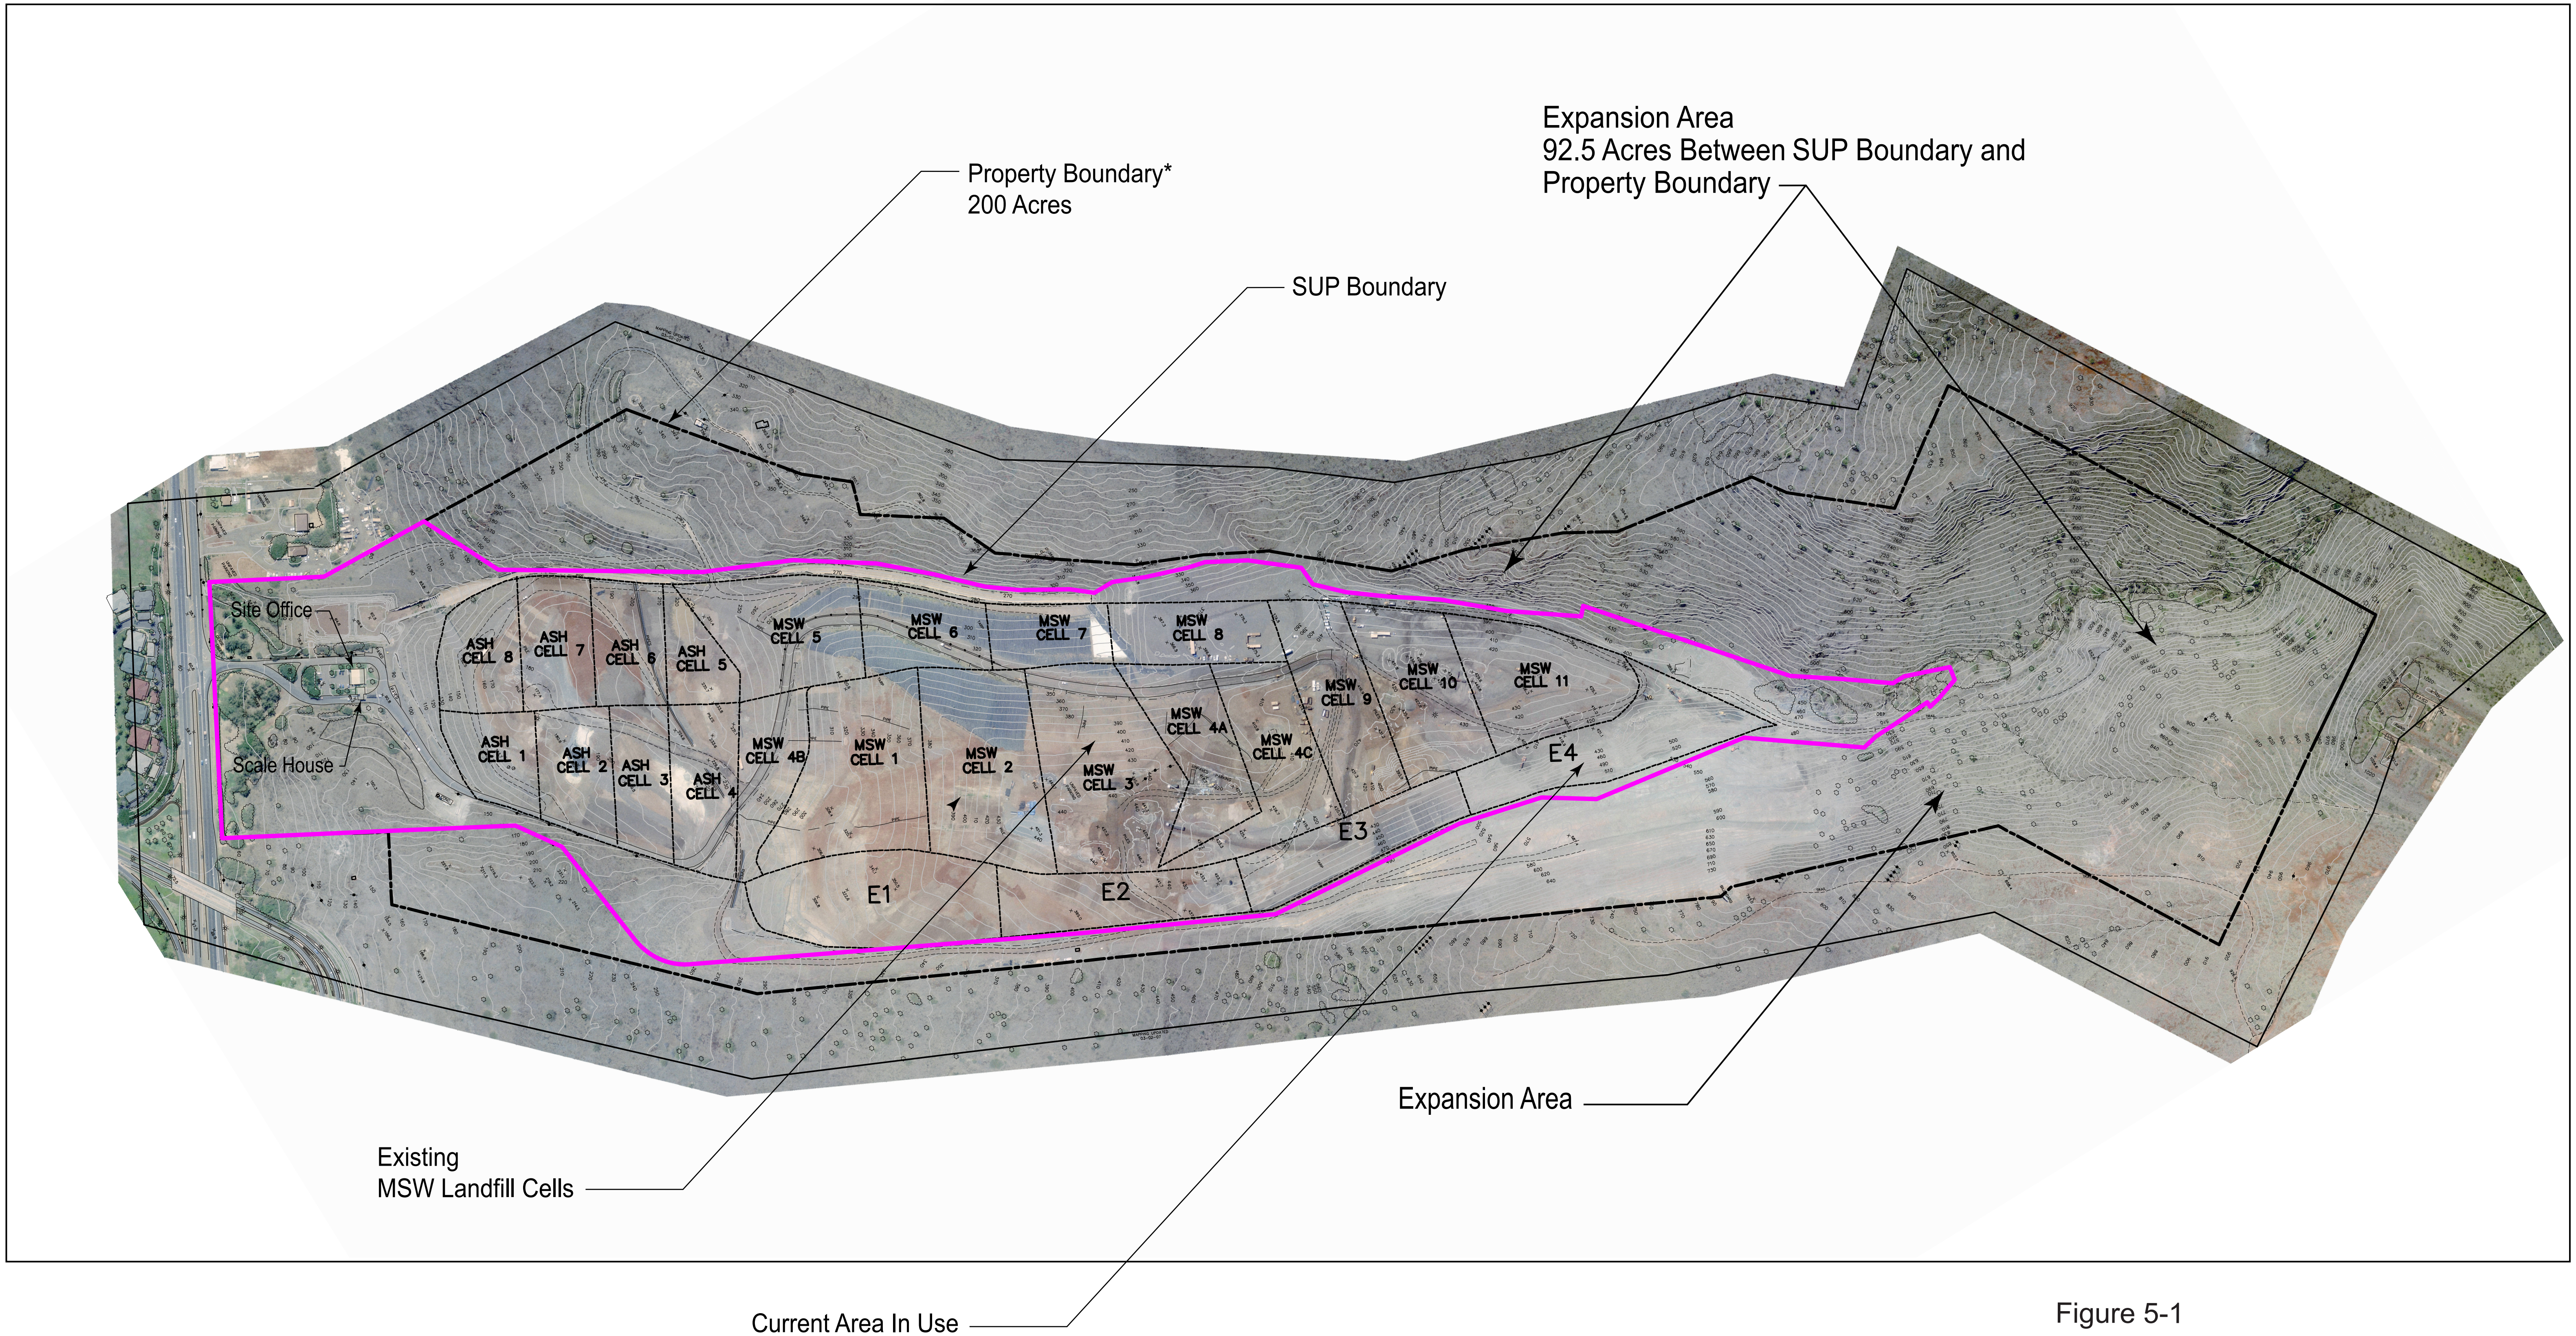


Figure 5-1

0 500 Feet 1000

R.M. TOWILL CORPORATION

March 2008

The Waiʻanae Volcanic Series was formed during the Tertiary time and forms the majority of the Waiʻanae Range. This series is divided into lower, middle and upper members originally by Streans and Vaksvik (1935) and Streans (1940). Sinton (1986) renamed the shield-building, caldera filling and post-caldera stages of the Waiʻanae volcanics. Currently, the lower member has been remapped as the Lualualei Member, the middle member is now the Kamaileunu Member and the post-caldera lavas known as the upper member are now the Palehua Member (Mink & Yuen, Inc. and Knight Enterprises, Inc., 2006). The Lualualei Member consists of sequenced lava flows and associated pyroclastic rocks up to 2,000 feet thick, which makes up the majority of the Waiʻanae shield volcano. The rocks of this member are mostly thin-bedded pahoehoe that are locally intruded by dikes in the southwestern portion of the island (Takasaki, 1971).

The Kamaileunu Member of the Waiʻanae Volcanic Series is in unconformable contact with the Lualualei Member and consists of rocks that accumulated in the caldera and, as such, are thick (on the order of 2,000 feet) and generally horizontally bedded (Macdonald, 1940). This member resembles the lower member but contains more a'a flows than in the lower member. The Kamaileunu Member also is locally intruded by dikes in the southwestern portion of the island (Takasaki, 1971).

The Palehua Member is about 2,300 feet thick, and is mostly massive a'a flows that issued from large cinder cones (Takasaki, 1971). Dikes also locally intrude the upper member in the southwestern portion of the island, but fewer dikes are present in the upper member than in the lower two members. The valleys of the Waiʻanae Range typically contain moderately thick deposits of alluvium and colluvium.

Erosion has removed most of the western slope of the Waiʻanae shield and exposed the internal structure of the volcano. The shield was built by eruptions that took place along three rift zones. The two principal rift zones trended northwestward and southward from the summit, while a lesser one trends northeastward (Takasaki, 1971). A rift zone of an active volcano is characterized by parallel to subparallel fissures and a line of cinder and spatter cones. These features are absent in older, dormant volcanoes such as the Wai‘anae volcano where rift zones are identified by erosion-exposed dike complexes (Takasaki, 1971). The dikes are generally basalts and diabases and are aphanitic or have only a small content of phenocrysts and are typically orientated subparallel to the rift zone. The dikes typically have glassy chilled margins and show a gradual steady increase in grain size from rim to center. Near surface lava in Hawai‘i typically contains high numbers of cooling joints, vesicle partings, flow-unit boundaries, rubble layers and other planes of weakness (Walker, 1987). Dikes cutting near surface flows can be highly irregular in shape. Dikes are common in the western and southwestern Wai‘anae Range. They are sparse in the less permeable, massive, thick-bedded flows of the upper member and more numerous in the highly permeable, thin-bedded flows of the lower member of the Wai‘anae Volcanic Series (Takasaki, 1971).

"Caprock”, which consists primarily of alluvium, terrigenous and marine clays, and fossilized coral reef with associated calcareous detritus, overlies the volcanic sequences along much of the O‘ahu coastline. Portions of the caprock are important local coastal aquifers, such as in the ‘Ewa Plain. However, much of caprock is less permeable than the sequences of volcanic rocks so it acts a confining unit above the volcanic aquifer sequence (Hufen et al, 1980; RUST, September 1993).

5.3.2. Soils

According to the Soil Survey of Islands of Kauai, O‘ahu, Hawai‘i, Molokai, and Lanai, State of Hawai‘i (U.S. Department of Agriculture, 1972), there are primarily two soil associations found at the current WGSL and existing expansion area: Lualualei-Fill Land-Ewa Association, and Rocky Land-Stony Steep Land Association.

- Lualualei-Fill Land-Ewa Association: consists of deep, nearly level to moderately sloping, well-drained soils that have a fine textured or moderately fine textured subsoil or underlying material, and areas of fill land, on coastal plains. This soil association is primarily located from coastal areas to approximately ±1,500 feet mauka of Farrington Highway, within the landfill property.

- Rocky Land-Stony Steep Land Association: Consists of steep to precipitous, well-drained to excessively drained, rocky and stony land. This soil association is located within the remainder of the ±200 acre landfill property (USDA, 1972).

Most of the soil at the project site consists of Rock Land (rRK) with small amounts of Stony Steep Land (rSY) (**Figure 5-2, Soils Map**). According to the U.S. Department of Agriculture the general characteristics of these soils consist of the following:

- Rock Land (rRK), is a type of soil where exposed rock covers 25% to 90% of the surface. Rock outcrops and very shallow soils are the main characteristics. The rock outcrops are comprised primarily of basalt and andosite. This land type is nearly level to very steep. Soil materials associated with the rock outcrops are very sticky and very plastic, and have a high shrink-swell potential when moisture-laden.

- Stones and boulders usually cover 50 to 90 percent of the surface. There are usually small amounts of soil among the stones that provide a foothold for plants. The natural vegetation consists of kiawe, koa haole, and grasses.

- Rock land soil properties are not conducive to urban development. Intensive land use development on this soil type is usually difficult and costly because of construction restraints and requirements. Foundations for buildings and structures require additional construction effort to achieve a stable base for development, which are provided for the administrative buildings within the existing landfill site. (U.S. Department of Agriculture, 1972).

R.M. TOWILL CORPORATION March 2008

5.3.3. Potential Impacts and Mitigation Measures

The proposed project will involve an approximately 92.5 acre expansion of the existing permitted landfill area that currently comprises 107.5 acres. The potential impacts to topography and geology of the site are anticipated to involve changes to the landforms of the remaining undeveloped portions of the Waimānalo Gulch and the underlying soils and geology of the site.

Since construction of the site in 1989, major changes have modified the gulch. This has included excavation and grading to construct landfill cells, access roadways, drainage control features, and building structures to support administration, operation, and management of the site. These prior activities were primarily completed in the forward and eastern portions of the landfill property closest to the adjoining Farrington Highway.

In 2007, the report, Engineering Report for Grading Plan Modification, December 2005, Revision 3, Waimānalo Gulch Landfill, ‘Ewa Beach, O‘ahu, Hawai‘i, was completed to reassess and identify measures to maintain the soils and geologic integrity of the area of use (GeoSyntec Consultants, Inc., Revised February 8, 2007). Factors that were assessed for the design included:

- Static slope stability analyses
- Seismic slope stability analyses
- Seismic deformation analyses
- Drainage and surface water control system analyses
- Leachate collection and removal system (LCRS) design studies
- Liner system design studies
- Landfill gas collection system design studies[1]

The results of the report were submitted to the DOH to verify the basis for the design and to meet regulatory requirements of the Solid Waste Management Permit.

---

[1] Initial work for the landfill gas collection system design was undertaken by Shaw Environmental with follow-up work performed by Environmental Information Logistics (WMI, 2008).

Mitigation to address the proposed area of lateral expansion will involve updates to these studies, or additional studies as needed, to maintain the soils and geologic stability of the site as required by the DOH as the project progresses. One additional study proposed is an examination of the potential for rockfall hazards associated with the use of controlled blasting. According to the report, Blasting Effects on Rockfalls and Vibrations, Waimanalo Gulch Landfill (Geosyntec Consultants, September 2008) (**Appendix M**):

> "Prior to starting the full-scale blasting program for production, WM plans to conduct a [Controlled] Blast Test Program at the site. The program will consist of monitoring particle velocity and frequency of vibration with distance from the blast source for the known blast charge. Based on the Blast Test Program, the site-specific constants β and H can be determined. Once these site-specific constants are established, equation (1) can be used to establish the distance from the blast beyond which the impact from the blast will be safe. Similarly the frequency-distance attenuation relationship will also be established based on the test program.
>
> The above program will help establish the charge weights per delay that will be used during production blasting operations so that blasting does not adversely impact the residential developments.
>
> In addition to the above, as a part of the above Blast Test Program, WM will also monitor the potential for rockfalls during blasting. If a potential for rockfalls is identified, WM will use barriers (e.g., nets) to mitigate the potential rockfall issues."

Based on the results of the ~~study~~ studies and updates, an appropriate design will be prepared and reviewed by the Department of Environmental Services, the DOH, and other regulatory agencies as required by law. ~~The final design will be modified as required in accordance with agency comments to meet safety and engineering standards. Adverse impacts to topography, geology, or soils are not anticipated.~~

The final design will be modified based on maintaining the stability of all cut slopes and will be reviewed by registered professionals during construction. All slopes will be excavated to meet required factors of safety and work will be done in accordance with all OSHA requirements. The DOH engineers and staff are expected to review all aspects of the construction during the permit review and while construction is in progress.

Adverse impacts to topography, geology, or soils are not anticipated based on the use of the mitigation measures as described above.

Secondary or cumulative impacts are not anticipated or expected. The site has been in operation for approximately 18 to 19 years and has been subject to ongoing technical studies and evaluations by independent technical consultants for the topographic, geologic and soils resources of the site to ascertain the performance and environmental safety of the facility. During this period the technical studies that have been completed have been used to improve the capacity, capability, and safe use of the site for a landfill.

The evaluation of WGSL through the preparation of technical studies and reports will continue to be used for further improvements and modifications, as required, through the mitigative measures provided in this EIS document.

5.4. Surface Water

Surface water at the site is limited by the existing dry and arid conditions of the site. There are no natural perennial streams located within the project site. After heavy rainfall events, overland surface water flows occur in Waimānalo Gulch and are directed to surface water drainage systems constructed at the landfill.

5.4.1 Drainage Control System

In 2003, GeoSyntec Consultants, Inc., prepared the report, Revised 14.9 Acre Landfill Expansion Master Plan, Waimānalo Gulch Landfill, for WMH. The purpose of the report was to fulfill the permitting requirements for the landfill involving the prior expansion area which included composite lined disposal cells E-1 through E-4 that were added to the original footprint of the landfill along the eastern and northern sides of the existing landfill footprint. The development of cells E-1 through E-4 included the construction of a stability berm along a portion of the western side of the landfill to provide stability for the cells.

According to the 2003 report, the new western berm extends over and blocks a portion of the existing concrete lined channel. In order to replace this conveyance, the western surface water control system was to be modified to include an upper detention basin and two 42 inch pipes buried below the western berm (GeoSyntec, 2003). Water from the northern portion of the landfill property would flow into the detention basin to be constructed upstream of landfill cell E-4. Water temporarily stored in the detention basin would then flow into the two pipes, and discharge into the downstream portion of the western drainage channel that was unaffected by the construction of the western berm. Stormwater flows in excess of the capacity of the two pipes would be stored in the detention basin and would be released as the flows decreased. However, the detention basin was not included in the prior State Special Use Permit application limits and therefore, was not constructed. (GeoSyntec, 2007).

According to the GeoSyntec 2003 landfill master plan, the surface water at the site would be controlled by two drainage systems: (1) the eastern drainage system; and (2) the western drainage system. Conceptual details for both systems were presented in Appendix E of the GeoSyntec 2003 landfill master plan. Both drainage systems collect water from the landfill and offsite areas. However, the western drainage system collects surface water from a significantly larger area than the eastern drainage system.

The plan for the eastern drainage system consisted of a combination of rip rap swales, headwalls and piping to carry drainage from the eastern side of the landfill to the sedimentation basin. The eastern drainage system plans were submitted to the DOH in the 2006 Surface Water Management Plan but has not been constructed. Modifications to the drainage system to address use of the remaining landfill cells E-1 through E-4 have been prepared and were submitted to the DOH. (GeoSyntec, 2007).

The planned western drainage system will consist of a channel that will divert run-on from the watershed upstream of the landfill property around the landfill bypassing the existing sedimentation basin. A pipe and open channel system will collect runoff from the landfill and carry it to the existing sedimentation basin. (GeoSyntec, 2007, and WMH, 2008).

In 2006, as part of the MSW cell E-3 construction, WMH constructed two temporary 48-inch diameter corrugated metal pipes (CMP) to carry water from the area immediately upstream of the landfill under the west stability berm. These pipes will be extended up canyon as the Western Berm is increased in size. Use of these pipes will be phased out as the landfill is extended up the canyon and replaced with permanent drainage structures.

Figure 5-3, Surface Water Plan, shows the alignment for the landfill's eastern and western systems and general details for the pipe and collection channels for the preferred expansion. Pipes and channels will be sized when construction drawings for the expansion are prepared. (GeoSyntec, 2008).

5.4.2 Potential Impacts and Mitigation Measures

The potential for adverse impacts to surface water are not anticipated. The proposed lateral expansion will involve review of the existing drainage system and its capacity to handle the planned area of expansion. The design, engineering and construction of the system will receive similar review and analyses to maintain proper control of stormflows including Clean Water Act regulatory concerns as managed by the State DOH, Clean Water Branch including National Pollutant Discharge Elimination System (NPDES) standards to maintain protection of the coastal class "A" waters along the Waiʻanae Coast.

<u>See Section 5.5. Groundwater and Hydrology for further discussion of secondary and cumulative impacts to surface water.</u>

The system will be constructed upon satisfactory review by state and City & County of Honolulu regulatory agencies and completion of all required environmental and construction permit applications and documents addressing control of erosion and stormwater.

5.5. Groundwater and Hydrology

Information provided in this section is from (1) Hydrologic Setting and Groundwater Monitoring, Waimānalo Gulch Sanitary Landfill, Kahe Valley, Island of O‘ahu, Hawai‘i, by WMI and GeoSyntec, 2006 (**Appendix D**); and (2) Basalt Dikes Influence on Groundwater Flow, Waimānalo Gulch Sanitary Landfill, O‘ahu, Hawai‘i, by Golder Associates Inc., 2007 (see References).

5.5.1. Regional Hydrogeology

On a regional scale, fresh groundwater in aquifers on O‘ahu is similar to other islands, and occurs as a lens floating above and displacing saline groundwater. Generally, the fresh water lens is thickest at the center of the island and thins toward the edges of the island at sea level (e.g. Hufen and others, 1980).

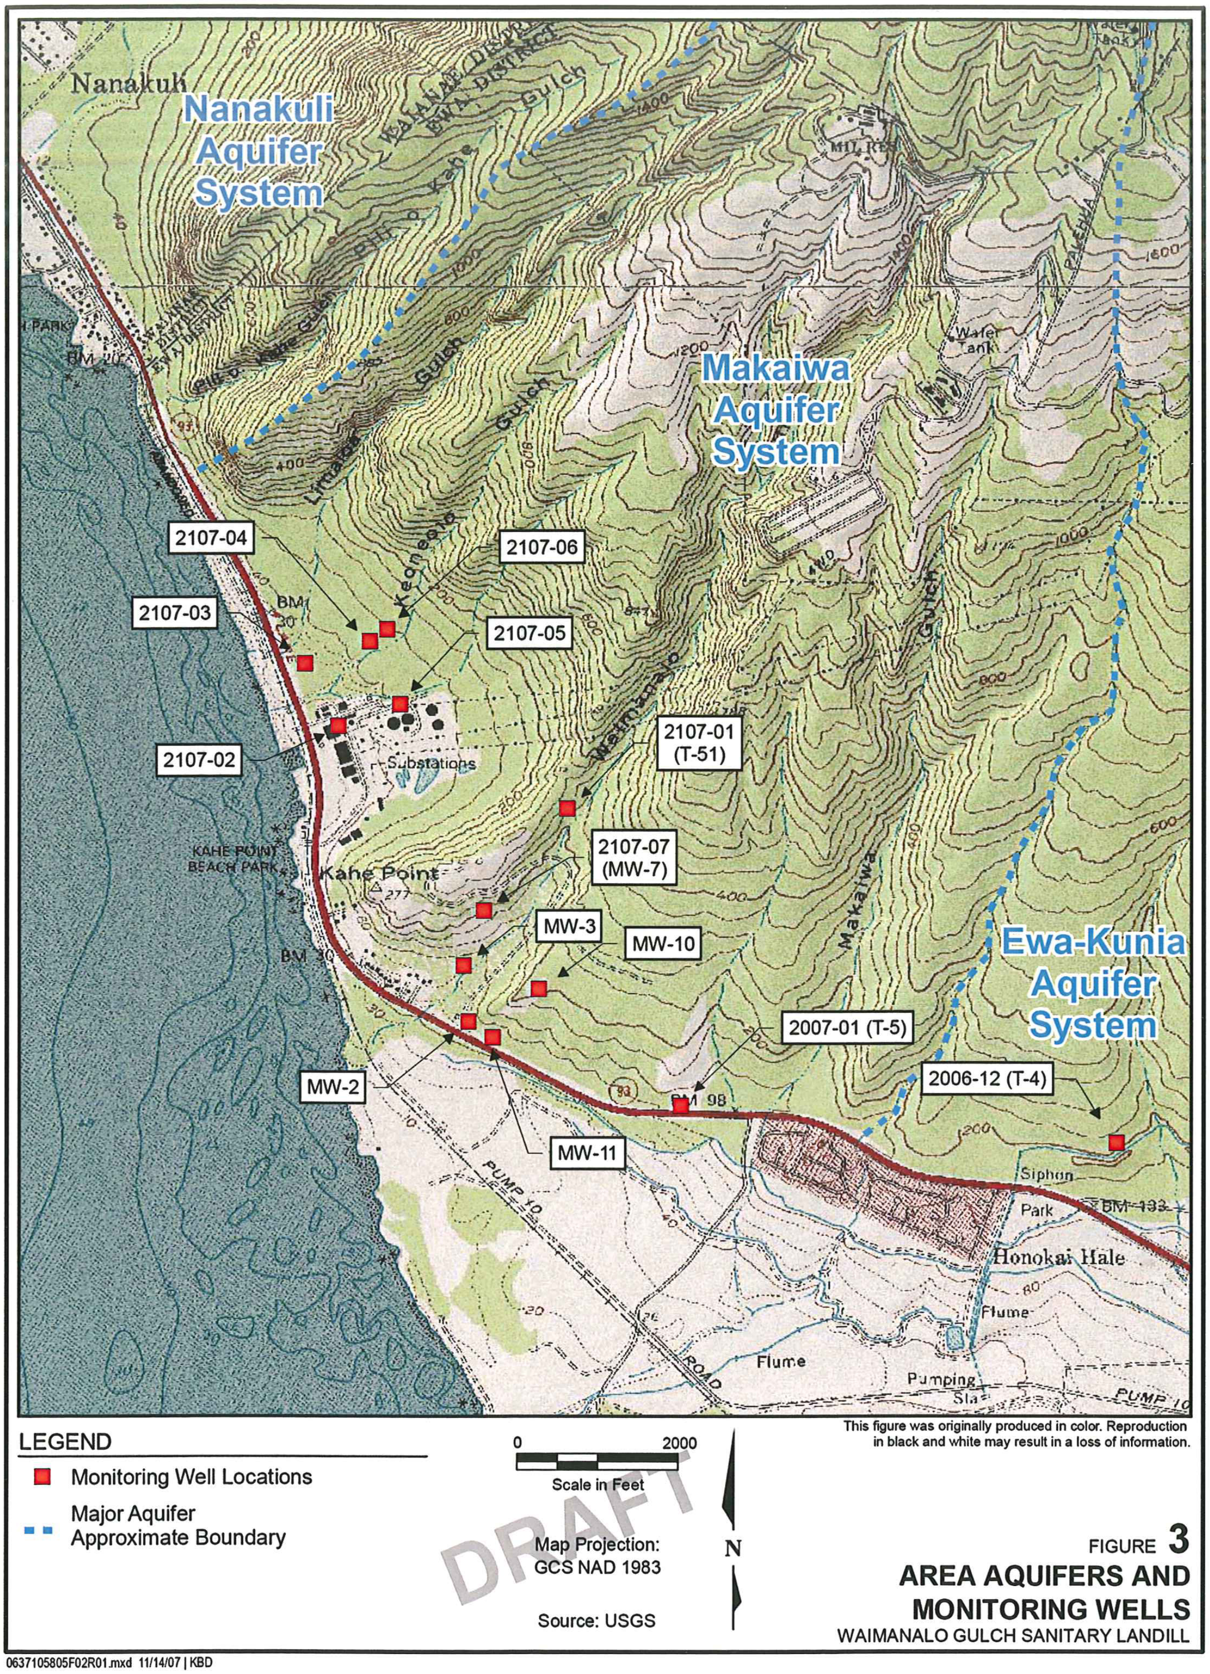
In the southwestern portion of the Wai‘anae Range, the principal groundwater aquifer system is the Kamaileunu and Lualualei Members of the Wai‘anae Volcanic Series. The volcanic aquifers are recharged by infiltration of rainfall and surface runoff originating in the Wai‘anae and Ko‘olau Ranges. Flows of the Palehua Member are largely above the water table and contain only a small perennial supply. Permeability of a volcanic aquifer is generally high due to presence of pahoehoe lava tubes and loose clinker zones and rubble between lava flows. However, permeability is highly variable on a local scale and the low-permeability dense interiors of a'a lava flows and cross-cutting near-vertical volcanic dikes can function as hydraulic barriers that locally partition groundwater both vertically and horizontally. Groundwater gradients in portions of the Wai‘anae Range have been shown to be step-like rather than smooth due to the presence of dikes that act as barriers to groundwater flow (Takasaki, 1971; Hufen and others, 1980).

Groundwater generally flows from inland areas outward toward the coast. However, locally, discharge of groundwater to the sea is limited by low permeability “cap rock” that overlies the volcanics along much of the coast of O‘ahu. Locally, the caprock prevents the free discharge of groundwater to the ocean, and diverts groundwater flow parallel to the coastline toward areas without confining cap rock where the groundwater discharge to the sea is unimpeded.

Waimānalo Gulch is located in the Makaiwa Aquifer System as defined by the Commission on Water Resource Management (CWRM) Water Resource Protection Plan, Volume II (George A. L. Yuen & Associates, 1990). This aquifer has not been assigned a sustainable yield by CWRM, though it is adjacent to the ‘Ewa-Kunia Aquifer System to the east and the Nānākuli Aquifer System to the northwest. The estimated sustainable yield of the ‘Ewa-Kunia Aquifer System is 16 million gallons per day (mgd); while the Nānākuli Aquifer System is assigned one (1) mgd for sustainable yield.

Although no groundwater is developed in the Makaiwa Aquifer System and near Waimānalo Gulch, several monitoring wells and test holes have been drilled in the lower part of the valley and the neighboring Kahe Point area.

Present water levels encountered in the ‘Ewa-Kunia Aquifer System, east of Waimānalo Gulch, are greater than 13 feet above msl. Near Makaiwa Gulch, just east of Waimānalo Gulch, a hydrologic discontinuity occurs where water levels drop to less than 6 feet above msl (see Stearns, 1940, p.36). U. S. Geological Survey test holes T-4 (2006-12) in the ‘Ewa-Kunia Aquifer System and T-5 (2007-01) in the Makaiwa Aquifer System are only a mile apart and reflect the discontinuity (CWRM well database). **Figure 5-4, Well Location Map**, is a well location map that also depicts the approximate location of wells T-4 and T-5 and the boundary between the ‘Ewa-Kunia and Makaiwa Aquifer systems. When originally drilled in 1938, the water levels for T-4 and T-5 were 17.0 feet and 6.5 feet above msl, respectively (Stearns, 1940). The last water level measurement for T-4 was 13.73 ft above msl (December 6, 2001, Honolulu Board of Water Supply measurement). Well T-5 was previously abandoned and sealed (Mink & Yuen, Inc., and Knight Enterprises, Inc., 2006).



Source: Hydrologic Setting and Groundwater Monitoring, Waimānalo Gulch Sanitary Landfill, Kahe Valley, Island of O‘ahu, Hawai‘i, WMI, 2008 and Geosynthec, 2006

Figure 5-4
Well Location Map
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

Regular monthly water levels were measured from 1940-1953 and ranged from 1.60 feet to 3.14 ft above msl. The average water level for the period of record was 2.0 feet above msl. Chlorides varied from 86 to 119 milligrams per liter (mg/L) (Mink & Yuen, Inc., and Knight Enterprises, Inc., 2006).

Hydraulic conductivities in dike-free basaltic lavas on O‘ahu typically range between 1,000 and 2,000 feet per day (ft/d). A value of 1,500 to 2,000 ft/d is commonly used in analytical and numerical groundwater models (Mink, 1980; Oki, 1997). The hydraulic gradient for dike-free lava flows is typically 1-foot per mile, which is the value found in the adjoining ‘Ewa-Kunia Aquifer System.

For dike-impounded aquifers, the hydraulic conductivity depends upon dike spacing, their distribution and continuity, and depth of penetration into the aquifer. In an aquifer where there are more than 100 dikes per linear mile, or as used by Takasaki and others (1969) as constituting 5 percent or more of the country rock, the hydraulic conductivity is generally low (<1 percent), typically ranging between 1 and 100 ft/d. While in the marginal dike zone where dike occurrence is much less, the conductivity values typically range between 100 and 1,000 ft/d (Takasaki and Mink, 1982; Takasaki and Mink, 1985).

Wells, test holes, and monitoring observation wells were drilled in the lower valley as part of a regular monitoring program and for the proposed expansion plan. Wells are sampled regularly and used to determine groundwater gradients. The wells listed below in **Table 5-1** are located near Makaiwa Gulch, Waimānalo Gulch, and Kahe Valley. Well data are from the CWRM database and data for the monitoring wells are provided by Waste Management of Hawai‘i, Inc.

The wells shown in **Table 5-1** are located in lava flows defined by Stearns (1940) as “Lower and Middle Members' of the Wai‘anae Volcanic Series. **Figure 5-4, Well Location Map** identifies the location of wells and also depicts the location of T-15.

**top well head

a – data from Quarterly Monitoring Report for January–March 2006 at the WGSL

The quality of groundwater in the volcanic aquifers is generally good, except where proximity to the ocean results in elevated salinity (Takasaki, 1971). Other sources of lower quality groundwater include leaching of hydrothermally altered volcanic rocks in the central vent area and of carbonate rocks above or adjacent to the volcanic aquifer (i.e., caprock; Takasaki, 1971). Total dissolved solids concentrations in wells to the northwest of the WGSL range from about 200 to about 2,000 mg/l. Chloride concentrations in these same wells range from about 10 to greater than 10,000 mg/l[2].

---

[2] In similar wells, chlorides are not expected to be much higher than the values for total dissolved solids concentrations (Waste Management Inc., 2008).

A summary of the results of studies related to site geology, hydrogeology, and geochemistry that have been performed at the WGSL since the early to mid 1990s indicate the following:

> The sequence of volcanic rocks encountered in borings and exposed on slopes at the WGSL is the lower member of the Waiʻanae Volcanic Series (e.g. TNWRE, August 7, 1993). The lava flows include both a'a and pahoehoe flows ranging from aphanitic[3] to porphyritic[4]. Coloring of the rock material varies from grey to reddish grey to red, and the texture varies widely from highly vesicular to dense and fine-grained.
>
> Based on observations made during drilling and down-hole video logs of borings drilled in October 2006 for monitoring wells MW-10 and MW-11, lava flows range in thickness from 3 to 20 feet thick, and loose clinker zones between flows comprise approximately 20 percent of the volcanic sequence (GeoSyntec, December 7, 2006).
>
> U. S. Geological Survey (USGS) personnel identified a near-vertical dike striking between about 15 and 20 degrees west of north, located at the approximate midpoint of the WGSL property. Furthermore, dikes have been documented to exist through visual observation from site personnel during excavation activities. Two dikes were documented during the construction of Cell E1 (A-Mehr Inc, 2003). In addition, recent geologic reconnaissance has confirmed the presence of dikes to the north of the site (Mink & Yuen and Knight Enterprises, 2006). The trends of the dikes are predominantly north/northwest, and when projected to the southwest, intersect portions of the northern and northeastern cells of the existing landfill. The approximate location of near vertical dikes in the vicinity of the WGSL that cross-cut the sequence of basaltic lava flows are shown on **Figure 5-5**.

---

[3] Textural term used to describe igneous rocks having such fine-grained nature that individual mineral constituents are not visible to the naked eye, but are visible under magnification (http://www.taranis.us/Glossary.htm).

[4] Of, having to do with, containing, or resembling porphyry; of the nature of structure characteristic of prophyry; containing distinct crystals embedded in a compact groundmass (http://www.memphisgeology.org/glossaryoq.htm).

NOTES:

1. EXISTING TOPOGRAPHY BASED ON 30 DECEMBER 2005 AND 29 DECEMBER 2001 AERIAL SURVEY PROVIDED BY OWNER USING LOCAL COORDINATE SYSTEM.

2. LOCATIONS OF DIKES D1, D2, AND D3 ARE BASED ON HISTORICAL REPORTS (E.G. RUST, 1993, 1997; EARTH TECH, 2006A) BUT NO EVIDENCE OF REPORTED DIKES D1, D2, AND D3 IS VISIBLE IN THE SLIDE SLOPES OF WAIMANALO GULCH. LOCATIONS OF DIKES D3, D4, AND D5 ARE BASED ON RECENT GEOLOGIC RECONNAISSANCE MAPPING AND GPS COORDINATES (MINK & YUEN AND KNIGHT ENTERPRISES, 2006).

5.5.2. Site Groundwater and Hydrogeology

Groundwater under the WGSL is present within the lower and middle members of the Wai‘anae Volcanic Series that dips slightly towards the coast (southwest). In the vicinity of the WGSL, the water table occurs at an elevation of approximately 4 to 5 feet above msl and is very flat[5]. As a consequence of the topographic relief, depth to groundwater at six monitoring wells ranges from 55 to 468 feet. **Table 5-2, Monitoring Wells at WGSL** provides depths and screened interval information.

Table 5-2

Notes:

MW-2, 3, 7, 10 & 11 monitoring wells are Schedule 40 PVC casing.

MW-2, 3, 7, 10 & 11 monitoring wells Surveyed by Park Engineering 24 October 2006.

Surveyed MP (measuring point) is top of PVC casing (TOC).

Oct 20, 2006 depth to water at MW-2, MW-3, and MW-7 was measured from top of cap for pump assembly, which is 3.16 inch (0.0156 ft) above top TOC.

**Pump assemblies at MW-2, MW-3 & MW-7 were removed prior to 11/20/2006 measurements so depth to water was measured from TOC for all wells.

Water levels in monitoring wells are tidally influenced. Water levels reported here do not include averaging or compensation for tidal influence.

***MW-12 data represents new 490 ft. monitoring well data as of October 2007.

The marine sediments of the ‘Ewa Plain to the south and east forms a low permeability caprock that inhibits groundwater discharge to the ocean south and east of the WGSL. However, the caprock is reported to be generally absent along the coast to the west and northwest of Waimānalo Gulch, in the area of the Kahe Park. The distribution of confining caprock is interpreted to control the westward flow of groundwater and unimpeded discharge to the sea west to northwest of the WGSL.

---

[5] All the groundwater elevation at WGSL, including at MW-12, is at 4 to 5 feet above msl (Waste Management, Inc., 2008).

Salinity measurements of ocean water along this stretch of coastline performed by the USGS and TNWRE in 1991 are consistent with major discharge of fresh groundwater in this area (RUST, September 1993, 1997; Earth Tech, 2006). **Figure 5-6** shows an aerial photo of the general vicinity of the WGSL with approximate groundwater elevations at wells. This data supports a general northwest direction of groundwater flow toward the Kahe Beach coastline.

In the upper portion of the WGSL, three near-vertical, north-northwest to south – southeast trending basaltic dikes (designated Dike #1, 2, and 3) have been mapped during a site geologic reconnaissance (Mink & Yuen, Inc. and Knight Enterprises, Inc., 2006). The geologic reconnaissance observed moderate dike density ranging from 10 dikes per mile, which is indicative of locations near the margins of rift zones. The dikes strike at from north-northwest to north.

A hydrogeological investigation (Golder, 2007) has been conducted to evaluate the potential influence of the dikes on groundwater flow in the upper portion of the WGSL. In other aquifers containing intruded dikes on O‘ahu, groundwater has been observed to be compartmentalized with higher water levels on the up-gradient side of the dikes. Dike #1 was chosen to study groundwater on the hydraulically up-gradient side of the dike with MW-12 borehole. Dike #1 had a strike of N 18.90 W (or 341 degrees) and a dip angle of about 85 degrees to the northeast from horizontal.

The aquifer hydraulic data suggest that Dike #1 has little influence on groundwater flow. The static groundwater level in MW-12 was 4.9 feet above msl, which is less than 1 foot higher in elevation to basal aquifer monitoring wells farther down Waimānalo Gulch. The hydraulic gradient is approximately 1.4 foot per mile, which is within the range of hydraulic gradients normally observed in basal aquifers without dikes. The groundwater levels in MW-12 are consistent with the water levels and the hydraulic gradient observed in the monitoring wells in the lower portion of the WGSL and does not indicate a dramatic gradient change that would be caused by dike compartmentalization of groundwater.

Source: Geosyntec Consultants, December 2006

Figure 5-6
Groundwater Elevations at Wells
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

~~The aquifer hydraulic data suggest that Dike #1 has little influence on groundwater flow. The static groundwater level in MW-12 was 4.9 feet above msl, which is less than 1 foot higher in elevation to basal aquifer monitoring wells farther down Waimānalo Gulch. The hydraulic gradient is approximately 1.4 foot per mile, which is within the range of hydraulic gradients normally observed in basal aquifers without dikes. The groundwater levels in MW-12 are consistent with the water levels and the hydraulic gradient observed in the monitoring wells in the lower portion of the WGSL and does not indicate a dramatic gradient change that would be caused by dike compartmentalization of groundwater.~~

A hydraulic pump test was performed on MW-12 to compare hydraulic aquifer properties with other aquifers on the island. Lower hydraulic transmissivities and conductivities have been documented to occur in dike-influenced aquifers with higher dike occurrence frequencies, and which are in closer proximity to the associated caldera. From the pump test, the aquifer at MW-12 in the Waimānalo Gulch had a hydraulic transmissivity and conductivity comparable to aquifers without dikes on the Island of O‘ahu. Although drawdown in pumped water levels was small, negative boundaries such as a barrier-type dike that may be in the immediate area were not noticeable.

The groundwater flow direction was measured and varied between 210 and 290 degrees, which is approximately the axis of the Waimānalo Gulch. Since Dike #1 strikes at 341 degrees, groundwater flow is approximately perpendicular toward the strike of Dike #1. If Dike #1 had a strong influence on basal groundwater flow direction, groundwater flow would be expected to be more parallel along the strike of the dike. This groundwater flow direction is consistent with groundwater flow directions determined by groundwater elevations using other basal groundwater monitoring wells at the WGSL.

Dike #1 appeared to have little or no influence on horizontal basal groundwater flow. The static basal groundwater level observed in MW-12 does not indicate groundwater is being compartmentalized with higher water levels behind Dike #1 or other dikes west of MW-12 that do not have a surface exposure. The groundwater flow direction and water level gradient are consistent with groundwater patterns observed in the lower portion of the WGSL where dikes are not present. Dike #1 may have undergone post-intrusion fracturing or faulting and may have sufficient horizontal fracture permeability to not act as a groundwater barrier.

5.5.3. Project Site in Relation to Protected Groundwater Areas

Groundwater found below and surrounding the WGSL is not designated as a groundwater recharge area by the City and County of Honolulu Board of Water Supply. **Figure 5-7, BWS Groundwater Protection Zones**, indicates areas identified by BWS which may be acceptable for sanitary landfill development.

Prior to 1987, groundwater recharge areas for O‘ahu were identified by BWS. Since 1987, DOH has administered the No Pass Program. The proposed expansion area and adjacent existing sanitary landfill facility are outside the groundwater recharge zone, in the area designated as “Pass Zone.” The Pass Zone is an area where sanitary landfills and shallow waste disposal systems are generally permitted.

The areas designated as “No Pass Zone” are areas where sanitary landfills and waste disposal systems are not permitted.

The proposed expansion area is consistent with the State Department of Health (DOH), Underground Injection Control (UIC) program established in 1984. Rules for the UIC program are promulgated in Hawai‘i Administrative Rules (HAR), Chapter 11-23. The purpose of the program is to protect the State’s drinking/potable groundwater resources from pollution by subsurface wastewater disposal. The program regulations are accompanied by UIC maps which demarcate a WGSL boundary line known as the “UIC Line.” Lands that are makai of this line are not restricted from subsurface wastewater disposal by underground injection (**Figure 5-8, UIC Line**).

5.5.4. Site Groundwater Hydrogeochemistry

The inorganic geochemistry of groundwater beneath the WGSL is fairly complex, reflecting both the facility's coastal location and its proximity to the coastal cap rock. Groundwater monitoring wells at the WGSL are screened within a transitional groundwater zone in which there is mixing between freshwater and seawater. Groundwater from each of the WGSL monitoring wells is a sodium-magnesium-calcium-chloride (Na-Mg-Ca-Cl) type water which generally reflects this mixing of freshwater and seawater. Total dissolved solid (TDS) concentrations in Monitoring Wells 03M and 07 are consistently lower than TDS concentrations in Monitoring Well 02M, a condition that is also consistent with the facility's position within the coastal transition zone. The relative percentage of dissolved calcium in groundwater from Monitoring Well 02M is slightly higher than that in groundwater from Monitoring Wells 07 and 03M. This is likely related to the fact that Monitoring Well 02M is located nearer the cap rock (primarily calcium carbonate) than are Monitoring Wells 07 and 03M.

The most comprehensive study of groundwater chemistry was conducted in 1992 (by the former Waste Management Environmental Monitoring Laboratory in Geneva, Illinois). The purpose of that study was to establish the degree of hydraulic continuity across the WGSL and to further establish if the groundwater on either side of the dikes was hydraulically connected. The results of the geochemical study were consistent with little to no barrier to lateral groundwater flow between the downgradient edge of the landfill and the ocean west of the WGSL. This is further corroborated through the results of the tidal study described above which show hydraulic continuity between all monitoring wells at the WGSL with the sea. This also is consistent with the concept of transition-zone groundwater (RUST, 1997).

Basal groundwater quality obtained during the October 2007 quarterly sampling period shows that groundwater at MW-12 is a sodium-chloride type water as is the groundwater from other monitoring wells near the bottom of the WGSL. The major ion content of groundwater at MW-12 appears to be caused by the same source or by the same aquifer mineralogy and represents a younger upgradient groundwater that would be anticipated to evolve to the chemistry observed in the groundwater from the other WGSL monitoring wells. The major ion chemistry supports that the groundwater from MW-12 is upgradient along the flow path of groundwater from the other site wells (Golder, 2007).

5.5.5. Potential Impacts and Mitigation Measures

The potential for adverse impacts to groundwater and hydrogeological resources are not anticipated. Appropriate and sufficient mitigative measures and controls will be applied consistent with sound engineering and operating practices.

The marine sediments surrounding the WGSL property consists of low permeability caprock inhibiting groundwater discharges to the ocean south and east of the project site. However, west and northwest of the WGSL in the area of Kahe Park, the presence of caprock is absent allowing for some groundwater flow toward coastal waters.

Potential impacts to groundwater resources involve the possible release or entry of leachate entering brackish groundwater. Mitigation to address this potential will be addressed through the existing LCRS design. The existing system is based on the use of a series of monitoring wells sited according to hydrogeological analyses as indicated above. The wells are regularly sampled to collect information on the condition of the site and to detect potential changes in groundwater quality.

The existing leachate collection and removal system for the MSW portion of the landfill cells consists of a 1 foot thick gravel drainage layer with a perforated, HDPE collection pipe placed within the drainage layer. The leachate drains down the lined canyon (gulch) walls toward a sump furnished with a riser pipe and clean-out pipe.

The leachate collection and recovery system for the ash monofil portion of the landfill consists of piping to collect the leachate. The sump in the ash area of the landfill is approximately 3 feet deep. The sump for the MSW portion of the landfill is similar but is located approximately 4 feet deep. The site operator adjusts the leachate handling capacity and disposal of the leachate to an appropriate facility, as required, to maintain the leachate head.

This existing system will be extended for use in the lateral expansion area of the landfill. Once the new LCRS is installed, it will become part of the overall site system to monitor and manage the generation of leachate. This system, as with all other control systems of the planned lateral expansion will be submitted to the DOH for review and approval, and will be modified as required.

Secondary or cumulative impacts to surface water, groundwater, and hydrological resources at the WGSL and region are not anticipated. The proposed practices, procedures and mitigative measures provided in this EIS have been designed to maintain the use of the site for a landfill for a period of not less than 15 years. Long term monitoring and inspection of the site by WMH will be further provided through a EPA required post closure plan for not less than 30 years following the closure of the site. These measures, which are designed to mitigate against potential primary impacts associated with stormwater erosion and discharges of refuse and leachate to the surface water, groundwater, and hydrologic resources of the site and the surrounding region, would serve as the principal means of avoiding the occurrence of secondary or cumulative impacts.

5.6. Natural Hazards

5.6.1. Flood Zone

The Federal Emergency Management Agency (FEMA), Flood Insurance Rate Map (FIRM) identifies the landfill property as within “Zone D,” an area in which flood hazards are undetermined, but possible (**Figure 5-9, Flood Map**). The West Side Drainage Diversion Channel will be designed to pass run-on ~~from the 100 year storm around the landfill~~ in accordance with applicable standards. Run-on from areas outside the footprint on the east side of the landfill is relatively minor and will be carried along with run-off from the landfill via a buried HDPE pipeline to the existing sedimentation basin.

5.6.2. Hurricanes

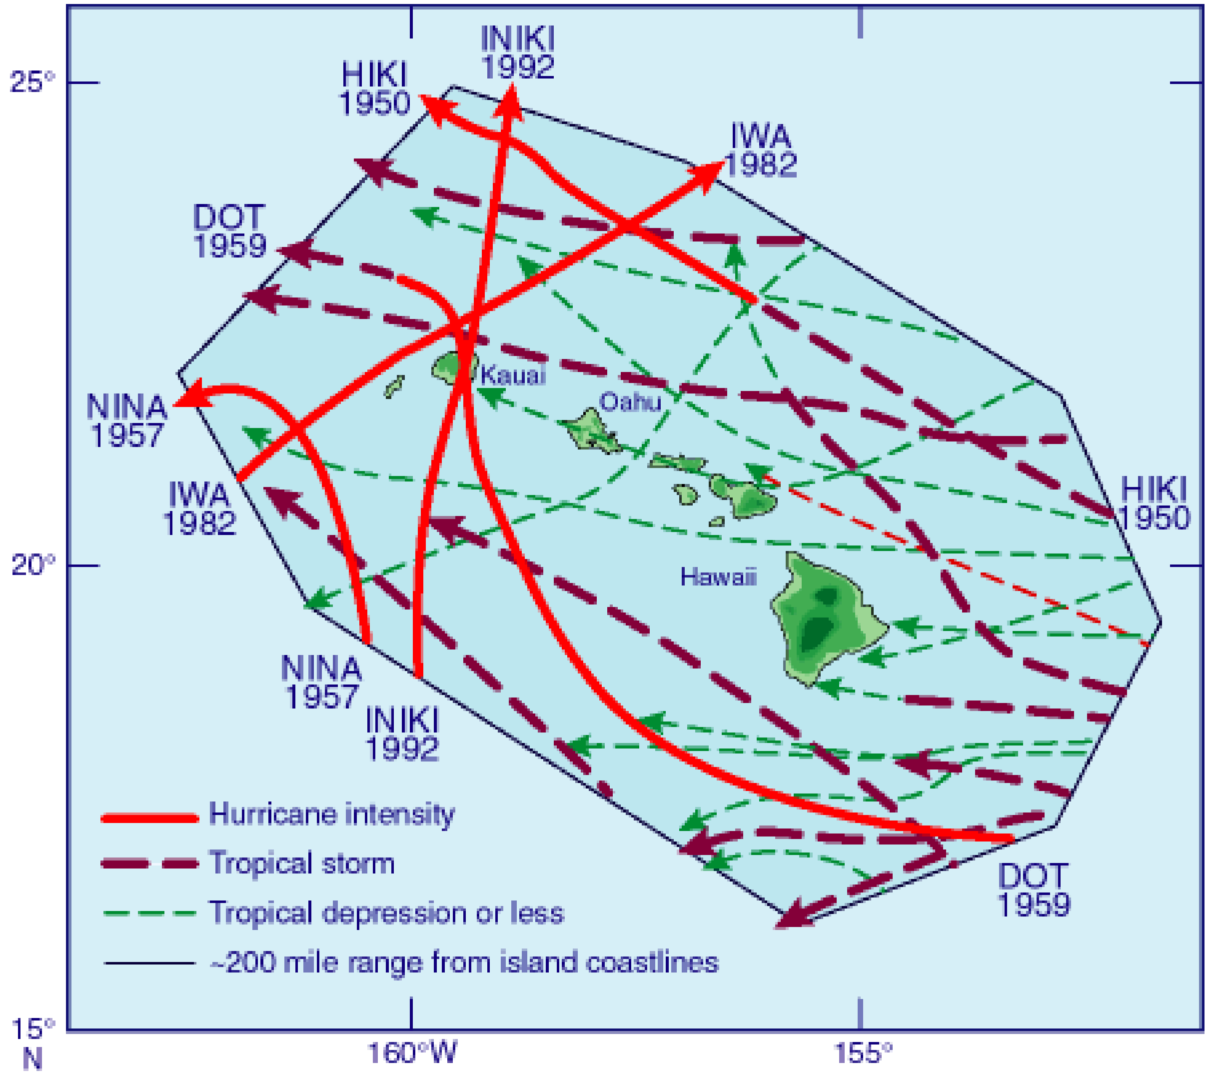
Hawai‘i’s annual “hurricane season” is from June through November. Hawai‘i has experienced the full effects of five hurricanes since 1949. The first (Hiki, 1950) moved from east to west, north of the islands. The other four, Nina, (1957), Dot (1959), Iwa (1982) and Iniki (1992), all traveled on more-or-less northerly headings and affected the Wai‘anae Coast with high winds and storm surge. Except for Hiki, the storms moved across, or very close to, Kaua‘i, about 90 nautical miles west-northwest of O‘ahu.

Nina remained southwest and west of the islands. **Figure 5-10, Hurricane Tracks** depicts the tracks of the five hurricanes while in the vicinity of the Hawaiian Islands (U.S. Navy, 2002).

The primary impacts of past hurricanes in the WGSL region resulted from high waves. Because the WGSL facility is set far back from the shoreline and the working face is at a relatively high elevation, waves and/or storm surge from future hurricanes will not affect the integrity of the landfill.

High wind conditions, however, could be of concern for active landfill cells in use. Mitigation against widespread wind impacts are handled by standard operating procedures involving the covering each day's MSW fill with soil effectively provides a blanket that reduces the potential for debris becoming airborne.

The ash fill operation requires cover approximately once per week. The rate of ash disposal and routine 24 hour a day deliveries make daily cover operations impractical. Portions of the ash fill area, therefore, could be impacted in an ultra-high wind, hurricane situation with minor amounts of dust occurring prior to rainfall. This is somewhat addressed by the stable nature of the ash material itself which arrives on-site with a relatively high moisture content that is generally resistant to becoming airborne in high winds.



All tropical cyclone tracks passing within 200 miles of the coast of the Islands of Hawai'i during the period 1949 to 1997.

Figure 5-10
Hurricane Tracks
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

Intermediate cover is placed over MSW and ash monofill areas that are not actively worked. Intermediate cover is compacted to a minimum of one (1) foot of depth and graded to promote runoff in a controlled manner. The process of compacting the solid waste and soil material increases the surface stability of the site. In the case of a hurricane, exposed fill would be consolidated and covered with compacted soil.

5.6.3. Seismic Activity (Earthquakes)

Seismic stability was evaluated in terms of acceptable levels of seismic deformation. The RCRA Subtitle D (258) Seismic Design Guidance for Municipal Solid Waste Landfill Facilities notes that permanent acceptable seismic displacements of up to 12 inches are typically used in practice for the design of liner systems (U.S. EPA, 1995). GeoSyntec estimated seismic deformations using the procedures developed by Newmark (1965) as modified by Makdisi and Seed (1978). Using this method, the estimated seismic deformation is less than or equal to 6 inches for both the MSW and ash disposal areas. Therefore, the proposed expansion design is “acceptable” in terms of potential seismic deformations at the expansion final grades (GeoSyntec 2002, and WMH 2008).

The Island of O‘ahu is an emergent portion of several basaltic shield volcanoes that rise from the ocean floor. Some the earthquakes that strike O‘ahu are related to the injection of magma into the volcanic edifice (shape of the volcano), whereas others maybe due to gravitational collapse of the flanks of the volcano (Yeats et al., 1997). In general, the earthquakes that impact O‘ahu are relatively shallow crustal (shallow, in the earth’s crust) events (GeoSyntec, 2002).

The Uniform Building Code scale is rated from Seismic Zone 0 through Zone 4, with 0 the lowest level for potential seismic-induced ground movement. All of the WGSL site is designated in Seismic Zone 2a (United States Geological Survey, 1997).

In 2002, consultant GeoSyntec evaluated the seismic hazard at the 200-acre WGSL site using the most recent United States Geologic Survey (USGS) probabilistic seismic hazard maps for the State of Hawaiʻi (Klein et al., 1998). Such seismic-hazards analysis combines:

1. Earthquake rates known from the historical record;
2. Information about how strong ground shaking dissipates with increasing distance from the earthquake; and
3. Determination of the probabilities that specified levels of ground motion will occur in a specified time period (U.S. Geological Survey, 1997).

As required by the State of Hawaiʻi regulations, the seismic-hazards analysis considered seismic motions with a 2 percent probability of being exceeded in 50 years (Note: this is equivalent to 10 percent probability of exceedance in 250 years). The consultant established the “design earthquake” (strength of an earthquake that WGSL is designed to withstand) for the site to have a moment magnitude (M_w) of 5.0 to 6.0 for local events and 6.8 M_w for distant events (GeoSyntec, 2002 and WMH 2008).

To select representative earthquake acceleration time histories (called “accelerograms”) for use in design, GeoSyntec selected a suite of three time histories for the western United States that were similar in magnitude, tectonic environment, and PHGA (peak horizontal ground acceleration). GeoSyntec selected the following analyses from the catalog of shallow crustal earthquakes in the western United States for the site:

1. To represent a local, low-magnitude event, GeoSyntec selected the 27 June 1966, Magnitude 6.3 Parkfield, California earthquake.
2. To represent a far-field (distant from site), high-magnitude event, GeoSyntec selected the 29 November 1975, Magnitude 7.2 Island of Hawaiʻi earthquake.
3. To represent both the local and distant design events due its large magnitude and short site-to-source distance, GeoSyntec selected the 28 June 1992, Magnitude 6.7 Big Bear, California earthquake. (GeoSyntec, 2002).

As required by Subtitle D (40 CFR Part 258), a “seismic deformation” (movement along a defined plane) analysis was performed to assess the performance of the landfill under the 7.0 M_w “design earthquake.”

The seismic site response of the landfill was evaluated using the equivalent-linear, seismic response program SHAKE91 developed by Schnabel et. al. (1972) and Idriss and Sun (1992). The waste/base liner/bedrock profile was modeled using three earthquake time histories to represent the design ground motions at the site. For each seismic ground motion time history, the SHAKE91 model was used to generate shear stress time histories at the level of the base liner and to determine maximum acceleration along the top of the landfill (umax). The landfill was modeled as consisting of (GeoSyntec, 2002):

1. A 90-foot high ash column to represent the ash fill disposal area; and
2. 150-foot and 200-foot high MSW columns to represent the MSW cells.

The results of the modeling show the landfill is stable under seismic conditions and exhibits less deformation then allowed. The structural integrity of the landfill and supporting infrastructure was most recently tested when a magnitude 6.7 earthquake occurred about 10 miles north-northwest of Kailua-Kona at 7:07 a.m., on October15, 2006. Power outages occurred throughout the Hawaiian Islands and initial damage estimates were placed at $73 million, primarily on the Island of Hawai‘i.[6] According to WMH an inspection following the earthquake indicated there was no damage to the landfill and supporting infrastructure as a result.

---

[6] http://earthquake.usgs.gov/eqcenter/eqinthenews/2006/ustwbh/#summary

5.6.4. Tsunami Hazard

A tsunami involves the generation of a series of destructive ocean waves that can affect all shorelines. These waves can occur at any time with limited or no warning. Persons in low lying shoreline or beach areas are advised to immediately go to higher ground.

According to the Oʻahu Civil Defense Agency, the evacuation boundary for the project area runs along Farrington Highway. The location of the project site mauka of the highway is considered to be safe from wave action and is not identified as a location subject to inundation by a tsunami.

5.6.5. Potential Impacts and Mitigation Measures

Flood Zone

Drainage controls to handle storm events have been implemented for the portions of the site used for landfilling. The drainage controls were designed to accept peak flows from ~~a 100-year design storm from~~ a tributary area of 622 acres. Future control of storm and flood flows will be designed by the City and WMH to be consistent with the requirements for control of storm water runoff by the State and City & County of Honolulu. With the mitigation measures proposed, the potential for adverse impacts associated with flooding are not anticipated.

Hurricanes

Work procedures that are practiced within the existing area of landfilling will be practiced within the area of lateral expansion. The measures identified above are designed to reduce the potential for loss of soils, MSW, and ash due to a hurricane related storm. With the mitigation measures proposed, the potential for adverse impacts associated with hurricanes are not anticipated.

Seismic Activity (Earthquakes)

Seismic risk at the project site is minimal. The design of both the current sanitary landfill and the proposed area of lateral expansion will meet the EPA Subtitle D (40 CFR Part 258) standard for stability. The design of the expansion will also be subject to review by appropriate City and State agencies when they evaluate the design documents. No further mitigation measures with regard to seismic activity are required or recommended.

Natural Hazards Summary

The potential for secondary or cumulative impacts associated with floods, hurricanes, earthquakes, and tsunami have been considered in the design and operating practices applied to the site. Potential adverse impacts are not anticipated. Safe engineering and design standards have been incorporated in the construction of the existing area of landfilling and will be applied to the proposed area of lateral expansion. The standards applied to the site are designed to maintain a reasonable level of long term safety and reduce or prevent secondary effects due to natural hazards from floods, earthquakes, or tsunami.

5.7. Air Quality

Air quality conditions at the WGSL are presented in the following: (1) overall air quality, and (2) landfill associated gas emissions.

5.7.1. Overall Air Quality

Ambient air quality on O‘ahu is monitored by the DOH for selected constituents at nine locations. Three of these stations are located in proximity to the WGSL: Stations 7-Makaiwa, 8-West Beach, and 9-Kapolei (**Figure 5-11, O‘ahu Air Quality Monitoring Stations**). The constituents monitored include carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and particulate matter (PM_{10} and $PM_{2.5}$) (DOH, 2006):

> **CO** is a colorless, odorless, tasteless gas under atmospheric conditions. It is produced by the incomplete combustion of carbon fuels with the majority of emissions coming from transportation sources.

R.M. TOWILL CORPORATION
May 2008

NO_2 is a brownish, highly corrosive gas with a pungent odor. It is formed in the atmosphere from emissions of nitrogen oxides (NOx). Sources of nitrogen oxides include electric utilities, industrial boilers, motor vehicle exhaust and combustion of fossil fuels. NO2 is also a component in the atmospheric reaction that produces ground-level ozone.

SO_2 is a colorless gas that easily combines with water vapor forming sulfuric acid. When sulfur dioxide mixes with atmospheric moisture, the result is commonly known as acid rain. Emissions of sulfur dioxide are largely from sources that burn fossil fuels such as coal and oil. In Hawaiʻi, another major source of sulfur dioxide emissions is from the eruption of Kilauea Volcano on the Big Island.

Particulate Matter (PM) is any dispersed matter, solid or liquid, in which the individual aggregates are larger than the single molecules in diameter, but smaller than 500 microns. PM includes dust, soot, smoke, and liquid droplets from sources such as factories, power plants, motor vehicles, construction, agricultural activities, and fires.

PM_{10} is particulate matter that is 10 microns or less in aerodynamic diameter. These are considered “coarse” particles, generally from sources such as road and windblown dust, and crushing and grinding operations.

$PM_{2.5}$ is particulate matter that is 2.5 microns or less in aerodynamic diameter. Considered “fine” particles, these are generally a result of fuel combustion such as from motor vehicles, utility generation and industrial facilities. Fine particles can also be formed when gases, such as sulfur dioxide and nitrogen dioxide, are chemically transformed into particles.

Air quality data collected for the year 2006 (the most recent year for which data is available) was assessed in comparison to state and federal standards. The following graphs illustrate the 5-year trends for carbon monoxide, nitrogen dioxide, sulfur dioxide, and PM_{10} and $PM_{2.5}$ for the period 2002 to 2006 at the state monitoring stations for those pollutants. The data is representative of the annual averages for each year and for each station. Annual averages are derived by calculating the arithmetic mean of all valid hours recorded in the year. Included in the graphs are the state and federal annual standard(s). See **Figures 5-12**, **Carbon Monoxide Monitoring; 5-13**, **Sulphur & Nitrogen Dioxide Monitoring**, and **5-14**, **Particulate Matter Monitoring**.

The figures for 1-hour and 8-hour carbon monoxide represent the average of the daily maximum 1-hour or 8-hour values recorded in the year. These values are obtained by taking the highest recorded 1-hour or 8-hour value for each day then calculating the arithmetic mean of all those hours to arrive at the annual maximum average.

Based on the results of the data collected the DOH concluded that, "Air quality in the State of Hawaiʻi continues to be one of the best in the nation, and criteria pollutant levels remain well below state and federal ambient air quality standards" (DOH, 2006).

5.7.2. Landfill Associated Gas Emissions

According to the EPA, municipal solid waste contains significant portions of organic materials that produce a variety of gaseous products when disposed of, compacted, and covered in landfills. Anaerobic bacteria thrive in the oxygen-free environment, resulting in the decomposition of organic materials and the production of primarily carbon dioxide and methane. Carbon dioxide is capable of leaching out of the landfill because it is soluble in water. Methane, which is less soluble in water and lighter than air, is likely to migrate out of the landfill (EPA, July 2007).

Because of the organic material present in municipal solid waste landfills, there is the potential to produce odors as landfill gases are generated. Sulfides and ammonia are the most common sources of odor in landfill gas. Sulfides produce a strong, rotten-egg smell that humans can detect even at very low concentrations. Ammonia produces a pungent odor that many people are familiar with because it is often used in household cleaning products. Both are normally present in the air, regardless of the presence of a landfill (http://health.state.ga.us/pdfs/hazards/LandfillGas.bro.pdf).

The primary types of gases that may be produced in a landfill are identified in **Table 5-3**, **Typical Landfill Gas Components** (ATSDR, 2001).

The generation of landfill gas is normally accomplished through the bacterial decomposition of waste in four phases. The composition of the gas produced changes with each of the four phases. Landfills often accept waste over a 20- to 30-year period, so waste in a landfill may be undergoing several phases of decomposition at once. This means that older waste in one area might be in a different phase of decomposition than more recently disposed of waste in another area (ATSDR, 2001) (see **Figure 5-15**, **Landfill Gas Production Phases**):

> Phase I
>
> During the first phase of decomposition, aerobic bacteria consumes oxygen while breaking down complex carbohydrates, proteins, and lipids that comprise organic waste. The primary byproduct of this process is carbon dioxide. Nitrogen content is high at the beginning of this phase, but declines as the landfill moves through the four phases. Phase I continues until the available oxygen is depleted and can last for days or months, depending on how much oxygen is present when the waste is disposed of.
>
> Phase II
>
> Phase II decomposition starts after the oxygen in the landfill has been used up. Using an anaerobic process that does not require oxygen, bacteria convert compounds created by aerobic bacteria into acetic, lactic, and formic acids and alcohols such as methanol and ethanol. The landfill becomes highly acidic. As

the acids mix with the moisture present in the landfill, nutrients dissolve, making nitrogen and phosphorus available to the bacteria in the landfill. The gaseous byproducts of these processes are carbon dioxide and hydrogen. If the landfill is disturbed or if oxygen is somehow introduced into the landfill, microbial processes will return to Phase I.

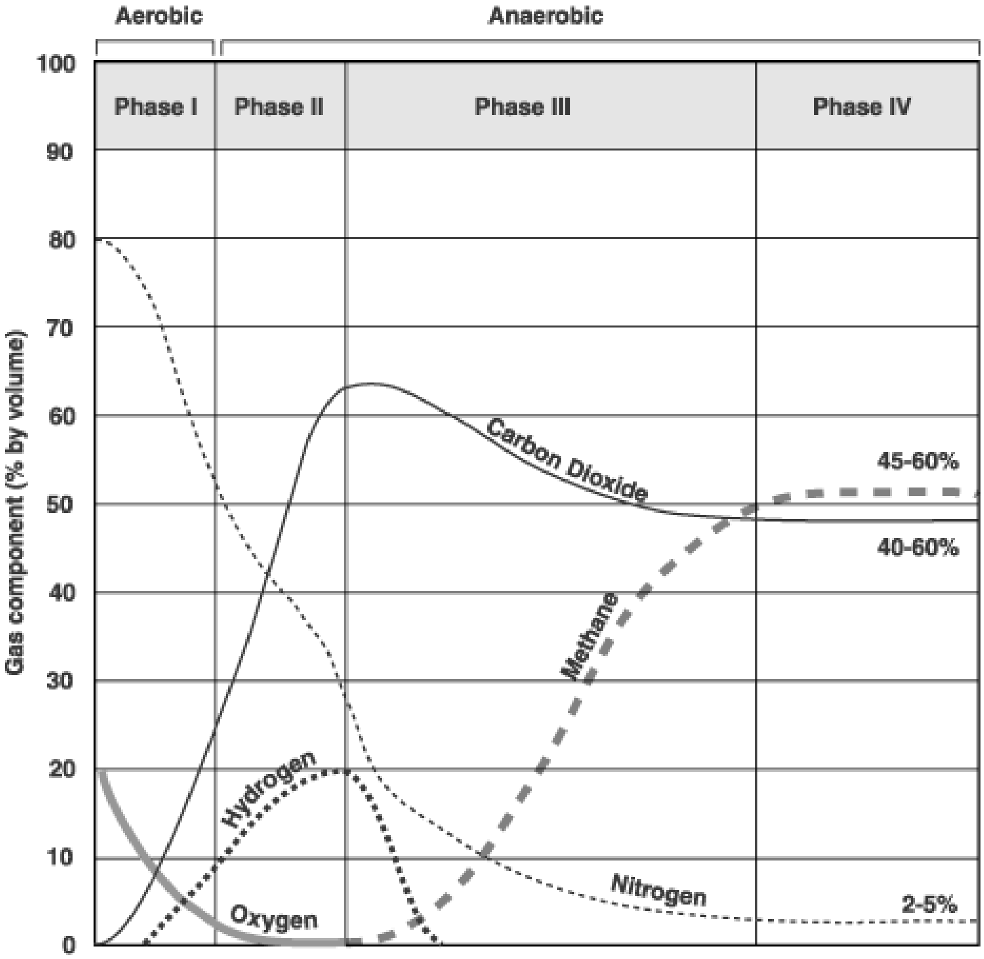
Table 5-3
Typical Landfill Gas Components[7]

Component	*Percent by Volume*	*Characteristics*
methane	45–60	Methane is a naturally occurring gas. It is colorless and odorless. Landfills are the single largest source of U.S. man-made methane emissions
carbon dioxide	40–60	Carbon dioxide is naturally found at small concentrations in the atmosphere (0.03%). It is colorless, odorless, and slightly acidic.
nitrogen	2–5	Nitrogen comprises approximately 79% of the atmosphere. It is odorless, tasteless, and colorless.
oxygen	0.1–1	Oxygen comprises approximately 21% of the atmosphere. It is odorless, tasteless, and colorless.
ammonia	0.1–1	Ammonia is a colorless gas with a pungent odor.
NMOCs (non-methane organic compounds)	0.01–0.6	NMOCs are organic compounds (i.e., compounds that contain carbon). (Methane is an organic compound but is not considered an NMOC.) NMOCs may occur naturally or be formed by synthetic chemical processes.
sulfides	0–1	Sulfides (e.g., hydrogen sulfide, dimethyl sulfide, mercaptans) are naturally occurring gases that give the landfill gas mixture its rotten-egg smell. Sulfides can cause unpleasant odors even at very low concentrations.
hydrogen	0–0.2	Hydrogen is an odorless, colorless gas.
carbon monoxide	0–0.2	Carbon monoxide is an odorless, colorless gas.

Source: Tchobanoglous, Theisen, and Vigil 1993; EPA 1995

---

[7] The values presented are for a typical landfill. Composition at the WGSL flare (including all wells) is approximately 44% methane, 40% carbon dioxide, 0.1% oxygen, 5% hydrogen, 10% nitrogen, <0.005% carbon monoxide, <0.01% sulfides. Individual wells vary considerably from these values. (WMH 2008).



Note: Phase duration time varies with landfill conditions

Source: EPA 1997

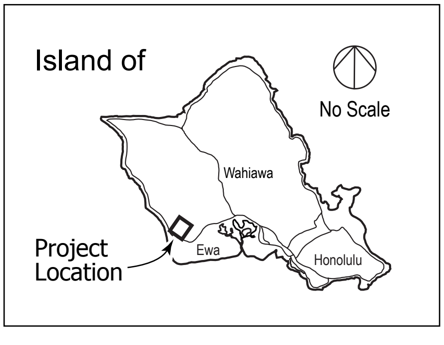


Figure 5-15
Landfill Gas Production Phases
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

R.M. TOWILL CORPORATION May 2008

Phase III

Phase III decomposition starts when certain kinds of anaerobic bacteria consume the organic acids produced in Phase II and form acetate, an organic acid. This process causes the landfill to become a more neutral environment in which methane-producing bacteria become established. Methane-and acid-producing bacteria have a symbiotic, or mutually beneficial, relationship. Acid-producing bacteria create compounds for the methanogenic bacteria to consume.

Methanogenic bacteria consume the carbon dioxide and acetate, too much of which would be toxic to the acid-producing bacteria.

Phase IV

Phase IV decomposition begins when both the composition and production rates of landfill gas remain relatively constant. Phase IV landfill gas usually contains approximately 45% to 60% methane by volume, 40% to 60% carbon dioxide, and 2% to 9% other gases, such as sulfides. Gas is produced at a stable rate in Phase IV, typically for about 20 years; however, gas will continue to be emitted for 50 or more years after the waste is placed in the landfill (Crawford and Smith 1985). Gas production might last longer, for example, if greater amounts of organics are present in the waste, such as at a landfill receiving higher than average amounts of domestic animal waste. (ATSDR, 2001).

5.7.3. Potential Impacts and Mitigation Measures

The proposed project will involve the use of an area of expansion within the existing property for the handling and disposal of municipal solid waste including ash and residue generated from the City's H-POWER facility. Sources of potential air quality impacts include:

Construction of the proposed project (including generation of vehicular exhausts)
Landfill associated odor
Landfill associated gases

Potential Impacts and Mitigation During Construction

Airborne dust will be the primary air pollutant generated from use of the planned area of expansion. Sources of this dust include earthwork (including controlled blasting and rock crushing), grading, excavation, stockpiling, and vehicles transiting to, from, and within the area of lateral expansion. To reduce and mitigate the potential for the release of fugitive dust from the site preventative measures will be practiced by the operator in accordance with the provisions of HAR, Chapter 11-60.1-33, Fugitive Dust. The measures that will be practiced include, but are not limited to, the following:

- The application of water during any earthwork or movement of vehicles that generates excessive levels of dust capable of migrating off of the landfill property. Only enough water will be used to sufficiently wet the surface of the ground to inhibit the generation of dust;
- Potential for generation of dust from controlled blasting is anticipated to be limited and isolated to only the immediate area of the blast. This is primarily due to the subsurface placement of micro charges arrayed in a grid configuration to only yield the amount of blast necessary to fracture rock facilitating its removal with a bulldozer. Control of potential dust will be addressed with the inspection of the site for any loose sediments or soils that can constitute a dust source. As required, the area of the blast will be wetted down around the immediate area just prior to setting off the charge;
- Potential for generation of dust from rock crushing will be limited to a relatively isolated location adjacent to the area of the planned working cells. On-site water spraying will be used to control any inadvertent releases of dust;
- All open bodied trucks transiting to or from the landfill will be covered except when discharging or filling loads, or during the on-site clean-up of truck beds;
- Surface roads within the landfill property shall be properly maintained with the prompt removal of earth or other materials that would constitute a source of dust; and

- Dust screens shall be erected in areas that are in active construction such as during excavation or grading to establish landfill cells.

Potential Impacts and Mitigation Associated with Landfill Odor

Odors associated with use of the planned area of lateral expansion include vehicular odor, odors from the hauling of waste to the landfill, and odors as a result of landfill gas emissions. The potential for adverse impacts are not anticipated based on the following measures that will be applied to the WGSL.

Vehicular Odors and Exhausts

Operation of the landfill will involve daily deliveries of municipal and commercial refuse vehicles, transfer trailers, and public self-haul vehicles. Bulldozers, water tank trucks, and related landfill vehicles will also be used. Air pollution from vehicle exhausts will be similar to existing conditions involving use of the current area of landfilling. Exhaust emissions are mitigated to some extent by compliance of the landfill operator, commercial, and private vehicle operators with HAR, Chapter 60-1, Air Pollution Control, Subpart 1.34, Motor Vehicles. The site operator will also ensure that all internal combustion powered vehicles and equipment associated with landfill operations are properly muffled and maintained in good operating condition.

Odors from Waste Hauling

Potential sources of odor from waste hauling primarily involve the delivery of refuse vehicles containing organic material including putrescible waste, sewage solids that cannot be processed by wastewater treatment plants and other types of putrescible organic waste including animal carcasses and food waste.

Odor management of these types of municipal waste involve: (1) refuse vehicle processing and control; and (2) use of an on-site odor neutralizing system.

Refuse vehicles entering the WGSL are directed to the scale house where loads are inspected and waste manifests reviewed prior to the weighing and delivery of the load to the landfill. In order to minimize the potential exposure of loads all incoming vehicle beds must be covered with a tarpaulin or equivalent cover sufficient in size to reduce the exposure of the load. All incoming loads must report directly to the scale house for processing; and refuse vehicles are prohibited from queuing along the Farrington Highway or any location outside of the landfill property.

The on-site odor neutralizing system involves the use of aerosol sprayers located at various points within the landfill property. The locations selected for placement of the aerosol sprayers are based on prevailing wind patterns and portions of the general roadway system that are used by refuse vehicles making deliveries to the landfill.

The odor neutralizing system is based on use of a sprayable non-toxic and non-hazardous solution to control the source of the odors. Odors associated with landfills are normally the result of aerobic and anaerobic processes that generate sulfides and other odor and non odor producing constituents.

~~Solid sewage sludge that was previously disposed of at the WGSL is currently undergoing treatment in a waste digester that was recently installed at the Sand Island Wastewater Treatment Plant (SIWWTP). The waste digester recycles the sewage sludge into fertilizer pellets for commercial and public uses. It is anticipated that as this system is brought to full operational capacity that the requirement for disposal of treated sludge solids will further decrease, eventually removing this source of odorous waste from the landfill.~~

Sludge from the Sand Island Wastewater Treatment Plant (SIWWTP) previously disposed of at WGSL is currently undergoing treatment in a waste digester at the SIWWTP where the sludge is turned into fertilizer pellets. The process of drying sludge into fertilizer pellets began in March 2007.

In June 2007, due to a fire, operations at SIWWTP pelletizing facility ceased until September 2007. During that time 763 tons of de-watered sludge from SIWWTP was landfilled at WGSL. For the entire 2007 year, approximately 3,122 tons of stabilized, dewatered sludge (pelletized and nonpelletized) from the SIWWTP were disposed of at WGSL. At present, all of the dewatered sludge from SIWWTP is turned into fertilizer pellets, and on average, 85% of the pellets is being used for golf course construction and soil manufacturing. The remaining amount of pellets, approximately 15% on average, is disposed at WGSL. All regulatory requirements have been met to allow beneficial use of the pellets. As the process matures and marketability increases, we anticipate a decrease in the amount of pellets that are landfilled at WGSL. Due to unforeseen circumstances, however, such as the June 2007 fire at the pelletizing facility at SIWWTP, there may times when stabilized, de-watered sludge from SIWWTP will need to be landfilled at WGSL.

Besides some of the fertilizer pellets from the SIWWTP, stabilized, dewatered sludge from the Honouliuli, Waiʻanae, Kailua Regional, and Kahuku Wastewater Treatment Plants, as well as sludge from private (non-City) sources is still being landfilled at WGSL. For the entire 2007 year, the following approximate amounts of stabilized, de-watered sludge were disposed of at WGSL from the following City waste water treatment plants: Honouliuli - 4,192 tons; Kailua Regional - 766 tons; Waianae - 277 tons; and Kahuku - 1 ton. Besides the significant reduction of sludge from the SIWWTP being landfilled, the City is in the process of seeking beneficial uses for the stabilized, de-watered sludge from the Honouliuli WWTP.

Landfill Gas Associated Odor

The generation of landfill associated gas at the WGSL is controlled by use of a landfill gas collection and control system (GCCS) that was installed in 2005. The GCCS is designed to collect gases generated as a result of decomposition processes and to prevent their uncontrolled release to the atmosphere. The GCCS is comprised of a number of subsystems that include: Landfill Gas (LFG) Collection System; Landfill Flare System; and a Condensate Collection System. (Shaw Environmental, Inc., 2006).

LFG Collection System. The LFG collection system includes all LFG conveyance components installed in the landfill, from the LFG extraction wells to the inlet of the condensate knock-out pot on the LFG blower skid. These components currently include the following (WMH, 2008):

- 27 vertical LFG extraction wells;
- 27 wellhead monitoring and LFG flow control assemblies;
- Approximately 1,100 feet of 12-inch LFG header piping, 5,000 feet of 8-inch LFG header piping, and 1,500 feet of 6-inch LFG lateral piping connecting extraction wells to the headers;
- 3 LFG header control valves; and
- 1 condensate sump.

Additional wells and associated components including well heads and piping will be added as waste is placed into the landfill.

A vacuum applied to the extraction well field extracts LFG from the refuse into the vertical wells, through the wellhead monitoring assemblies and 6-inch diameter lateral piping, into 8-inch diameter header pipes. At the southeastern corner of MSW Cell 1, the header pipes combine into a larger 12-inch diameter header pipe, which conveys the LFG to the inlet of a condensate knock-out pot located at the blower skid at the flare station.

The existing vertical extraction wells were connected with above grade piping to maintain a positive slope in the lines to avoid low areas that can trap condensate. Trapped condensate can prevent gas flow through the line. The extraction wells in the waste disposal areas will be maintained and operated through the post closure period until the gas flow decreases. Damaged and nonproductive wells and piping will be decommissioned, and replaced with new wells and piping, as necessary to maintain compliance. (Shaw Environmental, Inc., 2006, and WMH 2008).

Landfill Flare Station. The landfill flare station is located in the southeastern comer of the landfill, southeast of the landfill's main entrance road. The major components of the flare station are:

- Condensate knock-out pot (KOP) to prevent condensate from adversely impacting downline components;
- Two fan blowers;
- Two 6-inch arrestors, specifically designed for elevated levels of hydrogen;
- Flare and blower control and monitoring instrumentation, and
- Compressed air supply, including air compressor.

The enclosed flare is designed to collect and thermally destruct the LFG flow rates anticipated within the design life of the flare station equipment. The LFG blowers were sized to accommodate turn-down to the current low level of LFG flows (350 to 400 scfm). When the blower capacity is exceeded, an additional blower can be readily added in parallel to increase the system design flow to the required capacity.

Depending on gas flow rates WGSL may construct a landfill gas to energy facility to provide beneficial use of the collected landfill gas. The proposed facility would consist of one or more reciprocating engine powered generators (gensets). The proposed facility would be located adjacent to the flare station.

The current achievable LFG extraction is approximately 500 scfm (WMH, 2008).

Condensate Collection System. The condensate collection system for the GCCS includes the following components:

- A condensate sump located at the inlet to the flare station;
- Two 1,000 gallon condensate storage tanks with spill containment; and
- A condensate KOP on the blower skid that gravity drains to the condensate sump.

The purpose of the condensate collection system is to minimize LFG flow obstructions by capturing and removing free liquid from the LFG flow stream for thermal destruction. (Shaw Environmental, Inc., 2006, and WMH 2008).

According to WMH, the GCCS has performed satisfactorily but is atypical. The typical characteristics normally include:

- Similar concentrations of methane and carbon dioxide;
- A mesothermophillic (medium temperature range) bacterial environment; and
- Low hydrogen gas concentrations.

Characteristics exhibited at the WGSL from monitoring of the extraction wells indicate:

- Some wells with low methane to carbon dioxide ratios;
- Hyperthermophillic (very high temperature range) bacterial environment; and
- High hydrogen gas concentrations in isolated portions of the landfill.

The elevated temperatures exceed EPA designated levels:

40 CFR §60.753(c) states that each owner or operator of an MSW landfill with a [GCCS] shall:

Operate each interior wellhead in the collection system with a landfill gas temperature less than 55°C [i.e., 131°F] and with either a nitrogen level less than 20 percent or an oxygen level less than 5 percent. The owner or operator may establish a higher operating temperature, nitrogen, or oxygen value at a particular well. A higher operating value demonstration shall show supporting data that the elevated parameter does not cause fires or significantly inhibit anaerobic decomposition by killing methanogens.

Due to a combination of naturally occurring biological and chemical processes, the gas temperatures of some of the wells at the WGSL exceed the EPA's ~~specified maximum~~ standard operating temperature of 131° Fahrenheit. The wells with temperatures above 131° F average approximately 165° F. One well has had an isolated temperature reading of 184° F, which is the highest recorded temperature of any well at the landfill. ~~and have been approximately 165° F.~~ While the temperatures exceed the normal allowable under 40 CFR 60.753(c), WMH has shown that the elevated temperatures have not caused a fire (Evaluation of Combustion as a Possible Cause of Elevated Temperatures, Waimānalo Gulch Sanitary Landfill, Oʻahu, Hawaiʻi, GeoSyntec, February 29, 2008) nor have they significantly inhibited anaerobic decomposition by killing methanogens.

Since the New Source Performance Standards (NSPS) temperature threshold was established in 1996, numerous landfills operating at temperatures higher than 131°F have successfully demonstrated that a higher operating temperature is appropriate for some or all of the wells at a landfill. Most of these landfills have approved wellhead temperature limits in the 140°F to 155°F range. While Waste Management, Inc., has not attempted to survey all fifty states and all EPA regions to identify higher temperature limits at landfills, the company has identified 13 examples of landfills with EPA- or state-approved operating temperature limits greater than 155°F, including five landfills in the United States with temperature limits of 176°F or higher. The most recently approved is the Chambers Oakridge Landfill, South Carolina, with an operating temperature of 176°F.

Notification of the operating characteristics of the WGSL have been reported to the EPA to ensure sufficient monitoring and operating standards are carried out to maintain safety and security of the site, and to propose the granting of an alternate operating standard[8]. WMH is currently awaiting a response from the

---

[8] Letter to EPA dated October 21, 2005, Requesting Alternate Wellhead Operating Standards and Compliance Procedures, New Source Performance Standards, Subpart WWW, State of Hawaiʻi Covered Source Permit No. 0489-01C.

EPA and will coordinate appropriate measures to maintain compliance with all regulations as required by law.

Potential Impacts and Mitigation of Landfill Associated Gases

The potential for adverse impacts from landfill associated gases are not anticipated. The following practices and measures will be applied to the proposed project.

Landfill gases at WGSL are monitored as required by with RCRA Subtitle D regulations, HAR Chapter 11-58, and the WGSL Solid Waste Permit (No.LF-0054-02) issued by the DOH Solid Waste Section (SWS). The purpose for the monitoring ~~I~~is to regularly assess the condition and performance of the landfill concerning the generation of gases and odor, and to prepare an appropriate response to address any exceedances in allowable standards. Gases monitored at WGSL include methane and hydrogen (Waste Management of Hawaiʻi, Inc., Revised October 2007):

- Methane is monitored as one of the primary gases generated by MSW landfills and is a colorless and odorless gas which is lighter than air. It is formed by the decomposition of organic carbons under oxygen poor (anaerobic) conditions and is commonly found in or near swamps and wetland areas, peat deposits, wood waste, and landfills. Under certain conditions, the mixture of methane in air can be explosive in a confined area. The explosive range is between 5% and 15% methane-in-air.

  The EPA requires that combustible gas concentrations must not exceed the lower explosive limit in soils at the property line or 25 percent of the lower explosive limit at or in structures. The lower explosive limit corresponds to 5% concentration of methane-in-air. In addition to the risk of explosion at lower concentrations of methane-in-air, higher concentrations are also of concern, since such higher concentrations can be flammable and may also lead to asphyxiation due to lack of sufficient oxygen in the methane-air mixture.

- Hydrogen is not ordinarily monitored as a landfill gas but is included based on monitoring data indicating that it is present. Hydrogen is a naturally occurring lightweight gas that is colorless, odorless and without taste. Hydrogen is highly flammable and produces water when burned in the presence of oxygen and is a reactive substance easily combined with other atoms. Hydrogen is abundant in the universe with an occurrence of approximately 75 percent by volume (NASA, 2008).

The standards governing methane gas requires that the landfill owner or operator must ensure that[9]:

> §258.23 (a)(I) and §11-58.1-15(d)(1)(A) "The concentration of methane gas generated by the facility does not exceed 25 percent of the lower explosive limit (LEL) for methane in facility structures (excluding gas control or recovery system components)" and,
>
> §258.23 (a)(2) and §11-58.1-15(d)(l)(B) "The concentration of methane gas does not exceed the lower explosive limit for methane at the facility property boundary."
>
> §258.23 (b)(l) and §11-58.1-1 5 (d)(2)(A) "The type and frequency of monitoring must be determined based on the following factors:
> (i) Soil conditions;
> (ii) The hydrogeologic conditions surrounding the facility;
> (iii) The hydraulic conditions surrounding the facility; and
> (iv) The location of facility structures and property boundaries."

If methane gas levels exceed the RCRA Subtitle D regulations the owner or operator must:

A. Remonitor to verify the exceedance. Exceedances for methane are readings from probes at or above 5 percent methane by volume or hydrogen readings at or above 4.7 percent by volume.
B. If an exceedance is verified, then take all necessary steps to ensure protection of human health and notify the Director of the DOH;

---

[9] RCRA Subtitle D Regulations 40 CFR §258.23, and HAR Title 11, Chapter 58.1-15(d).

C. Within seven days of detection, place in the operating record the methane gas levels detected and a description of the steps taken to protect human health; and

D. Within sixty days of detection, implement a remediation plan for the methane gas releases, place a copy of the plan in the operating record, and notify the director that the plan has been implemented. The plan shall describe the nature and extent of the problem and the proposed remedy.

In addition, the DOH may establish alternative schedules for demonstrating compliance with items B and C.

The prescription for the detection of hydrogen will be established based on further coordination with the EPA and will be adhered to by WMH to maintain safety and security of the site.

Gas Monitoring Network

The gas monitoring network is based on the use of ten monitoring probes for detecting gas migration from the WGSL (**Figure 5-16, WGSL Gas Monitoring Network**). The average spacing between probes along the network boundary is approximately 978 linear feet (an average of one probe for every 978 linear feet of the WGSL property line). Currently, permanent probes are installed near the western, eastern, and southern property lines of the WGSL. Additional probes will be added as the landfill is expanded up the gulch. Permanent gas probes were not proposed for the northern end of the currently permitted waste area due to the pending application for landfill expansion into this area (Waste Management of Hawaiʻi, Inc., Revised October 2007). Therefore, the installation of the probes will be implemented only upon satisfactory approval for the lateral expansion of the WGSL.

The information collected from monitoring will be furnished to DOH according to the reporting requirements of the DOH. The information will include methane concentrations and pressure at each probe location; hydrogen concentrations at each probe location; site conditions during the monitoring event including the date, time, barometric pressure, atmospheric temperatures, and general weather conditions; and personnel

Air Quality Summary

The potential for secondary or cumulative effects from landfill gas emissions and operational use of the site involving earthwork and deliveries of refuse exists at the site without the long term use of the mitigative measures provided in this EIS document, and the operational practices that are employed by WMH. Potential long term effects can include the migration of landfill gas, dust, and nuisance odors associated with the landfill and refuse deliveries.

Mitigation to address these concerns will serve to address and avoid the occurrence of potential secondary and cumulative impacts through on-going monitoring and operational practices that maintain the existing environmental safety of the site, such that it would avoid the opportunity for other larger impacts to occur. In some cases, these measures have already been implemented: a landfill gas collection and control system has been constructed and is operating to reduce uncontrolled releases of landfill associated gases; and a waste digester at the Sand Island Wastewater Treatment Plant has been constructed and in recent months has demonstrated improved performance with fewer deliveries of odor generating sewage solids.

5.8. Acoustic Characteristics

5.8.1. Noise Sources

The proposed project is anticipated to generate noise associated with the operation of equipment and vehicles, and controlled blasting. These sources of noise are not expected to result in acoustic levels greater than produced from current levels. This is based on the generation of noise from existing operations that are planned to shift to the lateral expansion area.

Sources of noise generated by the proposed project will be substantively similar to the existing area of use and will include the use of construction vehicles and internal combustion powered machinery such as bulldozers, scrapers, water tankers, generators and rock crushing equipment. Controlled blasting will be used to fracture rock and hard substrate that will be removed by construction equipment.

5.8.2. Potential Impacts and Mitigation Measures

The potential for adverse impacts associated with the generation of noise from the proposed project are not anticipated as provided by the following:

Construction Vehicles and Equipment

Vehicles and equipment will produce noise from the operation of engines and earthwork. Mitigation of short-term potential construction impacts will involve compliance with the provisions of Chapter 11-43, Community Noise Control, HAR. All internal combustion powered vehicles and equipment will be equipped with mufflers or other noise attenuation devices as required by federal, state, and City & County of Honolulu regulatory requirements.

Noise associated with construction activities are not anticipated to result in adverse effects to the surrounding area and region: (1) the majority of the work will be limited to the area of lateral expansion; (2) the work required will be substantively similar to existing work involving the use of construction vehicles and equipment in support of landfilling activities; and (3) the location of the work will be within a relatively isolated portion of the landfill that is distant from the Farrington Highway. Portions of the work that may affect the adjoining Makaiwa Gulch and the future planned Makaiwa Hills development, will be buffered by a ridge separating the two gulches.

Rock Crushing

Materials excavated from the landfill will be comprised of soils and rocky substrate. Most of these materials will be reused for cover material within the landfill. Rocks and boulders too large for use will be reduced in size with a rock crusher. The rock crushing operation will be located within proximity to the planned lateral expansion area.

The crushed rock and cover material will be used for daily and intermediate landfill cover, meet slope stability requirements, landscaping, and other purposes associated with the landfill. Surplus rock material that cannot be reused on site will be used for other purposes that may include other construction projects of the City & County of Honolulu.

Potential impacts associated with the rock crushing operation include:

- Generation of noise and dust as rocks are crushed and turned into usable material for landfill cover.
- Visual impacts that could result if views of rock crushing equipment and machinery are readily visible from across the Farrington Highway and coastal shoreline.

Generation of noise will be within a relatively isolated portion of Waimānalo Gulch that is located approximately 0.5 to 0.75 miles northeast of Farrington Highway. The ridge between Waimānalo Gulch and Makaiwa Gulch will also serve to help to reduce potential noise impacts from the planned future Makaiwa Hills development. Other mitigative measures to reduce noise will include: proper maintenance of all equipment with appropriate mufflers or other sound attenuation as required in accordance with federal, state and City & County of Honolulu regulations; and the scheduling of rock crushing during normal landfill operating hours to avoid possible disturbance to surrounding neighbors.

Generation of fugitive dust will be addressed by regular spraying of water, as required, to suppress dust as rocks are crushed and turned into usable fill material. Use of dust screens around the rock crushing machinery may be employed based on the ability to suppress dust using water.

Views of machinery associated with rock crushing will be minimized or effectively blocked from view by placement within or within close proximity to excavated areas within the planned lateral expansion area. Because this area will be at a lower elevation relative to the surrounding completed portions of the landfill, views toward rock crushing operations will be inhibited. Additional treatment with vegetative cover including trees and shrubs would be used to fill gaps in screening coverage.

Controlled Blasting

Controlled blasting is employed within the current area of landfilling to fracture rock and loosen hard substrate. Blasting is performed by a qualified and licensed blasting contractor governed in accordance with standards of the federal Mine Safety and Health Administration (MSHA). Preparation prior to blasting involves: (1) identification of the area for removal of rock or hard substrate using a grid pattern to control and localize the amount of rock fracture that is required; (2) drilling to the proper depth for the placement of explosives; and (3) reviewing the explosive charge yield needed and placement of the charges into the bore holes. The procedure just prior to the blast involves notification to all workers on the day of the blast. When the warning horn is sounded all workers on site are required to stop all activity. Following the blast, when the all-clear signal is given workers may resume their tasks.

Noise generated from prior controlled blasting at the site has been characterized as a small muffled explosion that is localized and relatively isolated within the area of the blast. From Farrington Highway, the intensity of sound generated from prior blasting at the landfill can be characterized as approaching that of the background noise generated from passing heavy vehicles or distant thunder, with the exception that it is a one time noise event of very short duration that occurs toward the end of the day.

Controlled blasting for the proposed project will involve not more than one blast per day on an infrequent basis consisting of approximately one to three days per week, also taking place in the late afternoon toward the end of the work day.

The use of controlled blasting will not be required for the entire anticipated life of the WGSL. It will only be required until the construction of the final cell. The use of controlled blasting does not impact the stability of the WGSL or any of its berms as the blasting will be used only to fracture and loosen the rock from the slope. The energy output is expected to be well below that produced by the design earthquake considered in the stability analysis performed to evaluate the safety of the landfill.

Potential noise effects associated with controlled blasting for the proposed project are not expected to affect the surrounding community along Farrington Highway or the planned Makaiwa Hills development. In the unlikely event that controlled blasting is required in locations within the landfill property with the potential to disturb surrounding neighbors, WMH will provide appropriate notification and undertake work practices to minimize any disturbance. No major issues or concerns associated with noise generated from blasting are known to have resulted from prior work.

Acoustic Characteristics Summary

While the potential for noise impacts associated with construction and operational activities including construction vehicles and equipment, rock crushing, and controlled blasting are not anticipated, mitigative measures have been proposed to address these concerns. Potential for secondary and cumulative impacts with regard to the planned Makaiwa Hills subdivision located next to the WGSL along its eastern boundary and other adjacent properties, are similarly not anticipated. Construction and earthwork within the landfill will be inhibited by a ridgeline separating the properties on either side of the landfill, and the location of lateral expansion will be at a distance of over a half mile from the Farrington Highway. Mitigation to address the potential for secondary and cumulative impacts will be similar to those designed to address the primary impacts. This will include proper maintenance of all equipment with appropriate sound attenuation as required in accordance with federal, state and City & County of Honolulu regulations, the scheduling of rock crushing during normal landfill operating hours to avoid possible disturbance to surrounding neighbors, and conducting controlled blasting in accordance with regulatory requirements.

5.9. Flora and Faunal Resources

5.9.1. Flora

In 2007, AECOS Consultants, Inc., prepared the report, Botanical Resources Report for Alternative Municipal Refuse Disposal Sites on the Island of O‘ahu (**Appendix E**). The purpose of the report was to evaluate five potential landfill sites to assess which, if any of the proposed locations, support (1) plant species that are either listed by the state and federal government under an endangered species program, or (2) plant assemblages that are substantially native in composition and unique to the Hawaiian

Islands. The sites investigated included: Māʻili Quarry, Nānākuli B, Waimanalo Gulch (lateral expansion), Makaiwa Gulch, and Kapaʻa.

The following is a summary of the report emphasizing the conditions at WGSL.

Introduction

The botanical survey utilized a *wandering pedestrian transect*, a standard protocol for discovery-type surveys. In basic terms, this involved a botanist hiking around the property in a manner that allows a visual survey of all of the various types of habitats present on the property. During the transect examination, each plant species is noted as it is encountered, material is collected where a field identification proves difficult, photographs are taken, and a sense of the relative abundance of each species on the property is developed.

According to the report,

> "The survey of the Waimanalo Gulch was conducted during the wet season (January 2007). Consequently, most of the plants encountered (including annuals) were growing well and were in flower, making positive field identifications relatively straight forward. Nonetheless, a one time survey cannot expect to list every plant species growing on a subject property. Some species are seasonal or opportunistic, while others might be present, but in such low numbers that they are simply not encountered. Every square foot of the land cannot reasonably be covered, and some areas—in this case dangerously steep portions of the gulch margins and high cliff faces—will not be accessed. The botanist attempts to reach all physiographic types characteristic of the property and reach plants appearing from a distance to be "unique". Steep but traversable portions of the gulch margins and smaller cliff faces serve as representative of the inaccessible habitats on the property." (AECOS Consultants, Inc., 2007).

Findings

The proposed project site surveyed comprises approximately 60.5 acres of the property proposed for active landfilling and is located above the existing municipal landfill. The general route taken by the biological team is identified in **Figure 5-17, Botanical Survey Route**.

The survey results are summarized in **Table 5-4, List of Flora at Waimānalo Gulch**. According to the report,

> "A total of 50 species were recorded from the proposed Expansion Area. Of these, only 6 species (12%) are indigenous species (plants native to Hawai`i, but found elsewhere as natives as well). Lowland sites on O‘ahu typically have between 6 and 12% of the species present as natives. Thus, the percentage of natives in lower Waimānalo Gulch is better than might be expected, although not special. All of the species are widely encountered on leeward O‘ahu; none is considered rare or threatened. The only unusual botanical resource encountered was several large patches of pili grass across a broad shoulder of the ridge between Waimānalo Gulch and Kahe Gulch at the 600 ft (180 m) elevation. Pili grass may be locally abundant because there is no longer any grazing of cattle in this particular area." (AECOS Consultants, Inc., 2007).

In summary, the vegetation of the expansion area was found to be fairly homogeneous, consisting of grassed slopes with scattered kiawe trees. Along the bottom and eastern slope of the gulch the trees form an open forest transitioning to savannah. Grasses are mostly Guinea grass (Panicum maximum), although near the ridge lines, buffel grass (Cenchrus ciliaris) is the dominant species. In one area along the top of the western ridge, native pili grass (Heteropogon contortus) is abundant in large patches.

Kiawe, klu (Acacia farnesiana), and koa-haole dominate the scrub-shrub and tree components of the vegetation, which are relatively sparse on the upper slopes and made more so by recent fires that have burned across portions of the property destroying many of the kiawe trees. Crude roads have been bulldozed into the gulch, and these are marked by a diverse assemblage of weedy plants.

STATUS: Distributional status for the Hawaiian Islands:
- end. = endemic; native to Hawaii and found naturally nowhere else.
- Ind. = indigenous; native to Hawaii, but not unique to the Hawaiian Islands.
- nat. = naturalized, exotic, plant introduced to the Hawaiian Islands since the arrival of Cook Expedition in 1778, and well-established outside of cultivation.

ABUNDANCE AREAS: Expansion Area is treated as one plant assemblage or association.
ABUNDANCE CODES:
R – Rare; seen in only one or perhaps two locations.
U – Uncommon; seen at most in several locations
O – Occasional; seen with some regularity
C – Common; observed numerous times during the survey
A – Abundant; found in large numbers; may be locally dominant.
AA – Very abundant; abundant and dominant; defining vegetation type.

Numbers following an occurrence rating indicate clusters within the survey area. The ratings above provide an estimate of the likelihood of encountering a species within the specified survey area; numbers modify this where abundance, as encountered, tends to be greater than the occurrence rating:
1 – several plants present 2 - many plants present 3 - locally abundant

NOTES:
(1) – Especially abundant in disturbed areas as along rough graded road into valley.
(2) – Previously more common, but many burned trunks now present.
(3) – Plant lacking flowers or fruit.

5.9.2. Potential Impacts and Mitigation Measures

U. S. Fish and Wildlife Service Critical Habitat Designations

Critical habitat under the Endangered Species Act of 1973 (ESA) refers to special boundaries that are considered important to the conservation and recovery of species listed under the ESA. Although federal actions within a designated critical habitat area require consultation under Section 7 of the ESA, actions by other entities also come under this requirement if the action is funded or authorized by a federal agency. All entities are subject to provisions of the ESA based on actions that may impact a listed species, including "critical habit" whether the listed species is present or not. (AECOS Consultants, Inc., 2007).

A total of 55,040 acres of land on O‘ahu have been designated as critical habitat for 99 species of plants. The total number of separate units on O‘ahu representing designated habitats for these 99 species of plants is 36. (AECOS Consultants, Inc., 2007).

There are no critical habitat units in the vicinity of Waimānalo Gulch. The closest critical habitat to the site is Unit 16, encompassing most of the south slopes of Nānākuli Valley between about 400 and 1500 feet elevation, designated as critical habitat for Isodendrion pyrifolium, a species last seen on O‘ahu in 1870 (Wagner, Herbst, & Sohmer, 1990). The ridgeline representing the southernmost extent of Unit 16 is just over 1 mile from the northwest ridgeline bounding the Waimānalo Gulch property. No part of any proposed site overlaps into a critical habitat unit (Federal Register, 2003, and AECOS Consultants, Inc., 2007).

Endangered Species Act Listed Species

The results of the botanical survey indicate that the proposed project site is not located within any of the 36 designated critical habitat units on the Island of O‘ahu.

A number of species are known from individual specimens or populations evaluated in the botanical survey. A summary of these species is provided in the following (AECOS Consultants, Inc., 2007):

Marsilea villosa or ‘ili‘ihi is a small aquatic or semi-aquatic fern resembling a clover. This fern requires periodic flooding and drying of the ground to complete its short life cycle, and thus it is confined to shallow basins during the wet season. The following description is from the Recovery Plan for the Marsilea villosa as given by USFWS (undated):

"This fern requires periodic flooding for spore release and fertilization, then a decrease in water levels for the young plants to establish. It typically occurs in shallow depressions in clay soil, or lithified sand dunes overlaid with alluvial clay. All reported populations occur at or below 500 feet (150 meters) elevation. While M. villosa can withstand minimal shading, it appears most vigorous growing in open areas."

Only five populations of this species are known from three locations on O‘ahu: Koko Head (2), Lualualei Naval Reservation (2), and Kealakipapa (near Makapu‘u) (Palmer, 2003). A USFWS website confusingly lists 6 locations to account for “three currently occur[ing populations] on O'ahu… (USFWS, undated)[10]. Suitable habitat is not present at the Waimānalo Gulch, Makaiwa Gulch, or Kapa‘a sites.

Chamaesyce kuwaleana, is a species of ‘akoko listed as endangered (Federal Register, 1991). Critical habitat for this species has been designated in seven units. Unit 15 encompasses 454 acres of Pu‘u Haleakalā and is thought to presently harbor 300 individual plants (USFWS, 2003). Unit 15 lays upslope of the Nānākuli site. The plant is a small shrub between 0.2 and 0.9 meters (8 to 35 in) high, known only from “arid volcanic cliffs, 250 m [820 ft high], Wai‘anae Mountains, and also known from one specimen from Mokumanu, Kāne‘ohe, O‘ahu” (Wagner, Herbst, and Sohmer, 1990).

---

[10] A USFWS website confusingly lists 6 locations to account for “three currently occur[ing populations] on O`ahu (USFWS, undated).

This species was not observed in the botanical survey of the Waimanalo Gulch site.

Hawaiʻi Natural Heritage Database

The Hawaiʻi Natural Heritage Program (HNHP) was accessed and maps showing data entries were reviewed covering the lands for at least 1 mile around each of the proposed sites covered in the survey. The database has no rare or listed species of native plants at or close to any of the five proposed landfill sites. Within a distance of 1.25 miles the database yields entries for some of the sites. (AECOS Consultants, Inc., 2007).

Within roughly 1 mile of the Waimānalo Gulch and Makaiwa Gulch properties, the data base indicates the now extirpated populations of ʻEwa ʻakoko (Chamaesyce skottsbergii var. skottsbergii) that once occupied land that is the Barbers Point Deep Draft Harbor and associated dredge tailings. This endangered variety is no longer present in this area (David and Guinther, 2006), but is being maintained at several sites in Kalaeloa (former Barbers Point Naval Air Station). (AECOS Consultants, Inc., 2007).

Conclusion

The results of the botanical survey and search of pertinent sources of information indicate no special concerns or legal constraints related to botanical resources at Waimānalo Gulch or any of the sites investigated. Non-native or introduced species clearly dominate the natural vegetation and the remnants of native vegetation extant on or near the sites investigated consists of generally sparse growth of a limited number of species that remain relatively common in all undeveloped lowlands around Oʻahu. Although some rare native plants, and in a couple of cases, endangered species or varieties of plants, can be found within 1.2 miles of the sites, there is no reason to believe that the operation of a landfill would have any adverse impacts on such species. (AECOS Consultants, Inc., 2007).

The operation of a municipal solid waste landfill, by its very nature and in compliance with the most modern environmental requirements designed to minimize and contain offsite movement of pollutants (including sediments), will require removal of the vegetation from the selected site. **Figure 5-18, Waimānalo Gulch Typical Operations Along Ridge** shows the use of the existing Waimānalo Gulch site during the setting up of cells into which refuse is permanently stored. This initial phase entails making cuts into the hillside to create room and obtain soils for cover material. (AECOS Consultants, Inc., 2007).

Figure 5-18, Waimānalo Gulch Typical Operations Along Ridge
Composite photo of the eastern side of Waimānalo Gulch showing the upper end of the permitted landfill area (right) with reshaping of the site underway

Whatever botanical resources are present will require removal up to the limits of the proposed design. Following grading and use of the site for landfilling, surface stabilization will involve structural as well as vegetative practices. As appropriate, native species will be used to the extent practicable.

It is generally the case that many rare native plants of interest (an exception is the fern, ‘ili‘ihi which might be found at sites other than Waimānalo Gulch) growing in the lowlands of O‘ahu will be confined to steep gulch slopes and cliffs.

In most cases, these habitats would tend not to be developed, although steep gulch slopes could be incorporated into the overall reshaping of the site to a greater degree than might be the case for most other kinds of land development. (AECOS Consultants, Inc., 2007).

Summary

The botanical survey is based on recent investigation of the Waimānalo Gulch site and data associated with previous investigations of the Nānākuli, Māʻili, Makaiwa, and Kapaʻa sites. There is no guarantee that some small number of specimens of a listed species might be present at the Nānākuli, Māʻili, Makaiwa, or Kapaʻa sites that have not been subjected to a recent survey (such as conducted by AECOS Consultants, Inc., for Waimānalo Gulch). Should one or more of these other sites be selected for landfill use, additional botanical surveys should be conducted as deemed practical to better establish the conclusion of no adverse impacts on listed species. The desirability of doing such a future survey or surveys will depend upon habitat present at the site, proximity of the site to known populations of endangered species, and how recently and completely past botanical surveys covered the other sites. According to AECOS the botanical report is expected to be sufficient to cover the environmental botanical concerns of the Waimānalo Gulch site. (AECOS Consultants, Inc., 2007).

Flora Resources Summary

The potential for secondary or cumulative adverse impacts to flora resources at the site are not anticipated. The proposed project will be limited to the use of the City owned property and no expansion outside of the property boundary is planned or proposed. While the planned use of the site will require the removal of vegetation to establish the lateral landfill expansion area, this constitutes a short term effect of a scope and scale that is limited to the Waimanalo Gulch landfill property. In the longer term, upon completion of work the site will be restored with vegetation similar to that found on the adjoining hill sides. Whenever possible, native species will be used.

5.9.3. Fauna

In 2006, Phil Bruner, Ph.D., prepared the report, Survey of the Avifauna and Feral Mammals for the Proposed Waimānalo Gulch Landfill Expansion Project, Oʻahu (**Appendix F**). The purpose was to provide the findings of a bird and mammal field survey. The same area of the site was previously surveyed in 1999 (Bruner, 1999) and data from this earlier survey is provided in the current study for comparison purposes. References to literature and unpublished reports since 1999 are included.

The field survey objectives were to: (1) Document bird and mammal species currently occurring on the property; (2) Provide comparative data on the relative abundance of each species; (3) Determine the presence or likely occurrence of native or migratory birds including species listed as endangered or threatened; and (4) Determine if the habitats on the site are comparable with those seen in 1999.

Introduction

The proposed expansion area is located in a narrow "V" shaped valley with a dry stream bed that only contains water during flash flood events. Introduced vegetation continues to dominate the plant communities at this site. Many trees present in 1999 were burned in the August 2005 fire that affected the region and most of the surviving trees are along the stream bed. Dry grass covers most of the site. Weather during the survey was clear and warm. Winds were from the east at 10-15 miles per hour. (Bruner, 2006).

The site was surveyed on foot using the same access road used in 1999. Field observations were made with the aid of binoculars and by listening for vocalizations. All birds seen or heard were tallied and observations of feral mammals were limited to visual sightings. No attempts were made to trap mammals to obtain data on relative abundance and distribution. Scientific names of birds and mammals used in the report followed those given in Checklist of the Birds of Hawaiʻi (Pyle 2002) and Mammal Species of the World (Honacki et al. 1982).

Survey Results

A summary of the species observed during the field survey are provided in **Table 5-5**.

Resident Endemic (Native) Birds

No native land birds were recorded which was similar to the survey in 1999. The Hawaiian Owl or Pueo (Asioflammeus sandwichensis) is listed as endangered on O'ahu by the state. This species was not recorded but may forage in the area. Bruner noted that since 1999 he has observed Pueo at locations only a few miles on either side of Waimānalo Gulch. Pueo hunt over grasslands as well as forests and nest on the ground in tall grass (Pratt et al. 1987, Hawai'i Audubon Society 2005).

Table 5-5
Avifauna Observed at Waimānalo Gulch Landfill
1999 and 2006

Alien (introduced) species of birds recorded on and near the site of the proposed Waimānalo Gulch Landfill Expansion, O'ahu during the 1999 and 2006 field surveys. Relative abundance estimates are based on total numbers of birds recorded:

A = abundant (30-50);
C = common (1 5-29);
R = rare (1 -4);
U = uncommon.
Species not recorded are indicated by a (-).

		Relative Abundance	
Common Name	Scientific Name	1999	2006
Cattle Egret	Bubulcus ibis	U	R
Erckel Francolin	Francolinus erckelii	R	-
Rock Dove	Columba livia	C	-
Spotted Dove	Streptopelia chinensis	A	C
Zebra Dove	Geopelia striata	C	U
Red-vented Bulbul	Pycnonotus cafer	A	R
Common Myna	Acridotheres tristis	A	U
Japanese White-eye	Zosterops japonicus	R	C
Northern Cardinal	Cardinalis cardinalis	R	R
House Finch	Carpodacus mexicanus	U	-
Common Waxbill	Estrilda astrild	A	C
Red Avadavat	Amandava amandava		R
Nutmeg Mannikin	Lonchura punctulata	U	-
Java Sparrow	Padda oryzivora	R	-

Migratory Indigenous (Native) Birds

No migratory shorebirds were recorded. The project area lacks suitable habitat.

Resident Indigenous (Native) Seabirds

No seabirds were observed. The White-tailed Tropicbird (Phaethon lepturus) can be seen soaring above valleys and ridges on O‘ahu. This species is not endangered or threatened.

Resident (Native) Waterbirds

The stream only contains water during flash floods and therefore no waterbirds would be expected at this site.

Exotic (Introduced) Birds

Only nine species of exotic birds were recorded during the course of the field survey compared with 13 species in 1999. These species are comparable to those observed on other surveys in similar habitat (Bruner 1989, 1990a, 1990b, 1992, 1993, 1996, 1999, 2000, 2001a, 2001b, 2002, 2003). None of these species are listed as endangered or threatened.

Feral Mammals

The only feral mammal observed was the Small Indian Mongoose (Herpestes auropunctatus). Two were seen in the stream bed. Rats (rattus sp.) and Mice (Mus musculus) were not seen but probably occur on site (as they do in the surrounding area and region). The endemic and endangered Hawaiian Hoary Bat (Lasiurus cinereus semotus) is rarely seen on O‘ahu (Tomich 1986, Kepler and Scott 1990). No bats were observed on the survey. This species is known to roost solitarily in trees and forages for flying insects (Jacobs 1993). They use a variety of habitats including native forests, ranchlands, ponds and bays as well as urban areas (Jacobs 1991, Reynolds et al. 1998).

5.9.4. Potential Impacts and Mitigation Measures

Potential for adverse impacts to the faunal resources of the WGSL are not anticipated. No mitigation measures are proposed and none are expected to be required.

Native and migratory birds were not observed at the property. This is not unexpected based on the elevation of the site and lack of available habitat for these species. It is possible that Pueo forage on occasion in the region. However, all bird species recorded in 1999 and in 2006 are non-native, introduced species. There were fewer alien species and lower relative abundance found on the 2006 survey which may be due to the August 2005 fire which had a major impact on this habitat. Other factors may also account for the differences in bird populations between 1999 and 2006 (Williams 1987, Moulton 1990). In conclusion, Waimānalo Gulch is not remarkable in the diversity of non-native and alien species, or in the number of birds and mammals found there. There are no unique habitats. Similar areas occur all along the leeward side of Oahu. (Bruner, 2006).

Faunal Resources Summary

The potential for secondary or cumulative adverse impacts to fauna resources are not anticipated. The proposed project will be limited to the use of the City owned property and no expansion outside of the property boundary is planned or proposed. While use of the site for a landfill may continue to attract bird species that might otherwise scavenge refuse as it is landfilled, work practices will remain to place cover material over the refuse as it is landfilled to reduce its attractiveness to avifauna. This existing procedure is designed to also reduce the incidence of other vectors such as rats and mice. While it is possible that the Pueo may overfly the landfill property in search of these food sources, the covering of refuse will help to reduce these vectors and any potential for impacts to Pueo within the landfill property.

~~The aquifer hydraulic data suggest that Dike #1 has little influence on groundwater flow. The static groundwater level in MW-12 was 4.9 feet above msl, which is less than 1 foot higher in elevation to basal aquifer monitoring wells farther down Waimānalo Gulch. The hydraulic gradient is approximately 1.4 foot per mile, which is within the range of hydraulic gradients normally observed in basal aquifers without dikes. The groundwater levels in MW-12 are consistent with the water levels and the hydraulic gradient observed in the monitoring wells in the lower portion of the WGSL and does not indicate a dramatic gradient change that would be caused by dike compartmentalization of groundwater.~~

A hydraulic pump test was performed on MW-12 to compare hydraulic aquifer properties with other aquifers on the island. Lower hydraulic transmissivities and conductivities have been documented to occur in dike-influenced aquifers with higher dike occurrence frequencies, and which are in closer proximity to the associated caldera. From the pump test, the aquifer at MW-12 in the Waimānalo Gulch had a hydraulic transmissivity and conductivity comparable to aquifers without dikes on the Island of O‘ahu. Although drawdown in pumped water levels was small, negative boundaries such as a barrier-type dike that may be in the immediate area were not noticeable.

The groundwater flow direction was measured and varied between 210 and 290 degrees, which is approximately the axis of the Waimānalo Gulch. Since Dike #1 strikes at 341 degrees, groundwater flow is approximately perpendicular toward the strike of Dike #1. If Dike #1 had a strong influence on basal groundwater flow direction, groundwater flow would be expected to be more parallel along the strike of the dike. This groundwater flow direction is consistent with groundwater flow directions determined by groundwater elevations using other basal groundwater monitoring wells at the WGSL.

Dike #1 appeared to have little or no influence on horizontal basal groundwater flow. The static basal groundwater level observed in MW-12 does not indicate groundwater is

5.9.5. Invertebrates

In September 2008, Steven Lee Montgomery, Ph.D., prepared the report, Survey of Terrestrial Invertebrate Resources in the Waimānalo Gulch, Oʻahu, Hawaiʻi: Sanitary Landfill Expansion Area (**Appendix L**). The purpose of the invertebrate survey was to report on the findings of a field investigation to ascertain the relative abundance and distribution of species found and likely to be found at the proposed project site, and to identify mitigation measures as appropriate.

Introduction

Invertebrates are often the dominant fauna in natural Hawaiian environments. The primary emphasis of the survey was to investigate terrestrial arthropods, particularly those that are endemic, indigenous, or threatened species, especially those having legal status under either, or both federal and state endangered species statutes (DLNR 1996, USFWS 2005a, 2008). (Montgomery, 2008).

Native Hawaiian plant, vertebrate, and invertebrate populations are often interdependent. Certain insects are obligatorily attached to specific host plants and are able to use only that plant as their food. Those insect - host relationships are ancient and intertwined. Invertebrates are the food of some birds and the pollinators of plants. Native invertebrates have proven inventive in adapting to opportunities in changed ecosystems. (Montgomery, 2008).

A number of native arthropod species survive even in degraded habitats. Nevertheless, the overall health of native Hawaiian invertebrate populations depends upon habitat quality and absence or low levels of predators introduced from the continents. Sufficient food sources, host plant availability, and the absence or low levels of introduced, continental predators and parasites comprise a classic native, healthy ecosystem. Consequently, where appropriate in the survey discussion, host plants, and some introduced arthropods were noted. (Montgomery, 2008).

Invertebrate Survey Methods

Previous Surveys and Literature Search

Prior to the field survey, a search was made for publications relating to invertebrates associated with the WGSL expansion area. A recent survey at the adjacent proposed Makaïwa Hills housing development provided a comparison to a similar environment (Montgomery 2006). University of Hawai‘i Library holdings, Bishop Museum library and data bases, and regional and national databases were also searched. These searches returned no records of invertebrate surveys in Waimānalo Gulch. (Montgomery, 2008).

Fieldwork

Field surveys were conducted in August 2008. A general assessment of terrain and habitats at the start of the survey was undertaken and surveying efforts were conducted at various times of day and night, a technique which is vital for a thorough survey. Native botanical resources identified by Char (1999) and Guinther (2007) were an important focus of the searches. The talus slopes of lichen covered rocks and older rock ledges were of special interest as undisturbed Hawaiian ecosystem habitat. These areas support a microflora of lichens and algae, food for a higher diversity and larger number of native invertebrates than other locations within the valley. (Montgomery, 2008).

Survey Limitations / Conditions

The investigator was limited / influenced by the following (Montgomery, 2008):

> *Common alien species*: No attempt was made to collect or completely document common alien arthropod species present in the area.
>
> *Collecting conditions*: Monitoring at a different time of the year, or for a longer period of time, might produce a longer or different arthropod list. Weather and seasonal vegetation play an especially important role in any survey of invertebrates. Many arthropods time their emergence and breeding to overlap or

follow seasonal weather or to coincide with growth spurts of an important plant food. Host plant presence/absence, and seasonal changes, especially plant growth after heavy rains, affect the species collected.

Weather was favorable for collecting during each day of collecting. This survey was conducted without the benefit of winter rains, however native dryland adapted vegetation was in a better than expected condition due to several summer rains. If vegetation displayed young tender or mature new growth, a different insect list might have resulted.

The moon did not present competition to light collecting efforts and should not have affected the number of insects attracted to the light. The steepness of slopes in some areas made access to some possible host plants difficult. Light censusing at night was some compensation for this hurdle.

Physical limitations: The steepness of slopes in some areas made access to some possible host plants difficult.

The size of the project area and the steepness of many slopes means that the survey was not comprehensive. The overall study strategy and site selections were designed to mitigate this recognized handicap. The resulting survey was representative and targeted in favor of locating and examining native host plants.

Findings

In addition to the observation of invertebrates, the investigator observed a Barn Owl (Tyto alba) pellet containing rat bones, confirming the expectation that the Owl would be present on the property (Bruner 1999). There was also evidence of dogs in the area but no signs of feral goats or pigs, which are common enemies of native host plants. Cattle in the upper shrub land above the Landfill property could be seen and heard. (Montgomery, 2008).

Native invertebrates found in this survey and significant non-native species are listed in **Table 5-6, List of Invertebrates: Waimānalo Gulch, Oʻahu**. Native species of note are discussed and information is provided on adventive species often misidentified by the public as native species. Also, information is provided on some medically important species (Montgomery, 2008):

Invertebrate Resources
Mollusca: Gastropoda Pulmonata
Succineidae: *Succinea caduca* or Hawaiian amber snail
This was the only native terrestrial mollusk encountered. Endemic Succinea snails were observed under stones and on rocky ledges that provide food and shelter from heat and desiccation. This species is endemic to O'ahu, but widely distributed. This distribution pattern is not uncommon in Succinea. This group of snails may be arboreal or ground dwelling, and occupies a wide range of habitats. They are not known to eat healthy, growing plants and poses no threat to home gardens or landscaping (R. Cowie, personal communication 2002). The group is under study by Dr. Cowie's lab at the University of Hawai'i (Cowie 2006).

Arthropods
Insecta
Lepidoptera
Cosmopterigidae: *Hyposmocoma*
Two species of Hyposmocoma, as caterpillars, were found on the rocky outcroppings and three species, in adult stage, came to light. Considering the population is likely at a low level due to the dry weather, the diversity is noteworthy. In the wet season it could be expected that a higher number of individuals and more species would be recovered.

?	? unknown

Abundance = occurrence ratings for plants by area:

R	Rare	seen in only one or perhaps two locations
U	Uncommon	seen at most in several locations
O	Occasional	seen with some regularity
C	Common	observed numerous times during the survey
A	Abundant	found in large numbers
AA	Very abundant	abundant and dominant

Properly called "case bearers," the caterpillars are sometimes misleadingly called "bagworms." Very young caterpillars of case bearers find safety inside a leaf curl or similar hiding place, but when growth forces them out of that protection, they intricately weave a portable shell of their own silk from a lip spinneret. For camouflage, they add bits of their surroundings to the case using their silk: snips of dry grass or leaves, flakes of bark, maybe a little dirt. The case is then easily mistaken by a predator as another part of the landscape. They are dependent on their case, and die if removed – even if protected from predators and given food. They don't move far, but feed while partly emerged from the case, dragging along their protective armor by their six true legs.

With over 500 kinds, Hyposmocoma micro moths are the greatest assemblage of Hawaiian Island moths, showing astonishing diversity. After writing 630 pages on them, Dr. Elwood Zimmerman lamented the inadequacy of his study. He noted an enormous cluster of species with explosive speciation and diverging radiation (Zimmerman 1978).

Much remains to be learned about the life ways of this interesting group of insects now under study by University of Hawaii's Dr. Daniel Rubinoff and colleagues (Rubinoff et al. 2008). The UH lab will attempt to rear out the caterpillars to identify the species.

Noctuidae: *Ascalapha odorata*
The black witch moth found in the survey is widely distributed in the island chain. This large moth is occasionally mistaken for a bat when seen in flight in low light. It is most frequently seen at dawn or dusk. In cities it is seen resting under the eaves of roofs during the day. In rural areas it rests under foliage and against tree trunks.

The sweetpotato hornworm, a large and easily seen moth, is often confused by the public with the Blackburn's sphinx moth (*Manduca blackburni*). They are distinguished by their pink markings, as opposed to orange markings on Blackburn's sphinx moth. The species is widely distributed around the Hawaiian Islands.

Homoptera (Planthoppers)

Cixiidae *Oliarus discrepans* Giffard, 1925

Oliarus discrepans was previously listed by the US Fish & Wildlife Service as a "Species of Concern." (HBS 2002a) This designation has been abandoned by the Service. Five individuals of this native, lowland planthopper, rarely seen in the last 40 years, were recovered. *O. discrepans* is considered a founding species or ancestor for a large cluster of species.

Odonata (Dragonflies and Damselflies)

Libellulidae: *Pantala flavescens* Globe skimmer

This indigenous dragonfly was observed at the site and is among the most easily observed native insects. This dragonfly is large, easily approached by people, and graceful in flight. Any small amount of fresh water will attract globe skimmers and they often colonize human maintained water sources such as golf-course water hazards and ponds. It is widely distributed throughout the Hawaiian Islands, from Kure to Hawai'i Island and has even been found flying at sea (Howarth & Mull 1992).

Invertebrates Not Present

Plant and invertebrate populations are interdependent, meaning host plant presence previews invertebrate diversity. The absence of wiliwili (*Erythrina sandwicensis*) and ma'o or Hawaiian cotton (*Gossypium tomentosum*) and the low levels of 'ilima (*Sida* sp.) (Char 1999, Guinther 2007) contribute to the paucity of Hawaiian arthropods at Waimānalo Gulch. A longer survey after the winter flush of plant growth would surely have found several more frequently seen native arthropods as noted below.

Alien predatory ants are another major cause of low native arthropods. Both the fire ant (Solenopsis geminata) and big-headed ant (*Pheidole megacephala*), which prey on other insects (Zimmerman 1948-80), are present on the property. Ants are well documented as a primary cause of low levels of native arthropods at elevations up to 2,000 feet (Perkins 1913). On all nights during light collecting, ants quickly appeared and began attacking the resting moths and smaller insects at the light. Ants frequently do not overlap territories, but have separate territories, effectively apportioning the hunting grounds between themselves, offering few ant-free zones to native arthropods.

Mollusca: Gastropoda (Snails) Pulmonata

Achatinellidae

The Oahu Tree Snail (*Achatinella*), listed on the federal endangered species list, was not found (DLNR 1996; Federal Register 1981). The habitat (elevation, host plants, and moisture levels) make the area inappropriate for the snail.

Arthropoda Araneae

Lycosidae: *Lycosa* sp.

Native Lycosa or wolf spiders (18 mm) were not seen on the property, although they are probably present based on their distribution in similar habitat island-wide. These are quick, strong predators which give maternal care to their young. They hide alone by day and hunt by night in established individual territories. (Manning/Montgomery in Liittschwager & Middleton 2001).

Arthropoda Insecta

Diptera

Drosophilidae: *Drosophila*

No native Drosophila were observed on the property. The location does not provide appropriate habitat for any of the 12 native Drosophila species recently listed as endangered or threatened. (USFWS 2006a, b).

Heteroptera

Lygaeidae *Nysius* sp.

Although commonly found in dryland locations, this native seed bug which uses many host plants, alien and native, was not recorded by this survey.

Hymenoptera

Colletidae *Hylaeus* sp.

The yellow-faced bee was not found, but is likely present. This native, ground nesting bee is often found in dry habitats at similar elevations. *Ceratina smaragdula* (Fabricius, 1787), the small carpenter bee, was noted and is often confused with the yellow-faced bee as it is similar in size and often visits the same native plants. (Daly & Magnacca 2003).

Lepidoptera

Sphingidae: *Manduca blackburni*

Blackburn's sphinx moth (*Manduca blackburni*), an endangered species (Fed Reg 1999-2000) which favors drylands, was not found in this survey. The moth's native solanaceous host plant, 'aiea (*Nothocestrum* sp.), was not observed on the property in this survey or prior botanical surveys. The best alien host, tree tobacco (*Nicotiana glauca*), however, is present in many locations in the expansion area. Over 50 plants were searched without finding evidence of feeding or presence of caterpillars.

The moth has not been seen on O'ahu for many decades. The Recovery Plan (USFWS 2005b) for this large sphinx moth proposes only one Management Unit on O'ahu, at the Nature Conservancy's Honouliuli Preserve and relies on future reintroductions from other islands.

Medically Important Species

The Waimānalo Gulch Landfill Expansion area includes prime habitat for medically important species: centipedes, scorpions, and paper wasps. Widow

> spiders also may be present in the area. Paper wasps were plentiful and aggressively defensive on overhanging ledges. Honey bees were in low numbers, most likely the result of the recent introduction of the Varroa mite which is killing colonies.
>
> Employees should be alert for these species during their work. These species may pose a serious risk to some individuals, and supervisors should be aware of any special allergy by employees. Some individuals can experience anaphylactic reactions to venom. When dislodging stones or brush, use of gloves and long sleeves will greatly reduce the risk of accidental contact and bites or stings. See "What Bit Me?" (Nishida and Tenorio 1993).

5.9.6. Potential Impacts and Mitigation Measures

Potential Impacts on Federal or State Listed Species

No federally or state listed endangered or threatened species were noted in this survey (USFWS 2008). No anticipated actions related to the proposed project activity in the surveyed locations are expected to threaten entire species or entire populations. (Montgomery, 2008).

The invertebrate survey, however, recommends that it is possible to reduce the potential for adverse effects to invertebrate species through the improvement of the watershed, within an area that is beyond the property boundary of the WGSL. According to the survey:

> "It is important to manage the ahupua'a to reduce peak flooding, which can damage stream banks, culverts, and undermine waste storage cells. The presence of cattle in the watershed above the Landfill has had and will have negative impacts. For example, at Hawai'i Kai's Haha'ione Valley and Mānoa Valley, exceptional downpours on goat and pig disturbed mauka landscapes and have exacerbated extreme water runoff. Improving the quality of watershed on

> the property above the Landfill would reduce the intensity of flash flooding and the potential for damage. Removal of the cattle in the catchment area above the Landfill would improve vegetation and reduce erosion. Restoration of the watershed with selective planting of fire resistant plants intended to slow runoff (a mix of plant heights with a strong ground cover) would make a substantial contribution toward soil and water retention." (Montgomery, 2008).

Although the implementation of these measures will not be possible outside of the property boundary of the WGSL, stormwater management controls will be implemented within the site to ensure against the undermining of any landfill cells or landfill associated structures. Runoff that is generated from on-site will be properly managed with appropriate management, structural, and vegetative controls to address soil and sediment erosion in accordance with HAR, Chapter 11-54, (State) Water Quality Standards. (See also Section 5.4. Surface Water).

Invertebrate Resources Summary

The potential for secondary or cumulative adverse impacts to invertebrate resources are not anticipated. The proposed project will be limited to the use of the City owned property and no expansion outside of the property boundary is planned or proposed. While the planned use of the site will require the removal of soils and vegetation that may constitute habitat for the species identified in the survey,

There were no state or federally listed threatened or endangered species discovered at the site. Many species identified were relatively common and can be found in other locations of Oʻahu. Upon the completion of work the site will be returned to its existing vegetated condition that will include, as appropriate, native plant species that may serve as new habitat, i.e., "The absence of wiliwili (*Erythrinia sandwicensis*) and ma'o or Hawaiian cotton (*Gossypium tomentosum*) and the low levels of ''ilima (*Sida* sp.) (Char 1999, Guinther 2007) contribute to the paucity of Hawaiian arthropods at Waimanalo Gulch" (Montgomery, 2008).

5.10. Scenic and Aesthetic Environment

5.10.1 Scenic and Aesthetic Environment

The Hawaiian Electric Company's (HECO) Kahe Power Generating Station, located directly north and west of the WGSL, is a dominant landmark in the region marking a point of transition between the Wai'anae Coast and the 'Ewa Region. The plant's smokestack penetrates the view plane from various locations in the surrounding area and can be seen from Farrington Highway both north and south of Kahe Point (see Photos 1 and 3).

Farrington Highway traverses along the southern foot of the Wai'anae Mountain Range as it makes its way along coastal Wai'anae. Ridges and valleys in the area are covered with keawe trees, dryland grasses and other dryland scrub vegetation. During periods of high rainfall the hillsides turn green with new vegetative growth, however the typically arid conditions normally give the landscape a more yellowish-brown, dry appearance with scattered keawe trees providing most of the greenery. The higher elevations of the Wai'anae Range contain denser foliage and larger trees due to the availability of more moisture.

Approaching the project site from the southeast along the Farrington Highway, major views include the rugged slopes of the Wai'anae mountain range mauka of the highway, distant buildings and other structures associated with development in the 'Ewa Plain (i.e. City of Kapolei and Ko Olina Resort area), residences adjacent to the highway, the entrance and overpass structure to the Ko Olina Resort and intermittent views of the ocean. Continuous views of the ocean begin soon after passing the overpass/entrance to Ko Olina. The ridges of the Waimānalo Gulch block views from the southwest along Farrington Highway up to the Waimānalo Gulch stream crossing while direct views into the gulch from the highway are limited due to existing topography and vegetation fronting the site.

Kahe Point blocks most views into the WGSL from the northwest as the site is approached along the highway. Viewpoints near the Kahe Power Generating Station and the Kahe Point Beach Park (see Photos 1 and 2) show only the upper reaches of the eastern ridge. The only indications of activity beyond the ridgeline are vehicles conducting work, traveling on the access road within the landfill property, and limited views of the landfill itself.

The entrance to the landfill, located approximately 700 feet to the west of the entrance to Ko Olina, is marked by a small sign announcing the location of WGSL. Landscaping treatments including the use of trees and vegetation screens the administration building from the highway. Portions of a permanent litter fence are visible from the highway and occasional queuing of refuse vehicles within the landfill along the WGSL access road during peak delivery periods makes the presence of the landfill known to Farrington Highway motorists.

The WGSL site is visible in varying degrees from surrounding development such as the Kai Lani subdivision, Coconut Plantations town homes, Ko Olina Golf Course and the Marriott Ihilani Resort (see Photos 3 thru 6). The appearance of the landfill from these locations is dominated by a large earthen mound representing filled portions of the landfill. Stabilized lower sections of the landfill have begun to take a more ‘naturalized’ look as grass and other vegetation take root. The upper portion of the site resembles a quarry operation due to the piles of soil and rocks being readied for use as cover material (see Photos 3 thru 6). Also visible from some vantage points, is the concrete drainageway that runs along the northwest rim of the valley. Views of the landfill from areas further away from the mouth of the gulch begin to recede with increasing distance from the WGSL.

Caterpillar tractors moving refuse and cover material within the remaining active landfill cell (E-4) are not readily visible based on the location of the cell within a depression further back into the landfill. However, refuse vehicles can be seen traveling up and down the access road to deposit their loads in the landfill as well as construction vehicles transiting the site.

The **Photo Key** indicates the approximate locations where Photos 1 through 6 were taken. Kahe Point blocks views of the gulch from the northwest while the gulch walls block the view from the southwest along Farrington Highway up to the Waimānalo Gulch stream crossing.

Photo 1 – Taken off of Farrington Highway northwest of Kahe Power Generating Station. Only a portion of the upper reaches of the eastern valley wall is visible. Dust clouds can be seen rising above the ridge as vehicles negotiate along the access road within the site.

Photo 2 – Taken from the parking lot at the Kahe Point Beach Park. Views towards the project site are limited due to the proximity of Kahe Point. The nearby ridge blocks potential views of the landfill.

Photo 3 – Taken from the tennis court area of the Marriott Ihilani Resort. The higher elevation above existing structures, trees, and vegetation offers an unobstructed view of the project site. The lower to middle elevations show the start of landscaping efforts to blend the landfill with the surrounding hillsides. Refuse vehicles and bulldozers can be seen moving within the site.

Photo 4 – Taken from the Ko Olina Beach Resort parking lot. Existing trees in the foreground block views of the lower portions of the landfill. The upper elevations show more recently disturbed soils. The active working cell is not visible due to the existing elevation of completed landfill cells, including MSW Cell 1.

Photo 5 – Taken along Koio Drive adjacent to the Ko Olina Golf Course. The cover material in the upper reaches of the landfill is visible. The active working cell is not visible.

Photo 6 – Taken from the southern end of Lagoon 1, adjacent to the Marriott Ihilani Resort. Existing vegetation and buildings in the foreground block views of the lower portions of the landfill site. Only the upper region of the site with more recent cover material can be seen. The active working cell is not visible.

Changes to Viewplane Over the Life of the WGSL

The proposed project will be developed in accordance with a preliminary closure sequencing plan up to and after the approximately 15 year life of the facility as provided in **Figure 4-9, Preliminary Closure Sequence**.

It is important to note that a number of factors can potentially affect the sequencing plan. The landfill elevations shown are based on conservative waste disposal estimates from the prior history of use and consideration for the future adoption of waste reduction strategies. Factors that can affect the rate of waste disposal include: a downturn in the economy such that fewer goods and products would be replaced at any given period. Replaced goods would in part be disposed of at the landfill; use of new waste treatment and disposal technologies not yet available, but successfully adopted in the future, would reduce the need for landfilling; and, a natural or man-induced disaster would be expected to generate waste debris requiring landfilling. The occurrence of one or more of these factors could result in either the more rapid exhaustion of space, or it may lengthen the period of time involving the use of landscaping or other mitigation measures.

In order to ascertain changes to the WGSL viewplane over the minimum 15 year period of anticipated use, digital analysis of the site was undertaken based on the closure sequence as provided in **Figure 4-9, Preliminary Closure Sequence**. The depiction of these changes are provided in **Figures 5-18A** through **5-18D**. The figures represent views toward the WGSL from the vantage point of the upper floors of the Marriott Ihilani Resort, Ko Olina. Color has been added to the landfill footprint and grades to clearly distinguish the site from the surrounding terrain and hillsides. Site terrain is based on recent topographic data obtained from WMH. Surrounding terrain is based on topographic data from the City & County of Honolulu.

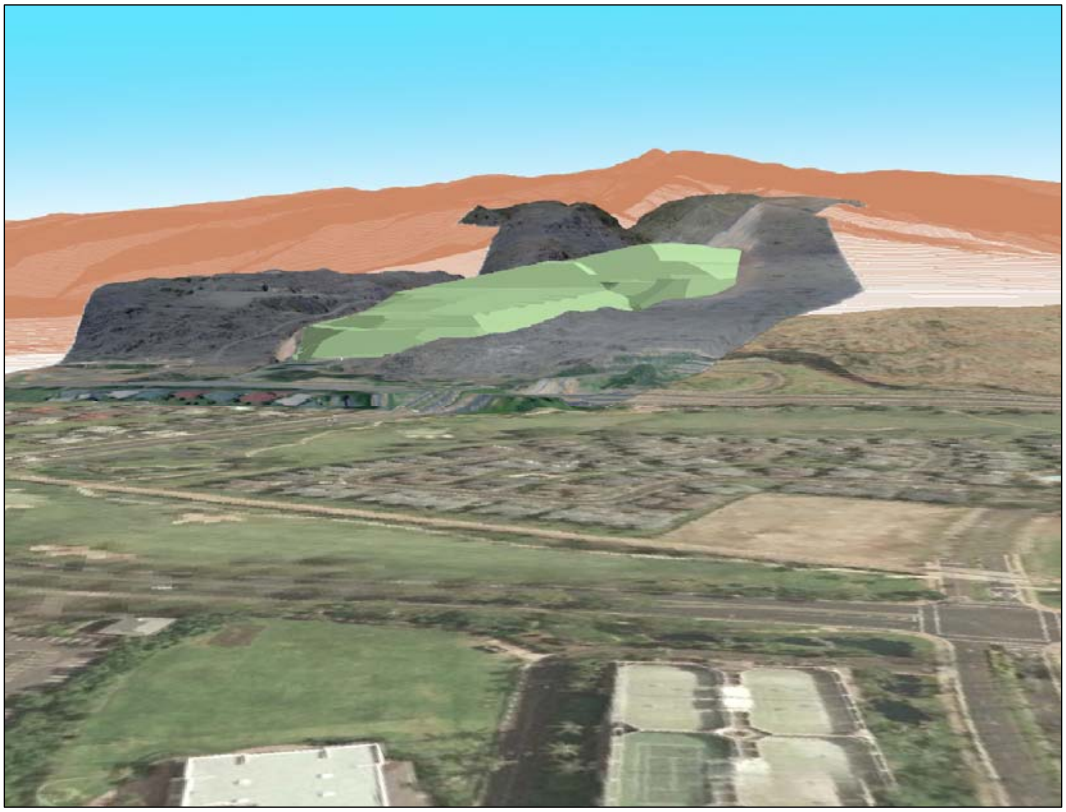

Figure 5-18A, Existing Permitted Area or Footprint of WGSL

Existing Conditions

Figure 5-18A depicts the existing condition of site as it is presently utilized. The grades and footprint (green) of the WGSL also represent the existing areas permitted for use.

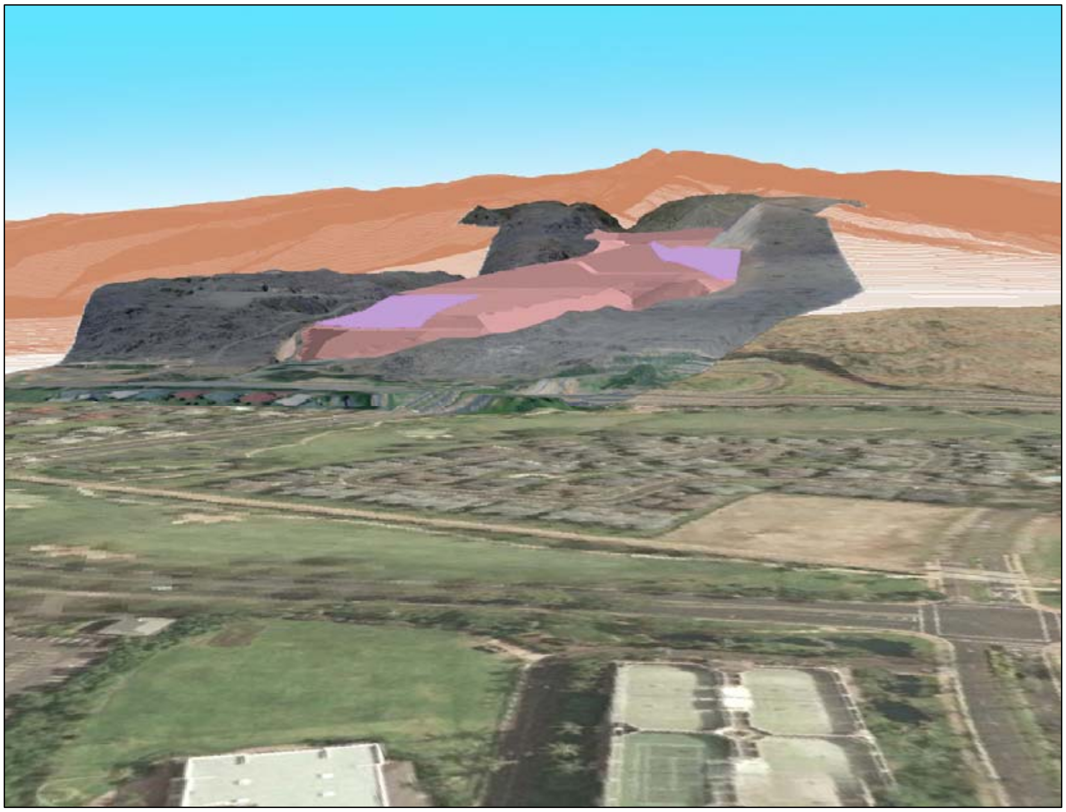

Figure 5-18B, WGSL Closure Sequence 1

Closure Sequence 1

Figure 5-18B depicts the start of Closure Sequence 1 reflecting sequences A through C in **Figure 4-9**. This is anticipated to occur on or after a period of approximately five years from start of use of the area of lateral expansion. The specific timeframe will be determined and based on final use of the existing ash monofil and MSW cells, and other factors relating to maintenance of landfill stability and operational requirements.

The brown layer depicts the proposed grades and the violet polygons depict the areas to be closed.

These areas include a portion of the existing ash monofill cells fronting the WGSL closest to the Farrington Highway, highlighted in violet. MSW cell E2 would also be closed and can be seen as a violet patch in the upper right or north east portion of the site. Portions of MSW cells 9 and 10 located to the northwest would also be closed, but are not visible based on their elevation below and behind the viewplane. Visual changes would primarily involve earthworking activities on a portion of the forward third of the landfill and a portion of the area containing cell E2. These activities would include the placement of surface treatments including grassing, planting of appropriate vegetation, and the use of stockpiled boulders.

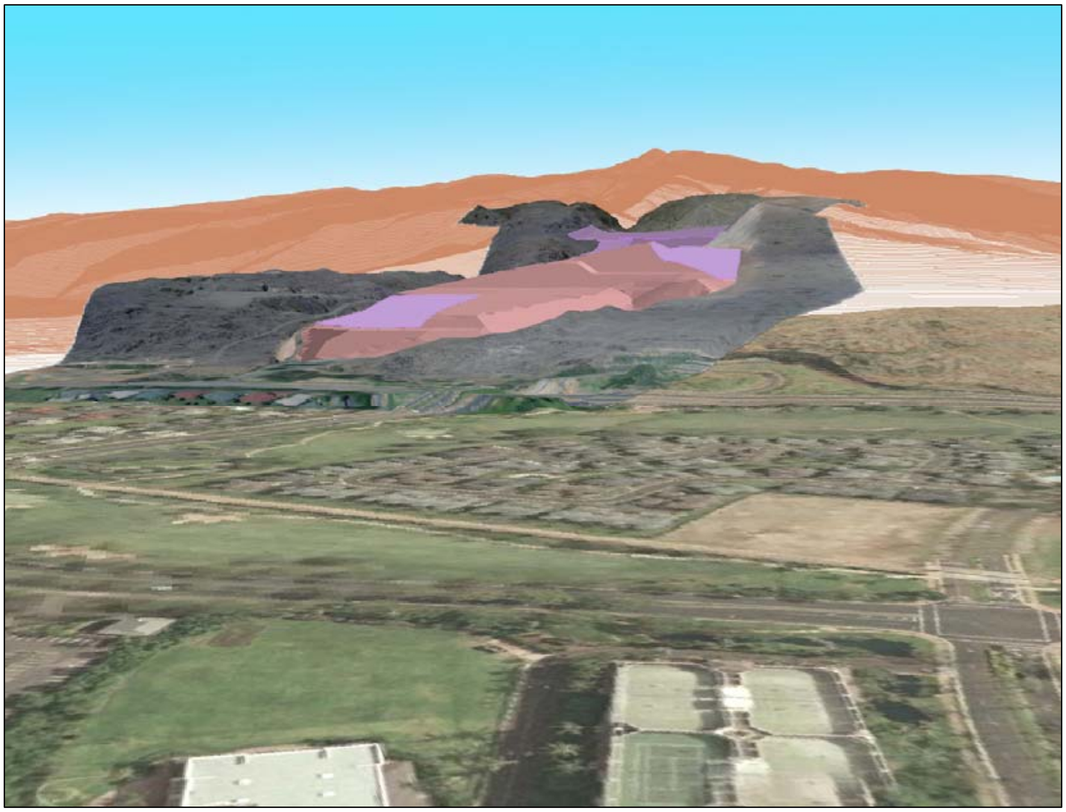

Figure 5-18C, WGSL Closure Sequence 2

Closure Sequence 2

Figure 5-18C depicts the start of Closure Sequence 2, reflecting sequences D through F in **Figure 4-9**. This is anticipated to occur on or after a period of approximately fifteen years after start of use of the expansion area. The specific timeframe will be determined and based on final use of the cells and other factors relating to maintenance of landfill stability and operational requirements.

The areas highlighted in violet begin from the approximate midpoint of the landfill and extend completely to the rear of the site. This area will include closure of: (1) all or portions of the existing permitted MSW cells 4A, 4C, 9, 10, and 11; and (2) closure of the lateral expansion cells E6, E7, E8, E9, E10, and E11.

Views of the area of lateral expansion are anticipated to initially be below the viewplane of this vantage point. As the lateral expansion area is utilized and nears the end of its life, however, distant views toward the lateral expansion cells would become visible at a distance of just over 1-mile from this hotel vantage point. Vantage points at lower elevations, and on either side of the ridgelines forming the Waimanalo Gulch, would be constrained from viewing the lateral expansion area.

The majority of views to the site during Closure Sequence 2 would primarily involve earthworking activities during landfilling, the transit of vehicles, and the eventual placement of surface treatments such as grassing, planting of appropriate vegetation, and the use of stockpiled boulders to reduce viewplane impacts.

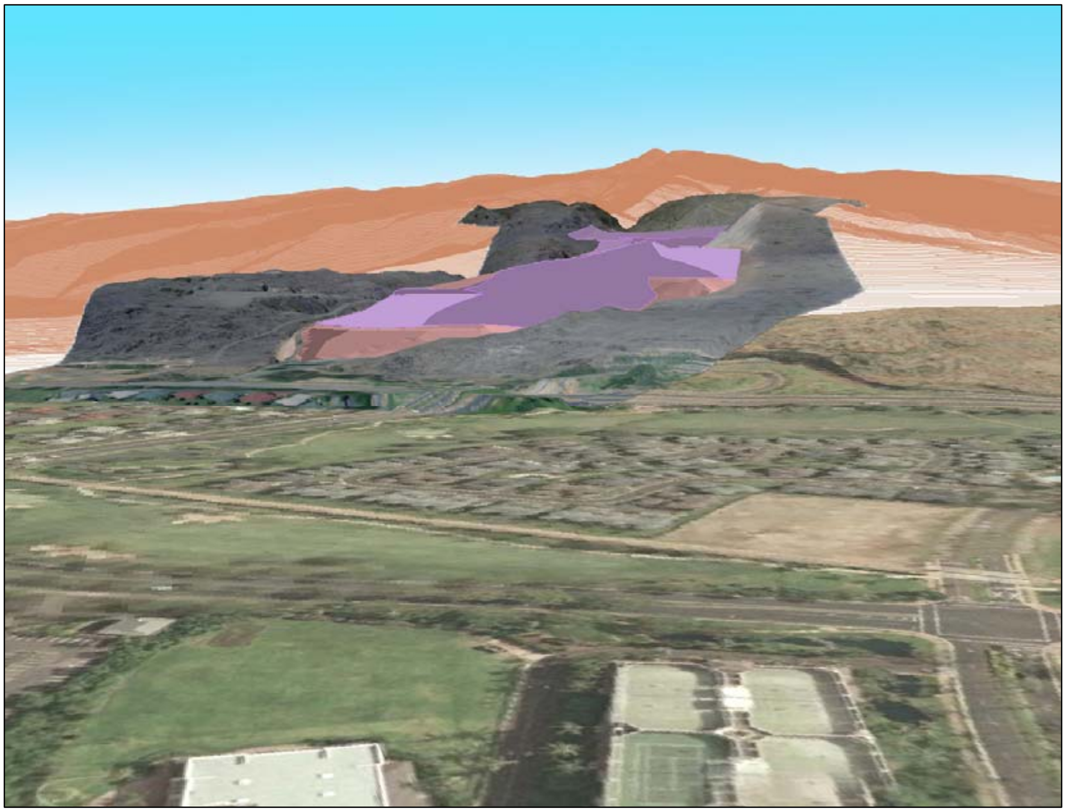

Figure 5-18D, WGSL Closure Sequence 3

Closure Sequence 3

Figure 5-18D depicts the final closure sequence reflecting sequences G through I in **Figure 4-9**, and primarily involves the forward half of the WGSL. This final sequence will occur after the end of Closure Sequence 2 and the cessation of landfilling at the site.

The areas highlighted in violet are located in the approximate forward half of the WGSL and include all or portions of the permitted: (1) Ash cells 1 through 5; (2) MSW cells 1 through 3, 4A, 4B, 5 through 8, and 11; and (3) MSW cell E1. Views toward the site would include earthworking activities to establish the placement of surface treatments including grassing, planting of appropriate vegetation, and the use of stockpiled boulders. Views of vehicles transiting across the landfill are expected to be significantly curtailed with the cessation of landfilling, and would only involve vehicles participating in closure and post-closure operations.

As discussed below, while the use of the WGSL will involve the transit of vehicles for access to various portions of the site, the use of access roads will be modified over time based on the progress of work. In general, views of refuse vehicles traversing the site are also expected to change over time as various portions of the landfill are used. Landscaping and existing on-site boulders will be used to vary the appearance of the site consistent with the surrounding hillsides and ridges. The phasing plan will consider the presence of the access roads and as feasible, identify specific locations where plantings or the placement of material would help to shield or camouflage views.

5.10.2. Potential Impacts and Mitigation Measures

The majority of the proposed project will not be visible from most vantage points along the Farrington Highway in the Waiʻanae or Kahe Point directions. The existing Kahe Point ridge line provides some screening of views of the landfill, including the proposed expansion area.

The general area that fronts Waimānalo Gulch (i.e. from the Kai Lani subdivision to Ko Olina Beach Club) is expected to be the most impacted from the proposed expansion project. Because this area has an unobstructed view into the gulch, activities can be seen from areas within this “view corridor”. However, once disposal activities are confined to the area of the lateral expansion (located mauka from current operations), line of sight views are anticipated to be limited to only the uppermost levels at the rear of the Waimānalo Gulch.

Views into the WGSL are expected to be an improvement from the existing conditions of the site, consisting of periodic views of vehicles in transit to and from active landfill cells. Due to the existing height of the berm in the area of MSW Cell 1, the majority of daily landfill activities in the expansion area will be obstructed from view. The progression of landfill operations beginning at the lower elevations and moving towards the rear of the gulch will help to mitigate and minimize any view impacts.

Views of the landscape within the Waimānalo Gulch will include the cut and grading of slopes to maintain the stability of the landfill cells. This will be somewhat similar to the existing conditions of the site adjacent to cell E-4. Views of landfill associated vehicles and the use of the proposed cells is not expected to be immediately visible until each of the cells are filled to the point that they are high enough to be seen from the surrounding lower elevations within the view corridor. Once the final elevation of the active cells is reached however, the landfill cell will be grassed to reduce the potential for any view impacts. Disposal activities will move to the next cell which is expected to be largely hidden by the higher elevation of the previous cell.

Mitigation measures to reduce visual impacts associated with existing operations have been initially implemented and will be modified to incorporate the proposed expansion area. The existing sanitary landfill has a 400-foot-wide vegetative buffer strip along the eastern portion of the site with a north-south separation of 800 to 1,000 feet. The approved landfill area has been hydromulched to begin the growth of grasses in the filled areas. Further landscaping effort, however, will be required and implemented to address the dry conditions of the site that have hindered prior hydromulching and plantings. Landscaping and the further use of irrigation will promote vegetative growth similar to that found on the adjoining hillsides. This will follow the seasonal growth cycle influenced by dry, hot summers, with intermittent greening of the hillsides during the winter months. In time, plant species in the surrounding areas are expected to spread into the closed areas of the landfill through the natural seeding process.

Views of refuse and construction vehicles in transit to and from the active areas of landfilling will be periodically visible during the use of the site without further mitigation. Carefully located interior roads, taking advantage of the terrain to screen the vehicles, will be employed based on weighing the need to maintain safe access within the site. Carefully placed landscaping elements including trees or other tall vegetation, will also be implemented based on the selection of plants with suitable root systems to avoid damage to completed landfill cells.

Views toward the landfill along Farrington Highway, from the Waiʻanae side of the landfill, will be addressed with landscaping treatment, as appropriate, that will include the use of landscaping elements along the western ridge of the WGSL adjoining the Kahe Power Generating Station. This measure will require careful placement of landscaping elements to maintain views toward the ridgeline to respect the huakaʻi pō (procession of the night marchers) viewplane as identified in Section 7.4. Cultural Impact Assessment, 7.4.7. Summary and Conclusions, Potential Impacts and Mitigation Measures.

The use of plantings along Farrington Highway in the area of the Kahe Power Generating Station to screen motorists' views toward the western ridge of the landfill beyond the power plant was also considered. However, this mitigative measure was not considered feasible because it would be on land under ownership of the State DOT and the Hawaiian Electric Company, and involves further liability concerns.

The entrance to the landfill site contains existing landscaping including trees, hedges and grassed lawn areas as shown on **Figure 5-19, Existing Entry Landscaping**. In the short-term, additional landscape treatments are proposed to provide further vegetative cover to screen existing views of the WGSL from Farrington Highway and areas immediately adjacent to the entrance of the facility. See **Figures 5-20, Area B Landscape Plan** and **5-21, Area C Landscape Plan**. A long-term plan, already mentioned above, will involve continued revegetation of the slopes covering the landfill cells as they are incrementally closed with vegetation that is compatible to the dry conditions of the region. With the final closure of the existing landfill, the cap will be landscaped to match the vegetative cover of the surrounding hillsides. As much as possible, native trees, shrubs and groundcover will be integrated into the landscaping plan.

Planting on Earthen Berm

Not to Scale

NOTES:

1. Contractor to provide temporary irrigation systems (on-grade) as follows:
   A. Trees:
      - 6- 1 gpm bubblers per Monkeypod tree
      - 3- 1 gpm bublers per Norfolk Island pine and Kiawe tree
   B. Lawn:
      - 25'-30' impact sprinklers on 12" risers
   C. Water source shall be provided by Owner and located within project limit
2. All systems to be left in place for 1 year minimum
3. Backflow prevention device to be reduced pressure type (BWS approved)
4. Controller to be battery-operated with lithium battery
5. Exact locations of earthen berms and trees shall be staked out by Contractor with approval by Landscape Architect and Owner's Representative prior to construction of berms and planting of trees
6. All sloped areas shall be covered by erosion control netting (jute type) and installed as per manufacturer's instructions
7. All work shall be accepted and approved in writing by Landscape Architect and Owner's representative

Scenic and Aesthetic Resources Summary

The potential secondary or cumulative impact of the planned use of the site will involve modification of the surface contours within the Waimānalo Gulch, that may be considered as a continuation of the present land use, but within the lateral expansion area. This modification is a necessary part of the project to establish landfill cells, stability slopes, berms, and installation of supporting facilities to allow for a landfill that meets the required federal, state, and City & County of Honolulu regulations for a properly designed and safe facility. While use of the site for landfilling will involve the alteration of the viewplane the mitigative measures as provided in this section are proposed to reduce the impacts.

Over the long term, during the operational use of the site vegetative practices and landscaping will serve to minimize the appearance of the landfill. The site will be allowed to revegetate to match as closely as possible the surrounding, undeveloped hillsides once the capacity of the facility has been reached, and during the planned 30 year period of landfill maintenance and monitoring.

Section 6

Public Services, Potential Impacts and Mitigation Measures

6.1 Traffic and Circulation

6.1.1. Traffic Impact Report

In January 2007, Wilson Okamoto Corporation prepared the report, Traffic Impact Report, Waimānalo Gulch Sanitary Landfill Expansion (**Appendix I**). The purpose of the report was to identify and assess the potential for traffic impacts resulting from the expansion of the WGSL. The scope of the study included:

- An evaluation of existing roadway and traffic operations in the vicinity of the project;
- An analysis of future roadway and traffic conditions without the proposed project;
- An analysis and development of trip generation characteristics for the proposed project;
- Superimposing the site-generated traffic over future traffic conditions; Identification and analysis of traffic impacts resulting from the proposed project; and
- Recommendations for improvements to mitigate the traffic impacts.

The following is a summary of the report findings (Wilson Okamoto Corporation, 2007).

Area Roadway System

In the vicinity of the landfill, the highway is a predominantly four-lane, two-way divided State roadway generally oriented in the east-west direction that serves as the primary access road along the southwest coastline of Oʻahu.

At the unsignalized intersection of the highway with the access road to the landfill, the eastbound approach has an exclusive, left-turn lane and two through lanes. There is an additional lane along the south side of the highway that serves as the eastbound off-ramp to Ko Olina Resort. The westbound approach of the highway has an exclusive right-turn lane and two through lanes. A median storage lane is provided along Farrington Highway for vehicles turning left from the landfill access road.

The WGSL access road approach of the intersection has one channelized lane that serves left-turn and right-turn traffic movements. Vehicles turning left from the access road are channelized into the median storage lane along Farrington Highway.

Traffic Volumes and Conditions

The field investigation consisted of manual turning movement count surveys and traffic flow assessments at the intersection of Farrington Highway with the access road to the landfill. The turning movement count surveys were conducted during the morning commuter traffic peak hours of 6:00 AM and 8:00 AM, and the afternoon commuter traffic peak hours of 3:00 PM and 6:00 PM.

The highway capacity analysis is based on procedures presented in the "Highway Capacity Manual", Transportation Research Board, 2000, and the "Highway Capacity Software", developed by the Federal Highway Administration.

The analysis is based on use of Level of Service (LOS) to identify the traffic impacts associated with traffic demands during the peak hours of traffic. LOS is a quantitative and qualitative assessment of traffic operations and is defined by LOS "A" through "F"; LOS "A" representing ideal or free-flow traffic operating conditions and LOS "F" unacceptable or potentially congested traffic operating conditions as follows:

LOS	Ave Control Delay (seconds per vehicle)
A	≤ 10.0
B	> 10.0 and ≤ 15.0
C	> 15.0 and ≤ 25.0
D	> 25.0 and ≤ 35.0
E	> 35.0 and ≤ 50.0
F	> 50.0

'Volume-to-Capacity" (v/c) ratio is another measure indicating the relative traffic demand to the road carrying capacity. A v/c ratio of one (1.00) indicates that the roadway is operating at or near capacity. A V/C ratio of greater than 1.00 indicates that the traffic demand exceeds the road's carrying capacity.

Existing Peak Hour Traffic

Figure 6-1 shows the existing AM and PM peak hour traffic volumes and operating traffic conditions. The AM peak hour generally occurs between 6:15 AM and 7:15 AM in the vicinity of the existing landfill. In the afternoon, the PM peak hour generally occurs between 3:45 PM and 4:45 PM. The analysis is based on these peak hour time periods to identify traffic impacts resulting from the proposed project.

At the intersection with the existing landfill access road, Farrington Highway carries 2,046 vehicles eastbound and 859 vehicles westbound during the AM peak period. During the PM peak period, the overall traffic volume is higher with 1,131 vehicles traveling eastbound and 2,079 vehicles traveling westbound. The critical movement on the Farrington Highway approaches of the intersection is the eastbound left-turn traffic movement which operates at LOS "B" during both peak periods.

The WGSL access road approach of the intersection carries 11 vehicles southbound during the AM peak hour of traffic. During the PM peak hour of traffic, the traffic volume is slightly higher with 31 vehicles traveling southbound. The access road approach of the intersection operates at LOS "C" during both peak periods. Traffic queues occasionally formed on this approach of the intersection with average queue lengths of 2-3 vehicles observed during both peak periods.

Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

Projected Traffic Conditions

Site-Generated Traffic

The expansion of the WGSL is being proposed to increase the capacity and extend the current lifespan of the landfill. Since traffic impacts are dependant on the amount of waste generated, neither an increase in capacity nor an extension of the current lifespan will change the daily traffic rates. As such, the expansion itself is not expected to generate additional trips to and from the facility.

However, increased development throughout O‘ahu may result in an increase in site-generated trips to the landfill since additional refuse vehicles may be required to service these areas. As such, additional trips were conservatively assumed in order to assess traffic impacts.

Trip Distribution

Figure 6-2 shows the distribution of site-generated traffic during the AM and PM peak hours of traffic. Access to the landfill will continue to be provided by the existing access road off Farrington Highway. The directional distribution of site-generated traffic at the intersection of Farrington Highway with the access road was assumed to remain similar to existing conditions.

Traffic Signal Warrant

As a result of the proposed expansion of the landfill, a traffic signal system may be warranted at the intersection of Farrington Highway and the WGSL access road. The installation of a traffic signal at an intersection may be justified by one or more of the eight warrants outlined in the "Manual on Uniform Traffic Control Devices for Streets and Highways," 2003 Edition (MUTCD). Warrant 3 was applied to the intersection to determine whether or not a traffic signal system might be justified.

Warrant 3, the "Peak Hour Warrant," consists of several conditions that may justify the installation of a traffic signal at an intersection where vehicles experience high traffic delay due to large volumes of intersecting traffic during the peak hour periods.

Figure 6-2
Distribution of Additional Vehicles
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

One of the conditions is based upon the relationship between the traffic volumes along the major and minor street. If the traffic volumes along the minor street exceed the thresholds shown in the MUTCD, a traffic signal system may be warranted. Since the intersection lays within an isolated community with a population less than 10,000, Figure 4C-4 "Warrant 3, Peak Hour (70% Factor)" of the MUTCD was used to determine if a traffic signal system is warranted at this intersection. Under the "with project" conditions, the traffic volumes entering the subject intersection are below the thresholds during both peak hours of traffic and, as such, do not satisfy Warrant 3 for minor street approaches with one lane for high traffic volumes on the major street. Therefore, the intersection of Farrington Highway and the WGSL access road does not warrant a traffic signal system and is assumed to remain unsignalized.

Total Traffic Volumes With Project

The projected AM and PM peak period traffic volumes and operating conditions with the proposed expansion of the existing WGSL are shown in **Figure 6-3**. The cumulative volumes consist of additional site generated traffic superimposed over existing traffic demands.

The cumulative AM and PM peak hour traffic conditions with the proposed expansion of the WGSL are summarized in **Table 6-1**.

Table 6-1
Existing and Projected With Project LOS
Traffic Operating Conditions

Intersection	Critical Movement		AM		PM	
			Exist	w! Proj	Exist	w! Proj
Farrington Hwy/ Waimanalo Gulch Sanitary Landfill Access Road	Eastbound	LT	B	B	C	C
	Southbound	LT-RT	B	B	C	C

Traffic operations in the vicinity of the landfill are expected to remain similar to existing conditions during both peak hours of traffic despite the anticipated increases in traffic along Farrington Highway due to the proposed expansion.

PROJECTED PEAK HOURS OF TRAFFIC WITH PROJECT

FIGURE 6

Source: Traffic Impact Report for the Waimanalo Gulch Sanitary Landfill Expansion, Wilson Okamoto Corp., March 2007

Figure 6-3
Traffic Volumes With Project
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

The critical traffic movements at the intersection of Farrington Highway with the WGSL access road are expected to continue operating at LOS "B" and LOS "C" during the AM and PM peak periods, respectively. The total traffic volumes entering the intersection are expected to increase by less than 1% during both peak hours of traffic with proposed expansion. These increases in the total traffic volumes are in the range of daily volume fluctuations along Farrington Highway and represent a minimal increase in the overall traffic volumes.

Recommendations

Based on the analysis of the traffic data and projected traffic conditions, the following are the recommendations of the study:

1. Maintain sufficient roadway width to accommodate safe vehicle ingress and egress.
2. Maintain adequate turning radii at all project roadways to avoid or minimize vehicle encroachments to oncoming traffic lanes.
3. Maintain adequate sight distances for motorists to safely enter and exit all project roadways.
4. Maintain adequate on-site loading and off-loading service areas to ensure that vehicular queues do not extend onto the highway.

Conclusion

The proposed expansion of the existing WGSL is not expected to have a significant impact on traffic operations in the vicinity. Although the expansion of the landfill is not expected to generate additional trips to and from the facility, additional trips were conservatively assumed to be generated by the proposed expansion to account for additional refuse vehicles generated by on-going development throughout O‘ahu. However, traffic operations in the vicinity of the landfill are expected to remain similar to existing conditions during both peak hours of traffic despite the anticipated increases in traffic. The critical traffic movements at the intersection of Farrington Highway with the WGSL access road are expected to continue operating at levels of service similar to existing conditions. In addition, the total traffic volumes entering the intersection are expected to increase by less than 1% during both peak hours of traffic with the proposed expansion. These increases in the total traffic volumes are in the range of daily volume fluctuations along Farrington Highway and represent a minimal increase in the overall traffic volumes.

6.1.2. Potential Impacts and Mitigation Measures

The proposed project is not anticipated to result in the potential for adverse traffic impacts to the surrounding area or region.

The period of greatest concern would be during the morning and afternoon peak hours when the maximum number of motorists would be utilizing the section of Farrington Highway fronting the landfill. During the AM period the project would generate 11 vehicles southbound and during the PM period there would be 31 vehicles generated. The finding of the Traffic Impact Report is that this minimal increase in overall traffic volume is not expected to have a significant impact on traffic operations in the vicinity.

Although no adverse impacts to traffic are anticipated or expected, the Traffic Impact Report identifies four recommendations (see above). Each of the recommendations calls for maintaining roadway widths, turning radii, sight distance, and on- and off-loading areas to prevent excessive numbers of vehicles from queuing onto the highway. Each of these recommendations will be maintained by WMH and ENV.

Potential for secondary or cumulative impacts associated with traffic and circulation are not anticipated. The proposed project will constitute a continuation of use of the site for landfilling which was started in the early 1990s. According to the traffic impact report performed for the project, the WGSL is not expected to itself generate major new transportation demands along Farrington Highway, but that the demand for use of the area roadways would most likely be from increasing development in the area. In order to maintain safe operating conditions for the users of the WGSL and the public transiting along Farrington Highway, WMH will periodically evaluate traffic to assess the need for further traffic controls to maintain public safety.

6.2 Wastewater

6.2.1. Wastewater Facilities

The existing landfill facility is served by an existing on-site wastewater disposal system which accommodates domestic flows from the administrative and service buildings of the site. According to the WGSL operator WMH, the continuation of use of the existing system will be adequate for the proposed project based on no major increase in waste water flows or demands for use of the system.

6.2.2. Potential Impacts and Mitigation Measures

The proposed project is not anticipated to result in potential for negative adverse impacts due to wastewater treatment. The project will not require upgrades to municipal wastewater service lines or to the Honoʻuliʻuli Wastewater Treatment Plant. If the facility is connected to the City wastewater system in the future, there is an existing 8-inch line located in Aliinui Drive that may be available for use. A Sewer Connection Application Form for sewer capacity reservation, and payment of a Wastewater System Facility Charge, would be required for the connection.

Potential for secondary or cumulative impacts are not anticipated. The site is currently provided with adequate service for wastewater. No new or future demands that would exacerbate the current or long term provision of this service is anticipated.

6.3 Potable/Drinking Water

6.3.1. Potable/Drinking Source Water

WGSL is served by lateral service lines from the existing Board of Water Supply (BWS) main along Farrington Highway. Water uses at WGSL are currently 1.3 million gallons per month with approximately 30 percent used for irrigation and approximately 70 percent used for dust control. An incidental amount is used by the administrative office.

6.3.2. Potential Impacts and Mitigation Measures

The proposed project will be served by existing BWS facilities. No major new construction involving new water supply facilities are anticipated to be required. Should new supply requirements be needed for irrigation or dust control, the BWS will be notified with appropriate coordination taken by ENV and WMH.

According to the BWS there are no objections to the proposed project (BWS Memorandum, December 18, 2006).

Potential for secondary or cumulative impacts are not anticipated. The site is currently provided with adequate water service. No new or future demands that would exacerbate the current or long term provision of this service is anticipated.

6.4 Power and Communications

6.4.1. Power and Communication Facilities

Electrical power is provided from the Hawaiian Electric Company (HECO) Kahe Power Generating Station by overhead service lines. Overhead high capacity transmission lines cross the middle to upper portions of the existing landfill site within an existing easement. ~~A separate easement crossing the present landfill access road is also held by HECO for periodic maintenance of the overhead lines.~~ Separate easements are held by HECO to cross the present landfill access road for periodic maintenance of the overhead lines, and for access to an existing telecommunications facility at Kahe Point near Battery Arizona.

Telephone and telecommunications services are provided by Hawaiian Telecom from lateral service lines connected to overhead service lines along Farrington Highway.

No new demands for power and communications services are anticipated. The existing power and communications facilities are expected to be sufficient for the proposed lateral expansion project.

6.4.2. Potential Impacts and Mitigation Measures

The proposed expansion of the site will maintain the existing 100-foot-wide easements for each of the four HECO transmission lines and landfill access road easement. As required by the State of Hawaii General Order No. 6 (Rules for Overhead Electric Line Construction in Hawai'i), the conductor-to-ground clearance for landfill operations will be at least 30 feet for areas traversed by vehicles and 25 feet for areas accessible by pedestrians only. This requirement will also provide necessary clearance for maintenance equipment.

Use and operation of the planned expansion area will be coordinated with HECO to minimize the possibility of a disruption of service due to the entanglement of litter on the power lines. Measures and practices will include:

> The use of permanent and portable litter fencing along the working face of landfill cells in relation to prevailing winds such as trades, Kona winds, and storm generated wind.
>
> Work crews will be dispatched should there be an event involving windblown litter crossing the Farrington Highway to neighboring residences within Ko Olina, and adjacent to the landfill. This may occur with high winds causing the loss of lighter paper and/or plastic material as it is being discharged from refuse vehicles onto active working landfill cells.
>
> MSW will be compacted and covered with approximately six inches of soil or suitable cover material at the end of each working day. The ash fill operation requires cover approximately once per week. The rate of ash disposal and routine 24 hour a day deliveries make daily cover operations impractical. The ungrassed portion of the ash fill area, therefore, could be impacted in an ultra-high wind, hurricane situation. This is somewhat addressed by the stable nature of the ash material itself which is conducive to the formation of a surface that is generally resistant to high winds.

Should any damage to existing utilities occur, they will be restored or relocated based on coordination with HECO and WMH.

These measures and practices will reduce the opportunity for windblown litter to affect the transmission lines and will further reduce potential vector, odor, and fire problems.

The Palehua Solar Observatory, operated by the U.S. Air Force, is located approximately 10 miles northeast of the landfill and could be affected by maintenance or installation of high capacity power lines. The U.S. Air Force will be notified concerning any work that is required for the proposed project.

Power and Communications Summary

Potential for secondary or cumulative impacts are not anticipated. The proposed project is adequately served and it is anticipated that future requirements would not result in the demand for services beyond those provided by the existing utility companies.

6.5 Police Protection

6.5.1. Police Facilities

The area of the proposed project is within the Honolulu Police Department (HPD), District 8, and includes the Waiʻanae and Kapolei region. The communities served include:

ʻEwa	ʻEwa Beach	West Loch
Barbers Point	Kapolei	Campbell Industrial Park
Makakilo	Honokai Hale	Ko Olina
Nānākuli	Māʻili	Waiʻanae
Mākaha	Makua	Kaʻena

The District 8 Kapolei Station Headquarters is located at 1100 Kamokila Boulevard, Kapolei, and can be reached at phone number: 692-4262. The building contains 50,589 square feet and is built on 5.13 acres of land donated by the James Campbell Trust

Estate. The station has three levels and provides offices and meeting rooms for District 8 command staff and patrol officers as well as personnel from the Criminal Investigation, Juvenile Services and Narcotics/Vice Division. The station has a modern cellblock consisting of 41 cells. (http://www.honolulupd.org/patrol/d8/index.htm, Website Accessed on 2/26/08).

A substation serving District 8 is located in Waiʻanae and provides a base of operations for the personnel patrolling the Waiʻanae Coast (http://www.honolulupd.org/patrol/d8/index.htm). The Waiʻanae Substation is located at 85-939 Farrington Highway, and can be reached at phone number: 696-4221 (http://www.honolulupd.org/patrol/d8/index.htm).

6.5.2. Potential Impacts and Mitigation Measures

The current level of police service provided to the WGSL is expected to be sufficient for the planned lateral expansion of the site. No new demands are expected based on the closure of the existing area of use prior to use of the new expansion area.

According to the HPD the planned project should have no unanticipated impact on the facilities or operations of the police department (HPD Memorandum, November 28, 2006).

The potential for secondary or cumulative impacts to future demands for police service is not anticipated. The proposed project is adequately served and it is anticipated that future requirements would not result in the demand for services beyond those provided.

6.6 Fire Protection

6.6.1. Fire Stations

The project area is served by the Honolulu Fire Department (HFD), Kapolei Fire Station 40, located at 2020 Lauwiliwili Avenue, Kapolei, and can be reached at phone number:

682-0533. The fire station serves as the headquarters for Battalion 4 and houses Engine 40 and Ladder 40.

Stations in the area that would provide additional coverage of service area include:

> Nānākuli Fire Station 28, located at 89-334 Nanakuli Avenue. The station houses Engine 28 and Tanker 28.
>
> Waiʻanae Fire Station 26, located at 85-645 Farrington Highway. The station houses Engine 26, Quint 26, and Tanker 26.
>
> Makakilo Fire Station 35, located at 92-885 Makakilo Drive. The station houses Engine 35.
>
> ʻEwa Beach Fire Station 24, located at 91-832 Pohakupuna Road. The station houses Engine 24.

6.6.2. Potential Impacts and Mitigation Measures

The potential for adverse impacts to the delivery or provision of fire fighting services is not anticipated. Existing and planned landfill construction activities will include the compaction and covering of refuse with approximately six inches of soil material that has proven effective in fire prevention. The cover material reduces oxygen from penetrating the landfill and reduces the opportunity for combustion. Further landfill preventative practices will maintain the use of earth stockpiles near the working face of active landfill cells to smother fires, the use of fire breaks to serve as a buffer zone, and the use of an on-site 6,000-gallon water truck as needed.

Site personnel for the existing and proposed project will continue to be instructed in proper fire fighting procedures. Equipment storage and maintenance fires will be handled with fire extinguishers. Fire extinguishers will be supplied on landfill work vehicles and all on-site fire fighting equipment will continue to be regularly inspected and maintained to ensure optimum operating effectiveness. If a fire is detected at the landfill surface:

> Burning refuse is excavated and separated from the fill area with heavy equipment and covered immediately with on-site soil.
>
> If necessary, water is applied to the burning refuse using the on-site water truck.
>
> If site personnel and equipment cannot extinguish the fire the HFD is called on to respond based on dispatches from the 911 emergency number. The number of stations responding to the 911 dispatch is based on the size of the fire.

According to the HFD, the maintenance of fire apparatus access for the duration of construction activities at the project site was requested in 2001 and 2006. ENV and the site operator, WMH, will continue to maintain fire apparatus access throughout the site to ensure that fire fighting vehicles and equipment are capable of mobilizing to all locations of the existing and planned lateral expansion areas. (HFD Memorandums, December 19, 2006 and June 29, 2001).

Practices and procedures for other types of fires including brush fires in the buffer zone or fire break area and structure fires are described in <u>Section 4, Project Description</u>, in this document.

<u>The potential for secondary or cumulative impacts are not anticipated. The proposed project is adequately served and it is anticipated that future requirements would not result in the demand for public fire protection services beyond those provided.</u>

6.7 Health Care and Emergency Services

6.7.1. Hospital and Ambulance Services

Two major medical facilities provide service to the area of the proposed project:

> St. Frances West is located at 91-2141 Fort Weaver Road in ‘Ewa Beach. The facility is a general medical and surgical medical center with approximately 102 hospital beds. Key services provided include general medical and surgical care, general intensive care, and emergency services. (http://health.usnews.com/ listings/hospital-directory/hawaii/ st_francis_medical_center-westdepartment, St. Francis Medical Center listing, website accessed February 26, 2008).
>
> The Wai‘anae Coast Comprehensive Health Center (WCCHC) is located at 86-260 Farrington Highway in Wai‘anae. The facility offers family practice and a wide range of other services including 24-hour emergency care, specialty services, laboratory and radiology services, dental, preventive health, case management, outreach, family planning, a teen clinic, perinatal case management, Native Hawaiian healing and integrated services, homeless outreach, adult day care, transportation, mental health treatment, substance abuse outreach and treatment, health career training, health professional training, and women, infant, and children (WIC) services. (http://www.aapcho.org/site/aapcho/ content.php?type=1&id=10154, website accessed February 26, 2008).

Emergency Medical Services (EMS) are provided by the Wai‘anae Fire Station 26, the St. Francis West facility, and WCCHC.

Other medical clinics and private facilities operate in the region.

6.7.2. Potential Impacts and Mitigation Measures

The proposed project will involve the continuation of use of the site and does not represent a major increase in landfilling activities, e.g., the planned lateral expansion area will only be utilized after the current area of use reaches capacity. This use is not expected to require the need for additional health care or emergency services beyond those that are presently available. Potential for adverse impacts are not expected.

The potential for secondary or cumulative impacts are similarly not anticipated. The project will be adequately served and it is anticipated that future requirements would not result in the demand for services beyond those provided.

6.8 Education

6.8.1. Educational Facilities

Public educational facilities in the area of the proposed project are designated as within the Department of Education (DOE), Campbell-Kapolei-Wai‘anae Complex Area region. Schools within the region include:

Campbell Complex Schools

Campbell High
‘Ewa Elementary
Kaimiloa Elementary
Ilima Intermediate (Middle)
Iroquois Point Elementary
Pohakea Elementary
‘Ewa Beach Elementary
Holomua Elementary
Keoneula Elementary

Kapolei Complex Schools

Kapolei Elementary
Kapolei Middle
Barbers Point Elementary
Mauka Lani Elementary
Kapolei High
Makakilo Elementary

Waiʻanae Complex Schools

Leihoku Elementary	Māʻili Elementary
Mākaha Elementary	Waiʻanae Elementary
Waiʻanae High	Waiʻanae Intermediate (Middle)

Ka Waihona ka Na`auao NCPCS (Charter School)
Kamaile Elementary PCCS (Charter School)

Public and private schools closest to the proposed project include the following:

- Ka Waihona O Ka Na'auao, located at 89-195 Farrington Highway, Nānākuli, approximately 2.4 miles west of the WGSL.
- Nanaikapono Elementary School, located at 89-153 Mano Avenue, Nānākuli, approximately 2.6 miles west of the WGSL.
- Nānākuli Elementary School, located at 89-778 Haleakala Avenue, Nānākuli, approximately 2.6 miles west of the WGSL.
- Mauka Lani Elementary School, located at 92-1300 Panana Street, Makakilo, approximately 2.6 miles east of the WGSL.
- Makakilo Elementary School, located at 92-675 Anipeahi Street, Makakilo, approximately 2.5 miles east of the WGSL.
- Island Pacific Academy, located at 909 Haumea Street, Kapolei, approximately 2.9 miles east of the WGSL.

6.8.2. Potential Impacts and Mitigation Measures

The proposed project is not expected to affect existing schools located in the region. The proposed project in itself will also not generate major new construction or development growth that would require the future delivery or provision of school services. <u>The potential for primary, secondary, or cumulative impacts is not anticipated.</u>

6.9 Library Services

6.9.1. Library Facilities

The DOE operates the following public libraries in the area of the proposed project:

Name and Location	Distance to WGSL
‘Ewa Beach Public Library 91-950 North Road ‘Ewa Beach, Hawai‘i 96706	Approx. 7.8 Miles
Kapolei Public Library 1020 Manawai Street Kapolei, Hawai‘i 96707	Approx. 3.0 Miles
Wai‘anae Public Library 85-625 Farrington Highway Wai‘anae, Hawai‘i 96792	Approx. 8.1 Miles

6.9.2. Potential Impacts and Mitigation Measures

The proposed project is not expected to affect the operation or use of public libraries. ~~Potential for adverse impacts are not expected.~~ The potential for primary, secondary, or cumulative impacts is not anticipated.

6.10 Parks and Recreation

6.10.1. Area Beaches and Park Facilities

The major public recreational areas in the immediate WGSL vicinity are the beach parks along the Kahe coastal areas including the Kahe Point Beach Park, Makaiwa Beach Park, and beaches located northwest along the coastline. Within the Ko Olina Resort are four constructed lagoons with sandy beaches. The beaches along the lagoon and region support surfing, swimming, picnicking, skin diving, boating, and related uses.

District III of the City & County of Honolulu, Department of Parks and Recreation, encompasses approximately 23 parks along the leeward side of O‘ahu. Parks are situated in each of the major residential zones and are located along the Wai‘anae Coast, at the tip of Barbers Point (in the James Campbell Industrial Park) and in ‘Ewa Beach. Within the Kalaeloa Community Development District (formerly the Barbers Point Naval Air Station), the White Plains and Nimitz Beaches are popular. These are under joint Navy and Parks Department control.

After the closure of Barbers Point NAS, most of the Navy land was conveyed to the City & County of Honolulu for redevelopment as recreational and sports facilities.

Other private recreational facilities include the Ko Olina Golf Course, tennis courts and facilities associated with the Ko Olina Resort including the Marriott Ihilani Resort and Spa; Marriott's Ko Olina Beach Club (resort timeshare units), and other developments within Ko Olina. Hiking trails available to the public are also located in the area.

6.10.2. Potential Impacts and Mitigation Measures

The proposed project is anticipated to have potential impacts that are somewhat similar to existing operating conditions that include the migration of landfill associated odor, windblown litter migrating to area beaches and parks, and visual impacts. The exception to these existing potential impacts, however, involves the location of the proposed project further mauka within the Waimānalo Gulch which will help to reduce potential odors directly attributable to the landfill, the control of windblown litter from working cells, and the visibility of working activities on the landfill working face.

Control of Landfill Odor

There are three pathways whereby odor may affect locations adjacent to the landfill: (1) odors from vehicles transiting to the landfill; (2) odors from refuse awaiting disposal once unloaded from refuse vehicles; and (3) odors as a result of decomposition processes within the landfill.

The potential for odor from transiting vehicles to the landfill include: vehicles that carry putrescible waste from residential and commercial sources; vehicles that carry treated sewage solids from the Sand Island Wastewater Treatment Plant digester and potentially other wastewater facilities; and private self-haulers from area farms disposing animal carcasses. Odors from refuse awaiting disposal involve a temporary condition in that once the refuse is buried and covered, the source of the odor is removed from exposure to the air column. Odors resulting from landfill decomposition involve bacteriological processes and are further described in Section 5.7. Landfill Associated Gas Emissions.

Mitigative measures to address landfill associated odor are provided in Section 5.7.3. Potential Impacts and Mitigation Measures (for Air Quality).

Control of Windblown Litter

The release of windblown litter is normally the result of improperly secured loads from transiting refuse vehicles, temporary high wind conditions, or a combination of these. During periods of high winds certain types of litter can become airborne and lodge in the portable litter fences deployed around the active working areas of the landfill. As the litter becomes lodged it accumulates and prevents the further capture of litter. Under this condition the litter escapes the fencing and drifts off-site to the Farrington Highway and neighboring properties.

Mitigative measures to control windblown litter at WGSL include the following:

- Permanent, temporary, and portable litter fences are used based on prevailing wind conditions and the nature of waste that may contain refuse prone to becoming windblown, e.g., lightweight materials especially plastic bags and paper products. Permanent fencing is erected in locations downgradient of the site where tradewinds normally blow. Temporary litter fencing is erected in locations adjacent to active landfill cells where tradewinds and gusts can be controlled for the duration of use of the active landfill cell. The temporary fencing is erected and removed according to the use of any active working cell. Portable machine-movable litter fencing is designed to be quickly positioned within active landfill cells based on prevailing wind conditions at the time of refuse delivery, handling, and the immediate location of the active working face of the landfill cell. As required, the approximately 7 to 12 foot high portable litter fencing can be relocated on-site on an as-needed basis. All litter fencing is regularly maintained by requiring work crews to remove litter as it is captured on the fence.

- Waste is processed and covered with cover material as soon as practicable upon the delivery of refuse to WGSL. Under normal operating conditions the refuse is delivered to the landfill and cover material placed over the refuse at the end of the working day. Under high wind conditions intermediate fill material is placed over refuse more frequently to suppress and reduce the opportunity for litter to become windblown.

- On-call or standby work crews are deployed on a schedule that is concurrent with the acceptance of refuse at the WGSL. The intent is to be able to act immediately upon an incident involving the loss of windblown refuse from the landfill. Work crews are mobilized when: (1) WGSL personnel observe windblown litter crossing the landfill property and drifting off-site to the Farrington Highway or adjoining property; or (2) a complaint is received from the general public or Honolulu Police Department, that windblown litter is being released from the WGSL.

- ENV will enforce existing rules, regulations, and procedural practices designed to reduce or mitigate the incidence of windblown litter. ENV regularly notifies refuse hauling firms that litter falling from refuse trucks onto highways, streets, and adjoining property is unacceptable and subject to penalty (including the loss of access to WGSL by offending drivers).

  Management personnel at WGSL also enforce the rule requiring all loads entering the landfill to be secured by use of a tarp, cover, or enclosure to mitigate against the loss of refuse. Inspection of all loads is from the landfill scale house via remote cameras situated above the beds of incoming trucks. Refuse delivery operators and drivers are issued warnings and are prohibited from entering the landfill if there are repeated infractions.

Visibility of Working Activities on the Landfill

Portions of the existing area of work within the WGSL are visible from various locations along Farrington Highway and the Ko Olina Resort (see Section 5-10, Scenic and Aesthetic Environment).

Views of ongoing waste disposal activities within the existing active landfill cells may be temporarily visible from Farrington Highway or the Ko Olina Resort. This is because the elevation of the active work area involving disposal of refuse will normally be located below the ridgeline, and completed portions of the landfill will screen views into the working cell. The proposed lateral expansion is expected to minimize line of sight views of landfill cells based on the work being located further mauka and within the Waimānalo Gulch.

Other views of the expansion area will include: vehicles traveling along the access roadway in transit to and from the disposal of refuse into cells; construction vehicles conducting periodic maintenance, repair, upkeep, and construction of the access road, drainage facilities, berms, and other structures associated with the proper operation of the site; and related structures including berms to maintain landfill stability and control runoff.

Mitigation to address these issues involves: (1) the location of the planned area of expansion further mauka and within the Waimānalo Gulch will itself minimize views into active areas of landfilling; and (2) the use of landscaping with trees and vegetative cover to act as a screening element to improve views of the site. While not all elements of the proposed project can be totally screened from view, the location of work and the careful placement of landscaping elements is expected to significantly reduce the potential for viewplane and aesthetic impacts.

A planned public drop off center at WGSL will further help to reduce the transit of residential and small self haulers along the access roadway to the working face of the landfill. This will remove from visibility some of the vehicles that would ordinarily travel along the access roads.

In the long term Waimānalo Gulch may one day itself be used as a reclaimed recreational facility that is not unlike parks on Oʻahu that were once refuse sites. These locations include Ala Moana Park and the Honolulu Waterfront Park in Kakaʻako.

Parks and Recreation Summary

The potential for secondary or cumulative impacts to parks and recreational facilities are not anticipated. The mitigative measures as provided in this section will address the migration of landfill associated odor, windblown litter migrating to area beaches and parks, and visual impacts.

Other potential secondary effects from impacts to air, water, or soils that might otherwise affect the use of parks and recreational facilities in the area will be subject to the mitigative measures as provided in Sections: 5.2. Topography; 5.3. Geology; 5.4. Surface Water; 5.5. Groundwater and Hydrology; and 5.7. Air Quality.

Section 7
Socioeconomic and Related Environment, Potential Impacts and Mitigation Measures

7.1 Socioeconomic Characteristics

In March 2008, SMS Research prepared the report, Socioeconomic Impact Assessment, Waimānalo Gulch Sanitary Landfill Lateral Expansion, City and County of Honolulu (**Appendix J**). As a result of comments received during the DEIS public comment period, two addenda were added to the report: (1) Environmental Injustice Issues; and (2) Impact on Property Values. Both addenda have been included in Appendix J, referencing this section. According to the report, a socioeconomic impact assessment is conducted to establish, for the use of policy-makers and the public at large, information about a proposed project and its socio-economic consequences. The report is used, with other aspects of the EIS, to inform decision-makers, and to ensure that consequences are taken into account. Where appropriate, this report points to other technical studies for more detailed examination of related topics. (SMS Research, 2008).

7.1.1. Area of Study

A landfill on Oʻahu affects the entire island by providing a key element of Honolulu's solid waste system. All of Oʻahu's people and businesses are affected by the proposed action. The ʻEwa Development Plan (DP) Area within which the landfill is located is considered the area most affected by the daily operations of WGSL. The Waiʻanae DP adjoins the ʻEwa DP boundary and residents in the vicinity of the WGSL share the Farrington Highway, which is used for the hauling of refuse providing the only route into and out of Coastal Waiʻanae. (SMS Research, 2008).

Island of Oʻahu

Oʻahu has been the political and economic center of Hawaiʻi since the time of Kamehameha I. It is the most urbanized and populated of the Hawaiian Islands. After

World War II, Hawaiʻi residents moved to Oʻahu in record numbers. According to the 2000 U. S. Census, Oʻahu's resident population was 836,231, representing 72% of the State's population. By 2006, that population had risen to approximately 909,900. (SMS Research, 2008).

Hawaiʻi has witnessed rapid tourism since statehood that has supplanted agriculture and military spending as the major source of jobs and income. Because of their relative smaller economies on the neighbor islands, tourism has and continues to have a greater impact on the neighbor islands. But even in tourism, Oʻahu dominates the industry. In 2006, Oʻahu had nearly twice as many visitors as any neighbor island with 4,606,400. (SMS Research, 2008).

Oʻahu's tourism has been primarily centered in Waikīkī (87% of Oʻahu's hotel units are located in Waikīkī). However, in recent years Ko Olina in ʻEwa has begun to shape itself into a visitor destination area. During this same period, Oʻahu reinforced its role as the financial and shipping center of the State. Oʻahu's more diverse economy has also resulted in less economic fluctuation, lower unemployment and higher average income than has been experienced on other islands (SMS Research, 2008).

ʻEwa Development Plan Area

WGSL is situated within the ʻEwa DP Area which extends from Waipahu to Ko Olina and from ʻEwa Beach to Makakilo. The ʻEwa DP Area is the fastest growing region on Oʻahu and has nearly tripled its population over the 30 year period from 1970 to 2000. This compares to a 39 percent growth rate for Oʻahu as a whole during this same period (**Table 7-1**). (SMS Research, 2008).

Barbers Point NAS ("Kalaeloa"), with some 3,709 acres, was a major land use until closing in 1999. The airfield is now operated by the State Department of Transportation for general aviation, while the remainder of the Kalaeloa land is parceled among public and private users, including among others, the City, the Hawaiʻi National Guard, the

State Department of Hawaiian Home Lands, the U. S. Coast Guard, and the U. S. Navy. (SMS Research, 2008).

Source: DBEDT (2004a) and earlier years; City of Honolulu website (http://www.honoluludpp.org/Planning/ResearchStats.asp)

Honolulu has long been O‘ahu’s commercial and transportation center. Squeezed between the Ko‘olau Mountain Range and the ocean, growth has extended outward, southeast toward Koko Head, and northwest toward Central O‘ahu and the Leeward communities. Concentration of activities in Honolulu has also created the expected problems of traffic congestion, overtaxed infrastructure, and deteriorating urban spaces. (SMS Research, 2008).

Plans to develop a “Second City” at Kapolei on the ‘Ewa Plain responded in part to these problems. Planning began in 1955, when Harland Bartholomew and Associates prepared the first ‘Ewa region master plan for the Estate of James Campbell. The concept of a separate city emerged in 1974, and was officially sanctioned in 1977 when the City Council approved the new General Plan with a Secondary Urban Center for O‘ahu centered on the ‘Ewa Plain. In 1986, the Estate proposed a detailed implementation plan for a city center, naming it the City of Kapolei. Since breaking ground in 1990, the region has been bustling. (SMS Research, 2008).

Kapolei land uses include a large industrial complex, with areas for both heavy industry (in the 1,367-acre James Campbell Industrial Park) and light industry plus new technologies (in Kapolei Business Park) and areas for commercial and office development in the City of Kapolei urban center. A 2006 inventory of the Campbell Industrial Park showed there were 251 businesses with about 4,500 workers. Approximately 85 percent of the parcels in the park are owned in fee by its tenants. (SMS Research, 2008).

Kalaeloa Harbor located along the northern edge of the Campbell Industrial Park, was created in 1961 as a second harbor for O‘ahu. South of the industrial area, about a mile offshore, are a buoy and pipeline designed to allow oil tankers to off-load their cargo without docking in the harbor. Steps are currently underway by Campbell Estate to construct a second industrial park at Kalaeloa Harbor. This industrial park would be built on a 332-acre parcel and construction is expected to begin in 2008 or 2009. (SMS Research, 2008).

Over the years, residential areas developed along Farrington Highway and as of 1962, uphill in Makakilo. New residential development in Kapolei has been led by the State, as master developer of the Villages of Kapolei, beginning in the 1980’s with its first Village, Kumu Iki. The Villages of Kapolei and adjoining developments have rivaled developments along Fort Weaver Road, to the east, and Mililani in Central O‘ahu, as new residential areas emerged with aggressive growth through the last decade. (SMS Research, 2008).

While industrial and residential development proceeded over recent years, many of Kapolei’s residents still commute to Honolulu. Growth in the center of Kapolei has been spurred by relocation of banking activities and both State and City offices. The Campbell Estate stresses Kapolei’s advantages as a wired community with direct access to satellite and fiber-optic network communications. (SMS Research, 2008).

The Ko Olina Resort complements the rest of Kapolei. Its innovative man-made coves provide recreational areas and frontage for hotels, and a 430 acre privately owned marina offers 330 full service slips for boats. Plans have called for as many as 8,700 housing units. These were planned with vacation markets in mind. Projects to date include a hotel, a time-share resort, and townhouse condominiums. One project, The Fairways at Ko Olina, was sold to the resident market, and newer projects have aimed at both second- and first- home buyers (The Coconut Plantation, Kai Lani, Ko ‘Olina Kai). The newest project, the Beach Villas at Ko ‘Olina, with 247 luxury units in beachside towers, is expected to open in the spring of 2008. (SMS Research, 2008).

When first opened in 1989, WGSL was surrounded by vacant land and agriculture. Although Makakilo had begun to be settled by homes 27 years earlier, it was still a significant distance from the landfill. The resort of Ko Olina was still undergoing development and Kapolei’s Second City had only just begun. Today, urbanization of the ‘Ewa Plain approaches closer to the landfill, the second City is a becoming a reality, and the resort of Ko Olina is a growing vacation and residential community. (SMS Research, 2008).

7.1.2. Demographic and Economic Characteristics

‘Ewa DP Area

The ‘Ewa DP Area has a young population; the median age of its residents is 31.2 vs. O‘ahu’s residents’ median age of 35.7. Households are significantly larger than average (3.69 persons per household, vs. 2.95 persons in the average household for O‘ahu as a whole). Of the 20,804 housing units in Ewa in 2000, 63.7 percent were owner occupied. (SMS Research, 2008).

Within the ‘Ewa DP Area, the Ko Olina sub-region (Census Tract 86.09) stands out as having an older median age, a large proportion of vacant homes held for seasonal or recreational use, and, among occupied homes, a low proportion of renters (26.1%). (SMS Research, 2008).

In general, the average per capita income over the entire ‘Ewa DP Area is lower than the Island of O‘ahu average. In the two census tracts abutting the landfill however, incomes tend to be higher. In the Kahe Census Tract, per capita incomes are nearly at the O‘ahu average level; in the Ko Olina Census Tract incomes are much higher. (SMS Research, 2008).

Workers living in the ‘Ewa DP Area are diverse in occupation, and, despite the long history of sugar cultivation in the region, a lower percentage of workers are in agriculture than the percentage islandwide. Commuting times are long, and a third of the workforce normally drives over 45 minutes to work which is characteristic of a suburban community. (SMS Research, 2008).

Among the ‘Ewa DP Area communities, Ko Olina and Honokai Hale[1] stand out in several ways. In this sub-region, the population tends to be older with a median age of 36.8, slightly higher than the island median. Most households do not have members younger than 18. The median household income level is much higher than in the other communities studied. However, the share of children under 18 living with family who are below the poverty level is comparable to that found in the Wai‘anae Coast, suggesting that those families that do have children in this sub-region face an economic situation very different from that of their older neighbors. (SMS Research, 2008).

Despite the intention to develop Kapolei into the second major O‘ahu city, Kapolei is today not much more than a significant suburban community. The same can be said of the neighboring communities along Fort Weaver Road, in ‘Ewa and Makakilo. Outside

---

[1] In the Census tables, “Ko Olina” consists of Census Tracts 86.09 and 86.10, and includes Honokai Hale as well as Ko Olina.

of Campbell Industrial Park and the Kalaeloa Harbor, the commercial activity of the region is primarily designed to service a suburban community. (SMS Research, 2008).

Emerging Trends in the ‘Ewa DP Area

The building blocks laid today in the ‘Ewa DP Area forecast very strong future growth, although the business core has not yet emerged. According to **Table 7-2**, the ‘Ewa DP Area is the only Development Plan Area on the island that is expected to increase its share of the City’s population between 2005 and 2030. (SMS Research, 2008).

Table 7-2, Socioeconomic Projections, 2030

	2005		2025		2030	
DP Area	Population	Share of Island	Population	Share of Island	Population	Share of Island
Wai‘anae	**44,004**	**5%**	**49,682**	**5%**	**50,616**	**5%**
'Ewa	84,154	9%	164,136	15%	184,612	17%
Central O‘ahu	157,250	17%	180,687	17%	189,599	17%

Totals*	912,902	100%	1,078,051	101%	1,117,302	101%

Source: http://honoluludpp.org/planning/demographics2/Projections/2030byDP.pdf
Note: Percentage totals do not add due to rounding.*

The suburban residential areas that experienced vigorous growth through the last 15 years continue to fill in with projects by HASEKO, the Department of Hawaiian Home Lands, Gentry and others; and plans for accompanying major retail projects continue to progress. If anything is missing to complete the City, it is the maturing of an intense, downtown core characteristic of other cities: a corporate home to finance and professional service industries, upscale restaurants, specialty retail, medical services and other office tenants, that make a downtown viable. (SMS Research, 2008).

On February 9, 2005, ground was broken to begin construction of the North-South Road. This major roadway will connect the H-1 with Kapolei Parkway and extend into Kalaeloa. The project is targeted for completion later in 2008. The completion of the

North-South Road will signal the start of construction on the new University of Hawaiʻi West Oʻahu Campus and will provide a primary means of access to the underdeveloped lands of Kalaeloa and the largely vacant lands of West Kapolei. The confluence of activity along the North-South Road will have a significant impact on the shape and development timing of the entire ʻEwa DP Area. (SMS Research, 2008).

On the industrial front, Campbell Industrial Park is full and employment has remained stable for the past few years. Light industrial space in the City of Kapolei and Kapolei Business Park is anticipated to attract office and light industry jobs from other parts of Oʻahu as the region's residential population continues to grow. (SMS Research, 2008).

Kalaeloa Harbor, as is Honolulu Harbor, remains very active and in demand. The Sause Brothers barge operations have been shifted to this port from Honolulu. Kalaeloa also handles several bulk cargo operations and metals recycling. Space for expansion will remain tight for the next few years. (SMS Research, 2008).

A key to understanding the future of industrial/commercial uses in the ʻEwa region may lie with the Barber's Point Naval Air Station, now known as the Kalaeloa Community Development District. Because of its nearly 3,700 acre size and the undeveloped nature of much of its land, Kalaeloa offers business and commercial opportunities that no other part of the island can duplicate. (SMS Research, 2008).

Finally, as noted, Ko Olina continues to grow and to move toward a critical mass sufficient to fully support a resort community. (SMS Research, 2008).

If anything will slow the emergence of a true Second City at Kapolei, it is the capacity of the infrastructure. Despite construction of the North-South Road and the widening of the Fort Weaver Road, the road system in the ʻEwa region is significantly under capacity and deficient in connectivity. The school systems, finished park spaces, liquid and solid waste disposal, and drainage capacity must all be supplemented to accommodate the projected growth. (SMS Research, 2008).

Wai‘anae DP Area

The Wai‘anae DP Area is the fifth largest of the City Development Plan Areas. A long corridor, the Wai‘anae DP Area stretches 18 miles from Nānākuli to Kaena Point, and is confined by the Wai‘anae Mountain Range to the east and the ocean to the west. With ten percent of O‘ahu’s landmass, but less than five percent of the island’s population, the Wai‘anae DP Area is still rural, though it is becoming increasingly suburban. (SMS Research, 2008).

The Wai‘anae mountain range is a dominant feature and creates distinct valleys that line the corridor, linked by a single roadway and coastal beach parks. Nānākuli, about three miles from WGSL, includes the largest Hawaiian Homes community in the State, and is completely suburban in nature. Lualualei, adjoining Nānākuli, is home to large Navy munitions storage and communication facilities, as well as small residential communities along the Farrington Highway. Mā‘ili and Wai‘anae are home to large residential communities, as well as many small farms. Wai‘anae, is the urban core of the Wai‘anae DP Area, with its many shops and civic services. Mākaha has a small resort (now closed), but is essentially the last of the suburban housing communities along the coast. Makua is used by the U. S. Army for military training, while Ka‘ena is in the state's conservation district and inaccessible to public pedestrian or vehicular traffic. (SMS Research, 2008).

The Wai‘anae DP Area has experienced modest growth over the last 20 years (3.4%) and this has allowed the communities to retain the “small-town” values of the residents. But the isolation of these communities and its rural character has had its downside. Average incomes ($42,451) are significantly below the City average ($51,914) and the number of people living in poverty is nearly triple the number living in the ‘Ewa DP Area. Unemployment is very high and a host of social concerns threaten the region. Of equal concern, the Wai‘anae DP Area is seen by many of its residents as the “dumping” ground for problems that no one on O‘ahu wants, including the WGSL, PVT landfill (construction and demolition debris), a very large portion of O‘ahu homeless population, a major power plant, and firing ranges and military activities (over 32% of the region is controlled by the military). (SMS Research, 2008).

The entire region has been considered by some as at the "end of the road" and except for times of emergencies when the Kolekole Pass is opened to allow access to Wahiawā, across the Wai'anae range, there is only the Farrington Highway providing one way in and one way out of Coastal Wai'anae. The Farrington Highway lies at the entry to Wai'anae and runs past the WGSL. (SMS Research, 2008).

Emerging Trends in the Wai'anae DP Area

In recent years, the Wai'anae Development Plan has migrated from a "development plan" to a "sustainable community plan", reflecting the intention of the City and the community to retain the rural nature of the region. The plan's vision and supporting provisions are oriented "to maintaining and enhancing the region's ability to sustain its unique character, current population, growing families, rural lifestyle, and economic livelihood . . . " (SMS Research, 2008).

With the exception of significantly upgrading the infrastructure serving the region, and protecting and enhancing the lifestyle of Coastal Wai'anae, not much is projected to change. Although there have been on-going discussions for many years about adding a new highway through the Wai'anae Mountain Range or completing the highway around Ka'ena Point, plans have not been developed for such a project. Until then, the only access in and out of the Wai'anae DP Area will continue to be the Farrington Highway, and its connection with the H-1. (SMS Research, 2008).

7.1.3. Community Issues and Concerns

According to SMS Research, the information used to prepare the assessment of landfill issues and concerns included the following:

- Interviews with selected persons who SMS Research knew to be knowledgeable about the affected communities and activities relating to the proposed action
- Neighborhood Board resolutions and summaries of discussions of the issues during the years 2005, 2006 and 2007
- 2005, 2006 and 2007 local newspaper articles

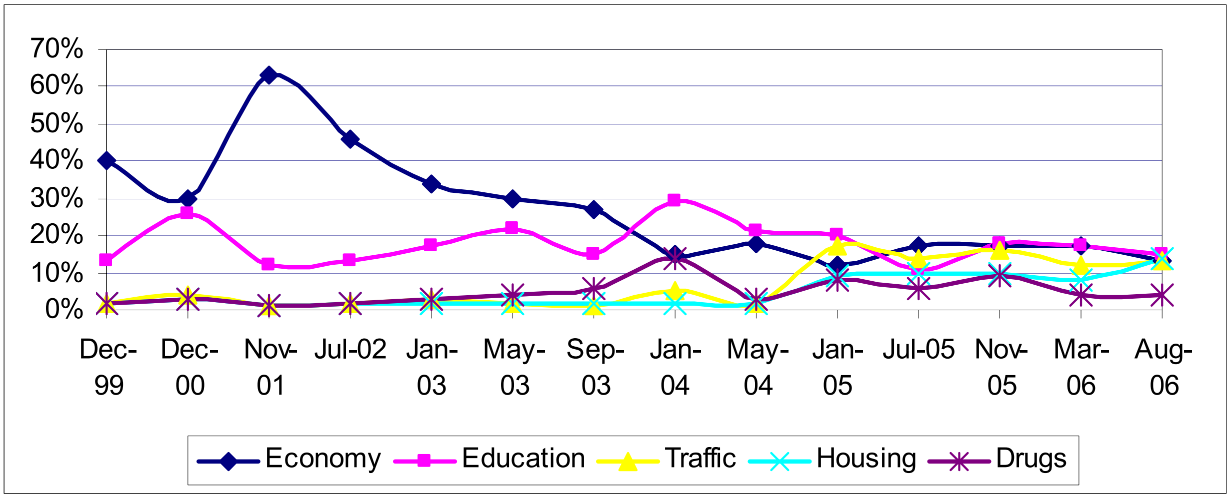
Other information from existing data sources was also used.

The objective of the data gathering is to understand the range of concerns and some of the linkages between them. The methodology was designed to cover a wide range of opinions, not to assess the relative importance of particular viewpoints. (SMS Research, 2008).

7.1.3.1. General Community Concerns and Issue

For several years, Hawai‘i residents have responded to polls on the major issues facing the community by pointing to the economy and education as the most important issues for the State (**Figure 7-1**). Environmental issues (e.g., environmental protection, recycling) do not achieve the same salience. (SMS Research, 2008).

Figure 7-1,
Major Public Issues, State of Hawaii, 1999-2006



Source: “People’s Pulse Poll – OmniTrak Group Inc.”

7.1.3.2. Community Issues and Concerns Regarding WGSL

Neighborhood Board Topics of Discussion

A total of 32 Neighborhood Boards meet monthly on the Island of Oʻahu. Discussion regarding the WGSL arose in the Waiʻanae, Makakilo/Kapolei/ Honokai Hale, and Kailua Neighborhood Board meetings.

Leeward communities were mostly interested in closing the WGSL and in ensuring that following the May 1, 2008 closure[2] of WGSL, that the next landfill would not be located in Leeward Oʻahu. Specific comments noted in italics included the following (SMS Research, 2008):

1. *Is the State Department of Health monitoring and conducting its own landfill investigations or are they relying on the operator?*
2. *What violations are outstanding and what is being done about them?*
3. *Is anyone, but in particular the military, being allowed to dump hazardous material in the landfill?*
4. *What is the present situation with transshipment? Is it a viable option to keeping WGSL open and at what cost?*
5. *What are the specific elements of the community benefits package and who benefits? Why? Who is represented in decision-making? Are there any features that are merely a substitute of City services that should be provided anyway?*
6. *What assurances are there that if WGSL is closed that another landfill is not opened on the Leeward Coast and what enforcement is available to prevent rogue trash dumping.*
7. *What is being done about the hazardous dump truck drivers and the dangerous traffic conditions caused by crossing the freeway without a light, by trucks lining up on the side of the highway waiting to enter the*

---

[2] The requirement for the closure of the WGSL has changed since the time the interviews were taken. The new date is November 1, 2009.

landfill area, by the airborne and highway trash left behind by trucks and the landfill operation?

8. *What is the situation with the leachates? What is the stability of the landfill walls?*
9. *How is the landfill affecting the for-profit businesses in the area or the decisions of businesses who would like to locate in the Leeward area?*

The Kailua Neighborhood Board, over the course of 2005 and 2006, had numerous mentions of WGSL Sanitary Landfill. A majority of the concerns involved the EIS; when the preparation process would begin and the expected completion date. The board was also notified monthly of any news or decisions surrounding the landfill. The specific mentions in italics included (SMS Research, 2008):

1. *Questions were raised numerous times in 2005 and 2006 regarding the status of the EIS. It was believed that there was no movement on this due to a face-off between the City Council and the Mayor's promise to Leeward not to extend the landfill.*
2. *Concern was expressed that if the EIS process did not begin soon the City would run into similar problems to what Maui was facing with their permit process.*
3. *Credit was given to the Mayor for vetoing Bill 37 that would have closed WGSL by May 1, 2008. They understood that it was not an easy decision.*

Individual Community Issues and Concerns

Interviews with community leaders, individuals and community groups solicited strong and wide ranging comments on the WGSL. A sample of the most often mentioned reactions, slightly edited for grammar and without analysis as to legitimacy, are presented in italics.[3] Information from ENV and WM are also presented. (SMS Research, 2008).

---

[3] In the course of the interviews, interviewees were assured anonymity and confidentiality by SMS Research. This allowed for free and frank conversations. As such, the names of interviewees are not presented.

Those Who Favor Closing the WGSL

On the City's Commitment to Close the Landfill

When it opened, the City committed to a short-term usage of WGSL. They extended it under the Harris Administration with a strong commitment that it would close in 2008. If we can't trust the City Administration to stand by the commitments of previous administrations, how can we trust anything they say?

The commitment to close the WGSL is reflected in the deeds of buyers in Ko 'Olina. We were told it would close in 2008. I'm not sure people would have bought units without that commitment by the Administration.

It's not like we have NO choices to using WGSL. We can expand H-POWER, we can ship waste to Washington State, we can landfill elsewhere on the island. So, if we have options, how do we justify going back on a commitment given in good faith?

It seems to me that if one reads the last EIS, there was absolutely no intention of keeping the timetable to five years. Remember, Harris started with an extension for 15 years, then cut it to five years after all the protest. There was no plan for what to do after five years. The City doesn't care; it takes the community for granted.

Where's the transparency necessary to deal honorably with the community? It robs the community and the larger O'ahu community of the opportunity to make reasoned judgments and it breeds distrust.

Does the Administration pay attention to its citizens; does it feel an obligation to keep its word. This is overwhelmingly the stuff that drives the response to ideas and fuels the energy behind the opposition to WGSL.

Discussions with ENV indicate that the City is continuously seeking ways to find relief for the landfill, but thus far with limited success (SMS Research, 2008). Currently available new technology based solutions as well as waste transshipment result in the generation of waste byproducts that cannot be further recycled or transshipped off island. These forms of waste will still require a municipal landfill for disposal. However, the use of alternative technologies and transshipment, as implemented, would reduce dependency and lengthen the life of the landfill through the reduction of waste volume.

The events that have transpired since the commitment of the prior administration to close WGSL is provided in Section 2, Project Background. The record of events presents the basis for the current Administration's decision to seek the expansion of the WGSL within the context of the prior commitment as considered by both the Administration and City Council.

On Management of the Operation

Despite numerous complaints over the years, we continue to have litter on the roads, we continue to have dangerous truck situations where merging into and crossing traffic occurs; we continue to have smells coming from the landfill; and we continue to have deliveries at off-hours. There may have been some improvements, but these issues are not being adequately addressed by Waste Management.

Waste Management is very secretive. They don't answer our questions; they subtly harass people who come to the site; they make the community suspicious.

Discussions with WMH indicate that they are taking steps to be more transparent on the operation of the landfill. They are active participants in the Mayor's Oversight Advisory Committee and provide tours of the landfill upon request. In 2006, more than 1,600 individuals toured the landfill (SMS Research, 2008). Both ENV and WMH provide website contact information to accept questions or complaints at:

http://www.keepinghawaiiclean.com/contact.htm; and
http://envhonolulu.org/solid_waste/contact/contact_us.html.

On Traffic

It is very dangerous when trucks line up on the highway waiting to turn mauka. It doesn't happen often, but when it does, it's very dangerous.

When trucks merge back onto the highway going toward town, they have to cut across traffic, sometimes very heavy traffic, without the benefit of a light. I'm surprised there haven't been any major accidents caused by these trucks.

The individual household deliveries, in cars and trucks, may be even more problematic than commercial trucks. These aren't professional drivers and they often don't cover the trash. These people are more likely to litter the road and to cause traffic hazards.

WMH notes that they are not aware of any major accidents involving trucks entering and exiting the landfill site. They continue to monitor the intersection and to counsel truck drivers on appropriate driving practices. (SMS Research, 2008).

An assessment of traffic conditions at WGSL in Section 5, Public Services, Potential Impacts and Mitigation Measures, provides further information regarding traffic volumes and safety at the entry to the site.

On Odors

The State Department of Health has done tests and they tell us that "yes, under certain conditions, odor is a very real problem." It is not our imagination. This is especially a problem for Honokai Hale and Ko 'Olina residents and guests.

The odor problem is most noticeable when they deliver sludge material from the Sewage Treatment Plant and it is not immediately buried. It happens often.

Sometimes it gets so bad, you can't come out of your house. I feel sorry for those people in Honokai Hale who may not have air conditioning.

Following numerous complaints a few years ago, WMH indicates it instituted a practice to immediately process sludge material upon delivery. WMH also improved the operation of their odor neutralizing misting system that functions during landfilling operations. Improved operating performance of the Synagro-WWT facility has reduced sludge delivery to the landfill by approximately 25 percent. (SMS Research, 2008).

Taken together WMH believes they are actively addressing this issue. According to WMH records there has been a drop in odor complaints from seven different instances in 2006 to one odor complaint in 2007. (SMS Research, 2008).

On Litter

This is the most visible problem. It was worse before, but the problem has certainly not gone away. Trucks litter because the load is not properly covered on the way to the landfill or because they do not clean the truck out completely before leaving.

Litter occurs sometimes because of the winds blowing over the landfill. Some days one can see paper and plastics hovering over the landfill, kicked up by the wind. And sometimes, that trash is blown down the mountain to the areas around the landfill and out to the ocean. There is a reason that wind farm people have looked seriously at sites above the landfill; the wind is very strong there.

Discussion with WMH indicate that it is their current practice to continuously process and cover the trash as it arrives, thereby limiting its exposure to wind. They also cover MSW daily, as is indicated by photos that are submitted to the State DOH at the end of each working day. WMH also employs people to pick up litter along the extremities of the landfill before it can blow off of the property. They appreciate that they are not always successful, but believe they have greatly reduced the problem. (SMS Research, 2008).

As to trucks not properly covering their load or not completely emptying their load, WMH contends that they monitor the trucks entering and leaving the landfill and are very aggressive about employing a system of counseling and fines. It is their position that anyone seeing violations of littering should call them and call the police with information on vehicle license numbers and the time and date of occurrence. (SMS Research, 2008).

ENV has stated that they are concerned regarding landfill bound vehicles as a potential source of odor and litter. Vehicles making deliveries to the landfill are prohibited from queuing outside of the landfill property or entering the landfill with uncovered loads. The scalehouse, which is operated by a City employee assists in monitoring vehicles and will enforce the provisions against uncovered loads at first with counseling. Repeat offenders are issued penalties and if the offense is serious, with prohibition against use of the WGSL.

On Views

The landfill is visible from Ko 'Olina and from the highway. It is most visible from Farrington Highway as you drive by the Kahe Power Plant.

If operations are visible now, how much more visible will it be if they expand operations? They are not supposed to excavate, so I don't understand how it will not be more visible?

The visibility of the landfill has a direct impact on the development of Ko 'Olina; on the largest single economic engine on the Leeward Coast. Hotel developers are very reluctant to buy parcels because all mauka view units will be looking at an operating landfill. One can say that the current landowners knew it was there when they bought the project, but they believed the City when the City committed to close the landfill in 2003 and then in 2008. The landfill is not the only reason these sites are difficult to sell, but it is a major reason.

People keep saying the view will improve as they plant cover and put in view screens. But it's been a long time and I don't see any trees or view screens.

Discussions and site visits indicate that Norfolk pines and monkey pod trees have been planted along a berm fronting the landfilling operation. These trees have yet to mature to a level to adequately screen views. Most of the finished surfaces have been hydro mulched, but grass has not yet taken hold. Berms have been erected in such a manner that views of the operation from the highway fronting the landfill and from much of Ko Olina have been partially obscured. WMH contends that if the operation is allowed to expand deeper into the Waimānalo Gulch, the finished heights of the berms and additional plantings will almost totally obscure any views of the operation for most of the neighbors. (SMS Research, 2008).

On the Safety of the Site

Is the site safe? I worry about the plastic linings since they have had some recent fires.

I worry about the fill coming down the hillside. When the recent earthquakes happened, my first thought was how we would handle the toxic materials if the walls of the landfill breeched.

WMH contends the landfill was never unstable and that the site has always been safe. However, to address the small area of the ash monofill that had a factor of safety less than permitted by the DOH, a berm was constructed and completed in 2005. The basis for WMH's contention are geotechnical studies and analyses that have been performed by third party professional firms whose work has been reviewed by independent, nationally recognized engineering professionals. (WMH and SMS Research, 2008).

A number of the special studies providing the basis for the design of the existing as well as proposed future areas of the landfill are identified in Section 5, Environmental Setting, Potential Impacts and Mitigation Measures, and in other sections of this EIS document.

On the Community Benefits Package

If the package is going to have elements that merely replace funds that should have been spent in the community anyway (e.g. park maintenance), then it's a farce.

Leave the decision to the community as to how the money is spent. Those decisions should not be controlled by people who don't have to live with the problem.

There is absolutely no reason not to include Makakilo as a recipient. They live next to the landfill. How does the WGSL affect the people living Ewa? Yet, they are recipients and the community of Makakilo is not.

If truth be told, the only communities that are directly affected by WGSL are Honokai Hale and Ko 'Olina; the communities indirectly affected are Makakilo, Kapolei, and the residents who pass by going further out Leeward.

I'm not sure I even want to discuss a "better" community package. As soon as we start "negotiating" a community package, we will surely have to keep the landfill. We'll get bought off. There's too much money being made by the City at the landfill.

ENV notes that the community benefits package thus far has been $2.7 million in 2007 and will be $2.0 million in 2008. They expect that participation and the benefits provided will continue to evolve as they gain experience in working with the community. (SMS Research, 2008).

The current City administration recognizes that WGSL has a potential impact on neighboring communities and implemented the community benefits program to provide those communities with funding for programs beyond those provided in the regular operating and capital budgets. A Committee comprised of representatives of Leeward Coast communities was established by the Mayor to review funding applications from nonprofit community groups, identify capital projects in their communities, and determine how funds will be utilized. The Committee will help to identify programs or projects to provide services and benefits that are in addition to any provided through the normal City budget process.

People Who Favor Extending the WGSL Landfill Operation

On the City's Decision

We need a landfill on the island, even if we have other successful alternative technologies. WGSL has more room for expansion; the investment is already made there. Honolulu town has had its share of landfills as has Windward O'ahu. It's just logical to extend the use of WGSL.

I support the full use of the Waimanalo site before any other site is considered. Anything else would be a terrible waste of money and resources.

Discussions with people opposed to continuing the operation of WGSL indicates that they believe the financial investment is not sufficient to offset the burden placed on the communities of 'Ewa and the Leeward Coast. They further indicate that this investment might have been more aggressively fought if they did not believe previous City administrations who indicated that the WGSL would be closed. (SMS Research, 2008).

7.1.4. Socioeconomic Impacts

The following discussion involves the potential social impacts of the proposed project. Information sources used include published annual reports and direct discussion conducted by SMS Research with governmental agency personnel.

7.1.4.1. Public Facilities and Services

Police Protection

The Honolulu Police Department (HPD) District 8 encompasses the Wai‘anae Coast, Makakilo, the ‘Ewa Plain, and the City of Kapolei. The District 8 headquarters is in Kapolei, while a substation in Wai‘anae provides a base of operations for officers patrolling the Wai‘anae Coast. (SMS Research, 2008).

During a one year time period, April 2006 - April 2007, in the area immediately surrounding WGSL, there were a total of 41 documented nuisance complaints, but they could not be specific on what types of complaints nor to whom they were attributable. Since April of 2007, their records show only one complaint in the area that was attributed to the landfill. This is consistent with WMH complaint logs which indicate 14 complaints in 2006 and only 4 complaints in 2007. Complaints made to WMH are not necessarily made to the police, and the police do not necessarily report complaints to WMH. (SMS Research, 2008).

Extension of the landfill operations should not result in any additional burden to the Honolulu Police Department. See also Section 6.5.1. Police Facilities.

Fire Protection

Leeward O‘ahu is served by the Honolulu Fire Department’s Fourth Battalion. The Kapolei Fire Station 40 also serves as the headquarters for Battalion 4. The headquarters building houses an engine and a ladder truck. Station 28, in Nānākuli, has an engine and a tanker. Station 26, the Wai‘anae Fire Station, has an engine, a quint truck (with pump and ladder), and a tanker. Also housed in Station 26 are the Waiʻanae EMS units. The Makakilo Fire Station 35 has a single engine. (SMS Research, 2008).

The Fire Department has worked successfully in the past with WMH supplying equipment to help with fighting area brush fires outside of the landfill property (no fires have occurred from within the landfill itself). No change in services is expected over the course of the next few years. (ENV and SMS Research, 2008).

The Honolulu Fire Department has requested that WMH maintain adequate access for fire apparatus and indicates that WMH is complying. As long as WMH continues to provide adequate access, the Fire Department foresees no necessary additions as a result of the WGSL expansion. See also Section 6.6.1. Fire Stations.

Emergency Services

Leeward Oʻahu has three EMS locations and one of Oʻahu's two Rapid Response Units. EMS is provided from the Waiʻanae Fire Station, in Nānākuli along Farrington Highway, and in Makakilo in Kapolei. The Rapid Response Unit location is at the St. Francis West Hospital. (SMS Research, 2008).

The WGSL and surrounding communities are adequately serviced by EMS services. Expansion of the WGSL will not add new residents and, according to WMH, only about 5 to 12 additional contract workers to the site. This will not significantly impact the quality of service currently available. See also Section 6.7.1. Hospital and Ambulance Services.

Education

Leeward Oʻahu has seen growth in school populations and schools in recent years, notably in Kapolei where new middle and high schools have opened. Availability of primary school space remains a problem. At least two schools were noted in the landfill site vicinity, Makakilo Elementary and Mauka Lani School. Mauka Lani School reported no complaints or staff concerns about WGSL Landfill or side effects including odor or children feeling ill at school. (SMS Research, 2008).

Development in the Kapolei area will lead to an increase in population, eventually causing the need for additional school locations. Expansion of the WGSL Sanitary Landfill will not create the need for additional elementary schools, nor will it affect existing elementary schools differently than they are affected at the present time. See also Section 6.8.1. Educational Facilities for other schools within the general project vicinity.

Library Services

Hawaii's public libraries are operated by the State Department of Education. Libraries are open in Waiʻanae, ʻEwa Beach and Kapolei. Due to limited funds, hours at libraries throughout Hawaiʻi have been reduced in recent years. No additional libraries have been announced. (SMS Research, 2008).

No impact on library services is anticipated as a result of the proposed project. See also Section 6.9.1. Library Services.

Parks and Recreation

There are parks situated in Waiʻanae, Māʻili, and Nānākuli, and throughout the major residential zones of ʻEwa. Also, beach parks are located along the Waiʻanae Coast at the tip of Barbers Point (in the Campbell Industrial Park) and in ʻEwa Beach. Odor issues and occasional airborne trash at nearby beach parks are the only reported issues caused by the current operations of the landfill. In the past, outdoor recreation at Ko Olina has been limited during occasions when odor was a problem. (SMS Research, 2008).

Long-term, WGSL may one day be used as a reclaimed recreational facility much like Ala Moana Park and the Honolulu Waterfront Park. (SMS Research, 2008).

After the closure of Barbers Point, much of the Navy land was conveyed to the City for eventual redevelopment as a recreation and sports facility. Funds for significant new developments have not been allocated, so major changes are not likely in the next few years. An expanded WGSL does not generate any additional demand for area parks. If odor issues and litter issues are adequately addressed, expansion and continued use of WGSL will have no impact on the use of nearby parks. (SMS Research, 2008). See also Section 6.10. Parks and Recreation.

Medical Services

Leeward O‘ahu is served by St. Francis West, a 100-bed hospital with 24 Emergency Service, located outside Waipahu, the Wai‘anae Coast Comprehensive Health Clinic, between Nānākuli and Wai‘anae, and clinics in Kapolei are maintained by other health care providers. SMS Research knows of no major changes in medical services planned for the study area. No impact is anticipated. (SMS Research, 2008).

7.1.4.2. Other Social Impacts

Positive Social Impacts

Reduced Impact on Other O‘ahu Communities

Unless a package of alternatives can feasibly process MSW and refuse currently handled by the WGSL, a landfill will still be needed. Without it, the health, sanitation and aesthetic issues associated with unprocessed waste or uncontrolled dumping will burden the entire island. Moving the current landfill operation to another O‘ahu location would only shift the potential for adverse impacts to another community, still requiring that the issues of litter, traffic, odors, and visual pollution be addressed and managed. (SMS Research, 2008).

Negative Social Impacts

Department of Health Issues

In February 2006, the Department of Health proposed one of the largest environmental fines against the City: Eighteen violations were identified in DOH’s six-month investigation. According to WMH, all but two violations were corrected when the Notice of Violation (NOV) was issued. The two violations were:

- Count VII, Failure to measure and maintain records of leachate levels in one sump due to a blockage caused by broken equipment, was addressed with the installation of the required equipment on September 27, 2007.
- Count I, Exceedance of permitted grades, was addressed through the submittal of an application to the DOH for a permit modification to increase the maximum final grades of the ash monofill. Public comments were solicited and a public hearing on the draft permit modification was held on December 11, 2007. The DOH permit allowing the height increase was approved on February 20, 2008.

On December 7, 2007, having addressed the two remaining counts identified in the NOV, the City and the DOH signed a settlement agreement which settled all issues arising from and related to the NOV. A summary of the counts identified in the DOH NOV are provided in **Table 7-3**.

According to WMH and the City, the public and the environment were never at risk during the period cited in the NOV or at any time over the period of use of the site. However, the public perception was of an improperly and poorly administered facility. An overview of the situation indicates:

- The DOH issuance of the NOV was based on information that was self-reported by WHM. WMH substantiates the safety of the WGSL with a number of technical studies and reports that serve as the basis for the design, operation, and monitoring of the facility, as required by both federal, state and City & County of Honolulu requirements, and WMH standards for safe engineering and operational practices.
- The community is highly sensitized to the presence of the landfill within the context of previous City administrations commitments to close the landfill, and experience with prior nuisances involving odor, litter, and visual aesthetics. Any activities of an operational nature will therefore continue to be scrutinized by the community. The situation involving the NOV exacerbates this and calls into question the management of the facility and its potential impact on the community and environment.

Table 7-3, DOH Notices & Finding of Violations

Count	*Alleged Violation*	*Date of Last Alleged Violation*	*Compliance Status*
1	Exceeding Permitted Grades	2/20/08*	In compliance
2	Failure to submit Annual Operating Reports in a Timely Manner	2/22/2005	In compliance
3	Failure to Place Daily Cover on the Active Face of MSW Landfill	6/9/2005	In compliance
4	Failure to Place Intermediate cover Material on the Ash Monofil	6/29/2005	In compliance
5	Exceeding Leachate Head on th4e Liner in Ash Monofill	6/15/2005	In compliance
6	Exceeding Leachate Head on Liner in MSW Cell E-1 Sump	6/22/2005	In compliance
7	Failure to Measure Leachate Levels and to Maintain Records on Leachate Levels in Cell 4B Sump	9/26/07*	In compliance
8	Failure to Measure Leachate Levels and to Maintain Records on Leachate Levels in Ash Monofill Sump	2/9/2005	In compliance
9	Failure to notify DOH of Noncompliance on Equipment Blockage in MSW Cell 4B Leachate Lateral line and inability to Measure Leachate Levels	6/22/2005	In compliance
10	Failure to Notify DOH of Noncompliance in a Timely Manner on the Exceedances of Permitted Grades and submission of the Annual Operating Reports	2/22/2005	In compliance
11	Unauthorized Storage of Material on the Ash Monofill	3/2005	In compliance
12	Failure to Manage and Ban the Acceptance of Special Waste	5/19/2005	In compliance
13	Failure to Maintain Records and Record Location of Asbestos Disposal at the Landfill	7/2/2005	In compliance
14	Failure to Cover a Dead Animal	2/17/2005	In compliance
15	Failure to Submit annual Surface Water Management Plan	9/1/2005	In compliance
16	Failure to Control the Generation of Dust from Vehicular Traffic	2/17/2005	In compliance
17	Failure to Minimize Free Litter Generation in the Landfill	6/24/2005	In compliance
18	Failure to Monitor Explosive Gases and Maintain Monitoring Records	2004	In compliance

* Date the DOH deemed WGSL to be in compliance.

Property Values

The 2002 Socio-Economic Impact Assessment of WGSL Expansion presented property value results that were not necessarily in line with what experts and the public at large would have expected. See also Section 7.1.5. Addendum to Socioconomic Impact Assessment, for additional information. (SMS Research, 2008).

Research found that single-family homes fit the hypothesis that property values increase with distance from the landfill up to a distance of about three miles. However, the condominium analysis shows a significant correlation of increased value and proximity to the landfill – the opposite result. (SMS Research, 2008).

Condominium property values are higher near WGSL due to the location of the condominiums within the Ko Olina Resort. According to the Ko Olina website, Ko Olina Resort & Marina's residential development will be Hawai'i's premier location for homebuyers across the world and for local residents…Ko Olina will provide a feeling of luxury in a private community…(SMS Research, 2008).

Diminishing Community Trust

The failure to follow through on commitments from the City to close WGSL may be having an impact in eroding public trust and increasing cynicism toward City government. This is happening in the fastest growing community on the Island of O'ahu where private-public partnerships are necessary to ensure sensible and well-managed growth. (SMS Research, 2008).

The problem is complicated by a "community-benefits package" proposal that both proponents and opponents of the landfill who were interviewed expressed some hesitation. There appears to be general agreement among them that there has been insufficient community involvement in questions surrounding "who should benefit?", "what impacts are being addressed?", and "what services are appropriate?" (SMS Research, 2008).

~~Environmental Injustice~~

~~Environmental Injustice is defined as: "An environmental injustice exists when members of disadvantaged, ethnic, minority or other groups suffer disproportionately at the local, regional (sub-national), or national levels from environmental risks or hazards, and/or suffer disproportionately from violations of fundamental human rights as a result of environmental factors, and/or denied access to environmental investments, benefits, and/or natural resources, and/or are denied access to information; and/or participation in decision making; and/or access to justice in environment-related matters."~~[4]

~~A number of interviewees point out that Leeward O'ahu has been and continues to remain on the receiving end of many of O'ahu's burdens. They argue that within a 10-mile stretch along Farrington Highway there are two separate landfills handling hazardous~~[5]~~, construction and municipal waste, as well as an two existing electrical power plants, a proposed new generator unit at the Campbell Industrial Park, a deep draft harbor and the Campbell Industrial Park, all of which service the entire Island of O'ahu -- all of which adversely impacts the environment of these communities. Further, Leeward O'ahu is now the home of thousands of homeless people, many of whom were driven out of other communities only to be "welcomed" and "tolerated" in Coastal Wai'anae. Inteviewees argue that the continued use and expansion of WGSL will only increase the imbalance of those impacts on Leeward O'ahu. (SMS Research, 2008).~~

~~Proponents of keeping the landfill in operation point out that the siting of the landfill occurred long before the siting of the other examples noted above and had nothing to do with the demographics of the people in surrounding communities. Furthermore, the surrounding communities also accommodate one of the most beautiful resort complexes on O'ahu, abutting the ever expanding Second City of Kapolei. This is the fastest growing region on O'ahu and WGSL does not appear to have stymied its growth. They believe that this is not indicative of a community suffering from environmental injustice. (SMS Research, 2008).~~

---

[4] ~~Wikipedia *Environmental Justice* http://en.wikipedia.org/wiki/Environmental_justice~~

[5] ~~WGSL does not accept hazardous waste for disposal.~~

~~Data from the SMS Report would appear to support this position. Although the median household income in the Wai‘anae DP Area ($42,451) is below the island average ($51,194), the median household income in the ‘Ewa DP Area ($59,583), in which the WGSL is located, exceeds the island average. In addition, median household incomes for the two communities immediately surrounding the landfill all significantly exceed the island averages. These are Makakilo ($88,515) and Ko Olina/Honokai Hale ($74,083). (SMS Research, 2008).~~

~~Finally, Windward O‘ahu residents note that for the last 40 years most of the active landfills were on the Windward side of the island. It is only recently that WGSL has been the only major landfill for MSW on O‘ahu. (SMS Research, 2008).~~

Environmental Injustice (Addendum to Socioeconomic Impacts)

On February 11, 1994, President Clinton issued Executive Order 12898, “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations” to focus federal agencies’ attention on disadvantaged communities with the goal of achieving Environmental Justice. Over the years, each federal agency has defined environmental justice or injustice within the context of the Executive Order and in a manner that allows its application to their particular agency’s functions. The EPA defines **Environmental Justice** as “the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation and enforcement of environmental laws, regulations and policies”.[6] (SMS Research, 2008).

---

[6] EPA goes on to define *Fair Treatment* to mean that no group of people, including racial, ethnic, or socioeconomic groups, should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal environmental programs and policies. And they define *Meaningful Involvement* to mean that: (1) potentially affected community residents have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health; (2) the public’s contribution can influence the regulatory agency’s decisions; (3) the concerns of all participants involved will be considered in the decision-making process; and (4) the decision-makers seek out and facilitate the

The U.S. Department of Transportation, like other service agencies, goes slightly further by noting three pro-active environmental justice principles: "*(1) to avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations; (2) to ensure the full and fair participation by all potentially affected communities in the decision-making process'; and (3) to prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations"*.[7] (SMS Research, 2008).

A number of interviewees point out that Leeward O'ahu has been and continues to remain on the receiving end of many of Oahu's burdens. They argue that within a 10-mile stretch along Farrington Highway there are two existing electrical plants, a proposed new generator unit at the Campbell Industrial Park, a deep draft harbor and a major industrial park, all of which service the entire Island of O'ahu – and all of which adversely impact the environment of these communities. Further, Leeward O'ahu is now the home of thousands of homeless people, many of whom were driven out of other communities only to be "welcomed" and "tolerated" on the Leeward Coast. They argue that the continued use and expansion of WGSL will only increase the imbalance of those impacts on Leeward O'ahu. They believe that the expansion of WGSL is a case of Environmental Injustice. (SMS Research, 2008).

Proponents of keeping the landfill in operation point out that when the landfill was sited, the only residential communities in the area were in Makakilo. The communities of Kapolei and Ko' Olina grew up on sugar fields that once abutted the landfill, after the landfill had already been in operation. Furthermore, they note that the surrounding communities also accommodate one of the more important and successfully developing resort complexes on Oahu, Ko 'Olina, and the ever-expanding Second City of Kapolei.

---

involvement of those potentially affected. (Toolkit for Assessing Potential Allegations of Environmental Injustice, Office of Environmental Justice, US Environmental Protection Agency, November, 2004).

[7] An Overview of Transportation and Environmental Justice, Federal Highways Administration, US Department of Transportation, May, 2000.

This is the fastest growing region of O‘ahu and WGSL does not appear to have stymied its growth. They believe that this is not indicative of a community suffering from environmental injustice. Finally, Windward Oahu residents note that for the last 40 years most of the active landfills were on the Windward side of the island. It is only recently that WGSL has been the only major landfill for MSW on O‘ahu. (SMS Research, 2008).

A closer examination of the surrounding communities against the definition of Environmental Justice provides further insight. In 2004, the O‘ahu Metropolitan Planning Organization (OMPO) and the City & County of Honolulu, Department of Planning and Permitting (DPP) attempted to identify areas of the island that are vulnerable to Environmental Justice concerns.[8] Using definitions and criteria established by the Federal Highway Administration (FHWA) and 2000 U.S. Census block data, OMPO/DPP developed a systematic and comprehensive methodology to identify such communities. In their final analysis, 70 of the 435 blocks that make up O‘ahu were determined to be environmental justice areas based on race, and 17 blocks were identified as environmental justice areas based on income. (SMS Research, 2008).

None of the Census blocks in the ‘Ewa Development Plan Area were identified as environmental justice areas **based on income**. One can understand this as the overall average income in the ‘Ewa DP of $59,583 far exceeds the island average of $51,194. Additionally, the median household incomes for the two communities in closest proximity to the landfill all significantly exceed the island averages. These are Makakilo ($88,515) and Ko ‘Olina/Honokai Hale ($74,083). (SMS Research, 2008).

On the other hand, two of the Census blocks in proximity to the WGSL are environmental justice areas **based on race**, one in Makakilo and one in Honokai Hale. Both were selected because they have a Hispanic population that slightly exceeds the average settlement pattern plus an acceptable standard deviation for Hispanics. The acceptable index for Hispanics is 14.3 percent of the population. Hispanics make up 17.3 percent and 16.5 percent of these two communities respectively. No other minority

---

[8] Environmental Justice in the OMPO Planning Process: Defining Environmental Justice Populations, Oahu Metropolitan Planning Organization and the County Department of Planning and Permitting, March, 2004.

groups exceed their acceptable indices in any block in proximity to WGSL. (SMS Research, 2008).

Having identified these two communities as EJ areas, one asks whether these two blocks are subject to disproportionately high and adverse health and environmental impacts due to the WGSL and whether they have had meaningful access to decision-making regarding the WGSL. (SMS Research, 2008).

On the first point, the EIS findings to date would indicate that with the possible exception of views and windblown litter, no one is subject to disproportionately high and adverse health and environmental impacts based on the use of existing and future mitigation measures that have been identified in the subject DEIS document. Further, the significant mix of EJ and non-EJ communities in proximity to the WGSL would indicate that the EJ communities are not suffering disproportionately. (SMS Research, 2008).

On the second point, it would appear that everyone has had opportunity to make their preferences known. The subject has been presented in numerous Neighborhood Board meetings, and in community meetings with the Mayor and other County officials. Additionally, the County Councilman for this district is very approachable. He is also an articulate and forceful spokesperson in opposition to the lateral expansion of the WSGL, he ably defends that position, and he is one of nine votes on the County Council to whom this question will be presented for approval. For those who support the extension, their position has been expressed by the Mayor and his Administration. (SMS Research, 2008).

Finally, while the present EIS adheres to the requirements of Chapter 343, HRS, which does not mandate EJ as a criteria for evaluation, the Chapter 343, HRS, EIS process does specifically allow for review and comment by all citizens. There has been significant opportunity for any expression of concern and such expressions become a part of the record for review by decision-makers.

7.1.4.3. Economic Impacts

Approach and Terminology

This ~~economic impact~~ section reviews the impacts that this project will contribute to the economic environment. The technical terms make a distinction between different types of impacts. First, in economic analysis, a distinction is made between impacts of the actual construction and operations of a project, and the effects of project-related spending throughout the local economy. In discussions of jobs, earnings, and taxes, three broad types are distinguished (SMS Research, 2008):

- Direct jobs/earnings/taxes are immediately involved with construction of a project or with its operations. It is important to note that direct jobs are not necessarily on-site: construction supports company personnel in offices and base yards, as well as on-site.
- Indirect jobs/earnings/taxes are created as businesses directly involved with a project purchase goods and services in the local economy.
- Induced jobs/earnings/taxes are created as workers spend their income for goods and services.

Direct, Indirect and induced economic impacts in Hawaiʻi can be estimated using multipliers from a model of input-output relations developed and refined by State researchers. (SMS Research, 2008).

It is also important to understand that although construction has a positive impact on the state economy, funds for the proposed expansion project will be generated from the tip fees assessed to haulers for the use of the landfill. These tip fees are translated to consumers and businesses through maintenance fees and collection fees. As a result, financial resources for construction will come from reallocation of funds that are already a part of the Hawaiʻi State economy rather than out-of-state investment. The reallocation of state monies results in a negative impact on jobs, earnings and taxes. These positive and negative impacts must be considered to gain a clear picture of the economic impact of the WGSL expansion. (SMS Research, 2008).

Employment and Earnings

Construction

Expansion of WGSL is expected to take 10 years to complete. This expansion will result in an increase in the capacity of the landfill and is expected to increase the life expectancy of the landfill by 15 or more years. (SMS Research, 2008).

Pending the receipt of final engineering figures, the construction of the expansion has been estimated at $86,000,000 over ten years, with expenditures spread consistently over those ten years. The construction estimates were determined through discussions with officials from WMH, the current operator. The expansion is planned in several stages. Each stage and year of construction will result in approximately the same level of construction spending. (SMS Research, 2008).

Employment

Construction spending will create jobs and spending in related industries. Direct jobs created as a result of this project will include some 746 person-years of employment[3] over the ten-year construction period. Direct jobs are not necessarily located on-site. As a rule of thumb, about 20% of direct construction jobs are off-site (in base yards, offices, and the like). (SMS Research, 2008).

Indirect and induced jobs are also created throughout the state. These are likely to be concentrated in commercial and/or industrial centers, rather than near a job site. In addition, this project will support some 328 indirect and 720 induced person-years of employment. In total, approximately 1,795 person-years of employment will be created as a result of the WGSL expansion. (SMS Research, 2008).

This, however, is not the net impact of the project. The project will result in a reallocation of funds that could be otherwise spent in other areas of the economy. The cost of construction is generated by revenue received from tip fees and these fees are translated to Hawaiʻi consumers; therefore, one must account for the negative impact associated with this project. Since tip fees are translated to consumers, it can be

---

[3] Person years of employment is the number of full time equivalent positions required to complete the work defined by the estimated cost of construction during the specific period of time.

inferred that the proposed expansion will have a negative impact on personal consumer expenditures. A reduction in personal consumer expenditures results in a negative impact on jobs, earnings, and tax revenues. **Table 7-4**, shows the negative impact on jobs associated with this project. (SMS Research, 2008).

Table 7-4, Economic Impact - Negative Impact on Jobs

Note: Totals do not add due to rounding.

As shown in **Table 7-5**, the WGSL expansion will result in a net positive impact. Despite the negative impact associated with the expansion, some 651 direct, indirect and induced person-years of employment will be created. (SMS Research, 2008).

Earnings

Positive workforce earnings associated with the project's construction will amount to $59.6 million in direct earnings and $40.1 million indirect and induced earnings (as shown in **Table 7-6**). The total positive impact on direct, indirect, and induced earnings associated with all construction will be about $99.8 million. (SMS Research, 2008).

As with employment, this project will also have negative impacts on earnings. As shown in **Table 7-7**, a total negative impact on earnings of approximately $36.5 million can be expected. (SMS Research, 2008).

On balance, the proposed project will result in an overall positive impact on earnings. In total, approximately $63.3 million in earnings will be generated per **Table 7-8**. (SMS Research, 2008).

These earnings will boost the local economy, as many of the dollars will be used to purchase goods and services from other industries. **Figure 7-2, Consumer Spending Patterns by Industry, 2003 - 2004**, shows Honolulu consumer spending patterns to illustrate how earnings may be used. (SMS Research, 2008).

Housing costs such as shelter and utilities account for more than 33 percent of consumer expenditures. Food and transportation also account for a large amount of consumer spending (14 and 18 percent). It can be expected these patterns will continue in the future creating economic growth in several industries. (SMS Research, 2008).

Fiscal Impacts

State of Hawaii

Construction spending has an impact on state tax revenues. **Table 7-9**, displays the estimated positive impact as a result of the WGSL Expansion. The expansion cost is estimated at $86 million and the planned construction would result in $3.2 million in direct state tax revenues. The indirect and induced impact of this project will result in $6.2 million in state tax revenues. In total, the project would result in an estimated positive impact of $10.4 million in state tax revenues. (SMS Research, 2008).

Note: Totals do not add due to rounding.

As shown in **Tables 7-10** and **7-11**, the total impact on state tax revenues will be positive. Approximately $6.6 million in state tax revenue will be lost as a result of this project. In total, there will be a small positive impact in state tax revenues of approximately $3.8 million during the 10 years of construction. (SMS Research, 2008).

In sum, the economic impacts of the expansion appear to be a net positive with approximately $63.3 million net flowing directly and indirectly through the economy and $3.8 million of net tax revenues being raised. All of the income is a result of a 10-year construction period. WMH does not believe the expansion will result in the need for new hiring or other increased operating costs. (SMS Research, 2008).

This socioeconomic analysis did not take into account any indirect or induced economic effects of the landfill operation on surrounding businesses. There was insufficient, verifiable information available at the time of the compilation of the report. As noted, the residential sales program at Ko Olina has been successful. If it could have been more successful without the landfill is speculative. (SMS Research, 2008).

7.1.5. Addendum to Socioeconomic Impacts

In September 2008, SMS Research completed its, Addendum to the Socioeconomic Impact Assessment, for the WGSL. The purpose of the addendum was to further investigate the potential for impacts to property values based on proximity of the WGSL to residential property. The study focused on the proposition that the closer a residential property is to the site of the landfill, the lower will be the sales price of that unit, other factors held constant.

The study data and findings are provided in the following and in **Appendix J**:

"For this study, we adopted the often used hedonic pricing model. The model considers a single family home to be a collection of attributes including physical characteristics (size, number of bedrooms and bathrooms, age, etc.) and location (neighborhood, distance from the landfill, etc.). The sales price of the unit is considered to be a function of all of these attributes. Multiple linear regression or some other appropriate analytical method is used to estimate the impact of each attribute net of the impacts of the other attributes. The impact of distance from the landfill, therefore, can be estimated independent of the other housing unit characteristics.

The data used for the study were a set of 173 property records taken from Multiple Listing Services for properties listed between August 1, 2007 and July 10, 2008. The properties were located in West O‘ahu between ‘Ewa and Mā‘ili and within six miles of the landfill site. Data extracted for each property included physical attributes (unit type [single or multi-family], number of bedrooms, number of bathrooms, size in square feet, age in years, and date sold), and location (neighborhood name, distance from the Waimānalo Gulch Landfill site in miles). These data were analyzed using multiple linear regression with sales price as the dependent variable. Results for all communities are shown in Table 1.

Results show that four of the eight property attributes had statistically significant relationships with property value (price). Based on the unstandardized regression coefficient, the most highly related attribute was size in square feet. It was positively related to price. The age of the unit was negatively related to price. That is, as the age of the unit increased, the price decreased. The number of bedrooms was also negatively related to price, suggesting that the greater the number of bedrooms, the lower the price. And finally, the distance from the Waimānalo Gulch Landfill was negatively related to unit price. That is, the greater the distance from the landfill, the lower the price.

This analysis shows no empirical support for the proposition that the landfill results in lower residential property values for the Waimānalo Gulch Sanitary Landfill. Specifically, that distance from the landfill would be associated with lower property values.

Table 1: Regression Results for All Properties, 2008
(Addendum to Socioeconomic Impact Assessment, SMS Research)

Property Attributes	Coefficients		Significance Test Results		
	Unstandardized Coefficient B	Standardized Coefficient Beta	t-value	Sig.	Std. Error
unit size in square feet	435.17	0.755	9.78	0.000	44.50
distance from landfill in miles	-27,602.06	-0.287	-6.06	0.000	4,552.41

(Constant)	-5,754,621.47		-0.47	0.636	

Dependent Variable: Price

---

[9] Dates were stored as the number of seconds since October 14, 1582, the start of the Gregorian calendar. The unstandardized regression coefficient will therefore be very small, but can be statistically significant if real differences exist in the model.

Studies that report a negative relationship between sanitary landfills and residential property values are not unusual in the literature. Negative or statistically insignificant results have been reported by Bleich, Findlay and Philips (1991); Cartee (1989); Reichert, Small, and Mohanty (1992); Thayer, Albers and Rahamatian (1992), Zeiss and Atwater (1989). Furthermore, many reviewers have cautioned that disamenities such as landfills do not necessarily cause nearby residential property values to decrease. They note that several issues have been confounded in the discussion in the recent past. Sanitary landfills generally have much less impact on property values than hazardous materials landfills. Very large landfills have some impact on property values while smaller ones have none or even increase values (Lim and Missios, 2007). Overall, the characteristics of the residential unit (size, configuration, amenities) generally have a greater impact on market prices than distance from a landfill (Chan et. al., 1993; Kung et. al., 1993). In this particular case, two factors are probably more important. First, the sample size for the study is small and the number of variables may be too large for reliable estimates. The adjusted R-squared value for this analysis was .728, suggesting that the model with eight property attributes explained about 73 percent of the variance in the prices measured. That is considered a reasonable level of reliability. Nevertheless, 27 percent of the variance was unexplained.

Second, the results were consistent with known property values in West Oʻahu. Koʻolina Resort properties are essentially "across the street" from the landfill site. Koʻolina properties are among the highest in West Oʻahu. As you move away from the site, you encounter communities with increasingly lower property values. We have not discovered a way to analyze this difference because the price of an individual residential property and the average property value in a community are based on the same variable – unit price. This suggests that the hedonic model may present problems when dealing with the impact of disamenities on residential property values.

In order to add some clarity to the situation, we developed a model for properties located in Koʻolina alone. It was necessary to drop the "unit type" attribute because all Koʻolina properties in our dataset were multi-family units. The results of this analysis are shown in Table 2.

Table 2: Regression Results for Koʻolina Properties, 2008
(Addendum to Socioeconomic Impact Assessment, SMS Research)

Property Attributes	Coefficients		Significance Test Results		
	Unstandardized Coefficient B	Standardized Coefficient Beta	t-value	Sig.	Std. Error
distance from landfill in miles	267,480.96	0.663	4.32	0.000	61,962.28
age of unit	-5,300.70	-0.116	-1.23	0.227	4,306.57
unit size in square feet	134.12	0.216	1.09	0.281	122.49
date sold	0.00	0.091	1.00	0.323	0.00
number bathrooms	61,273.99	0.142	0.97	0.338	63,107.20
number bedrooms	39,571.27	0.120	0.90	0.374	43,906.19
(Constant)	-24,096,747.51		-1.00	0.325	

Dependent Variable: Price

> Only one property attribute, distance from the landfill, had a statistically significant relationship with price. And that relationship was positive. That is, within the Ko‘olina Resort, the farther from the landfill a property is sited, the higher the unit price.
>
> The adjusted R-square coefficient was .629, somewhat less reliable than the prior analysis. The sample size was 41 property records, much smaller than we would have preferred for reliable estimates. This is particularly problematic because the price of Ko‘olina properties has 3.5 times the variance of other properties and is strongly skewed to the higher end of the market. Equally important, the other property attributes in our Ko‘olina dataset had only half the variance of the same attributes for other communities. Ko‘olina properties were 2- and 3-bedrooms only; others were 1 to 4 bedrooms. Ko‘olina unit sizes ranged from 653 to 1,834 square feet; other communities ranged from 407 to 1,766. The age of units varied from 2 to 14 in Ko‘olina and from 2 to 35 in other areas. Regression models analyze covariance, the extent to which the dependent variable co-varies along with independent variables. The limited variance associated with property attributes other than price will make it difficult to identify statistically significant relationships with those attributes.
>
> There is another issue with applying the hedonic model and regression analysis to the Ko‘olina dataset. In this procedure, the correlations or covariances among the individual property attributes are analyzed to produce unidirectional relationships. The finding that distance from the landfill is related to property value (price) can be interpreted to mean that the distances exist first (in time) and result in the observed price level differences. But the landfill predates the resort development. Therefore we cannot easily eliminate the possibility that the price came before distance from the landfill. That might occur, for instance, if a developer were to locate less valuable units nearer the landfill and more valuable units at greater distances. Regression results for our second model could be produced by either process.
>
> This analysis presents different results from the previous analysis. Once again, mixed results are not uncommon in the literature. Reichert, Small and Mohanty (1992) found all three possibilities – positive, negative and not significant -- within their landfill evaluations. Michaels and Smith found drastically different results for individual communities. Thayer, Albers and Rahamatian (1992) found that even when analysis shows a negative relationship with property value, the function may not be smooth. That is, the loss in value may not be the same for all neighborhoods." (SMS Research, 2008).

Summary of Findings

According to SMS Research, given the caveats described in the report, the results for the two analyses reported are clear: for properties located within six miles of the WGSL, there was no evidence that the landfill is associated with decreasing property values. As distance from the landfill deceases, however, property values tended to increase. Within the area of the Ko Olina Resort, distance from the landfill was associated with increasing property values. (SMS Research, 2008).

The authors of the report added that the interpretation of the results are subject to the limitations of the data and the use of the hedonic model. "Sample sizes for both analyses were small, and the Ko‘olina model is based on only 41 cases. The available data may exclude important variables used by property buyers in making their final decisions. And finally, there may be issues with applying the same hedonic model to both sets of property records." (SMS Research, 2008).

~~7.1.5. Socioeconomic Mitigation Measures~~

7.1.6. Socioeconomic Mitigation Measures

Mitigation measures are normally considered in anticipation of potential impacts. In the case of the WGSL, where there is history, as well as existing practices, one can observe the current impacts, and propose measures that are in addition to current practices of WMH and the City.

There are three types of mitigative measures that are proposed: (1) measures that are an improvement of current practices regarding nuisances and safety; (2) measures that improve on existing community involvement and communication; and (3) measures that commit to funding the necessary research and development into alternative solutions to the continued use of landfilling.

~~7.1.5.1. Improving Current Practices~~

7.1.6.1. Improving Current Practices

SMS Research provided the following recommendations for socioeconomic mitigation measures. These measures are indented and are followed by further discussion and mitigation that is proposed by WMH and ENV.

Views

> WMH should continue to implement the on-site landscaping plans that have already been developed; especially for those areas facing south toward Ko-Olina; and
>
> WMH should design and implement landscape screens (e.g., pines, tall hedges) along the berm and the access road that is visible from Farrington Highway, fronting the Kahe Power Plant. As an alternative, WMH might consider entering

> into a partnership with HECO to plant an effective screen of trees along Farrington Highway which would have the dual purpose of screening the landfill operations and the power plant from passing vehicles (SMS Research, 2008).

Because of its elevation, the most obvious views of the landfill are from a distance. Berms obscure much of the operations but the face of the berms are exposed dirt that is visible from within the Ko Olina view corridor and from Waiʻanae views toward the landfill above the HECO power generating station. Hydromulching has been applied to some of the exposed berms but the grass seedlings have not yet become well established. This has resulted in some portions of the landfill and landfilling operations to be readily visible.

Landscaping plans have been prepared to vegetate and screen exposed areas and views of landfill operations. Initial planting to provide screening has been started and will be augmented with new plantings or plantings of other plant types based on the results.

The west-facing stability berm along the upper access road shields views from some of the operations, but not all of it. Selected plantings, consistent with the area vegetation, such as keawe or haole koa, will be investigated for use as visual buffer.

Discussion with HECO will be undertaken to consider the use of trees or other tall vegetative cover along the HECO property boundary with the Farrington Highway to serve the needs of both the Kahe Power Generating Station and the WGSL.

Odor

> WMH and the City should continue to be vigilant in processing the sludge from the sewage treatment plants upon delivery and in taking all means to reduce any odor impacts (SMS Research, 2008).

In recent months, the combined impact of immediate processing, diversion of some of the sludge for processing at the Synagro-WTT facility, and the improved performance of the odor neutralizing mist system appears to have had a significant positive impact.

However, continued vigilance is required. While the current performance of the facility has been encouraging, WMH will pay continued attention to the performance of the Synagro system. A rapid response to any temporary resumption of disposal of untreated sewage sludge will be addressed with:

1. Immediate disposal practices that have previously been developed to remove of the source of the odor from the prevailing wind;
2. the landfill odor control misting system will be operated, if required, to reduce the potential impact of odors migrating off-site, in particular, towards Ko Olina, the adjoining residences along Nānākuli, beach parks such as at Kahe Point, and the beaches; and
3. Refuse trucks that are off loaded will be evaluated for the application of odor reducing solvent prior to allowing them to leave the site.

Litter

WMH must continue to monitor the egress and ingress of vehicles and continue to aggressively enforce the anti-littering regulations and fines; and

ENV and WMH should maintain a direct communication link with the HPD; in the case of littering, it will lead to faster, more effective response (SMS Research, 2008). Additionally, this communication linkage should expand to the community most affected by the potential loss of refuse from vehicles traveling along public thoroughfares.

WMH institutes inspection practices that monitor commercial trucks upon entering and leaving the landfill area to ensure that their loads are secured upon entry and that the trucks are free from debris before exiting. WMH policy prohibits repeat violators from entry to the landfill. These inspections are beneficial and will continue.

A potentially significant problem is from citizens and others who deliver trash, and who are not adequately securing their loads. This results in the generation of windblown litter. Further effort involving public education by ENV and WMH will be implemented to supplement the inspections. The public education would be supported through the possible use of the WMH newsletter for distribution to the community.

A good communication link between HPD and WMH/ENV will increase the shared understanding of the problem and the ability to respond in a timelier manner. However, prior effort involving discussions with HPD were limited by the need for the police to provide community services significantly greater than the enforcement of littering along the public thoroughfare. At the same time, once refuse vehicles leave the WGSL property, both WMH and ENV have no further legal control over the activities of the operator or the vehicle. For this reason an important part of improving the problem of commercial or personal vehicles littering the roadway must include the community.

Addressing this concern will therefore involve the following:

1. WMH and ENV will seek the participation of the HPD as a participant in the WGSL Oversight Advisory Committee. This will involve coordinating how litter complaints are addressed, who should receive the complaint, important information that should be recorded at the time of the complaint, and follow-up actions, if any, that would provide closure to an incident particularly if it is serious.
2. WMH and ENV will notify the community through the WMH newsletter and the ENV website, opala.org, of the steps that the public can take to help with reporting highway littering. The community will be advised concerning procedures, who to call, what to record, and subsequent actions that can be taken by all parties (including WMH and ENV).

While the community is asked to help with this problem, WMH and ENV will continue to provide litter pick up that migrates off-site from the area of the WGSL, either as a result of landfill operations or from vehicles that are not properly secured.

~~7.1.5.2. Improving Community Involvement and Communications~~

7.1.6.2. Improving Community Involvement and Communications

Community Involvement

The City must effectively use the Oversight Advisory Committee;

The City should continue to contribute to a community benefits package for as long as the landfill exists; and

The representation on the Committee that determines the benefits package should include all directly affected communities (SMS Research, 2008).

The Oversight Advisory Committee allows for building relationships that are important in addressing community concerns. However, this requires time and the commitment of the Committee participants. Providing website information and telephone numbers help with the effort but does not replace the need for regular face-to-face meetings to build community bonds. In 2007, the Oversight Advisory Committee went through a period of difficulty establishing a quorum for its meetings. A first step toward stimulating attendance and participation will be to focus on highway and off-site littering as described above. Other measures that will be developed will include, but are not limited to:

1. Maintain and expand outreach, education, and coordination of landfill operations through regular briefings before the Makakilo-Kapolei-Honokai Hale Neighborhood Board No. 34 and Waianae Neighborhood Board No. 24. Representatives from ENV and DPP currently provide information and receive comments from both boards on the activities of WGSL. The regular presentation of information by WMH should be added to establish a closer working relationship with the neighborhood boards in both the Kapolei and Nānākuli/Wai‘anae communities to convey that the implementation of mitigation measures will require their input.
2. WMH will continue to extend and to expand the opportunity for all members of the community to visit and inspect the operation of the landfill. The City Administration, ENV, and WMH has stated their commitment to

operating a well run facility with minimal impact to the surrounding community. Maintaining the opportunity for the public to visit the site will promote an understanding of landfill operational practices while allowing for improved communication and the establishment of linkages between the parties. Potential nuisance issues associated with operation of the facility can be identified early so that adjustments or modifications to operational practices can be discussed, considered, and implemented as soon as possible, e.g., increasing the frequency of water sprinkling to control dust during dry or high wind conditions. Other measures would be implemented as required.

3. WMH will continue its outreach efforts with the (1) Ko Olina Community Association (KOCA) and the various homeowner/owner associations within Ko Olina; and (2) adjoining homeowners and residents in the surrounding area including Nānākuli and the planned Makaiwa Hills project. The outreach would provide information to the community on operational practices at the WGSL and the schedule for anticipated events, such as the temporary shutdown of H-POWER for scheduled maintenance. This would allow for further coordination and cooperation to minimize the potential for landfill related nuisance impacts that include odor, litter and dust, and site aesthetics.

The proposal for a community benefits package was initiated by the current administration in an effort to address community based concerns related to presence of the landfill within the Waimānalo Gulch and its proximate location along Coastal Wai‘anae. The value of the community benefits have been identified as $2.7 million in 2007 and ~~will be~~ $2.0 million in 2008. The specific benefits that will be distributed in the future have not yet been determined. In order to accomplish this, the City will review and establish the priorities for the content of the benefits package based on use of open community forums, surveys, and maintaining a suggestion link on the website opala.org. While this effort is ongoing the City anticipates that with the experience gained from its current work that future modifications will be implemented to improve the system.

There is a perception that the Committee that determines the benefits package does not include representation from all neighboring communities. The effort to identify the specific benefits that will be distributed and the parties that will be responsible for representing the communities involved remain on-going. Future information, including the names of participants involved will be provided by the City by website on opala.org or other agency website as appropriate.

Website

> WM/ENV should use its web-sites aggressively as educational and communication tools (SMS Research, 2008).

Uncertainty is often the cause of increasing community concern; communication is usually the most effective remedy. According to SMS Research, many of the people interviewed were unfamiliar with the location of the WGSL on the Waste Management website and did not know that there was an avenue for electronic communication. Slight improvement to what is basically a good website and greater education as to its availability of information will help to maximize its use as a communication tool (SMS Research, 2008).

The appropriate party for the addition of publicly accessible information is the ENV website, opala.org. This site undergoes regular updating of information and is regularly maintained by ENV staff. This site will be used for the dissemination of future information regarding the availability of site tours to WGSL (currently offered), the status of new technology (including recycling proposals) undergoing evaluation by ENV, and other matters involving the operation of the City's refuse management system.

~~7.1.5.3. Improving the Commitment to Alternative Solutions to Landfilling~~

7.1.6.3. Improving the Commitment to Alternative Solutions to Landfilling

Alternatives to Landfills

> The City should continue to invest in Research and Development, and where feasible, implement alternative technologies that will result in a reduction in the City’s dependency on a landfill (SMS Research, 2008).

The City has remained actively involved in the investigation of feasible alternatives to landfilling and considers that a mix of different refuse management strategies will be required to reduce long-term dependency on landfilling. Some of the methods with potential for addressing O‘ahu's short term needs include waste to energy, recycling, and even transshipment. While none of these current alternatives can completely remove the need for a landfill the City remains committed to research and utilization of new methods as they prove feasible for City & County of Honolulu taxpayers and the environment.

A brief summary of prior efforts by the City to promote alternative technology and waste reduction strategies include:

1/12/98	Restriction of allowable cardboard and greenwaste in refuse for disposal to no more than 10 percent of volume. These items should be recycled.
2/9/98	Restriction on construction and demolition debris was accepted at landfill to no more than 10 percent of volume. C&D waste should be disposed of at the PVT Landfill.
5/7/02	Request for Proposals for an In-vessel bioconversion facility to convert wastewater sludge from Sand Island Wastewater Treatment Plant to a beneficial reuse product. Constructed and now operational.
1/13/03	Ban on green waste and white goods. These items should be recycled.
12/14/04	Municipal Solid Waste Recycling Facility. Project subsequently cancelled.
10/1/06	Ban on construction and demolition debris waste from landfilling. C&D waste should be disposed of at the PVT Landfill.
1/16/07	Request for Proposals to Construct and Operate an Alternative Energy Facility and/or H-POWER Facility. Currently under review.
1/22/08	Request for Proposals for the Interim Shipping of City-provided Municipal Solid Waste (MSW) to a Mainland Landfill. Bid submittal to City, May 14, 2008 (extended to May 28, 2008).

Alternative Locations

> The City should continue to seek an alternative site to WGSL as the primary landfill location on Oʻahu (SMS Research, 2008).

WGSL was once located in a part of Oʻahu with limited development and at the periphery of urban growth. Approximately 20 years later, WGSL is now located in the fastest growing region of Oʻahu and within a divergent mix of land uses that include resort, residential, and major urban uses such as the James Campbell Industrial Park and the HECO Kahe Power Generating Station.

Prior to the eventual closure of the proposed project the City will initiate the search for Oʻahu's next landfill site. In as much as this timeframe is envisioned to take place when the lateral expansion of the WGSL reaches its capacity in approximately 15 years, participation in this effort should be initiated within the next 10 years and include not only the potentially affected community in which the site is proposed, but all the communities of Oʻahu who would share in the use of the facility. Although it is not possible to assign the subjects or topics for this future effort, a list for future consideration should include: the relationship of the landfill to the refuse disposal needs of Oʻahu; the safety and design of the proposed landfill facility in relation to environmental and social issues; and appropriate mitigation measures to address environmental and nuisance concerns including odor, windblown litter, and visual aesthetics. Any community provided solutions that are proposed should be documented and made a part of the project record.

7.1.6.4. Summary of Potential Impacts and Mitigation Measures

The potential for primary, secondary, and/or cumulative impacts to the socioeconomic resources of the area and region are possible without implementation of the mitigative measures as provided in this EIS, and the operational and management practices employed by WMH for the proposed project. Potential impacts involve possible financial losses to area businesses, and resort and residential sales from landfill associated nuisances and environmental impacts as outlined in Section 7.1.3. Community Issues and Concerns, and Section 7.1.4. Socioeconomic Impacts.

If directly attributed to the landfill: (1) the immediate secondary potential impact could involve the loss of income, employment, sales, and tax revenues from the lowering of economic demand for the area; and (2) the cumulative potential impact could involve the long term loss of the capacity of the region to attract future business, residential, and other related economic growth.

The mitigative measures as provided in this EIS to address the socioeconomic resources of the area and region have been proposed to mitigate or reduce the potential for primary impacts that could lead to the potential secondary or cumulative impacts described above. These mitigation measures are provided in this and in other sections of the EIS to maintain the environmental quality of the area and region.

7.2 Land Use and Ownership

7.2.1. Regional Land Uses

The region of ‘Ewa surrounding the WGSL is composed of a mix of multiple land uses including residential, resort, recreational, business, commercial, and industrial uses. These uses include, but are not limited to, the following (**Figure 7-3, Regional Land Uses in Ewa**):

- Hawaiian Electric Kahe Power Generating Station - This is the largest power plant on O‘ahu producing approximately 651 megawatts of electricity for residential, commercial, business, government, military and industrial uses. The power plant is located west of the WGSL.
- Kahe Point Beach Park - This is public beach park situated less than half a mile south from the landfill. The park is located makai and oceanside of the Kahe Power Generating Station and the WGSL.
- Paradise Cove - This is a private recreational facility providing luaus and entertainment on approximately 12 acres about half a mile southwest of WGSL. It is located on the shoreline adjacent to the Ko Olina Resort and serves guests of the resort, tourists with other accommodations on O‘ahu and the neighbor islands, and the residents of O‘ahu.

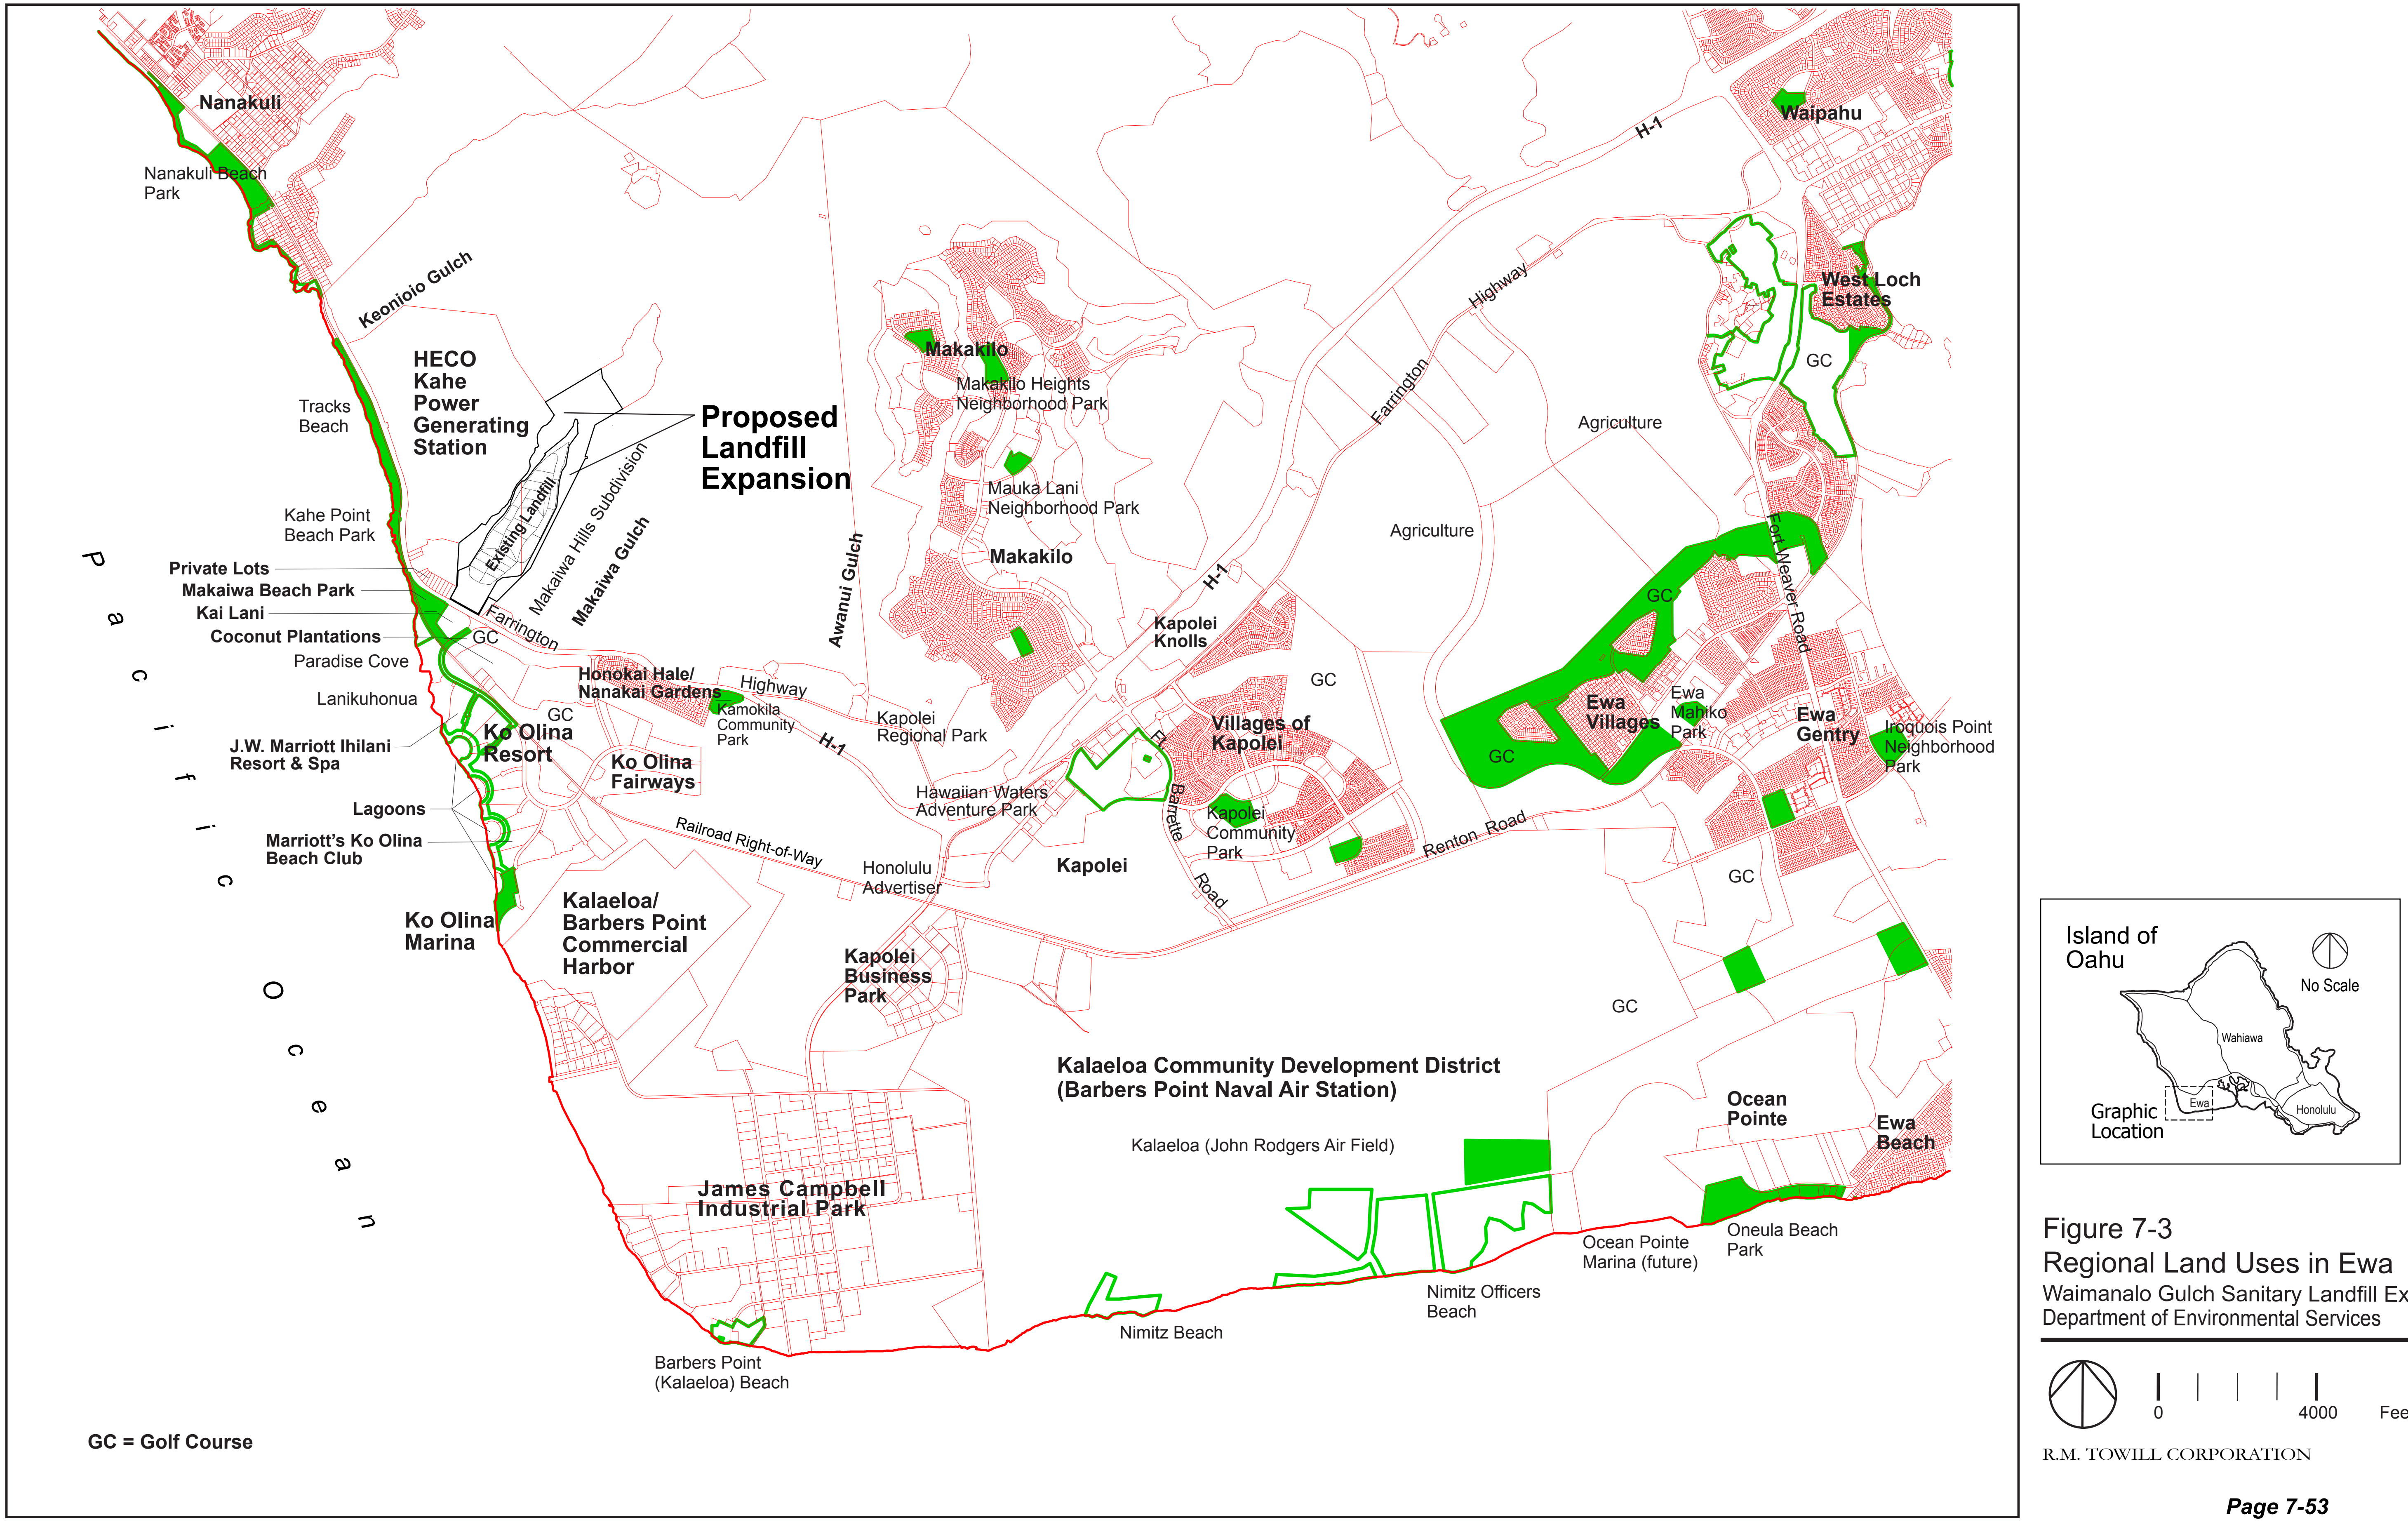

Figure 7-3

Regional Land Uses in Ewa

Waimanalo Gulch Sanitary Landfill Expansion

Department of Environmental Services

R.M. TOWILL CORPORATION

Mary 2008

- Lanikūhonua - Private property owned by the Estate of James Campbell. The site is used for recreational, cultural, and related purposes.
- Hawaiian Waters Adventure Park - This is a 25 acre water theme park located approximately 3 miles east of the WGSL. The park has served Leeward area and O‘ahu residents since May 1999.
- Ko Olina Resort - This 640 acre property is located makai of Farrington Highway and the WGSL. The Ko Olina coastline is comprised of sandy and rocky beachfront with a series of man-made lagoons along the shoreline. The site contains various resort, residential, and commercial facilities that include:
  - J. W. Marriott Ihilani Resort and Spa, is a resort hotel providing accommodation and amenities for tourists and local residents.
  - Marriott's Ko Olina Beach Club, is a timeshare resort. According to the Marriott website the facility is expanding with new construction that is scheduled to continue until July 2009. (http://www.vacationclub.com/resorts/ko/default.jsp).
  - Residential properties include: Ko Olina Kai Golf Estates and Villas, Kai Lani at Ko Olina, The Coconut Plantation, Ko Olina Fairways, Ko Olina Beach Villas, and the Ko Olina Hillside Villas.
  - Ko Olina Marina, opened in 2000, is a privately owned marina and situated on approximately 43 acres with 330 slips, maritime related facilities, and utilities.
  - Other properties and facilities associated with the Ko Olina Resort may be present at the site and it is expected that continuing resort and residential development will be planned in the future.
- Makaiwa Hills - This is a residential subdivision proposed for future development on land that is adjacent to and east of the WGSL. According to the Makaiwa Hills website, the project is a, "1,915 acre ocean view Hillside Planned Community over-looking Diamond Head with 1,875 homes, elementary school, a regional commercial center, parks, an 18-hole championship golf course, and extensive ridge and valley open spaces." (http://www.menne.com/maka.htm, Bryan Menne & Associates, website accessed 2/5/2008).
- James Campbell Industrial Park - This is a 1,267 acre commercial and industrial park with a number of businesses that include, but are not limited to, two oil refineries, a cement processing plant, 3 power

generating facilities, an aluminum fabricating company, moving and storage firms, and various other businesses. The facility was first constructed in 1958 and is located approximately 2.5 miles southeast of the landfill. The industrial park is home to H-POWER, the City's waste to energy recycling facility.

- Kalaeloa/Barbers Point Harbor - This is a commercial harbor that has become the second busiest harbor on O‘ahu. The harbor comprises 241 acres and includes facilities for container storage, ship repair, and related maritime activities. The site is located approximately 3.5 miles south of the landfill.
- Honokai Hale and Nanakai Gardens - These subdivisions are adjoining residential developments that are located less than approximately one mile southeast from the landfill.
- Makakilo - This is a residential development that was constructed prior to 1962 by Finance Realty. The subdivision is located approximately 2 to 3 miles east of the landfill. New subdivision development is presently on-going and future plans call for the construction of a Makakilo Drive bypass to relive traffic congestion.
- Villages of Kapolei - This subdivision includes a number of phased residential developments that were first constructed around 1990. The subdivision contains approximately 4,700 units on 698 acres of land. The site is located approximately 4 miles east of the landfill.
- West Loch Estates - This is a residential development initiated by the City & County of Honolulu. The site is located on the West Loch peninsula of Pearl Harbor.
- ‘Ewa Villages - This residential subdivision incorporates both new and renovated housing units that once served as sugar plantation housing for workers.
- ‘Ewa Gentry - This is a residential subdivision on land that was once under active sugar cultivation.
- Ocean Pointe - This residential development is situated on 1,100 acres of land along the ‘Ewa coastline.
- Kapolei Knolls - This is a residential subdivision located in the Kapolei area of ‘Ewa.
- Barbers Point Naval Air Station (BPNAS) - This is a closed Department of Defense facility now known as the Kalaeloa Community Development

District (July 1999). The 2,150 acre site is located 3 miles southeast of the landfill. In March 2006, the Hawaiʻi Community Development Authority (HCDA) published the Kalaeloa Master Plan to serve as a planning and policy guide and to coordinate the multiple entities with jurisdiction or interest in future land uses.

Other land uses including businesses, parks, schools, and other facilities also operate in the region.

7.2.2. Properties Within Proximity to the Proposed Project

Properties adjoining WGSL include the following (see **Figure 7-4, Properties in Proximity to WGSL**):

Table 7-12
Selected Properties Adjacent to the Southwest Corner of WGSL

No.	Tax Map Key	Ownership[10]
1.	(1) 9-2-003: 030 (1.0 acres)	Haili Rachel K
2.	(1) 9-2-003: 031 (0.8 acres)	Villanueva Sergio M
3.	(1) 9-2-003: 032 (0.8 acres)	Rapoza Moses & Iris T
4.	(1) 9-2-003: 033 (0.8 acres)	Lindahl-Giron Sherri M
5.	(1) 9-2-003: 034 (0.8 acres)	Kahe Homes
6.	(1) 9-2-003: 035 (0.8 acres)	Kahe Homes
7.	(1) 9-2-003: 036 (0.8 acres)	Kahe Homes
8.	(1) 9-2-003: 037 (0.7 acres)	Kehe [sic] Homes LLC
9.	(1) 9-2-003: 038 (0.6 acres)	Kahe Homes LLC & II LLC
10.	(1) 9-2-003: 039 (0.7 acres)	Richardson Florence C
11.	(1) 9-2-003: 047 (0.9 acres)	Nakatani Irene T & Robert I
12.	(1) 9-2-003: 049 (0.8 acres)	Nakano Judith R
13.	(1) 9-2-003: 013 (21.2 acres)	Lum Betsy F S A
14.	(1) 9-2-003: 015 (4.5.0 acres)	City & County of Honolulu

May 2008

- The northernmost point of the landfill adjoins land owned by the Loh Investment Ltd. Partnership (TMK: 9-2-003: 041, 48.9 acres).
- ~~West~~ Northwest of the landfill is the Hawaiian Electric Company (HECO) Kahe Power Generating Station (TMK: (1) 9-2-041: 027, 454.4 acres). Electrical transmission lines from the power plant traverse the project site at elevations of between approximately 760 and 840 feet.
- The northwestern and east portions of the landfill are bounded by land owned by the James Campbell Trust Estate/Makaiwa Hills LLC (TMK: (1) 9-2-003: 084, 1,376.7 acres). Future plans call for the development of a residential subdivision known as Makaiwa Hills[11].
- The northwestern most boundary of the Campbell Estate Trust property, northwest of the Kahe power plant, is also the location of the Southern Cross Terminal Building, a telecommunications facility which receives and processes communications signals from submarine fiber optic cables emanating from New Zealand, Australia, Fiji, and the Continental U.S.
- South of the project site is Farrington Highway (FASP No. S-900(4)), a State DOT facility which is the main thoroughfare serving the Waiʻanae Coast and the point of entry to the WGSL.
- Along the southwest corner of the landfill, above Farrington Highway, are private parcels under various ownerships (see **Table 7-12**, and **Figure 7-5**, **Selected Properties Adjacent to the Southwest Corner of WGSL**).
- Makai of the Farrington Highway to the south and southeast is the Kahe Point Beach Park (TMK: (1) 9-2-003: 015) and Ko Olina Resort (TMK: (1) 9-2-003, 9-1-056, and 9-1-057, various parcels). Kahe Point Beach Park is a City & County of Honolulu public park.

---

[11] According to Campbell Estate by letter (2002 Annual Report, Docket No. A92-687), to the State LUC dated October 22, 2002, the developer is exploring various ways to develop the project and will provide the required notice to prospective buyers of the project in accordance with Condition No. 19, of the Docket which states: *"19. Petitioner shall notify all prospective buyers of property in the Project of the potential odor, noise, and dust pollution resulting from surrounding Agricultural District land, Hawaiian Electric Company's Kahe Power Plant, and the City and County of Honolulu's Waimānalo Gulch Sanitary Landfill."*

R.M. TOWILL CORPORATION

May 2008

> Across Farrington Highway and approximately 200 feet from the southern landfill boundary is the main entrance to the Ko Olina Resort. Southeast of this boundary is the northwest corner of the Ko Olina Golf Course and The Coconut Plantations residential development comprised of approximately 270 multifamily units on approximately 29 acres of land. The Ko Olina Kai Lani Subdivision, first constructed in the early 2000s, lies across the highway from the WGSL.

Additional existing and planned properties and developments within the Ko Olina Resort in proximity to the proposed landfill expansion area includes the Paradise Cove Luau, Lanikūhonua, J. W. Marriott Ihilani Resort and Spa, and other residential developments associated with the Ko Olina Resort property.

7.2.3. Potential Impacts and Mitigation Measures

While WGSL is designed to serve all communities on the Island of Oʻahu, the potential for impacts associated with the use and operation of the facility are expected to be at a localized or community level based on the nature of the project involving waste handling and disposal within the Waimānalo Gulch. The operation of the proposed project therefore, is expected to result in potential land use impacts similar to those associated with the current use of the site. These potential impacts include:

- The generation of nuisance odors during delivery and landfilling of refuse.
- Windblown litter from the landfill becoming airborne and litter from improperly secured loads from refuse delivery trucks and private self-haulers.
- Traffic impacts associated with the transit of vehicles entering and leaving WGSL.
- The tracking of mud and sediments onto Farrington Highway from vehicles exiting the landfill.
- The migration of fugitive dust from landfill operations including earthwork and vehicles transiting to and from the site.

- The modification or loss of mauka view planes toward the WGSL.

A number of mitigation measures as described in this document have been identified to address the potential impacts described above. These measures, however, as previously noted in the WGSL Expansion FSEIS, 2002, will continue to require ongoing coordination with surrounding community and landownership interests. These parties include, but are not limited to: Ko Olina; Hawaiian Electric Company; James Campbell Estate Trust/Makaiwa Hills LLC; the Wai‘anae and Kapolei Neighborhood Boards; and other community groups and organizations that may be adversely affected or with an interest in the proper operation of the landfill.

Effort by the City Administration to establish an Oversight Advisory Committee for Waimānalo Gulch was initiated in July 2006. The purpose of the Committee was to serve in an advisory capacity to the Administration on landfill operational activities and to provide recommendations, as needed, to mitigate the potential effects of landfill operations on the community. While the Oversight Advisory Committee is continuing to serve in this capacity, on-going efforts by ENV and WMH will be maintained and extended to coordinate the operation of WGSL with the surrounding community. The mitigation measures that will be implemented are previously described in Section 7, 7.1.5. Socioeconomic Mitigation Measures.

Land Use and Ownership Summary

The proposed project is anticipated to result in the potential for secondary and cumulative land use impacts similar to those associated with the existing use of the site. These potential impacts would be an outgrowth of those identified in this section, summarized as:

- The generation of nuisance odors.
- Windblown litter from the landfill becoming airborne and litter from improperly secured loads from refuse trucks and private self-haulers.

- Traffic impacts associated with the transit of vehicles entering and leaving WGSL.
- The tracking of mud and sediments onto Farrington Highway.
- The migration of fugitive dust from landfill operations.
- The modification or loss of mauka view planes toward the WGSL.

These direct impacts could potentially lead to secondary and cumulative impacts that would include the loss or impaired use of land and properties in the affected area. Mitigation to address these concerns is addressed in this section and in the following:

- 4.2.3. Environmental Controls, Litter, to address windblown litter.
- 4.4. Dust and Mud, to address tracking of mud and migration of fugitive dust.
- 5.7.3. Potential Impacts and Mitigation Measures (Air Quality), for odor control.
- 5.10.2. Potential Impacts and Mitigation Measures (Scenic and Aesthetic Environment), to address impacts to view planes toward the WGSL.

7.3 Historic and Archaeological Resources

7.3.1. Introduction

An Archaeological Inventory Survey (AIS) of the proposed project site was conducted by Cultural Surveys Hawai‘i (CSH) in 2007 and 2008 (**Appendix G, Archaeological Inventory Survey**). The purpose of the AIS was to document all historic properties within the 92.5 acre area of the proposed project known as the Area of Potential Effect (APE). The following scope of work was identified to meet state and City & County of Honolulu requirements for AIS documentation in accordance with Chapter 13-13-276, HAR, and included coordination with the State Historic Preservation Division (SHPD) and City to address archaeological concerns:

1. A complete ground survey of the entire project area for the purpose of site inventory was completed. All sites were located, described, and mapped with an evaluation of function, interrelationships, and significance.

Documentation included photographs and scale drawings of selected sites and complexes. All sites were assigned State Inventory of Historic Properties (SIHP) numbers.

2. Limited subsurface testing was conducted to determine if subsurface deposits were located in the project area (particularly in potential archaeological sites).
3. Research on historic and archaeological background, including search of historic maps, written records, and Land Commission Award documents. This research focused on the specific area with general background on the ahupuaʻa and district, and emphasized settlement patterns.
4. As appropriate, consultation with knowledgeable individuals regarding the project area's history, past land use, and the function and age of the historic properties documented within the project area.
5. Preparation of the inventory survey report included:
    a) A project description
    b) A section of a USGS topographic map showing the project area boundaries and the location of all recorded historic properties
    c) Historical and archaeological background sections summarizing prehistoric and historic land use of the project area and its vicinity
    d) Descriptions of all historic properties, including selected photographs, scale drawings, and discussions of age, function, laboratory results, and significance, per the requirements of HAR 13-276
    e) A section concerning cultural consultations [per the requirements of HAR 13-276-5(g) and HAR 13-275/284-8(a)(2)]
    f) A summary of historic property categories, integrity, and significance based upon the Hawaiʻi Register of Historic Places criteria
    g) A project effect recommendation
    h) Treatment recommendations to mitigate the project's adverse effect on any historic properties identified in the project area that are recommended eligible to the Hawaiʻi Register of Historic Places

7.3.2. Methodology

Field Methods

Fieldwork was accomplished over a one-week period from January 25th to February 2nd, 2007. The CSH field crew consisted of Matt Bell, B.A., Amy Hammermiester, B.A., and Kevin Dalton, B.A., under the general supervision of Hallett H. Hammatt, Ph.D. (principal investigator).

The fieldwork consisted of a 100% coverage pedestrian inspection of the study area and limited subsurface testing at select locations. The pedestrian inspection of the study area was accomplished through systematic sweeps (transects). The spacing interval between archaeologists was 5-10 meters. Cliffs and rock overhangs were inspected thoroughly for evidence of burials or cultural activity. All potential historic properties encountered were recorded and documented with a written field description, site map, photographs, and located using Global Positioning System (GPS) instruments.

Subsurface testing consisted of the partial excavation, by hand, of selected natural features located during the pedestrian survey. The purpose of the subsurface testing was to aid in determining if selected geological features (i.e. rock shelters, rock mounds, etc.) had been culturally modified or contained subsurface cultural deposits. All excavated material was sifted through a 1/8 in. wire mesh screen to separate out the soil matrix. Each test excavation was documented with a scale section profile, photographs, and sediment descriptions. Sediment descriptions included characterizations of Munsell color, compactness, texture, structure, inclusions, cultural material present, and boundary distinctness and topography.

Document Review

Background research included a review of previous archaeological studies on file at SHPD; a review of geology and cultural history documents at Hamilton Library of the University of Hawai‘i, the Hawai‘i State Archives, the Mission Houses Museum Library, the Hawai‘i Public Library, and the Archives of the Bishop Museum; study of historic photographs at the Hawaiʻi State Archives and the Archives of the Bishop Museum; and a study of historic maps at the Survey Office of the DLNR. Information on Land Court Awards (LCAs) was accessed through the Waihona ʻĀina Corporation's Māhele Data Base (www.waihona.com).

The research provided the environmental, cultural, historic, and archaeological background for the project area. The sources studied were used to formulate a predictive model regarding the expected type and location of sub-surface pre and post-contact historic properties in the project area.

Consultation

CSH worked with the Office of Hawaiian Affairs (OHA), SHPD, and knowledgeable cultural consultants pursuant to the requirements of HAR 13-276-5(g) and HAR 13-275/284-8(a)(2). This effort is dove-tailed with the cultural consultation effort currently underway for the project's cultural impact assessment, which CSH is also preparing pursuant to Chapter 343, HRS, and the Office of Environmental Quality Control's guidelines for assessing cultural impacts. **Table 7-13** summarizes the individuals and organizations/agencies that have been consulted.

7.3.3. Summary of Background Research and Predictive Model

Historical background research of Honoʻuliʻuli Ahupuaʻa indicated that pre-contact settlement would have been centered around the rich cultivated lands of Honoʻuliʻuli ʻili for extensive wetland taro cultivation and abundant coastal resources. The extensive limestone plain would also include recurrent use habitations for fishermen and gatherers, and sometimes gardeners. The upland dry forest areas would be used for hunting and gathering of forest resources, but likely not for widespread permanent settlement. In the intermediate area between the limestone plain and the upland forests indigenous Hawaiian activities would have been limited to dry land agriculture within gulches or near springs, and mauka/makai transportation routes (i.e. trails) and associated temporary shelters. (CSH, 2008).

By 1920, the lands of Hono‘uli‘uli were used primarily for commercial sugar cultivation and ranching (Frierson 1972:18). Much of the mauka lands in western Hono‘uli‘uli, including ridges and deep gulches, were unsuitable for commercial sugar and remained as pasture land for grazing livestock. Historical maps indicate a lack of any significant development within the study area into the late 1920s. (CSH, 2008).

Major land use changes came to western Hono‘uli‘uli when the U.S. Military began development in the area. Military installations were constructed both near the coast, as well as in the foothills and upland areas. A 1943 War Department map reflects the military presence and associated land use within and south of the study area during this time period. Access roads to power lines and telecommunications lines are indicated throughout the southeastern portion of study area. Also of note are the presence of access roads leading to the Battery Arizona, a subterranean WWII bunker complex identified by Hammatt and Shideler in 1999, situated on the southwest ridge above Waimānalo Gulch. (CSH, 2008).

Previous archaeological research in the vicinity of the study area has identified numerous pre-contact sites including: habitation structures (platforms and enclosures), agricultural features (walls, terraces, and mounds), and religious sites (kūʻula stone and koʻa). Within the "Makaīwa Hills" project area, which is abuts the southeastern boundary of the current study area, pre-contact habitation sites were found to be clustered in higher elevations above 1000 ft., and in lower elevations below 500 ft (Hammatt et al. 1991). (CSH, 2008).

Historic archaeological sites identified in the vicinity of the study area include the Battery Arizona military complex (WWII bunker complex), sugar cane cultivation infrastructure, and walls and fences attributed to the Campbell Ranch. (CSH, 2008).

The background research indicates that historic properties are not expected to be encountered in the study area. This is based on review of the AIS for the proposed WGSL Project Site conducted by CSH in 1999, in which no historic properties were identified within the current study area (Hammatt & Shideler 1999). However, if historic properties are encountered they are likely to include both pre-contact and historic sites. Pre-contact archaeological sites may include: dry land agricultural sites, including planting mounds and terraces in the vicinity of springs or drainage gulches; habitation sites, including enclosures and platforms; trail markers (ahu); religious sites including enclosures, terraces, platforms, and/or upright stones located on prominent hills or other significant locations; and burials located within discrete rock shelters and/or caves. Historic archaeological sites may include: ranch related structures including walls, fences, and maintained springs; and military related structures including concrete bunkers, radio towers and related infrastructure. (CSH, 2008).

7.3.4. Results of Fieldwork

Fieldwork for the archaeological investigation was accomplished over a one-week period from January 25, 2007 to February 2, 2007 under state archaeological permit No. 07-19 issued by SHPD, per HAR Chapter 13-13-282. Fieldwork involved a 100% pedestrian inspection of the study area with limited subsurface testing. (CSH, 2008).

Survey Findings

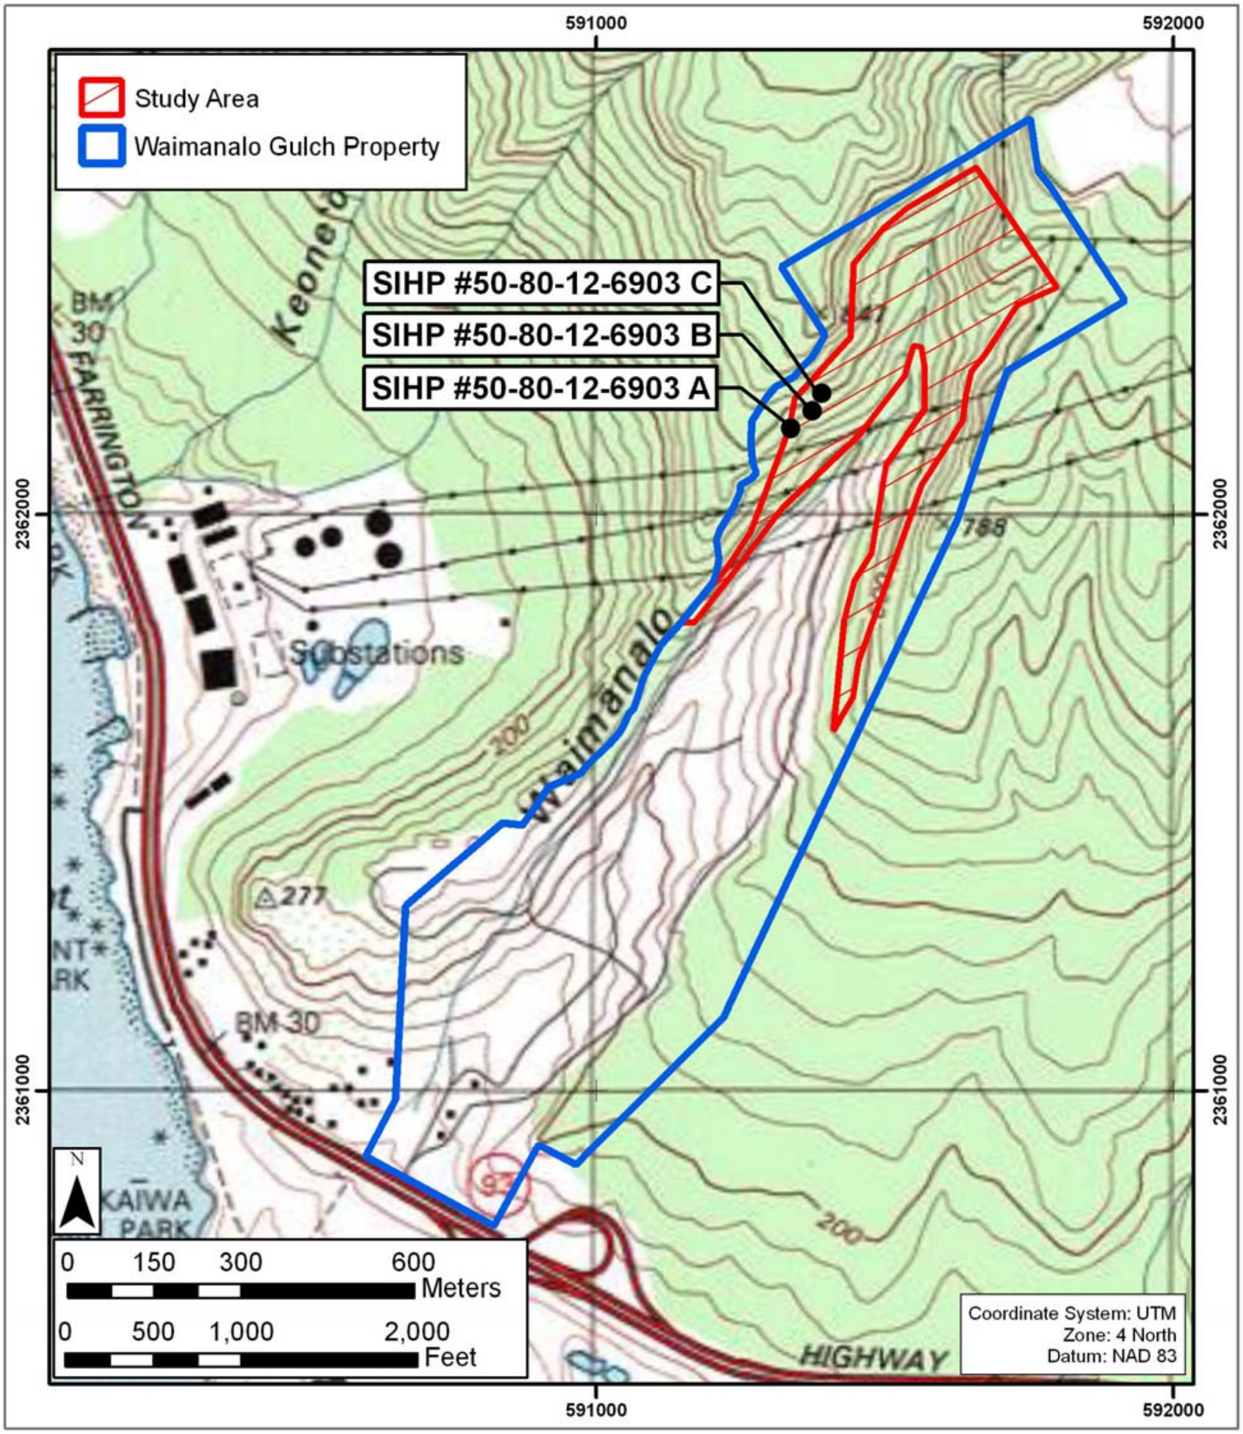
Pedestrian inspection of the study area identified one historic property, State Inventory of Historic Properties (SIHP) # 50-80-12-6903, within the study area (**Figure 7-6**). SIHP #50-80-12-6903 is of pre-contact origin, and consists of three large upright boulders potentially utilized as trail or boundary markers. A description of this historic property is presented below (see Description of Historic Property). (CSH, 2008).

Numerous natural caves and rock overhangs were observed and inspected for cultural modifications and/or the presence of human burials. Where significant sediment deposits were observed, subsurface testing in the form of controlled hand excavation was undertaken to establish if subsurface cultural deposits were present. (CSH, 2008).

The observed topography within the study area consisted of talus slopes with an average slope of 65 degrees. The observed geology consisted of exposed basalt outcrops with minimal soil deposition. (CSH, 2008).

As of February 2, 2007, activities taking place in a 6.8 acre area included: controlled dynamite blasting of gulch walls, bulldozing, construction of roads, and removal of material. This area was not included in the pedestrian inspection due to the hazardous conditions present. The exclusion of this area was not a major concern as it was previously surveyed in 1991 by Hammatt et al. and was determined to have no historic properties present. (CSH, 2008).

Figure 7-6, USGS 7.5 Minute Series Topographic Map, Ewa Quadrangle (1998), showing location of SIHP #50-80-12-6903 (Features A-C) (CSH, 2008)



Inspection of Geologic Features

Numerous natural caves and rock overhangs area were discovered and investigated in the study area. The larger caves and overhangs (greater than two meters in depth and 4 meters in width) were documented and their position mapped using GPS (**Figure 7-7)**. (CSH, 2008).

A rock alignment identified as "CSH 3", located near the northeastern edge of the study area was also discovered. The alignment was determined to be of modern origin due to its location along a talus slope, in which soil erosion and rainwater runoff channels were observed. If the feature was of antiquity it would reflect disturbances associated with erosion and/or rainwater runoff, such as the retention of eroding rock and soil or the displacement of boulders incorporated into the alignment. Subsurface testing was conducted at this alignment to confirm the initial age determination of this feature. (CSH, 2008).

Cave 1 - Located on the western slope of Waimānalo Gulch, situated at the base of a small rock outcrop (**Figure 7-8**). The mouth of the cave opens to the northeast and measures 1.5 m high. The internal dimensions of the cave are: 8.0 m wide and 4.0 m deep, with a maximum ceiling height of 1.2 m. No cultural material or human skeletal remains were observed on the surface of the cave floor.

Cave 2 - Located on the western slope of Waimānalo Gulch, situated at the base of a pronounced rock outcrop (**Figure 7-9**). The mouth of the cave opens to the east and measures 1.3 m high. The internal dimensions of the cave are: 8.0 m wide and 4.1 m deep, with a maximum ceiling height of 0.8 m. The roof of the cave has experienced some collapse and now covers approximately 70 percent of the floor. No cultural material or human skeletal remains were observed on the surface of the cave floor.

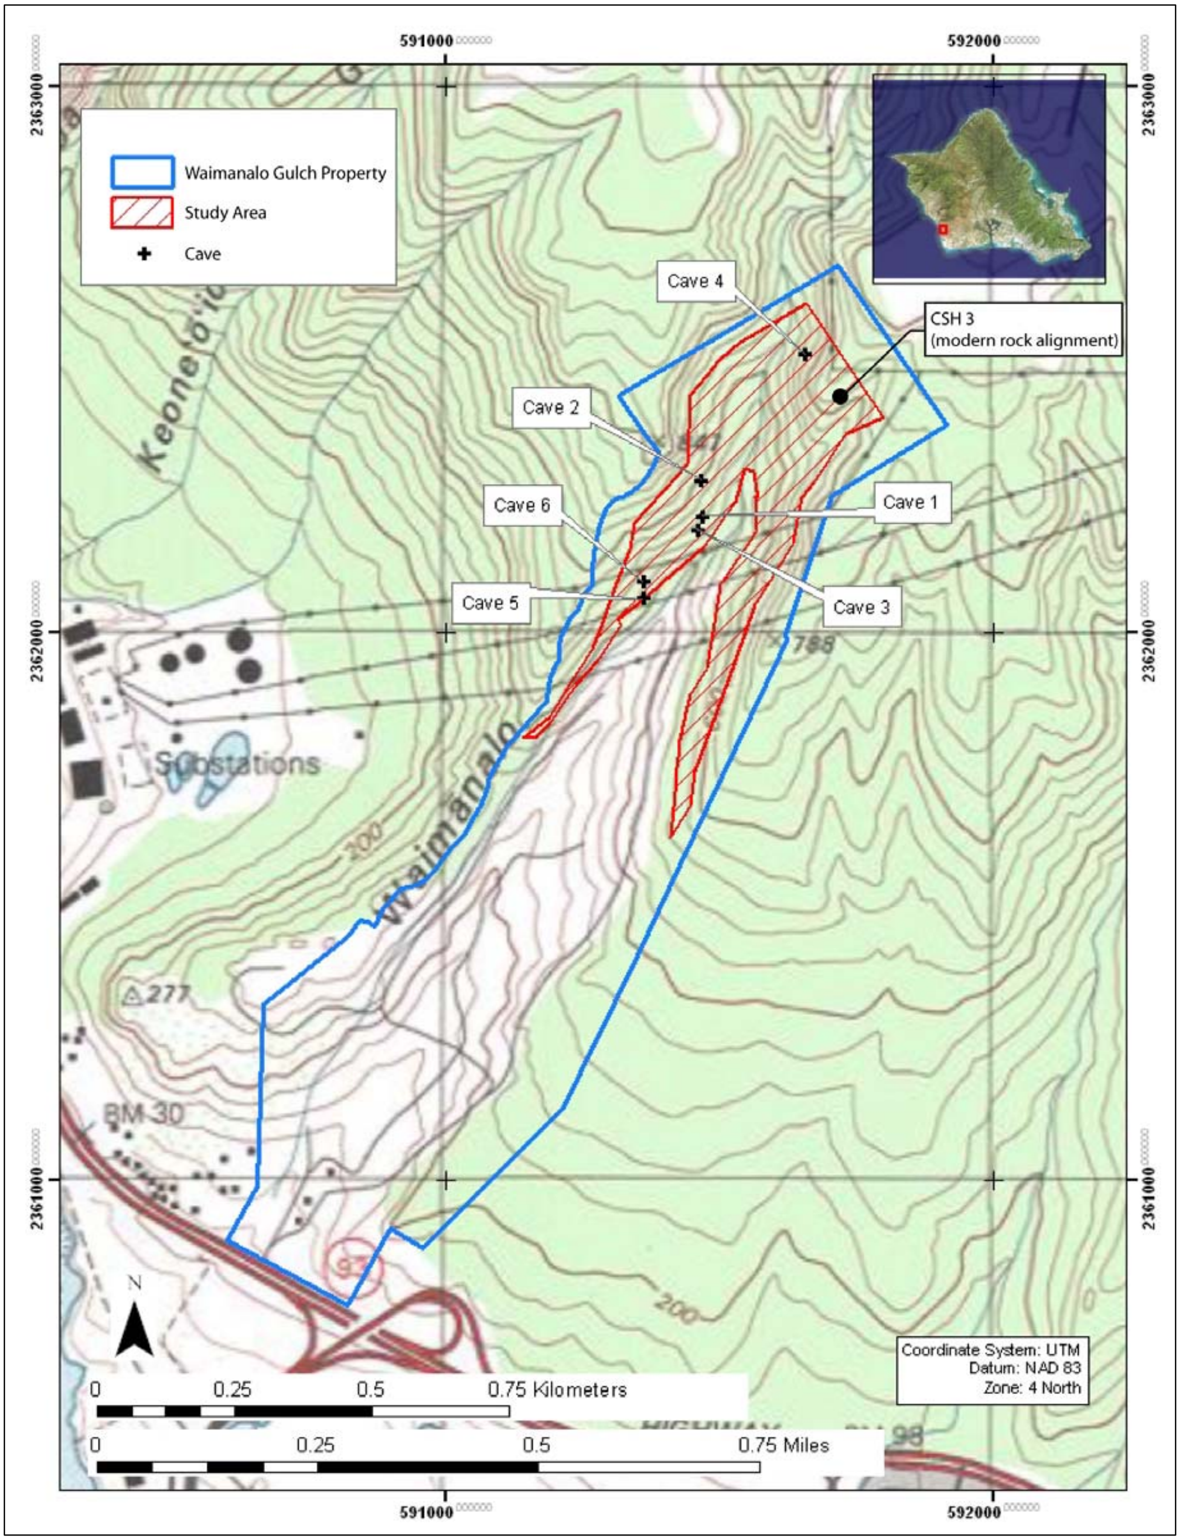

Figure 7-8, Photograph of Opening of Cave 1
View to the North (CSH, 2008)

Figure 7-9, Photograph of Opening of Cave 2
View to the Northwest (CSH, 2008)

Cave 3 - Located on the western slope of Waimānalo Gulch (**Figure 7-7**). The mouth of the cave opens to the south and measures 1.2 m high. The internal dimensions of the cave are: 4.0 m wide and 2.0 m deep, with a maximum ceiling height of 1.2 m. No cultural material or human skeletal remains were observed on the surface of the cave floor.

Cave 4 - Located on the eastern slope of Waimānalo Gulch (**Figure 7-10**). This cave consists of a rock overhang situated at the base of the large rock outcrop. The mouth of the cave opens to the west and measures 2.0 m high. The internal dimensions of the cave are: 10.0 m wide and 4.0 m deep, with a maximum ceiling height of 2.5 m. A pair of small skeleton keys was observed within the cave (**Figure 7-11**). No other cultural material or human skeletal remains were observed on the surface of the cave floor.

Cave 5 - Located on the western slope of Waimānalo Gulch, situated near the southwestern end of the study area, overlooking the modern landfill (**Figure 7-7**). The mouth of the cave opens to the south and measures 1.0 m high. The internal dimensions of the cave are: 1.4 m wide and 1.3 m deep, with a maximum ceiling height of 0.8 m. No cultural material or human skeletal remains were observed on the surface of the cave floor.

Cave 6 - Located on the western slope of Waimānalo Gulch (**Figure 7-7**). The mouth of the cave opens to the east and measures 1.2 m high. The internal dimensions of the cave are: 2.4 m wide and 1.5 m deep, with a maximum ceiling height of 0.7 m. No cultural material or human skeletal remains were observed on the surface of the cave floor.

Modern Rock Alignment - A linear rock alignment (CSH 3) was located near the northeastern edge of the study area (**Figure 7-7**). The alignment is constructed of a single course of six small boulders, situated on the eastern slope of Waimānalo Gulch (**Figure 7-12** & **Figure 7-13**). It measures 1.2 m long and 0.6

Figure 7-10, Photograph of Opening of Cave 4 View to the Northeast CSH, 2008)

View to the South (CSH, 2008)

m wide, and is aligned cross slope. The alignment was determined to be of modern origin due to its location along a talus slope, in which soil erosion and rainwater runoff channels were observed. If the feature was of antiquity it would reflect disturbances associated with erosion and/or rainwater runoff, such as the retention of eroding rock and soil or the displacement of boulders incorporated into the alignment. No cultural material was observed on the ground surface in the vicinity of this feature.

Historic Property Description

Designation and Formal Type:	SIHP # 50-80-12-6903, Rock uprights
Function:	Trail / boundary marker
No. of Features	3
Age:	Pre-contact
Dimensions:	80 m long (NE-SW) x 10 m wide (NW-SE)
Location:	Waimānalo Gulch
Tax Map Key:	(1) 9-2-003: 073
Land Jurisdiction:	City & County of Honolulu

SIHP #50-80-12-6903 consists of three large upright boulders (Features A-C) possibly utilized as trail or boundary markers, located approximately 1320 m (4330 ft) inland of the coast along the western edge of the study area (**Figure 7-6**). The site is situated approximately 140 m (459 ft) north of the existing WGSL operations. The topography of the immediate area is moderately sloping to the southwest, while the geology consists of exposed basalt bedrock outcrops with pockets of shallow soil. Koa haole and exotic grasses dominate the surrounding landscape. A description of the features indicate (CSH, 2008):

> **SIHP# 50-80-12-6903 Feature A** - Consists of a large upright basalt boulder measuring 1.20 m length, 1.12 m wide, and 2.10 m high (**Figure 7-14** and **7-15**). There appears to be no intentionally placed rocks surrounding the base of this upright. The flat face of this stone is directed south, as to mark a trail or boundary for a traveler moving up slope. The face of this feature is discolored and appears

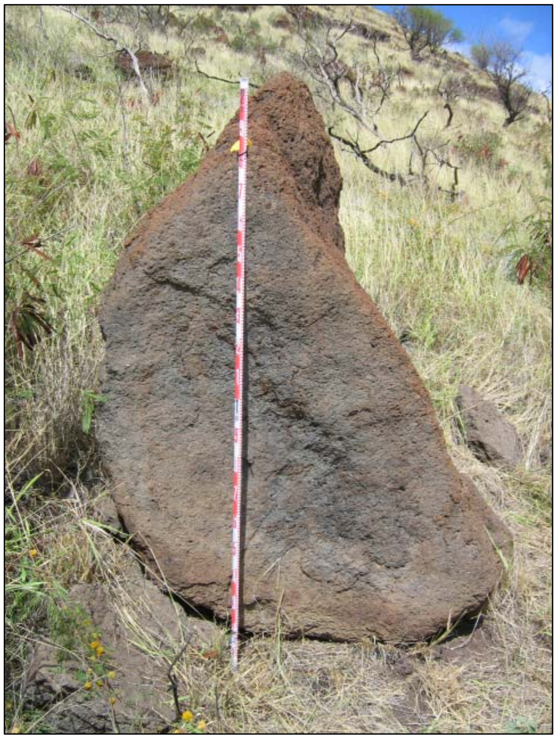

Figure 7-14, Photograph of Feature A
Upright Boulder, View to the North (CSH, 2008)

Figure 7-15, Photograph of Feature A
Upright Boulder, View to the West (CSH, 2008)

to have once rested on the ground. Feature A is interpreted as being of pre-contact origin, and its function is determined to be a trail or boundary marker. No cultural material was observed on the ground surface in the vicinity of this feature.

SIHP # 50-80-12-6903 Feature B - Consists of a large triangular upright basalt boulder measuring 1.63 m long, 0.75 m wide, and 1.78 m high (**Figure 7-16** and **7-17**). The upright appears to have one or more stones intentionally set at its western base. However, the majority of the upright's base rests upon naturally exposed bedrock. Feature B is interpreted as being of pre-contact origin, and its function is determined to be a trail or boundary marker. No cultural material was observed on the ground surface in the vicinity of this feature.

SIHP # 50-80-12-6903 Feature C - Consists of a large upright basalt boulder measuring 2.3 m long, 1.7 m wide, and 2.5 m high (**Figure 7-18** and **7-19**). This feature is believed to be in a natural upright position. Feature C is interpreted as being of pre-contact origin, and its function is determined to be a trail or boundary marker. No cultural material was observed on the ground surface in the vicinity of this feature.

7.3.5. Cultural Consultation Process

Introduction

The AIS investigation was carried out pursuant to the requirements of the Hawai‘i archaeological inventory survey regulations (HAR 13-276-5(g)) and Hawai‘i historic preservation review legislation (HAR 13-275-8(a)(2)). The cultural consultation effort focused on locating any additional cultural and/or historical land use information for the study area and focused on better establishing the age, function, cultural affiliation, and significance of the historic property identified in the study area. Mitigation measures were also developed for the significant historic property that would be affected by the proposed project. (CSH, 2008).

Process Chronology

March 13, 2007 - During an SHPD site visit to the study area, former Oʻahu Island Archaeologist, Adam Johnson toured the location of SIHP #50-80-12-6903 and vicinity. At this on-site meeting SHPD directed CSH to proceed with cultural consultation to establish the cultural significance of the three upright stones. Mr. Johnson indicated that, based on the results of the consultation, it was likely that the upright stones would be determined significant under criteria D (information content) and E (traditional cultural significance to an ethic group) of the Hawaiʻi Register of Historic Places.

March 27, 2007 - CSH conducted a cultural consultant site visit with William Ailā (Hui Malāma I Nā Kūpuna), Eric Enos (cultural practitioner and Director of Kaʻala Farms), Shad Kane (ʻAhahui Siwila Hawai'i O Kapolei Hawaiian Civic Club), and McD Philpotts (long-time resident of Waimānalo ʻIli). The age, function, cultural affiliation, and significance of the upright stones were discussed. Potential functions for the stones included trail markers, markers for observation points for celestial observation and/or navigation, or markers used to calculate the location of specific coastal and/or off-shore resources. Although there was no clear consensus on function, all of the cultural consultants present indicated the stones were significant and that they had been used by traditional Native Hawaiian cultural practitioners in the past. They indicated that the stones' location was likely an important part of their cultural significance and function. Potential mitigation measures, including preservation in place and relocation were discussed.

The cultural consultants expressed concern regarding the final appearance of the landfill once it has reached capacity and will no longer be used. They wanted to see the new surface of the landfill naturalized with the random placement of basalt boulders and more natural vegetation, preferably Native Hawaiian dry land species, so that the final land fill surface appears more like the surrounding hillsides.

May 1, 2007 - CSH mailed a consultation letter to the Office of Hawaiian Affairs (OHA). This consultation was initiated pursuant to HAR Chapter 13-276-5 and 13-275-6. A copy of the consultation letter is provided in the CSH AIS Report.

May 24, 2007 - OHA provided a response to CSH's May 1, 2007 consultation letter on May 24, 2007, and is included in the CSH AIS Report. OHA requested additional project-related cultural consultation with members of the Koa Mana organization and Nettie Tiffany associated with Lanikūhonua. Additionally, the letter queried whether or not subsurface testing was undertaken as a part of the project AIS. Finally, the OHA letter took the position that the single historic property, SIHP #50-80-12-6903, consisting of three upright stones, should be preserved through adjustment of the current study area boundaries.

CSH responded to OHA in a March 7, 2008 mitigation consultation letter. As a result of OHA's suggestions, members of the Koa Mana organization visited the SIHP #50-80-12-6903 location and vicinity and provided input. Additionally, Nettie Tiffany was included in further cultural consultation.

July 18, 2007 - CSH held another on-site visit. Glenn Kila and Alika Silva from Koa Mana were present, along with Kaleo Paik, SHPD Culture and History Branch. At this meeting the age, function, cultural affiliation, and significance of the upright stones were discussed. Potential mitigation measures, including preservation in place and relocation were discussed. Once again, there was no clear consensus regarding the function of the stones, all of the cultural consultants present indicated the stones were significant and that they had been used by traditional Native Hawaiian cultural practitioners in the past.

October 5, 2007 - CSH held another on-site meeting with the current SHPD O‘ahu Island Archaeologists, Lauren Morawski and Teresa Davan. The AIS effort and results was discussed and the three upright stones were observed. CSH provided the SHPD archaeologists with a summary of the project's cultural consultation effort to date.

March 7, 2008 - A mitigation consultation letter was sent to OHA, SHPD, William Ailā (Hui Malāma I Nā Kūpuna), Eric Enos (cultural practitioner and Director of Ka‘ala Farms), Shad Kane (‘Ahahui Siwila Hawai’i O Kapolei Hawaiian Civic Club), Doug "McD" Philpotts (long-time resident of Waimānalo ‘Ili), Nettie Tiffany (Lanikūhonua), and Glenn Kila and Alika Silva (Koa Mana). The consultation letter included response information to the OHA May 24, 2007 letter. It included the results of the project’s AIS investigation and a description of the three upright stones. It also summarized the project’s cultural consultation effort to date. Finally, it described the proposed mitigation measures (See CSH AIS Report, Appendix C).

In March 2008, following the posting and emailing of the March 7, 2008 consultation letter, CSH attempted to contact the letter recipients by email and telephone to obtain feedback and comments. As a result of the effort on March 20 2008, CSH was contacted by telephone by Shad Kane (‘Ahahui Siwila Hawai’i O Kapolei Hawaiian Civic Club) and McD Philpotts (long-time resident of Waimānalo ‘Ili). Their comments are summarized as follows:

Doug “McD” Philpotts had four general comments:

1. He confirmed that he felt the stones were indeed naturally occurring and that they had not been modified or set up-right by human hands.
2. He and his son went out in his canoe to see how visible the stones were from offshore Lanikūhonua, makai of Waimānalo Gulch. He said he could see the stones faintly, by knowing where to look, but that the stones did not stand out on the Waimānalo Gulch slope and were hard to see. He said the stones did line up with the location of a fishing spot he knew, but that other landscape features were more easily discernable and made much better geographic reference points for triangulation.
3. He finds the proposed treatment of the stones, their movement to the Battery Arizona location, an acceptable form of mitigation.
4. He is most concerned about the final look of the landfill once it reaches capacity and the area will no longer be used. He feels the new final

surface of the landscape needs to be landscaped to be more natural, with native Hawaiian dry-land vegetation, and a more natural land covering of basalt stones. He thinks this naturalization of the surface will make the area much more useful in the future.

Shad Kane had five general comments:

1. He is disappointed about the landfill project as a whole as well as the proposed movement of the three stones (SIHP #50-80-12-6903)—but he understands the need and why the landfill needs to be expanded and the stones need to be moved.
2. He indicated that the stones' meaning and significance will be lost once they are moved from their original location.
3. He is interested in having research continue on the stones after they were moved. This further research should focus on determining the stones past use and/or significance to Native Hawaiian cultural practitioners.
4. He is in favor of interpretation of the stones based on the results of further research, with signage and public access.
5. He would like to see the stones moved back to as close as possible to their original location, from temporary curation at Battery Arizona, after the landfill has reached capacity and it would be safe to move the stones.

As a result of telephone follow up by CSH, Nettie Tiffany (Lanikūhonua) contacted Matt McDermott of CSH. Although Ms. Tiffany had not participated in the previous site visits, she had four general comments:

1. She indicated the description of the stones, their location, and photographs included in the consultation letter accurately portrayed what her mother described to her as trail markers that marked mauka/makai trails. These trails were used by Native Hawaiians to support mauka/makai trade and/or resource distribution. They were also used by bird catchers to access the mauka forests.
2. She was disappointed with the landfill expansion project and that the stones could not be left in place.

3. She felt that the stones significance as trail markers would be ruined if the stones are relocated.
4. She would like to see the stones moved back to as close as possible to their original location, from temporary curation at Battery Arizona, after the landfill has reached capacity and it would be safe to move the stones.

March 25, 2008 - SHPD staff Kaleo Paik (Culture and History Branch) and O‘ahu Island Archaeologists Lauren Morawski and Teresa Davan met with CSH to discuss the project’s ongoing consultation effort results. The project proponent’s proposed mitigation were also discussed. The SHPD staff had the following comments regarding the stones and their proposed mitigation:

1. Kaleo Paik thought it was unlikely that the stones would have functioned for marking coastal or offshore locations or resources, because of their position and the difficulty of seeing the stones from a distance.
2. All felt that the stones should be preserved in place if at all possible because their significance and function are likely tied to their current location.
3. If preservation in place is truly not an option, they were in favor of temporary relocation of the stones to Battery Arizona, with movement back of the stones to as near as possible to their original location once the landfill is closed.
4. All were in favor of further research regarding the stones significance and function, with eventual public signage and interpretation for the stones once they are moved back to as close as possible to their original location.

Summary of Consultation Effort

According to CSH the consultation effort determined no clear consensus regarding the function of the three stone uprights. However, all of the cultural consultants indicated that the stones were significant and that they were likely used by traditional Native Hawaiian cultural practitioners in the past. All cultural consultants also felt the stones should be preserved in place if at all possible because their significance and function are likely tied to their current location. If preservation in place is not an option, most were in favor of temporary relocation to Battery Arizona, with movement of the stones back to as near as possible to their original location once the landfill is closed. (CSH, 2008).

Some cultural consultants expressed an interest in having research continue on the stones after they were moved. This further research would focus on determining the stones past use and/or significance to Native Hawaiian cultural practitioners. Once the results of this additional research were interpreted, public access to the stones with interpretive signage was felt to be appropriate. (CSH, 2008).

The cultural consultants expressed concern regarding the final appearance of the landfill once it reaches capacity and is no longer used. They wanted to see the new surface of the landfill naturalized with the random placement of basalt boulders and more natural vegetation, preferably Native Hawaiian dry land species, so that the final landfill surface appears more like the surrounding hillsides. (CSH, 2008).

CSH thanks all the cultural consultants and OHA and SHPD representatives for their time and consideration during the project's archaeological consultation effort. Their input is extremely valuable and will help all concerned parties make the best, most well-informed management decisions for the historic property in the project APE. (CSH, 2008).

7.3.6. Summary and Interpretation

The AIS was completed by CSH in compliance with applicable State of Hawaiʻi historic preservation legislation. Land disturbing activities associated with the landfill expansion would include: major grading, including blasting of exposed rock surfaces, and excavation of the base and walls of Waimānalo Gulch to prepare the expansion area for landfill use; grading for a perimeter road around the expansion area; excavations for the stockpiling of sediment for use as cover material; excavations for associated landfill infrastructure; excavation for the installation of a storm water runoff control channel along the west side of the gulch; and filling of the expansion area with refuse material. (CSH, 2008).

The archaeological survey of the project area identified one historic property designed as SIHP #50-80-12-6903, consisting of three stone uprights, and is located along the western edge of the study area, situated on the western slope of Waimānalo Gulch. The site is of pre-contact origin and is identified as Features A through C. The three upright boulders were potentially used as trail or boundary markers. (CSH, 2008).

The inventory survey fieldwork also involved a thorough inspection of caves and rock shelters observed within the study area. The caves and rock shelters were inspected for cultural modifications and/or the presence of human burials. Where significant sediment deposits were observed, subsurface testing in the form of controlled hand excavation was undertaken to establish if any subsurface cultural deposits were present. All observed and inspected caves contained no indications of cultural modification, subsurface cultural deposits, or use as a human interment site. (CSH, 2008).

A rock alignment (CSH 3) was also found located near the northeastern edge of the study area. The alignment was determined to be of modern origin. If the feature was of antiquity it would reflect disturbances associated with erosion and/or rainwater runoff, such as the retention of eroding rock and soil or the displacement of boulders incorporated into the alignment. Test excavations yielded no cultural material and confirmed the modern construction of the rock alignment. (CSH, 2008).

The AIS findings are largely consistent with expectations based on background research. An archaeological inventory survey of the “Makaīwa Hills” development project, totaling 1,850 acres and encompassing large portions of the Makaīwa and Pālailai gulches, identified pre-contact habitation sites clustered in higher elevations above 1,000 ft., and in lower elevations below 500 ft (Hammatt et al. 1991). Hammatt et al. (1991) indicated that the higher elevations would contain ample forest subsistence resources for gathering on both a continual basis, as well as during times of famine and drought, while the lower elevations would be in close proximity to the shoreline and bountiful coastal resources. The current study area is located 80 m east of the “Makaīwa Hills” development project, contains a similar topographic and geologic setting, and is situated within an elevation range of 400 to 900 feet, the zone in which pre-contact archaeological sites were absent in the neighboring “Makaīwa Hills” study area. Thus, the fact that only a single historic property was identified within the current study area is not surprising and is consistent with the pattern observed by Hammatt et al. in 1991. Furthermore, SIHP #50-80-12-6903, consists of trail and/or boundary markers utilized by pre-contact populations, suggesting that portions of the study area were utilized for transportation to more resource rich areas (i.e. the coast and upland forest). (CSH, 2008).

Both the Hammatt et al. (1991) study and the current AIS are important because they provide valuable data toward establishing a settlement pattern for the leeward gulches and ridges of the Honoʻuliʻuli Ahupuaʻa. The current study area has been determined to be situated in an intermediate zone between the coast and the upland forest. This intermediate zone is defined by an extremely arid environment, a lack of vegetation, and steep rocky terrain which would have made pre-contact habitation and agriculture very difficult. This intermediate zone is focused between the 500 and 1,000 foot elevations and was most likely utilized for transportation between the more hospitable coast and upland forest areas. (CSH, 2008).

7.3.7. Significance Assessment

The AIS investigation provides sufficient information for an evaluation of significance in accordance with the Hawaiʻi State Registers of Historic Places (HAR 13-275-6). The criteria used to establish significance include:

> **Criteria A** - Historic property reflects major trends or events in the history of the state or nation.
>
> **Criteria B** - Historic property is associated with the lives of persons significant in our past.

Criteria C - Historic property is an excellent example of a site type.

Criteria D - Historic property has yielded or may be likely to yield information important in prehistory or history.

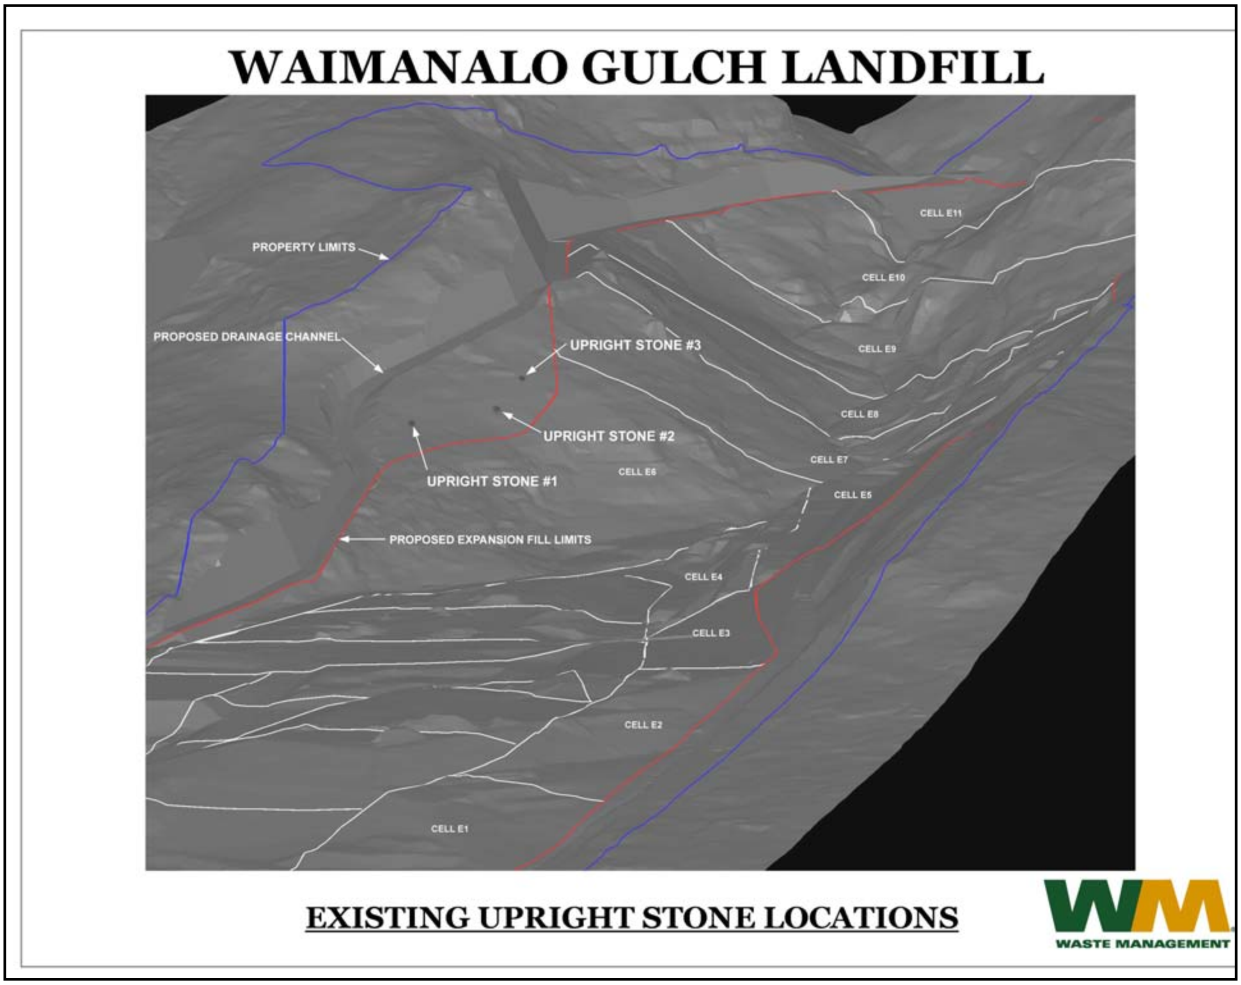
Criteria E - Historic property has cultural significance to an ethnic group, including, but not limited to, religious structures and burials.

SIHP #50-80-12-6903, consisting of three rock uprights, possesses integrity of location and materials and is recommended by CSH as eligible to the Hawaiʻi Register under criteria D & E.

7.3.8. Potential Impacts and Mitigation Measures

The proposed project will require excavation, mass grading, controlled blasting, and the use of heavy machinery and equipment to develop landfill cells and other structural features that will maintain the integrity and safety of the proposed area of lateral expansion. The development of a modified landfill design was considered by WMH and ENV as a means of providing further protection to the stone uprights. This consideration would avoid the location of the uprights along a steep slope to maintain and preserve the condition of the existing site. However, according to WMH the uprights are located along a ridgeline that would remain susceptible to vibration (**Figure 7-20**):

1. The safety of the stones cannot be guaranteed if they were preserved in place. Excavation, mass grading and controlled blasting in the area of the uprights and elsewhere within the WGSL would subject the stones to repeated vibration over the next 15 years of the proposed project. Vibration from construction activities could potentially be sufficient to dislodge the stones from their existing resting place, causing them to roll down the steep slope they rest on. Upon completion of construction, the original location of the uprights would also have been graded based on landfill design requirements to provide appropriate drainage and slope stability.



Note: Graphic shows the proposed landfill expansion in relation to the three stone uprights comprising SIHP # 50-80-12-6903. Note the large drainage channel upslope of the stones and the cell E6 immediately down slope. (WMH and CSH, 2008).

Figure 7-20, Proposed WGSL Expansion Project Three-Dimensional Graphic

2. Preservation in place would require a significant reduction of the overall area and volume of the proposed facility expansion. In addition, the stone uprights would be in proximity to a proposed large storm water drainage channel and Cell E6, immediately above the location of the uprights.

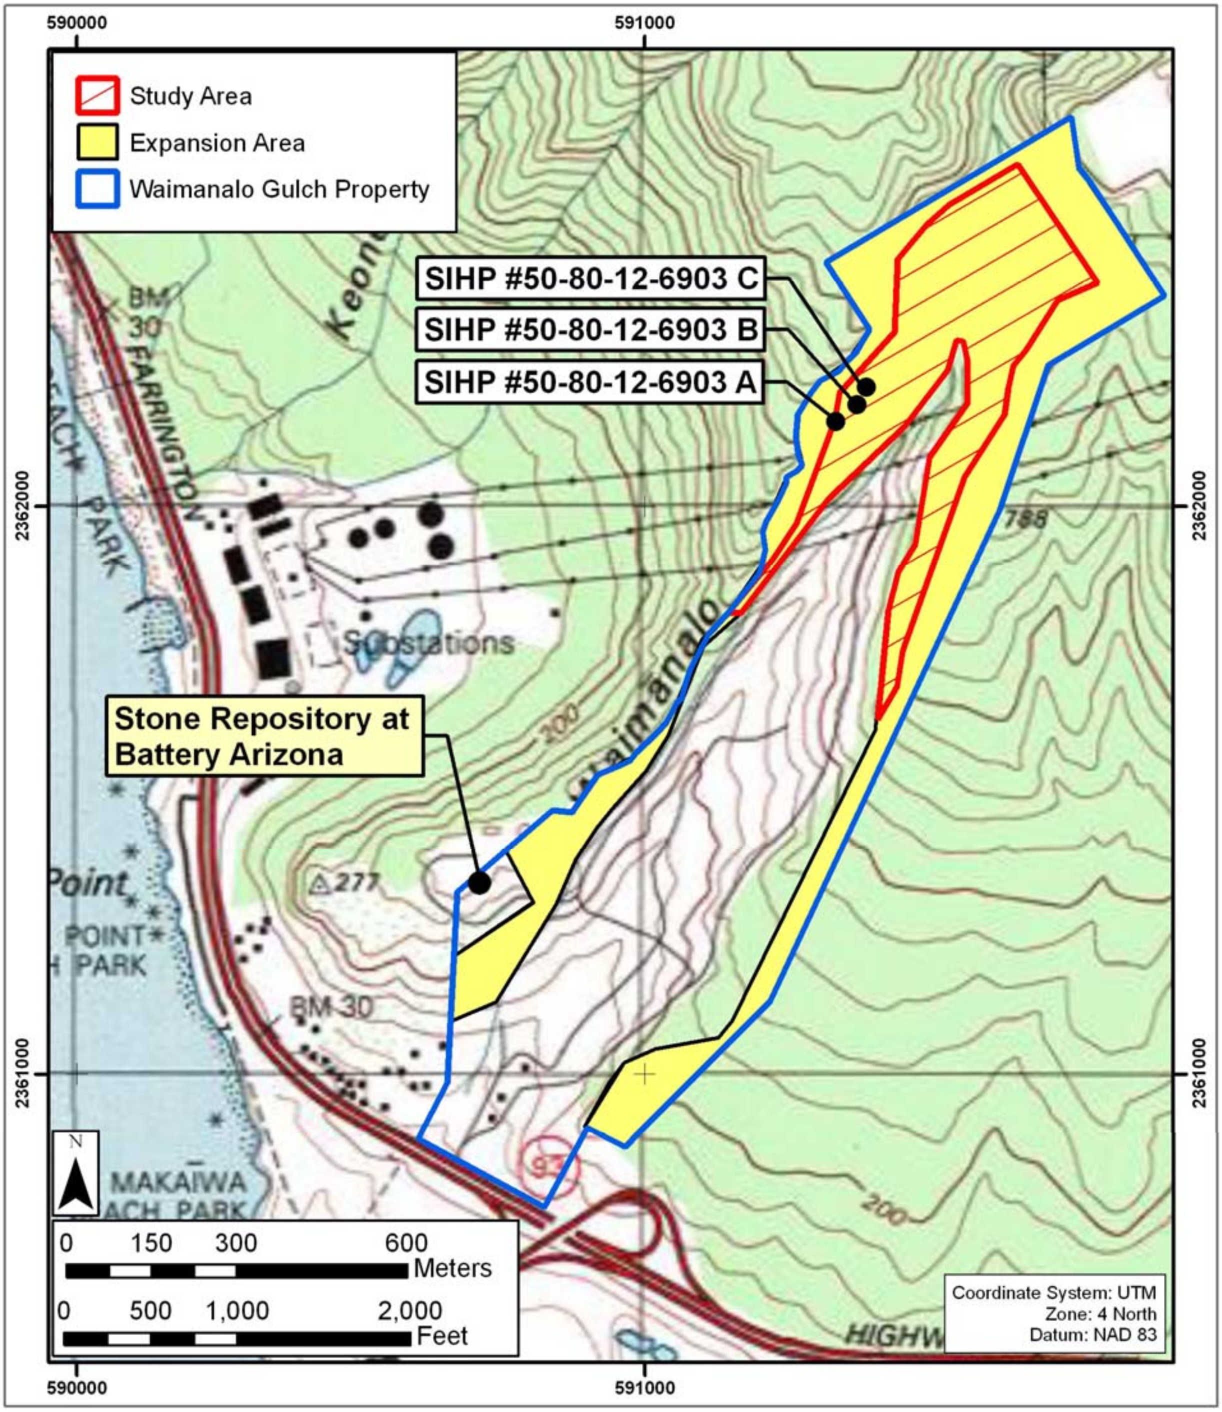
3. Considering the use of the site as a landfill, preservation in place is not thought to be an appropriate mitigation treatment for the stones, considering their cultural sensitivity.

Because of concern that construction activities could jeopardize the area of the site and potentially undermine the stability of the underlying surface of the stone uprights, or the uprights themselves, WMH and ENV have determined that the three upright stones comprising SIHP # 50-80-12-6903 cannot reasonably be preserved in place in a safe and appropriate manner. Accordingly, a project effect determination of “effect with agreed upon mitigation commitments” is proposed.

Mitigation to address the preservation of the site is recommended in the form of relocation of the three SIHP # 50-80-12-6903 upright stones to the Battery Arizona site, located in the southwestern portion of the WGSL (**Figure 7-21**). This recommendation is based on precedent that was established for three prior noteworthy stones of cultural significance to Native Hawaiians that have already been relocated based on earlier expansion of the WGSL. These stones, described by Hammatt and Shideler (1999), were relocated to the Battery Arizona site in 1988. **Figure 7-22**, shows the location of this established stone repository in relation to the Battery Arizona features. **Figures 7-23** and **7-24**, are photographs showing the proposed relocation area in relation to the already established Battery Arizona stone repository site. The proposed relocation would ensure and maintain the safety of the stones during construction activities for the proposed project, and would make them much more accessible to interested parties.

The specific actions required for the proposed relocation would be prepared as part of an Archaeological Mitigation Plan (AMP) for SIHP # 50-80-12-6903. The details would be determined based on further consultation with the cultural consultants, SHPD, ENV, and WMH. The AMP is proposed to include additional research to help better establish the function of the three stones. The option of relocating the stones back to near their original resting places would be included as a part of the discussion.

Figure 7-25 is a modified photograph showing approximately the appearance of the relocation from coastal Honoʻuliʻuli. The relocation would only take place after the planned area of lateral expansion has been completed in approximately 15 years.



Note: Portion of the 1998 `Ewa USGS 7.5-minute topographic quadrangle showing the Waimānalo Gulch property boundaries, the boundaries of the proposed 90-acre expansion area, the 36-acre study area, the location of Features A, B, and C of SIHP #50-80-12-6903, and the previously established stone repository at Battery Arizona. (CSH, 2008).

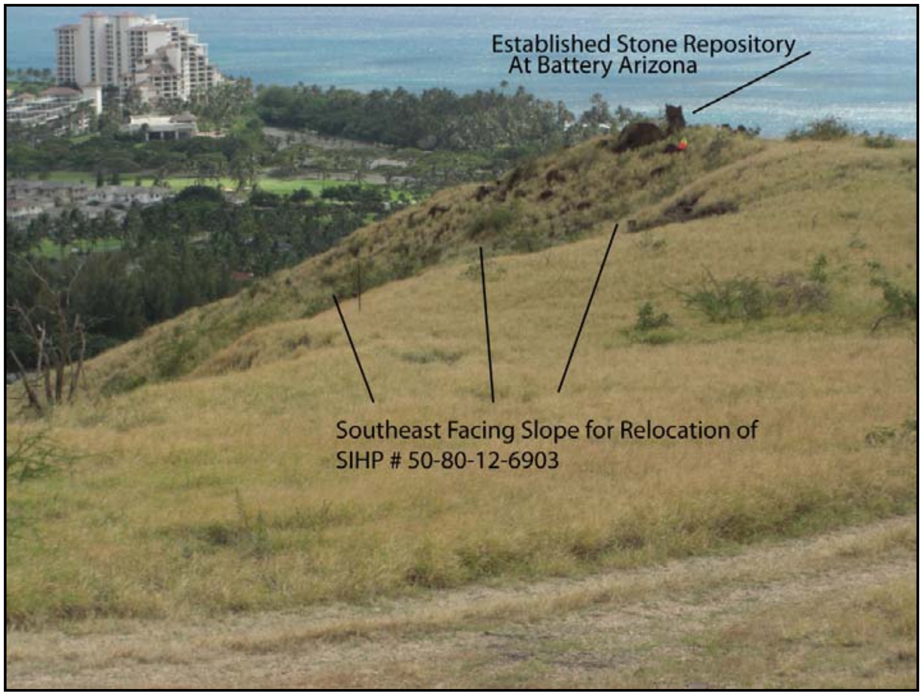

Figure 7-23, Photograph of Proposed Relocation Area at Battery Arizona for SIHP # 50-80-12-6903, View to the South

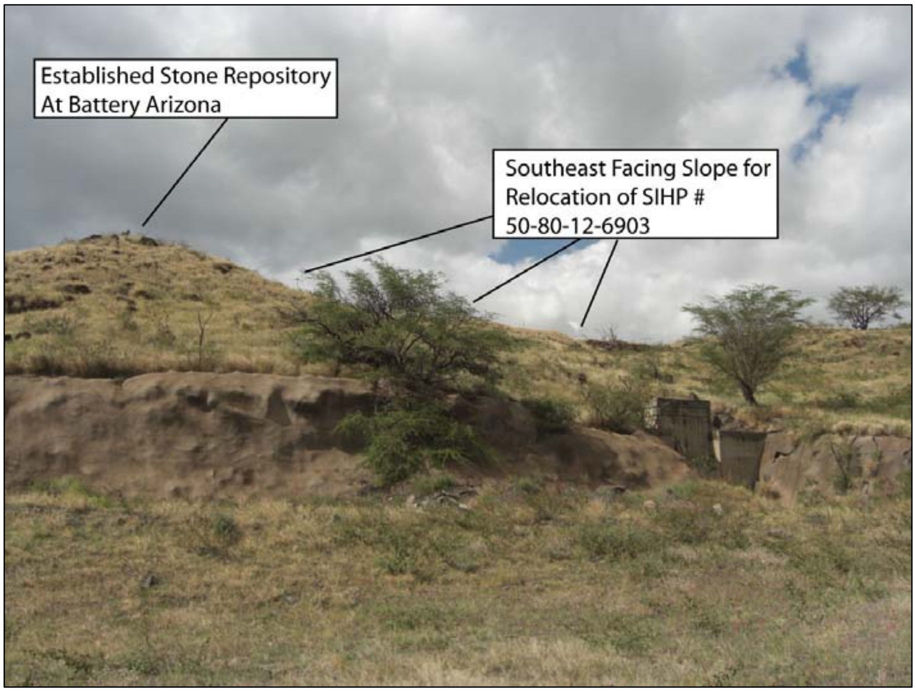

Figure 7-24, Photograph of Proposed Relocation Area at Battery Arizona for SIHP # 50-80-12-6903, View to the North

Note: Altered photograph showing the planned landfill surface topography in 15 years. The potential SIHP # 50-80-12-6903 relocation site, on top of the new landfill surface, is shown. (CSH and WMH, 2008).

Figure 7-25, Altered Photograph
Planned Landfill Surface in Approximately 15 Years

The permanent relocation of the stones to the Battery Arizona site will also be considered as a more feasible mitigation option. Based on the results of the cultural consultation, however, cultural informants would prefer to see the stones eventually returned to near their original resting places once the landfill is no longer active, with interpretive signage based on further background research and making public access available. (CSH, 2008).

Historic and Archaeological Resources Summary

There is potential for secondary impacts to historic and archaeological resources that may be present in the area of lateral expansion. Mitigation to address this possibility has been provided in Section 7.3.8. Potential Impacts and Mitigation Measures (Historic and Archaeological Resources), and in Section 7.4.7. Summary and Conclusions, Potential Impacts and Mitigation Measures (Cultural Impact Assessment).

The potential for cumulative or additive impacts are not anticipated. Prior archaeological studies and reports have been prepared to ensure appropriate examination and historical review of both the existing and proposed areas of use. In addition to the examination of the site by a qualified professional archaeologist, the SHPD and cultural informants with knowledge of the site and region have also reviewed the site. As appropriate, an Archaeological Mitigation Plan (AMP) and other documentation will be prepared and coordinated with the appropriate parties to ensure against adverse effects to historic properties and resources.

7.4 Cultural Impact Assessment

7.4.1. Introduction

A Cultural Impact Assessment (CIA) of the proposed project site was conducted by Cultural Surveys Hawaiʻi (CSH) in 2007 and 2008 (**Appendix H, Cultural Impact Assessment (Draft)**). The purpose of the CIA is to consider the effects the proposed project may have on traditional cultural practices and resources and: (1) comply with the Hawaiʻi environmental review process (HRS, Chapter 343), which requires consideration of a proposed project's effect on cultural practices; (2) provide an assessment of the proposed project's impacts to cultural practices in accordance with the OEQC, Guidelines for Assessing Cultural Impacts; and (3) support the project's historic preservation review under HRS, Chapter 6E-8 and HAR, Chapter 13-275.

The scope of work for the CIA included (CSH, 2008):

1. Examination of historical documents, Land Commission Awards (LCAs), and historic maps with the specific purpose of identifying Hawaiian activities including gathering of plant, animal and other resources or agricultural pursuits as may be indicated in the historic record.

2. A review of the existing archaeological information pertaining to the sites on the property as they may allow us to reconstruct traditional land use activities and identify and describe the cultural resources, practices and beliefs associated with the parcel and identify present uses, if appropriate.
3. Oral interviews with persons knowledgeable about the historic and traditional practices in the project area and region.
4. Preparation of a report on items 1-3 summarizing the information gathered relating to traditional practices and land use. The report assesses the impact of the proposed action on the cultural practices and features identified.

7.4.2. Methodology

Historical documents, maps and existing archaeological information pertaining to the sites in the vicinity of this project were researched by CSH at the SHPD library, the Cultural Surveys Hawai‘i library, and the University of Hawai‘i (UH) Hamilton Library. The Office of Hawaiian Affairs (OHA), O’ahu Island Burial Council (OIBC), and members of other community organizations were contacted in order to identify potentially knowledgeable individuals with cultural expertise and/or knowledge of the study area and the surrounding vicinity. The names of potential community contacts were also provided by colleagues at CSH and from the researchers’ familiarity with the families who live in the area. Some of the prospective community contacts were not available to be interviewed as part of this project.

7.4.3. Traditional and Historic Background

7.4.3.1. Introduction to the Cultural Landscape

The project area is situated on the eastern side of the Wai‘anae Mountains in the Hono‘uli‘uli Ahupua‘a and is sub-divided into the ‘ili of Waimānalo in the moku or district of ‘Ewa. Hono‘uli‘uli is the largest ahupua‘a on O‘ahu and includes all the land from the western boundary of Pearl Harbor westward around the southwest corner of O‘ahu to the ‘Ewa/ Wai‘anae District Boundary with the exception of the west side of the harbor entrance which is in the ahupuaʻa of Puʻuloa (the ʻEwa Beach/Iroquois Point area). The Honoʻuliʻuli Ahupuaʻa includes approximately nineteen kilometers (twelve miles) of open coastline from Oneʻula to Pili o Kahe. The ahupuaʻa extends mauka, almost pie-shaped, from West Loch nearly to Schofield Barracks in Wahiawā; the western boundary is the Waiʻanae Mountain crest running north as far as Puʻu Hapapa (or to the top of Kaʻala Mountain according to some). (CSH, 2008).

The Honoʻuliʻuli Ahupuaʻa includes a long coastline and four miles of waterfront along the west side of West Loch. The land immediately mauka of the coast consists of a flat karstic raised limestone reef forming a level nearly featureless "desert" plain marked in pre-Contact times (previous to illuviation caused by sugar cultivation) by a thin or non-existent soil mantle. The micro-topography is notable in containing countless sinkholes caused by chemical weathering (dissolution) of the limestone shelf. Proceeding mauka from the limestone plain, the shelf is overlain by alluvium deposited through a series of gulches draining the Waiʻanae Mountains. The major gulches are, from east to west: Awanui, Pālailai, Makaīwa, Waimānalo and Limaloa. The alluvium carried by the gulches has spread out in delta fashion over the mauka portions of the plain, which comprises a dramatic depositional environment at the stream gradient change. These gulches are generally dry, but seasonal Kona storms carry immense quantities of runoff onto the plain and into the ocean. As typical drainages in arid slopes they are either raging uncontrollably, or are dry and do not form stable water sources for traditional agriculture in the upper reaches. The Honoʻuliʻuli gulches, in contrast to those draining into Pearl Harbor to the east, do not have valleys suitable for extensive irrigated agriculture. However, the lack of suitable valleys is compensated for by the rich watered lowlands at the base of Honoʻuliʻuli Gulch (the ʻili of Honoʻuliʻuli). (CSH, 2008).

The Honoʻuliʻuli Ahupuaʻa, as a traditional land unit, had tremendous and varied resources available for exploitation by early Hawaiians that included (CSH, 2008):

1. Twelve miles of coastline with continuous shallow fringing reef that offered rich marine resources.

2. Four miles of frontage on the waters of West Loch which offered extensive fisheries (mullet, awa, shellfish), as well as frontage suitable for development of fishponds (for example, Laulaunui).
3. The lower portion of Hono‘uli‘uli Valley in the ‘Ewa plain offered rich level alluvial soils with plentiful water for irrigation from the stream as well as abundant springs. This land would have stretched well up the valley.
4. A broad limestone plain which because of innumerable limestone sink holes offered a nesting home for a large population of avifauna. This resource may have been one of the early attractions to human settlement.
5. An extensive upland forest zone extending as much as twelve miles inland from the edge of the coastal plain. As Handy and Handy have pointed out, the forest was much more distant from the lowlands here than it was on the windward side, but on the leeward side was more extensive (1972:469). Much of the upper reaches of the ahupua‘a would have had species-diverse forest with kukui, ‘ōhi‘a, sandalwood, hau, kī, banana, etc.
6. A network of trails giving access to Lualualei and Wai‘anae coastal reaches.

7.4.3.2. Main Areas of Settlement

Cultural, archaeological, and historical sources show a general pattern of three main areas of settlement within the ahupua‘a: (1) a coastal zone, (2) inland settlement at Pu‘u Ku‘ua and (3) the Hono‘uli‘uli taro lands (CSH, 2008).

The Coastal Zone - Ko ‘Olina and Kalaeloa (Barbers Point)

Ko ‘Olina - There are three major studies on the Ko ‘Olina project area (Davis et al. 1986a; Davis et al. 1986b; and Davis and Haun 1987). Davis documents around 180 component features at 48 sites and site complexes consisting of habitation sites, gardening areas, and human burials. Chronologically the occupation covers the entire span of Hawaiian settlement in what Davis and Haun describe as "one of the longest local sequences in Hawaiian prehistory"

(Davis and Haun 1987:37). The earliest part of the sequence relates to the discovery of an inland marsh and early dates were also obtained for the beachfront site (Lanikūhonua) and an inland rock shelter. (CSH, 2008).

Kalaeloa (Barbers Point) - Archaeological research at Barbers Point has focused on the areas in and around the newly constructed Deep Draft Harbor (Barrera 1975; Davis and Griffin 1978; Hammatt and Folk 1981, McDermott et al. 2000). A series of small clustered shelters, enclosures and platforms show limited but recurrent use at the shoreline zone for marine oriented exploitation. This settlement covers much of the shoreline with more concentrated features around small marshes and wet sinks. Immediately behind the shoreline under a linear dune deposit is a buried cultural layer believed to contain some of the earliest habitation evidence in the area. (CSH, 2008).

Inland Settlement at Puʻukuʻua

It is mentioned in moʻolelo (oral history) that the area of Puʻukuʻua, on the east side of the Waiʻanae Ridge, north east of the current project area, seven miles inland of the coast, was a Hawaiian place of great importance. (CSH, 2008).

In 1899, the Hawaiian language newspaper "Ka Loea Kālaiʻāina" relates a story of Puʻukuʻua as "a place where chiefs lived in ancient times" and a "battle field," "thickly populated." This area was well known and visited by all Oʻahu chiefs. (CSH, 2008).

McAllister recorded three sites in this area: two heiau (shrines) (sites 134 Puʻu Kuina and 137 Puʻukuʻua; both destroyed) and a series of enclosures in Kukuilua which he calls "kuleana sites" (McAllister, 1933). On the opposite side of the Waiʻanae range along the trail to Pōhākea Pass, as Cordy (2002) states, “Kākuhihewa was said to have built (or rebuilt) Nīoiʻula, a poʻokanaka heiau (1,300 sq. m.) in Hālona in upper Lualualei, along the trail to Pōhākea Pass leading into ʻEwa, ca. A.D. 1640-1660" (Cordy 2002:36). There is no direct archaeological evidence available to the authors’ (CSHs') knowledge that intensive Hawaiian settlement occurred along the Pōhākea Pass trail but it is considered as a place of higher probability for traditional Hawaiian sites, based on the above indications. Geographically, the area receives sufficient quantities of water and would have had abundant locally available forest resources. (CSH, 2008).

Honoʻuliʻuli Taro Lands
Centered around the west side of Pearl Harbor at Honoʻuliʻuli Stream and its broad outlet into the West Loch are the rich irrigated lands of the ʻili of Honoʻuliʻuli which give the ahupuaʻa its name. The major archaeological reference to this area is Dicks, Haun and Rosendahl (1987) who documented remnants of a once-widespread wetland system (loʻi and fishponds) as well as dry land cultivation of the adjacent slopes. (CSH, 2008).

The area bordering West Loch was clearly a major focus of population within the Hawaiian Islands and this was a logical response to the abundance of fish and shellfish resources in proximity to a wide expanse of well-irrigated bottomland suitable for wetland taro cultivation. Dicks et al. (1987:78-79) conclude, on the basis of nineteen carbon isotope dates and three volcanic glass dates that "Agricultural use of the area spans over 1,000 years." Undoubtedly, Honoʻuliʻuli was a locus of habitation for thousands of Hawaiians. (CSH, 2008).

7.4.3.3. Traditional and Legendary Accounts of Honoʻuliʻuli

Honoʻuliʻuli, Oʻahu, is associated with a number of legendary accounts. Many of these concern the actions of gods or demi-gods such as Kāne, Kanaloa, Māui, Kamapuaʻa, the pig god, Maunauna, the shark deity, Kaʻahupāhau, and the hero Palila. There are several references to chiefly lineages and references to the ruling chiefs Hilo-a-Lakapu and Kūaliʻi, (Ko ʻOlina is reported to have been a vacationing place for Kākuhihewa). Traditional and legendary accounts identified by CSH include references to the following:

- The Naming of Honoʻuliʻuli (Legend of Lepeamoʻa)

- The Pele Family at Honoʻuliʻuli
- Keahumoa, Residence of Māui's Grandfather (Legend of Māui's Flying Expedition)
- Kāne and Kanaloa and the Boundaries of ʻEwa (Simeon Nawaa Account)
- Kamapuaʻa, The Pig God, Associated with Honoʻuliʻuli
- Home of the Shark-Goddess Kaʻahupāhau (Legend of Kaʻehuikimanōo Pu'uloa)
- The Frightened Populace of Honoʻuliʻuli (He Kaʻao no Palila)
- Two Old Women Who Turned To Stone (Ka Loea Kālaiʻāina)
- The Strife of Nāmakaokapāoʻo and Pualiʻi (Kaʻao no Nāmakaokapāoʻo)
- The Story of Kaihuopalaʻai Pond, Honoʻuliʻuli (Kaʻao no Maikohā)
- The Traveling Mullet of Honoʻuliʻuli (Fish Stories)
- Honoʻuliʻuli and the Head of Hilo-a-Lakapu (Legend of the Sacred Spear-point)
- The Strife at Honoʻuliʻuli from Which Kūaliʻi Unites Hawaiʻi Nei (Moʻolelo o Kūaliʻi)
- The Last Days of Kahahana and Honoʻuliʻuli (The Land is the Sea's)
- Puʻuokapolei and the Reckoning of the Seasons (Kamakau)
- Honoʻuliʻuli in the Poetry of Halemano (Kaʻao no Halemano)

7.4.3.4. Legends and Traditional Places in Upland Honoʻuliʻuli

Kahalaopuna at Pōhākea Pass - One of the most popular legends of Oʻahu is that of Kahalaopuna (or Kaha) a young woman of Mānoa who is slandered by others and is then killed by her betrothed, Kauhi, a chief from Koʻolau, Oʻahu. While the numerous accounts (Day 1906:1-11, Fornander 1919 Vol. V: 188-193, Kalākaua 1888:511-522, Nakuina 1904:41-45, Patton 1932:41-49, Skinner 1971:220-223, Thrum 1907:118-132, Westervelt 1907a 127-137, Westervelt 1907b 84-93) vary in details, they typically have Kahalaopuna slain and then revived repeatedly with the aid of a protective owl spirit. (CSH, 2008).

Moʻo at Maunauna (Kuokoa) - Moses Manu in recounting the Legend of Keaomelemele makes a reference to a moʻo (fabulous lizard, dragon, serpent) named Maunauna who lived above Līhuʻe (presumably at the landform of that name in extreme northern Honoʻuliʻuli) and who was regarded as a bad lizard (Kuokoa April 25, 1885). (CSH, 2008).

Paupauwela and Līhuʻe - Paupauwela, also spelled Popouwela (derivation unknown), is the name of the land area in the extreme mauka section of Honoʻuliʻuli Ahupuaʻa. The land area of Līhuʻe is just makai of this land, and extends into the ahupuaʻa of Waipiʻo (adjacent to the eastern border of Honoʻuliʻuli). Both place names are mentioned in a chant recorded by Abraham Fornander, which was composed as a mele for the Oʻahu king, Kūaliʻi, as he was preparing to battle Kuiaia (Fornander 1917, Vol. IV, Part 2:384-386). The place name Līhuʻe means “cold chill" and is also cited in poem (Ka Loea Kālaiʻāina, July 22, 1899, translated in Sterling and Summers 1978:21). This explains the meaning of a Hawaiian saying “Hao na kēpā o Līhuʻe i ke anu” (The spurs of Līhuʻe dig in with cold) (Pukui 1983:#479). (CSH, 2008).

The aliʻi were closely associated with Līhuʻe, which had habitation areas and playing grounds set aside for their sports. (Ka Nūpepa Kūʻokoʻa, Aug. 26, 1865, translation in Sterling and Summers 1978:23).

Līhuʻe was also the home of a famous cannibal king-man, Kaupe, who overthrew the ruling chiefs to become the paramount power between Nuʻuanu and the sea. (Westervelt 1963:90-96).

Hill of Maunauna - The hill Maunauna lies between the lands Paupauwela and Līhuʻe. One translation of Maunauna is “mountain sent [on errands].” Two servant moʻo who lived here had no keepers to supply their needs” (Pukui et al. 1974:149). It was at Maunauna, according to one tradition, that the forces of the chiefs Kūaliʻi and Kuiaia of Waiʻanae met to do battle, which was averted when a mele honoring the god Kū was chanted. (Fornander 1917, Vol IV, Part 2:348).

> In the Legend of Ke-ao-melemele, a woman named Paliuli traveled in this area. In a very short time she [Paliuli] walked over the plain of ‘Ewa; ‘Ewa that is known as the land of the silent fish [pearl oysters]…She went on to the plain of Punalu‘u and turned to gaze at Maunauna point and the plain of Lihue. (Manu 1885, translation in Sterling and Summers 1978:21),
>
> Certain place names in the uplands, including Maunauna, are also mentioned in the story of Lo-lae’s Lament. The place of Lolale’s residence is given in King Kalākaua’s version of this story. (CSH, 2008).

7.4.3.5. Prehistory and Early History

Various Hawaiian legends and early historical accounts indicate the ahupua‘a of Hono‘uli‘uli was once widely inhabited by pre-Contact populations. This would be attributable for the most part to plentiful marine and estuarine resources available at the coast, along which several sites interpreted as permanent habitations and fishing shrines were located. Other attractive subsistence-related features of the ahupua‘a include irrigated lowlands suitable for wetland taro cultivation (Hammatt and Shideler 1990), as well as the lower forest area of the mountain slopes for the procurement of forest resources. (CSH, 2008).

Exploitation of the forest resources along the slopes of the Wai‘anae Range - as suggested by E. S. and E.G. Handy - probably acted as a viable subsistence alternative during times of famine (Handy and Handy 1972:469). The upper valley slopes may have also been a significant resource for sporadic quarrying of basalt for the manufacturing of stone tools as evidenced in part by the existence of a probable quarrying site (50-80-12-4322) in Makaīwa Gulch at 152 m. (500 ft.) above mean sea level (Hammatt et al. 1991). (CSH, 2008).

The Hawaiian ali‘i were also attracted to the region, which is steeped in myth. (Ke Au Hou, July 13, 1910).

Other early historical accounts of the general region typically refer to the more populated areas of the ‘Ewa district, where missions and schools were established and subsistence resources were perceived to be greater. However, the presence of archaeological sites along the barren coral plains and coast of southwest Hono‘uli‘uli Ahupua‘a, indicate that prehistoric and early historic populations also adapted to less inviting areas, despite the environmental hardships. (CSH, 2008).

Mid- to late-1800s
Associated with the Māhele of 1848, 99 individual land claims in the ahupua‘a of Hono‘uli‘uli were registered and immediately awarded by King Kamehameha III. The vast majority of the LCA were located near the Pu‘uloa salt works and the taro lands of the ‘ili of Hono‘uli‘uli. The present study area appears to have been included in the largest award (Royal Patent 6071, LCA 11216, ‘Āpana 8) granted in Hono‘uli‘uli Ahupua‘a to Miriam Ke‘ahi-Kuni Kekau‘ōnohi on January 1848 (Native Register). (CSH, 2008).

In 1877, James Campbell purchased most of the Hono‘uli‘uli Ahupua‘a and in 1879 brought in a well driller from California to search the ‘Ewa plains for water, and a “vast pure water reserve” was discovered (Armstrong and Bier 1983). Following this discovery, plantation developers and ranchers drilled numerous wells in search of the valuable resource. By 1881, the Campbell property of Hono‘uli‘uli prospered as a cattle ranch with “abundant pasturage of various kinds” (Briggs in Haun and Kelly 1984:45). (CSH, 2008).

In 1889, Campbell leased his property to Benjamin Dillingham, who subsequently formed the O‘ahu Railway & Land Co. (O.R. & L) in 1890. Dillingham’s Hono‘uli‘uli lands above 200 feet elevation that were suitable for sugar cane cultivation were sublet to the O‘ahu Sugar Co. Throughout this time and continuing into modern times, cattle ranching continued in the area, and Hono‘uli‘uli Ranch established by Dillingham was the "fattening" area for the other ranches (Frierson 1972:15). (CSH, 2008).

‘Ewa Plantation Co. was incorporated in 1890 and continued in full operation up into modern times. The plantation grew quickly with the abundant artesian water. As a means to generate soil deposition on the coral plain and increase arable land in the lowlands, the ‘Ewa Plantation Co. installed ditches running from the lower slopes of the mountain range to the lowlands and then plowed the slopes vertically just before the rainy season to induce erosion (Frierson 1972:17). (CSH, 2008).

The O‘ahu Sugar Co. was incorporated in 1897 and included lands in the foothills above the ‘Ewa plain and Pearl Harbor. Prior to commercial sugar cultivation, the lands occupied by the O‘ahu Sugar Co. were described as being “of near desert proportion until water was supplied from drilled artesian wells and the Waiāhole Water project” (Condé and Best 1973:313). The O‘ahu Sugar Co. took control over the ‘Ewa Plantation lands in 1970 and continued operations into the 1990s. (CSH, 2008).

1900s

By 1920, the lands of Hono‘uli‘uli were used primarily for commercial sugar cane cultivation and ranching (Frierson 1972:18). Much of the mauka lands in western Hono‘uli‘uli, including ridges and deep gulches, were unsuitable for commercial sugar cultivation and remained pasture for grazing livestock. Modest construction in the area included the realignment of the “Waianae Road” (present Farrington Hwy.) to run along the makai / southern edge of the Waimānalo Gulch property, and a road the top of the Kahe Point ridge, within the Waimānalo Gulch property. (CSH, 2008).

In the late 1920s, the main residential communities were at the northeast edge of the ‘Ewa Plain. The largest community was still at Hono‘uli‘uli village. ‘Ewa was primarily a plantation town, focused around the sugar mill, with a public school as well as a Japanese School. (CSH, 2008).

Major land use changes came to western Hono‘uli‘uli when the U.S. Military began development in the area. Long before the Japanese bombing of Pearl Harbor in

December 1941, the U.S. military had initiated the Oʻahu Coast Defense Command, a series of coastal artillery batteries designed to assist in the defense of Pearl Harbor and to prevent invasion of Oʻahu. Military installations were constructed both near the coast, as well as in the foothills and upland areas. (CSH, 2008).

In the 1950s, the Waimānalo Gulch site was used as a NIKE missile base. Palailai Military Reservation (a.k.a. Battery Palailai from 1942-1944), located atop Puʻu Palailai, was used from the 1920s and included Fire Control Station "B" (Payette 2003). (CSH, 2008).

Battery Arizona

On the southwest ridge above Waimānalo Gulch are the subterranean remnants of Battery Arizona, an ambitious World War II military project. The attack of December 7, 1941 impelled the construction of further defensive armament for portions of the Oʻahu coastline not protected by the existing batteries. Even the sunken ships at Pearl Harbor would be enlisted in Oʻahu's defense. When, early in 1942, it was discovered that the two rear three-gun turrets of the U.S.S. Arizona were salvageable, an ambitious plan to mount them at two land installations on Oʻahu was set into motion. The two sites chosen were the tip of Mōkapu Peninsula at Kāneʻohe Bay, designated Battery Pennsylvania, and Kahe Point above the Waiʻanae Coast, designated Battery Arizona. (CSH, 2008).

Construction of Batteries Pennsylvania and Arizona commenced in April 1943 and continued through all of 1944 and into two-thirds of 1945. Battery Pennsylvania at Mōkapu Point was near completion in August 1945 when its guns were test fired around the same time of Japan's surrender. Battery Arizona had not been completed by the war's end; its guns, though installed, were never fired. (CSH, 2008).

A 1943 War Department map indicates a road was constructed within the makai / southern portion of Waimānalo Gulch, ascending the western slope to the top of the Kahe Point ridge. This road, along with several other roads and trails indicated on the map, were likely constructed in association with the Battery Arizona complex and other military installations and training areas in the vicinity. (CSH, 2008).

1950s to Present

Waimānalo would once again play a role in the Oʻahu defense system when, sometime after 1959, the United States Army purchased or exchanged land with the Campbell Estate for a Nike-Hercules anti-aircraft missile base located at the head of Waimānalo Gulch. The Nike complex, in use between 1961 and 1968 consisted of two control sites and one double-sized launcher site (Murdock 2003). The tunnel complex of Battery Arizona was also used for civil defense circa 1960. (CSH, 2008).

Development in the uplands of western Honoʻuliʻuli have generally been limited to ranch related housing and infrastructure, military training and NIKE missile stations, as well as the construction of military and commercial communication and atmospheric observation stations on the ridges near Pālehua. In 1975, the U.S. Air Force constructed the Pālehua Solar Observatory with five solar optical telescopes. (CSH, 2008).

In 1985, the City condemned 81.5 acres of agricultural land in Waimānalo Gulch for use as a landfill to dispose of municipal refuse and ash from the H-POWER incinerator to be built nearby at Campbell Industrial Park. Work on the landfill began in 1987. In 1988, workers constructing the Waimānalo Gulch landfill were reporting strange incidents at the site. According to a newspaper article by Bob Krauss:

> We've been having funny things happen, said one of the men on the site. In one case, a man was standing on a flat rock and the thing threw him over. All of a sudden, it just flipped over.
>
> Another time a backhoe was knocking down kiawe trees. The trees have shallow roots systems so they usually just fall down. But one of the trees jumped up and did a somersault...
>
> Then there was the payloader filling in a huge hole where a $17,000 fiberglass fuel tank had been placed. The story is that the driver put his machine in reverse

> but it jumped forward and leaped into the hole, smashing the tank. (Honolulu Advertiser, 6/20/88:A-1, A-4)

Other incidents reported to Krauss were a truck that had flipped over, tools that had vanished, and a huge stone that had disappeared. The workers called in:

> …a woman recommended for lifting curses and banishing evil spirits. She said the trouble was caused by a certain stone, the “chief of the valley,” which was lying on its side.
>
> The men quickly set the stone upright. But they got it upside down. Things went from bad to worse. The woman came out again and recommended they place the stone on the hill where it will not be covered by rubbish when the landfill opens. (Honolulu Advertiser, 6/20/88:A-1, A-4).

According to Krauss, in April 1988, the stone was moved to a “nest of boulders so that it faces east,” at the “end of a Hawaiian Electric Company Road to one of its relay stations on top of [a] hill.” This site lies close to the Battery Arizona bunkers in the southwest portion of the WGSL property.

7.4.4. Previous Archaeological Research

The ‘Ewa Plain has been the focus of more than 50 archaeological studies over the last two decades, largely as the result of required compliance with county, state, and federal regulatory requirements. Kalaeloa, in particular, has been intensively studied. In contrast, relatively little research has been conducted in the uplands of Hono‘uli‘uli, along the southern slopes of the Wai‘anae Range. This discussion of previous archaeological research will focus on the results of this prior archaeological work at the southern end of the Wai‘anae range. (CSH, 2008).

Recent archaeological investigations in the southern Wai‘anae Range have generally been focused on deep gulch areas for potential landfill locations, lower slopes for residential development, and mountain peaks for antennae or satellite tracking infrastructure (**Table 7-14**).

Table 7-14, Previous Archaeological Investigations in the Uplands of Honoʻuliʻuli Ahupuaʻa

Reference	Type of Investigation	General Location	Findings
Bordner 1977a	Archaeological Reconnaissance	Proposed Makaīwa Gulch Landfill Site	No archaeological sites identified.
Bordner 1977b	Archaeological Reconnaissance	Proposed Kaloʻi Gulch Landfill Site	3 sites (-2600, -2601, -2602), low stacked boulder walls.
Bordner and Silva 1983	Archaeological Reconnaissance and Historical Documentation	Proposed Waimānalo Gulch Landfill Site	No archaeological sites identified.
Sinoto 1988	Archaeological Reconnaissance	Makakilo Golf Course	Low stacked boulder wall (-1975)
Bath 1989	Petroglyph Documentation	Waimānalo Gulch	3 petroglyphs (-4110)
Hammatt et al. 1991	Archaeological Inventory Survey	Makaīwa Hills Project Site	34 sites, including prehistoric habitation and agricultural features, rock shelters, petroglyphs, *ahu*, and various sugar cane cultivation infrastructure.
Hammatt 1992	Archaeological Inventory Survey	KAIM Radio Tower, Pālehua	No archaeological sites identified.
Nakamura et al. 1993	Archaeological Inventory Survey	Makakilo D and D-1 Development Parcels	Cement irrigation flume (-4664).
Borthwick 1997	Archaeological Assessment	Satellite Multi-Ranging Station, Pālehua	No archaeological sites identified.
Dega et al. 1998	Archaeological Inventory Survey	UH West Oʻahu	Two historic site complexes, (50-80-08-5593 historic irrigation system and 50-80-09-2268 Waiahole Ditch System).
Hammatt and Shideler 1998	Archaeological Inventory Survey and Assessment	Waimānalo Gulch Sanitary Landfill Project Site	Battery Arizona Complex and modern "shrine" site.

The earliest attempt to record archaeological remains in Honoʻuliʻuli Ahupuaʻa was made by Thrum (1906). He reports the existence of a heiau located on Puʻu Kapolei, southeast of the current project area. (Thrum 1906:46).

In his surface survey of 1930, archaeologist J. Gilbert McAllister recorded the specific locations of important sites, and the general locations of less important sites (at least at Honoʻuliʻuli). Archaeological investigations by McAllister along the southern slopes of the Waiʻanae Range identified a number of sites. McAllister's Site 136 is located near Mauna Kapu, northeast of the current project area, and is described as a small platform on the ridge dividing the ʻEwa and Waiʻanae districts. The 4 to 6 square foot platform was constructed of coral and basalt stones, and was believed to be an altar (McAllister 1933:107). It is noted to have been destroyed by the time of Sterling and Summers' work in the late 1950's (Sterling and Summers 1978:32). (CSH, 2008).

McAllister's Site 137 is located at Puʻu Kuʻua, a prominent landmark northeast of the current project area. Puʻu Kuʻua Heiau was described by McAllister as: (Destroyed) The heiau was located on the ridge overlooking Nānākuli as well as Honoʻuliʻuli at the approximate height of 1,800 feet. Most of the stones of the heiau were used for a cattle pen located on the sea side of the site. The portion of the heiau which has not been cleared for pineapple has been planted in ironwoods. (McAllister 1933:32).

Makaīwa Gulch, the next major gulch east of Waimānalo Gulch was surveyed as a potential landfill location (Bordner 1977a). The reconnaissance survey included lands within Makaīwa Gulch from Farrington Highway mauka to the approximately 1,000 ft (305 m) elevation. One archaeological feature was identified, a complex of three concrete platforms that was interpreted to be a military related structure. (CSH, 2008).

An archaeological inventory survey of the "Makaīwa Hills" development project located several traditional as well as post-contact archaeological sites (Hammatt et al. 1991). 34 sites were located, including prehistoric habitation structures (temporary and permanent), agricultural features (terrace and mounds), rock shelters, petroglyphs, *ahu*, and various sugar cane cultivation infrastructure. (CSH, 2008).

Kaloʻi Gulch, which borders the northern portion of the current project area, was also surveyed as a potential landfill location (Bordner 1977b). The survey included lands within Kalo‘i Gulch and its smaller tributaries from the *makai* end of the gulch up to the 1,400 ft elevation. It was noted that bulldozing extensively modified lands at the base of the gulch, *makai* of an historic quarry. In the *mauka* portions of the project area, three sites, possibly prehistoric, were identified. The three sites (50-80-12-2600, -2601, -2602) consisted of low-stacked basalt boulder walls located along the north side of the Kalo‘i Stream channel. (CSH, 2008).

During the initial archaeological survey of the lower portions of Waimānalo Gulch (the future site of the Waimānalo Gulch Sanitary Landfill), up to the 430-foot elevation, no archaeological sites were identified (Bordner and Silva 1983). In 1989, three petroglyph units (Site 50-80-12-4110) were located within the previously surveyed parcel (Bath 1989). Site -4110 is located in the southwest corner of Waimānalo Gulch, at approximately 80 ft. elevation. (CSH, 2008).

Further archaeological study within Waimānalo Gulch was conducted for the expansion of the sanitary landfill (Hammatt and Shideler 1998). No archaeological sites were located with the project area; however two sites, the Battery Arizona bunker complex and a modern “shrine” site, were observed along the northern ridge that separates Waimānalo Gulch from the HECO Kahe Power Plant property. The stones of the “shrine” site were believed to have been previously relocated from the central portion of Waimānalo Gulch circa 1988. (CSH, 2008).

An archaeological inventory survey for the proposed University of Hawai‘i-West O‘ahu campus was conducted by Dega et al. (1998). No traditional Hawaiian sites were located. (CSH, 2008).

Two archaeological studies were made in the Pālehua area, *mauka* of Makakilo. An archaeological inventory survey of the proposed KAIM radio tower (Hammatt 1992), located northwest of the current project area identified no archaeological remains. An archaeological assessment for the proposed Ministry of Transportation Satellite Multi-Ranging Station project site (Borthwick 1997), which abuts the western perimeter of the

Air Force Solar Observatory facility, identified no archaeological remains. In 2002, an informal survey conducted by SHPD/DLNR identified an enclosure site (50-80-08-6402) just off of Pālehua Road (SHPD personal communication 2004). The site consisted of two enclosures; one enclosure was determined to be of prehistoric origin, while the other was historic. (CSH, 2008).

Archaeological studies associated with the proposed Makakilo Golf Course (Sinoto 1988) and the Makakilo D and D-1 Development Parcels (Nakamura et al. 1993) were conducted in the immediate vicinity of the current project area. A single archaeological feature, a low stacked basalt boulder wall (50-80-12-1975), was identified (Sinoto 1988).

Archaeological inventory survey of the Makakilo D and D-1 Development Parcels included lands on the southern and western slopes of Puʻu Makakilo, adjacent to the golf course property. A single historic property, a cement irrigation flume (50-80-12-4664), was located in the southern portion of the project area near the H-1 Freeway (Nakamura et al. 1993). No sites were located in the vicinity of Puʻu Makakilo. (CSH, 2008).

7.4.5. Results of the Community Contact Process

Consultation with Hawaiian cultural organizations, government agencies, and individuals who might have knowledge of and/or concerns about traditional cultural practices specifically related to the Waimānalo Gulch was undertaken by CSH by letter, e-mail, and telephone or in-person contact. In the majority of cases, letters - including a map of the project area – were mailed. The specific language requesting the information included the following (CSH, 2008):

> "The purpose of this assessment is to identify any traditional cultural practices associated with the project area, past or present. We are seeking your kōkua and guidance regarding the following aspects of our study:
>
> - General history and present and past land use of the study area.

- Knowledge of cultural sites which may be impacted by the project – for example, historic sites, archaeological sites, and burials.
- Knowledge of traditional gathering practices in the study area–both past and on-going.
- Cultural associations with the study area through legends, traditional use or otherwise.
- Referrals of kūpuna or anyone else who might be willing to share their general cultural knowledge of the study area.
- Any other cultural concerns the community might have related to cultural practices in the Waimānalo area."

A total of twenty-one (21) individuals, organizations, and agencies were consulted (**Table 7-15**). Four of these referred CSH to other individuals who were included in the study. Seventeen (17) individuals contributed specific and relevant information via formal interviews, informal "talk story" discussion and / or email.

Table 7-15
Summary Consultation Efforts by CSH

Name	**Affiliation**	**Comments**
Ailā , William	Hui Mālama I Nā Kūpuna o Hawai'i Nei	Mr. Ailā feels it is very important to preserve the sites of this area. See Section 6 of the CIA for response.
Amaral, Annelle	'Ahahui Siwila Hawai'i O Kapolei Hawaiian Civic Club	Made referral to Shad Kane.
Cope, Aggie	Hale O Na'auao Society	Mrs. Cope mentioned that that area was known for the night marchers trail from *mauka* to *makai*. See CIA, Section 6 for response.
Desoto, Frenchy	Wai'anae Coast Archaeological Preservation Representative	Made referral to Gary Omori, William Ailā .
Eaton, Arline	*Kupuna* at Iroquois Elementary School	See CIA, Section 6 for response.
Enos, Eric	Cultural practitioner and director of Ka'ala Farms	Mr. Enos visited Site 6903 to view *pōhaku* within the project area. He is concerned about the protection of this site.
Flanders, Judith	Granddaughter of Alice Kamōkila Campbell	See CIA, Section 6 for response.
Greenwood, Alice	O'ahu Island Burial Council Member, Wai'anae District	Ms. Greenwood spoke of a village at Makaīwa. She recalls a story about a ceremony in the area that mentioned possible burials. She remembers the *mo'olelo* had the names of the unknown gulches. She also spoke about the

Name	Affiliation	Comments
		huakaʻi pō (procession of the night marchers) and *akua lele* (flying god, usually a poison god sent to destroy, sometimes in the form of fireballs). See CIA, Section 6 for response.
Hoʻohuli, "Black" Jo	Waiʻanae Neighborhood Board No. 24	Mr. Hoʻohuli is concerned about caves in the *mauka* area that may contain burials.
Rezentes, Cynthia	Waiʻanae Neighborhood Board No. 24	Mrs. Rezentes suggested contacting Frenchy Desoto. She is very concerned about the view plane.
Johnson, Rubellite	Hawaiian scholar	Ms. Johnson recommended consulting people who are from the project area.
Josephides, Analu	Oʻahu Island Burial Council Member, Waiʻanae District	See CIA, Section for response.
Kanahele, Kamaki	President of Nānākuli Homestead	See CIA, Section 6 for response.
Kane, Shad	Member of the Makakilo, Kapolei, Honokai Hale Neighborhood Board and ʻAhahui Siwila Hawaiʻi O Kapolei Hawaiian Civic Club	Mr. Kane made two site visits with CSH to the project area. Mr. Kane is very concerned about the cultural sites within the project area and wants to be involved in the preservation process. He is also concerned about the view plane. See CIA, Appendix A for complete interview conducted in 2002 in association with a previous CIA of portions of the project area (cf. Souza and Hammatt 2002)
Makaiwi, Martha	Makakilo, Kapolei, Honokai Hale Neighborhood Board No. 34	Made referral to Maeda Timson and Shad Kane.
McKeague, Kawika	Oʻahu Island Burial Council member ʻEwa District	See CIA, Section 6 for response.
Momoa, Joseph	Kamaʻāina of Nānākuli and member of Kamoʻi Canoe Club	Mr. Momoa mentioned the night marcher path in Waimānalo area and he feels the path needs to be kept clear of visual blockage.
Nāmuʻo, Clyde	Administrator at Office of Hawaiian Affairs	OHA recommended: (1) Consultation with seven specific individuals, all of whom CSH attempted to contact. (2) The project area should be considered a portion of a larger traditional cultural landscape, and that the possible presence of one or more Traditional Cultural Properties be considered (See CIA, Appendix C for OHA letter).
Philpotts, Douglas McDonald	Cultural practitioner and long time resident of Waimānalo ʻIli	Mr. Philpotts made a site visit to view the uprights within the project area. See CIA, Section 6 for response and CIA, Appendix B for complete interview.
Tiffany, Nettie	Kahu of Lanikūhonua and Former Oʻahu Island Burial Council member, ʻEwa District	See CIA, Section 6 for response.
Timson, Maeda	Member of the Makakilo, Kapolei, Honokai Hale Neighborhood Board No. 34 and President of Ua Au O Kapolei	Mrs. Timson shared two stories told to her by her Tutu Defreitas. Her *tutu* would bless the *hale* with *tī* (or *kī*) leaf and Hawaiian salt because all the *keiki* would get *makaʻu* (scared). They also had *tī* leaf on all four corners of the house for protection.

7.4.6. Cultural Resources and Traditional Practices

The areas of Waimānalo Gulch, Makaīwa Gulch, Ko ʻOlina, Lanikūhonua and the uplands of Pālehua and Puʻukuʻua are within the ʻili of Waimānalo located in the ahupuaʻa of Honoʻuliʻuli, ʻEwa District. ʻIli is defined as "a land section, next in importance to ahupuaʻa and usually a subdivision of an ahupuaʻa" (Pukui and Elbert 1971:91).

The current project area was a zone of less intensive land use between resource rich areas mauka and makai. The makai area has marine resources, a canoe landing, koʻa (fishing grounds) and loʻi (pondfield) that sustained a fishing village. The mauka area is considered a sacred place with many heiau, myths and legends. (CSH, 2008).

Although this area has been placed in the district of ʻEwa and the ahupuaʻa of Honoʻuliʻuli, some Waiʻanae community members feel a strong connection with this place as many traverse this area frequently to get in and out of Waiʻanae. Participants also mentioned the many natural and cultural resources of the region. (CSH, 2008).

Specific aspects of traditional Hawaiian culture mentioned during information gathering interviews and "talk story" sessions are incorporated in the CIA document. Some interview material is excerpted from past CIAs conducted by CSH. Interviewees for the current project gave their permission for past interviews to be included in this report. Participants also provided new stories for Waimānalo Gulch for which we have found no previous written documentation. Some of these stories include Spirits (ʻUhane), the "Legend of the Slain Girl", the "Legend of Two Giants", and associations with the Pueo ʻAumakua. (CSH, 2008).

Concerns for sacred sites in the area focused on the Pueo Stone which was relocated around 1988 for preservation. Nana Veary, a respected kupuna, relocated the pōhaku. Gary Omori asserts that after the Pueo Stone was moved to safe ground "the strange events stopped." Another concern of the area surrounds the tradition of "Night

Marchers” (huakaʻi pō); in particular, the passage in the makai region close to human habitation at Lanikūhonua. The huakaʻi pō inland route is somewhat vague but appears to be up the southern ridge of Waimānalo Gulch. (CSH, 2008).

7.4.6.1. Traditional Hawaiian Beliefs

A number of kūpuna and other community members spoke of beliefs associated with Waimānalo ʻIli of Honoʻuliʻuli and the surrounding valleys. While these beliefs and traditions are interrelated, they are discussed in terms of the presence of ʻuhane (soul, spirit, ghost), traditions of huakaʻi pō (procession of the night marchers), a legend of a slain girl, a legend of two giants, and a tradition of owl ʻaumakua (ancestor gods), in addition to accounts of other mysterious and strange incidents. (CSH, 2008).

Association with ʻUhane

Several people familiar with the area mentioned that Waimānalo Gulch and Makaīwa Gulch are associated with *ʻuhane*. In *Nānā i Ke Kumu*, a source book on Hawaiian cultural practices, concepts and beliefs, *ʻuhane* are introduced as follows:

> *Says Mary Kawena Pukui of certain of her ancestral beliefs, “Some things are ʻeʻepa. Unexplainable. ”Accept that, and it becomes easier to know about ʻuhane. For in Hawaiʻi’s religious mystic tenets, ʻuhane was: The animating force which, present in the body, distinguished the quick from the dead. And so ʻuhane can be called “spirit.”*
> *The vital spark, that departed from the flesh, lived on through eternity, rewarded for virtue or punished for transgressions in life. Thus ʻuhane is “spirit” in the immortal sense, and the “soul” of Christian concept. Or, as immortal spirit or soul, the ʻuhane might return to visit the living and so be termed a “ghost”. (Pukui et al. Vol. I, 1972:193)*

The following is a brief summary of the traditional Hawaiian beliefs as documented by CSH (See **Appendix H**, for further detail).

Huakaʻi Pō or ʻOiʻo (Procession of the Night Marchers)

There are Hawaiian beliefs regarding the presence of what are commonly known as “night marchers” and the huakaʻi pō or the, “night procession or parade, especially the night procession of ghosts that is sometimes called ʻoiʻo” (Pukui and Elbert 1986:84). The night marchers are the souls of those who have passed on. An ʻōlelo no’eau (proverb) makes reference to this tradition: “He pō Kāne kēia, he mā’au nei nā ‘e’epa o ka pō.” (This is the night of Kāne, for supernatural beings are wandering about in the night) (Pukui 1983:98).

Several of the participants in this cultural study talked about night marchers. Aunty Arline Eaton commented that there is a pathway for the night marchers that travel from the *mauka* area of Waimānalo ‘Ili down to the special place of Lanikūhonua. She feels strongly that this pathway must be kept clear for them to continue their traditional passage.

Aunty Aggie Cope and Kamaki Kanahele both mentioned that the *‘ili* of Waimānalo was well known for the pathway of the night marchers and they both feel it is of great importance to keep that pathway clear of visual impact.

Judith Flanders mentioned that her grandmother Kamōkila Campbell spoke about the night marchers’ trail that came from the uplands to the ponds at Lanikūhonua.

Nettie Armitage-Lapilio related a tradition that at certain times of the year night marchers would come down from the uplands to the vicinity of Kamōkila Campbell’s place on the coast (Lanikūhonua). The procession route indicated was on the east ridge of Waimānalo Gulch which is the west ridge of Makaīwa Gulch (Souza and Hammatt 2002).

Analu Josephides recalls mo‘oleo told to him by his kūpuna. One of the many stories shared and landscapes pointed out is both the path of the night marchers and of the night marchers themselves. One of the stories that Tutu Wahine related was that in the old days no homes were built in this particular area except for the mauka area of Makaīwa to the west, the mauka area to the east known as Makakilo, and the makai area below where in ancient time was the dwelling place of the Kamapua‘a ‘ohana.

> *We were told as children that one of the reasons that homes were not built on the path of the night marchers were that the night marchers and those who leaped from this world*

> *and taken to be with these clans were said to carry the burning kapu of Pihenakalani. This was a kapu that descends from Kauaʻi from the ancient days of the Mū and the Menehune people. It was also known as the prostrating kapu of Kalanikauleleiaiwi.*

Nettie Tiffany discussed her childhood memories about what her aunty called the “bird catchers.” They would come down from the Waimānalo and Makaīwa Gulch area through a trail that was marked by a large *pōhaku* (stone). The bird catchers would come down from the gulch to take a bath in the waters fronting Lanikūhonua.

Legend of Two Giants

A legend told by Alice Greenwood mentions two giants who live in the Waimānalo and Makaīwa area. The legend indicates that when one giant opens his eyes it means the giant will take someone’s life. There is concern that these legends may be connected with unexplained car accidents that have occurred on Farrington Highway in front of the two gulches. Few details of this legend were provided.

There are also several accounts of giants in the vicinity. The Hawaiian gods Kāne and Kanaloa, who are sometimes understood to attain supernatural size, are associated with the area of Piliokahe where stones they hurled from red hill landed (Simeon Nawa’a 1954 in Sterling and Summers 1978:1). Simeon Nawaʻa related another account of Piliokahe associating two hills with a male and a female - seemingly of fabulous size. The demi-god Māui is associated with the southern Waiʻanae area (particularly Lualualei) and is often thought of as a giant in his superhuman efforts to snare the sun.

Legend of the Slain Girl

These ʻ*uhane* may be explained by a few legends concerning the Waimānalo Gulch area. Mr. Omori tells about one legend of two lovers (Souza and Hammatt 2003):

> *…the girl is hunted down and killed in the Waimānalo Gulch. People say that the girl’s ʻuhane lingers in this gulch and an image of a white lady appears at times and strange things happen in the area. For example, unexplained car accidents happen on Farrington Highway.*

This account has strong similarities with the famous legend of Kahalaopuna, the young woman of Mānoa who is murdered repeatedly (she revives repeatedly) by Kauhi, her jealous lover from Koʻolau. Enraged at accounts of her sleeping with various lovers, Kauhi leads Kahalaopuna through the uplands of south Oʻahu traveling west from Mānoa Valley (with Kahala being slain repeatedly). While the many accounts differ in detail a common setting for the last of the beatings is Pōhākea Pass in Honoʻuliʻuli north of the project area. After being put to death, her ʻuhane flies up into an ʻōhiʻa lehua tree and calls out to travelers passing along the road asking them to inform her parents of her death.

ʻAumakua Pueo of the ʻIli of Waimānalo

Many people consulted for this project mentioned the frequent sighting of pueo (owl) in the area. Gary Omori and William Ailā mentioned that the pueo was the ʻaumakua of the ʻohana in the area (Souza and Hammatt 2002). In Nānā i Ke Kumu, a source book on Hawaiian cultural practices, concepts and beliefs, the concept of ʻaumakua is introduced as: “ancestor gods; the god spirits of those who were in life forebears of those now living; spiritual ancestors” (Vol. I, 1972:35). ʻAumakua fall into the English category of totems and were typically animal or plant species. ʻAumakua could be inherited bilaterally, from both the father’s and mother’s kin groups (ʻohana). Each individual had the opportunity to retain multiple ʻaumakua. Mary Kawena Pukui’s childhood education included memorizing the names of fifty of her family ʻaumakua (Nānā i Ke Kumu Vol. I, 1972:356). Aunty Aggie Cope mentioned that there was a rock in Waimānalo Gulch that resembles a pueo. The presence of the Pueo Rock connects the traditions and beliefs directly to this area. The Waimānalo and Makaīwa Gulches are typical habitat for pueo and they are often seen hunting in the grasslands.

7.4.6.2. Burials

Most Hawaiians in the pre-Contact period belonged to the makaʻāinana or commoner class and their bones were usually buried in their particular ʻili. Burials are commonly reported from clean, consolidated sand deposits, which was clearly a common method of internment practiced by Hawaiians (Cleghorn 1987:42).

No burials or iwi kūpuna (ancestral human remains) have been documented in two archaeological inventory surveys of the project area (Hammatt and Shideler 1998; Dalton and Hammatt 2008). The closest known burials were found in the Ko ʻOlina and Lanikūhonua in caves, sand dunes and sinkholes. However, Dalton and Hammatt's (2008) report states it is possible that burials may be discovered during proposed construction activities; in particular, several small caves and overhangs in the northwest portion of the current project area may contain such evidence. Some participants strongly recommend that the project does not extend any further into the mauka region, which may contain burials. (CSH, 2008).

Nettie Tiffany urged caution in regards to burials in the project area; she feels although the land has been heavily altered by ranching and other activities there is still a possibility of finding *iwi kūpuna*. She also strongly suggests that there be a plan of action if there are burials found during the project. (CSH, 2008).

Aunty Arline also mentioned that if people lived in the project area, there might be a possibility of finding burials (CSH, 2008):

> *My only thought is that for every person that lives in that area, that's where they bury their people… We never said anything if people died, we'd go over there and they'd bury them right there where the house is. We'd never go four-hundred-million-miles away, it's right there. All your ʻohana stay right in the same area. We never went afar, not in the rural areas.*

7.4.6.3. Trails

Trails connected the settlements throughout the District of ʻEwa and Waiʻanae. Based on nineteenth and twentieth century maps, the primary transportation routes correlated closely to the existing major roadways. (CSH, 2008).

It seems clear that a major east/west artery from ʻEwa and Kona Oʻahu to Waiʻanae ran just south of Makaīwa Gulch roughly along the Farrington Highway alignment. "As mentioned before, there were three trails to Waiʻanae, one by way of Puʻu o Kapolei, another by way of Pōhākea, and the third by way of Kolekole" (ʻĪʻī 1959:97).

The following on ancient trails is from the ʻAhahui Siwila Hawaiʻi O Kapolei letter:

> *There may have once existed an intersection of 2 trails in the approximate location where the present entrance to Ko 'Olina exist today. In ancient times there were 3 ways to get to Waiʻanae. One was by way of Kolekole, one was by way of Pohakea and the 3rd was by way of Puʻuokapolei. Farrington Highway follows the path of the ancient trail that passed Puʻuokapolei.*
>
> *Generally, petroglyphs are found on the high ground between Waimānalo and Makaiwa Gulches indicating that a trail may have once existed in this area, again confirming a mauka-makai path. The existence of this trail is supported by numerous amounts of cultural resources and structures built along this lineal mauka-makai relationship that follows the path of Waimānalo and Makaiwa Gulches.*

The petroglyph site described (State Inventory of Historic Properties [SIHP] # 50-80-12-2893) is located outside the southeast corner of the current project area. A mauka/makai trail, probably the one depicted on a 1914 Fire Control Map, starts at the area of the petroglyphs (SIHP # 2893) and goes up between the east end of Waimānalo Gulch and the west end of Makaīwa Gulch. This trail is most likely a pathway to the former village of Puʻu Kuʻua and the heiau in the mauka region of Honoʻuliʻuli. This mauka/makai trail would have also intersected the well known trails of upper Honoʻuliʻuli, Pōhākea Pass, Kolekole and Palikea which all lead to Kūkaniloko, the center or piko of the Island of Oʻahu. (CSH, 2008).

7.4.6.4. Gathering of Plant Resources

Given the ecosystem diversity of the coastal lowland, transition and upland forest zones in Honoʻuliʻuli Ahupuaʻa, it is likely that one of the primary traditional cultural practices associated with the present project area would have been the gathering of native plant resources. **Table 7-16**, lists Honoʻuliʻuli lowland plants and uses with columns for "common/Hawaiian name", "scientific name" and "use" based on research conducted by

Barbara Frierson (1973) on native plant species present in Hono‘uli‘uli before 1790, in addition to plant use recorded by Isabella Abbott (1992). (CSH, 2008).

Table 7-16, Native Plants in Hono‘uli‘uli

Hawaiian/Common Name	Scientific Name	Use
Hala, pandanus	Pandanus odoratissimus	Weaving
Hau, hibiscus	Hibiscus tiliaceus	Cordage
Milo	Thespesia paradisiaca	Wood used for bowls
Neneleau, Sumac	Rhus sandwicensis Rhus chinensis	Unknown
‘Ilima	Sida cordifolia	Leis, medicine
Kou	Cordia subcordata	Bowls
Makaloa, sedge	Cyperus laevigatus	Mats (Abbott)
Pili, grass	Heteropogon contortus	Thatch
Kakonakona, grass	Panicum torridum	Unknown
Honohonowai	Commelina nudiflora	Unknown
Ma‘o, cotton	Gossypium tomentosum Abutilon incanum	Flowers used as dye for kapa (Abbott)
‘Ūlei	Osteomeles anthyllidifolia	Branches used for fishing nets (Abbott)
‘Uhaloa	Waltheria americana	Medicine (Abbott)
Koali‘ai	Ipomoea cairica	Cordage (Abbott)
Pā‘ū o Hiiaka	Jacquemontia sandwicensis	Unknown
Ko‘oko‘olau	Bidens sp.	Use as tea (Abbott)
‘Ulu, breadfruit	Artocarpus incisus	Food
Kalo, taro	Colocasia esculenta	Food
Niu, coconut	Cocos nucifera	Food, liquid

The accessibility of Hono‘uli‘uli lands, including the present project area, to Hawaiians for gathering or other cultural purposes was radically curtailed during the second half of the nineteenth century. By the 1870s, herds of cattle grazing across the ‘Ewa Plain likely denuded the landscape of much of the native vegetation. Subsequently, during the last decade of the nineteenth century, the traditional Hawaiian landscape was further distorted by the introduction and rapid development of commercial sugar cane cultivation. Throughout the twentieth century sugar cane cultivation was the dominating land use activity within the project area. Cane cultivation – and the sense that the project area was private property – restricted access inside the project area to employees of ʻEwa Plantation. (CSH, 2008).

7.4.6.5. Native Gathering Practices for Plant Resources

Hiram Kamanā indicated that he used to gather ingredients for a cleansing *lāʻau lapaʻau* (botanical medicine), including "*Kī Māmaki*" (*Māmaki, Pipturus* sp.), in the uplands. The bark, fruit and young leaves of the Māmaki were used medicinally (Wagner et al. 1990:1307). It is definitely understood that this was picked well *mauka* of the landfill (no *Māmaki* is known to grow in the immediate vicinity of the landfill). (CSH, 2008).

Nettie Armitage-Lapilio spoke of gathering plants for both medicine and ornament in the uplands. She spoke of gathering Ēkoa (also known as Koa-haole and Lilikoa; Leucaena leucocephala aka Leucaena glauca) seeds and or seedpods for lei which the ʻohana would wear while performing hula and also sell to make extra money. She indicated the seeds/seedpods were gathered where the landfill is now. This exotic species (first collected on Oʻahu in 1837) is very common, often forming the dominant element of the vegetation in low elevation, dry, disturbed habitats of all the major islands (Wagner et al. 1990:680).

Nettie Armitage-Lapilio mentioned gathering two species for lāʻau lapaʻau: ʻUhaloa (Waltheria indica var. americana) and Kīnehe (Spanish Needle, Bidens spp.). According to Wagner et al. 1990:1280, ʻUhaloa, which is known by many alternative names (e.g., ʻAlaʻala, Pū loa, Hala uhaloa, Hiʻaloa, and Kanakaloa), is an indigenous pan-tropical plant, occurring in dry, often disturbed sites on all the major islands; it has been widely used medicinally by the Hawaiians as a painkiller especially for sore throat. Kīnehe (aka Kī, Kī pipili and Nehe) is a pan-tropical exotic weed widespread in disturbed areas (Wagner et al. 1990:279). Pukui and Elbert (1986:152) note for "Kīnehe" that: "The Spanish needle (Bidens pilosa) is a lowland weed; young fresh plants are still brewed for tea."

CSH is confident that Māmaki has not grown near the landfill in recent times as it prefers wetter environments found at higher elevations. Ha‘uōwī, Pānini, Ēkoa, Uhaloa, and Kīnehe are all quite ubiquitous in similar dry, lowland areas. It is interesting to note in passing that four of the six plant species used (Ha‘uōwī, Pānini, Ēkoa, Kīnehe) are exotic species. CSH further perceives no adverse impact on Hawaiian utilization of these species by the proposed landfill expansion action. (CSH, 2008).

7.4.6.6. Taro in Hawaiian Culture

Taro cultivation was mentioned in two of the LCA testimonies for individual kuleana claims in the ‘ili of Waimānalo of Hono‘uli‘uli Ahupua‘a. The testimonies indicated that these LCA’s contained at least two lo‘i as well as house lots, sweet potato, kula-at Pu‘ukuua, ponds, streams and fishery. The taro cultivation here was not as intensive as the well known “Hono‘uli‘uli Taro Lands” near the mouth of Pear Harbor and the Hono‘uli‘uli Stream. Apparently Waimānalo ‘Ili had sufficient water along with backshore swampy areas to provide personal lo‘i on a small scale. Although these claims were not awarded they provide a wealth of information. (CSH, 2008).

The area of Lanikūhonua south of the WGSL, once a marshy wetland fed by a natural springs, was an ideal place to cultivate taro. Davis et al. (1986) mapped the natural marshy area and spring. Many maps show water filtering down from the Waimānalo and Makaīwa Gulches as well as the unnamed gulches that could have also feed the *lo‘i* of this area. There is no mention of taro grown in the project area but there were natural springs that could sustain a small patch. Aunty Nettie Tiffany, Aunty Arline Eaton and Douglas McDonald Philpotts all mentioned that the area of Waimānalo, Makaīwa, and Lanikūhonua had sources of fresh water. (CSH, 2008).

Taro has an intimate connection to the Hawaiian culture. Taro (kalo; Colocassia esculenta) was probably brought to Hawai‘i by the earliest Polynesian voyagers and has been a staple crop on the islands ever since. Taro is intimately connected through myth to the origins of Hawaiians as a people. (CSH, 2008).

The physical attributes, the growth patterns, and the propagation of taro all reflect the structure of Hawaiian kinship and an obvious relationship to the human body. The main plant in the center is the *makua* (parent), the smaller plants budding out of the *makua* are the *ʻohā* (offspring). The center of the leaf where it connects to the stem is the growth center of the veins of the leaf and is called the *piko* (belly button). The stem is called *ha*, which is also a word for breath, the basis of life. The cycle of planting is a reflection of the human life cycle. (CSH, 2008).

All parts of the taro plant are used for food: the corm is cooked and eaten as table taro or steamed and pounded into *poi*; the stem can be steamed and used in various soup and stew dishes; the young leaves are used for *laulau* and *lūʻau* dishes mixed with fish, squid, pork, chicken or beef. Generally, the leaves are not harvested from the plants designated for corm production because continuous cutting makes the corms soft and tasteless (*loli*). Taro growers who grow leaf for home use or commercial purpose always have specially designated *lūʻau* patches. It is traditional Hawaiian practice to use all the coarse green cuttings that are the by-product of the harvesting of the corms as food for the pigs. This green material, when cooked and fed to the animals, is highly nutritious. For this reason, raising pigs is traditionally symbiotic to taro production. (CSH, 2008).

Although taro is not grown anymore near the project area, documents prove there once was taro cultivation west of Honoʻuliʻuli. (CSH, 2008).

Due to the dry conditions on the leeward side of Oʻahu, taro was not as abundant in Waimānalo ʻIli as it was in some of the surrounding marshy areas. Though, there was a fair amount of water sources in the area. (CSH, 2008).

7.4.6.7. Significant Cultural Sites within the Project Area

CSH previously performed an inventory survey of the project area in 1998 (Hammatt and Shideler 1998) and an additional assessment was conducted in 2007 (Dalton and Hammatt 2008). During the 2007 companion archaeological inventory survey, CSH identified one historic property within the project area: SIHP # 50-80-12-6903, three rock uprights, which were recommended eligible for the Hawaiʻi Register under Criteria D and E. (CSH, 2008).

A culturally significant Pueo Stone was identified by Bath in 1989. This “Pueo Stone” eventually had to be relocated to the northwest ridge of the gulch. Due to the significance of this cultural site, it has been protected and cared for in a safe area by a cultural practitioner. (CSH, 2008).

7.4.6.8. Marine Resources

The sea is a rich resource and the Hawaiian people were traditionally expert fishermen. Fish of all types supplied the Hawaiian diet with a rich source of protein. This source of food is a supplement to the things grown in the uplands. The LCA documents provide information that the people of Waimānalo area were utilizing the ocean resources as a fishery as well as the upland forest area for subsistence. This is a good example of the *ahupuaʻa* system that was once used. (CSH, 2008).

Through the interview process, a number of koʻa and fishing experiences were cited. A koʻa is defined as “Fishing grounds, usually identified by lining up with marks on shore or shrine, often consisting of circular piles of coral or stone, built along the shore or by ponds or streams” (Pukui and Elbert 1971:144).

Hawaiians were very conservative when it came to marine resources. They set kapu on certain fish during their time of spawning and made sure that these fish had time to repopulate. The following exert is a passage from Hawaiian Fishing Traditions which talks about the kapu on ʻōpelu (CSH, 2008):

> *An important fishing kapu concerned the ʻōpelu (mackerel) and the aku (bonito), two highly prized fish caught in great numbers in Hawaiian waters. ʻŌpelu was netted from July through January. Walter Paulo and Eddie Kaʻanana, two ʻōpelu fishermen from Miloliʻi, told me the best time for catching this fish is in October. ʻŌpelu was placed under kapu in February, until the end its spawning season, around July (Moku Manu and Others 1992:xii).*

7.4.6.9. Wahi Pana (Storied Places)

The concept of wahi pana, a place with a story or legend attached to it, is very important in Hawaiian culture because it is a connection to the past and the ancestors. From place names, one can know intimate details about people who lived there, the environment, cultural practices and historical events that took occurred. In Hawaiian culture, if a particular spot is given a name, it is because an event took place there that had meaning for the people of that time. Because Hawaiian culture was based on oral traditions, place names and their associated stories were an important way of remembering these traditions and ensuring these stories would be passed on to future generations. In Hawaiian thinking, the fact that a place has a name deems it important. Often, spiritual power or mana is attached to a place, which increases its importance. (CSH, 2008).

On the subject of wahi pana, Edward Kanahele writes:

> *As a native Hawaiian, a place tells me who I am and who my extended family is. A place gives me my history, the history of my clan, and the history of my people. I am able to look at a place and tie in human events that affect me and my loved ones. A place gives me a feeling of stability and of belonging to my family, those living and dead. A place gives me a sense of well-being and of acceptance of all who have experienced that place. (Kanahele in James 1995:6)*

Analu Kameeiamoku Josephides mentions a moʻolelo passed down to him by his kūpuna regarding some names of the Waimānalo ʻIli. The area was referred to as five brothers who protected and cared for the island of Oʻahu; they were the “Eyes” of Oʻahu (CSH, 2008):

> *Another concern that I may have is the place names of this particular area. A story that has been passed down to me from my kupuna is that there were five brothers who were the watchers. Their names were Makaīwa, Makaʻike, Makaloa, Maka-Io, and Makakilo. It was known that Makaīwa was to the farthest west and that Makakilo was to the farthest east. That these five brothers were the eyes of the Oʻahu people and were their protectors. They would watch for enemy intruders and relay messages to their makulu (runners). If enemy canoes were seen the makulu would run to the various districts and warn the chief and his/her people. This is why Oʻahu was a hard island to conquer in the ancient times. By the time the war canoes of the enemies would reach the shores they*

> *would be greeted by the warriors of Oʻahu, thus the enemies were never allowed to land upon the shores of Oʻahu.*

Douglas McDonald Philpotts also spoke about a connection between this area and the other islands through the path of the sun (CSH, 2008):

> *Whether you're a spiritual person or not you will be impressed by the sheer beauty of this place, and the spectacular views from here. But many who come here are surprised by the sense of mana here. The view is special here, from the top of Pālehua between Puʻu Manawahua and Mauna Kapu you can see all the islands and all of the mountain tops on those islands, this is the only place in all the islands you can do this. Hermann von Holt showed me the trench that still remains on the Honolulu ridge of Mauna Kapu and said another one in the south was taken out when the road was put in. It was right where the big blockhouse is now. Herman said they were told by the Hawaiians in the ranch camp at Honoʻuliʻuli this was a most sacred place, and the place of great mana, and that is why I think the Hawaiians lived here and their spirits never left. This could be part of the meaning in the name Pālehua. In addition to the unique view of the islands I have observed the annual journey of Iā (sun) from here. It starts on the first day of the celestial year on the winter solstice. At sunrise the sun can be seen rising from its house Haleakala as it begins its journey northward it rises from the west Maui Mountains and then from East Molokaʻi. Reaching Oʻahu it rises from Koko Head and moves from peak to valley north through the Koʻolau's reaching its destination Mokumanamana in exactly half a year. Then on June 21st, the summer solstice, the sun sets behind Kauaʻi and starts its journey back home. On this solstice line connecting Haleakala, Pālehua and Mokumanamana are also several heiau. Twice a year on the equinox the sun sets over Puʻu Heleakala. To me these and many other things seem to be more than coincidence.*
>
> *I am just starting to understand that there is no other place like this when you add the layer of the winter and summer solstice; there is no other place that lines up like that. So I think the real resource is the view, and the power that comes from that.*

7.4.7. Summary and Conclusions, Potential Impacts and Mitigation Measures

Potential Project

The WGSL was established in 1987. In addition to previous use activities, the importation of landfill material has most likely further eliminated any historic properties and plant resources related to Hawaiian cultural practices and beliefs that may have been present within the bounds of the landfill property. Additionally, the presence of the landfill over the last fifteen years has already precluded any traditionally established access to *mauka* areas through Waimānalo Gulch. (CSH, 2008).

The accessibility of Hono‘uli‘uli lands, including the present project area, to the Hawaiians for gathering or other cultural purposes would be radically curtailed during the second half of the nineteenth century. As noted above in this evaluation, by the 1870s, herds of cattle grazing across the ‘Ewa Plain likely denuded the landscape of much of the native vegetation. Subsequently, during the last decade of the nineteenth century, the traditional Hawaiian landscape was further distorted by the introduction and rapid development of commercial sugar cane cultivation. Throughout the twentieth century sugar cane cultivation was the dominating land use activity within the project area. Cane cultivation – and the sense that the project area was private property – restricted access inside the project area to employees of ‘Ewa Plantation. (CSH, 2008).

The ‘ili of Waimānalo including (Makaīwa, Lanikūhonua, Ko ‘Olina, and the uplands) has been described by community participants in this assessment process as a sacred area of great cultural importance. Many of the individuals contacted or interviewed for this study have expressed concerns about cultural impacts within and beyond the boundaries of the proposed project area. These concerns are based on a traditional view of the Hawaiian landscape as a continuum, in which the ‘ili of Waimānalo is perceived in unbroken relationship between mauka and makai lands and to the ocean beyond. This relationship is reflected in the oral traditions mentioned by the people of this land, the sites documented within the project area, as well as the many sites mauka and makai. The current project area is located along an ancient pathway between the mauka and the makai, i.e., the uplands and the coast. Both of these two general areas contain diverse and abundant resources. This pathway is traversed by Hawaiian ancestors in both the physical and the spiritual form. The makai area was rich in estuarine and marine resources including a canoe landing, a ko‘a, ki‘i pōhaku as well as lo‘i that sustained a thriving fishing village. The mauka area is covered with numerous religious cultural sites. (CSH, 2008).

Community participants have expressed great concern about the Huaka‘i Pō Kāne, also known as the Night Marchers, a monthly procession of the spirits of the dead. According to kūpuna, the trail of the Night Marchers in this area runs from mauka to makai.

Hawaiian cultural belief is that these trails are significant and must not be impeded for fear of retribution from spirits of the departed. This type of cultural tradition often goes unacknowledged because it is not an accepted part of the dominant Western culture; however it is very real for many people in Native Hawaiian communities. Hawaiian culture acknowledges a spiritual aspect to nature and interprets it in a way that has made certain Kānaka Maoli (native born) very sensitive to natural phenomena. (CSH, 2008).

According to the state OEQC's guidelines for preparation of cultural impact studies, analysis must take into account culturally significant physical and natural features of the landscape. For example (CSH, 2008):

> Certain landmarks and physical features are used by Hawaiian navigators for sailing and the lines of sight from landmarks to the coast by fisherman to locate certain fishing spots. Blocking these features by the construction of buildings or tanks may constitute an adverse cultural impact. (Office of Environmental Quality Control 2004:47)

Based on the information gathered during the course of this study and presented in this report, the evidence indicates that the proposed project will affect traditional Native Hawaiian stone uprights (SIHP # 50-80-12-6903), as identified in the CSH Archaeological Inventory Survey for the proposed project (CSH, 2008).

Recommendations and Mitigation Measures

The Cultural Impact Assessment prepared by CSH has identified community concerns regarding the potential for cultural impacts associated with the proposed project. The following provides CSH's recommendations and the proposed mitigative measures that will be implemented by ENV/WMH:

1. If cultural site SIHP # 50-80-12-6903 needs to be removed, a cultural monitor should respectfully care it for. Douglas McDonald Philpotts, Shad Kane, William Ailā, and Eric Enos all agree that the upright *pōhaku* should

> be removed from its original place during construction, then reunited with its former space and preserved in place. The removal of the *pōhaku* should be conducted in a cultural manner with a cultural monitor and the proper protocols. There should be a preservation plan in place for future cultural access and these community members should be involved in the mitigation process. (CSH, 2008).

As provided in Section 7.3.8. Potential Impacts and Mitigation Measures, ENV and WMH propose that the stone uprights be relocated based on the preparation of an Archaeological Monitoring Plan (AMP) that will be reviewed and approved by the SHPD. Guidance concerning the use of an archaeological monitor to maintain cultural sensitivity and the use of proper protocols will be sought from the SHPD and selected community informants identified by SHPD and CSH. The AMP will include a preservation plan for future cultural access that will incorporate the input of the community informants.

The primary provisions of this approach are that: (1) the period of time for the relocation of the stone uprights would coincide with the use of the area of lateral expansion, a period of approximately 15 years; and (2) although it may not be possible to relocate the stone uprights in the exact same location, ENV and WMH intends to maintain consultation with the SHPD and community for the final resting place for the stone uprights. The maintenance of access will be provided.

2. The traditional view of the Hawaiian landscape as a continuum should be taken into consideration during the planning process. Waimānalo Gulch is perceived as an unbroken relationship between *mauka* and *makai* lands. This relationship is reflected in the traditions of the Waimānalo area mentioned by the community contacts. In this view, any future activity within the landfill property will further distort and diminish the traditional landscape. (CSH, 2008).

The mauka lands of the Waimānalo Gulch have been bisected by the Farrington Highway as the ahupuaʻa transitions to makai lands along the coastline. Although it may not be possible to completely recover the traditional relationship that was once established between these lands, there are three important cultural properties described in the CIA that can be addressed with appropriate and culturally sensitive treatment. These properties include: (1) cultural site SIHP # 50-80-12-6903; (2) the legend of the huakaʻi pō (below); and (3) a series of six natural caves and rock overhangs (also below). ENV and WMH acknowledge these features as an important part of the Hawaiian landscape and will provide for their appropriate treatment as a part of the mitigative measured described in this section.

3. The huakaʻi pō (procession of the night marchers) viewplane should be taken into account in the planning process. Several community participants in this study stated that it is very important to keep the pathway clear of visual and structural blockage from mauka to makai on the east ridge of Waimānalo Gulch and the west ridge of Makaīwa Gulch, in order to allow the huakaʻi pō to continue. Several participants in this study cited the establishment of visual and physical buffer zones to protect the huakaʻi pō. CSH recommends this topic should be addressed in greater detail through further consultation with the community. (CSH, 2008).

ENV and WMH will consult with the community informants identified in the CSH study to mitigate or reduce the potential for visual blockage of the west and east ridgelines of the Waimānalo Gulch. A starting point for this discussion would be through the WGSL Oversight Advisory Committee. However, in order to maintain cultural sensitivity, ENV and WMH would remain open to other suggested venues by the community informants to further discuss and implement appropriate measures for protection of the huakaʻi pō.

4. A series of six natural caves and rock overhangs located in the northwestern portion of the project area were examined and documented

by CSH during an archaeological inventory survey (Dalton and Hammatt 2008). Subsurface testing (excavation) was conducted at two of these features; most do not contain substantial sedimentary deposits. No significant cultural material was observed or discovered at any of these six caves and overhangs; thus, they have not been designated historic properties. However, at least one community participant has voiced concerns about possible disturbances to burials in these caves. CSH recommends cultural monitoring of any proposed disturbance to these caves by qualified native Hawaiians familiar with the project area. (CSH, 2008).

ENV and WMH propose the use of an archaeological monitor during construction activities that may affect the northwestern portion of the WGSL. Prior to the start of work the archaeological monitor will be tasked with (1) reviewing the construction plans for the use of the area of the caves, and (2) consultation with community informants including native Hawaiians who are familiar with the project area. Although burials were not encountered at the time of the AIS, it is always possible that burials might be discovered in the course of earthwork. In the unlikely event of the discovery of a burial work in the immediate area will cease and the SHPD will be notified by the archaeological monitor at (808) 692-8015. Instructions and guidance for future steps will be obtained from the SHPD.

5. Although the land has been dramatically altered, there remains a possibility that burials and other archaeological sites may be present in and around the proposed project area Efforts need to be made to insure adequate archaeology and cultural monitoring are conducted at this project site. In addition to this cultural impact assessment, CSH is conducting an Archaeological Inventory Survey for this project area that was ongoing at the time of this report’s completion (Dalton and Hammatt 2008); its findings and recommendations should be faithfully carried out in

accordance with applicable laws and administrative rules governing historic preservation work in the State of Hawai‘i. (CSH, 2008).

ENV and WMH will comply with the requirements as provided for archaeological and cultural protection and preservation as provided in Chapter 6E, HRS, and other applicable laws and regulations.

6. CSH recommends that community members be further consulted about these and other concerns throughout the planning process. Addressing these cultural concerns is part of the City & County of Honolulu’s “good faith” effort to minimize the impact of the proposed project on Hawaiian culture, its practices and traditions. (CSH, 2008).

ENV and WMH will continue to consult with the community regarding archaeological, cultural, and other environmental matters involving the operation of the existing WGSL and the proposed lateral expansion project. A number of mitigative measures to provide community consultation are provided and are cited elsewhere in this EIS document. The mitigative measures as cited in this section are intended to address the potential for adverse cultural impacts.

See also Section 7.1.~~5~~6. Socioeconomic Mitigation Measures; Section 7.2.3. Potential Impacts and Mitigation Measures regarding Land Use and Ownership; and Section 7.3.8. Potential Impacts and Mitigation Measures regarding Historic and Archaeological Resources.

Cultural Impact Assessment Summary

Secondary and cumulative impacts associated with the use of the site involve the potential for the discovery of other cultural resources, artifacts, or burials that may be present at the project site. This potential however, was considered and served as one important reason for the completion of the Archaeological Inventory Survey (AIS) and Cultural Impact Assessment (CIA) for this project.

Mitigation to address the potential for impacts to archaeological and cultural resources will be coordinated between WMH, ENV, and the SHPD and community informants to develop an appropriate plan for treatment for the stone uprights (SIHP # 50-80-12-6903), huakaʻi pō (procession of the night marchers), and six caves and overhangs. The plan will consider the provision of access by cultural practicioners.

In the unlikely event of the discovery of a burial, work in the immediate area will cease until appropriate coordination with the SHPD has been completed. As required, the applicable provisions of law including HRS, Chapter 6E, and HAR, Chapter 13-300 (regarding burials) to maintain the protection of archaeological and cultural resources will be provided by WMH and ENV.

Section 8
Relationship to Land Use Plans, Policies and Controls of the Potentially Affected Area

8.1. Hawaiʻi State Plan

The Hawaiʻi State Plan, Chapter 226, Hawaiʻi Revised Statutes (HRS), was passed into law in 1978 and revised in 1986 to reflect the future long range planning goals, objectives, and policies of the State of Hawaiʻi. The proposed project maintains consistency with the provisions of the State Plan in the following:

> *Section 226-6(b) To achieve the general economic objectives, it shall be the policy of this State to:*
> *(14) Promote and protect intangible resources in Hawaii, such as scenic beauty and the aloha spirit, which are vital to a healthy economy."*

The proposed project provides for the safe and effective disposal of municipal refuse for all the communities of Oʻahu in accordance with applicable federal, state, and City & County of Honolulu laws and regulations. This waste, if not properly managed, could affect Oʻahu's islandwide "…scenic beauty and the aloha spirit, which are vital to a healthy economy." In as much as the proposed location of the project is within the Waimānalo Gulch, the provision of mitigative measures, practices, and procedures for the proper handling of refuse will be applied to the project to address the potential for adverse environmental effects. (See Sections 4 through 6 of this document).

> *Section 226-11(b) To achieve the land-based, shoreline, and marine resources objectives, it shall be the policy of this State to:*
> *(1) Exercise an overall conservation ethic in the use of Hawaii's natural resources.*

The proposed project is based on the use of an existing facility and property that is under ownership of the City & County of Honolulu. The use of this existing resource represents an effort to conserve the limited and precious land resources of O‘ahu by maximizing the capacity of the site.

The practice of conservation is further supported by the City through continuing efforts to promote recycling and the generation of energy through the use of municipal solid waste at H-POWER. Future plans also call for the use of landfill gas from the Waimānalo Gulch to one day be used in the generation of electricity at the neighboring Hawaiian Electric Company (HECO) Kahe Power Generating Station.

> *Section 226-11(b) (2) Ensure compatibility between land-based and water-based activities and natural resources and ecological systems.*
> *(3) Take into account the physical attributes of areas when planning and designing activities and facilities.*
> *(4) Manage natural resources and environs to encourage their beneficial and multiple use without generating costly or irreparable environmental damage.*
> *(5) Consider multiple uses in watershed areas, provided such uses do not detrimentally affect water quality and recharge functions.*
> *(6) Encourage the protection of rare or endangered plant and animal species and habitats native to Hawai‘i.*
> *(8) Pursue compatible relationships among activities, facilities, and natural resources.*

The natural attributes of the existing WGSL site include a relatively dry climate, the absence of drinking or potable groundwater resources that could be adversely affected by a landfill, and the absence of known threatened or endangered botanical and faunal species. These and other factors were taken into account in the assessment of the site for use as a municipal sanitary landfill.

Protection of the site to ensure against potential adverse effects that could otherwise generate "costly or irreparable environmental damage", will involve the use of mitigative measures and management practices and procedures as described in this EIS document. The protection of air, and ground and surface water quality will be provided through extensive monitoring as described in Sections 4 and 5 of this document. Air, groundwater, and surface water quality is monitored to regularly ascertain the performance of the protective features of the landfill and is an existing practice that would be extended to the proposed project. The monitoring procedures will enable early notification of any issues with the performance of the landfill and provide sufficient time to address and implement corrective actions before any issue becomes a problem.

While the WGSL was initially developed in 1989, at a time with few or limited residential, resort, commercial and business development pressures in the ‘Ewa region, there is now major growth and development of existing and new developments that include ‘Ewa, Kapolei, Makakilo, Ko Olina, the future Makaiwa Hills residential subdivision, and in various locations along Coastal Wai‘anae. Because this growth highlights the limited space available on the Island of O‘ahu for facilities such as a landfill, this EIS proposes a number of mitigative measures and other practices that are intended to reflect the stated commitment of the City and the operator of WGSL, WMH, for the operation of a well run facility that avoids the potential for adverse environmental effects on adjoining land use activities, other facilities, and the natural resources of the site.

> *Section 226-12 (b) To achieve the scenic, natural beauty, and historic resources objective, it shall be the policy of this State to:*
> *(I) Promote the preservation and restoration of significant natural and historic resources.*
> *(3) Promote the preservation of views and vistas to enhance the visual and aesthetic enjoyment of mountains, ocean, scenic landscapes, and other natural features.*
> *(4) Protect those special areas, structures, and elements that are an integral and functional part of Hawaii's ethnic and cultural heritage.*

> *(5) Encourage the design of developments and activities that complement the natural beauty of the islands.*

The preservation and restoration of natural and historic resources present at the WGSL has or is currently being addressed through the conduct of special studies of flora, fauna, archaeological, and cultural resources, and through the development of mitigative measures to address the potential for adverse environmental effects. Based on the conduct of special studies no known threatened or endangered species were observed to be present at the site. An existing archaeological site was found in the form of three stone uprights located along the southwestern edge of the landfill property. To address the discovery of the uprights: (1) the SHPD was notified to report the find and to ascertain further actions or requirements to ensure no disturbance until an appropriate plan for treatment is determined; and (2) notification and coordination with appropriate parties as determined by SHPD that includes the Office of Hawaiian Affairs (OHA) and SHPD designated cultural informants from the area.

The process of coordination to develop an appropriate treatment plan and to ascertain further the purpose and function of the uprights is in progress. The owner of the site, the City & County of Honolulu, intends to work with the SHPD and the community to provide appropriate treatment to ensure protection and preservation of the stone uprights an important part of Native Hawaiian culture and heritage. All required provisions of Chapter 6E, HRS, as well as other provisions of law governing archaeological preservation and protection will be complied with to prevent the irrevocable loss of this resource.

View impacts associated with the project involve mauka views toward the landfill property that includes: (1) some views from the Waiʻanae side of the property from construction vehicles transiting the southwestern and western ridge beyond the equipment and facilities of the HECO Kahe Power Generating Station; and (2) a view corridor providing views into the Waimānalo Gulch that extends from the Kai Lani subdivision to the Ko Olina Beach Club. From this location views of construction and refuse handling vehicles can be seen as they traverse the site to and from active areas of landfilling. Active cells located further back in the landfill cannot be seen based on the location of the cells below the completed portions of the site that are now closed from further landfilling.

While it is not possible to shield from view the location and features of the entirety of the WGSL, the potential for visual impacts during operation of the landfill will be minimized and mitigated with vegetative controls including the use of hydromulching, and plantings of grass, dryland shrubs, and trees, as provided in the project's landscaping plan.

> *Section 226-14 Objective and policies for facility systems-in general.*
> *(a) Planning for the State's facility systems in general shall be directed towards achievement of the objective of water, transportation, waste disposal, and energy and telecommunication systems that support statewide social, economic, and physical objectives. (b) To achieve the general facility systems objective, it shall be the policy of this State to:*
> *(1) Accommodate the needs of Hawaii's people through coordination of facility systems and capital improvement priorities in consonance with state and county plans.*

The proposed project represents a major capital project necessary for the safe, sanitary, and efficient disposal of municipal solid waste and refuse on the Island of O‘ahu. The project will serve all of O‘ahu's residents and visitors and is considered an essential part of the City's refuse management system that includes recoverable products recycling, waste to energy, and conservation of land resources for required public facilities such as landfills.

> *Section 226-14 (b)(2) Encourage flexibility in the design and development of facility systems to promote prudent use of resources and accommodate changing public demands and priorities.*

The proposed project will allow flexibility in the development and adoption of future City initiatives that will reduce dependency on landfills: (1) The future adoption of new technologies will require sufficient time for operational viability. The presence of the landfill will provide public safety and security for the disposal of refuse during periods of startup, maintenance, and for unforeseen circumstances that may require equipment repair.

(2) There are no existing refuse reduction or "elimination" technologies that do not themselves result in the generation of some refuse that cannot be further recovered, recycled, or otherwise reused. For these forms of waste, a landfill provides the most viable method of disposal.

(3) Any effort to reduce the volume of refuse being landfilled would benefit the Island of O‘ahu through an extension of the life of the landfill. Landfill capacity that is not used would forestall the need to seek a new location for a future municipal landfill.

(4) The landfill serves as a public resource in the event of a natural disaster such as a hurricane, earthquake or tsunami. A location for the disposal of cleanup and demolition debris would be required to meet public health and safety requirements during the recovery effort.

> *Section 226-14 (b)(3) Ensure that required facility systems can be supported within resource capacities and at reasonable cost to the user.*

The proposed project represents the effort to expand an existing public facility that is owned by the City & County of Honolulu. The expansion of the facility will be supported within the existing resource capacity of the site and at reasonable taxpayer cost to all users on the Island of O‘ahu.

> *Section 226-15 Objectives and policies for facility systems-solid and liquid wastes. (a) Planning for the State's facility systems with regard to solid and liquid wastes shall be directed towards the achievement of the following objectives:*

> *(1) Maintenance of basic public health and sanitation standards relating to treatment and disposal of solid and liquid wastes. (b) To achieve solid and liquid waste objectives, it shall be the policy of this State to: (2) Promote re-use and recycling to reduce solid and liquid wastes and employ a conservation ethic, and (3) Promote research to develop more efficient and economical treatment and disposal of solid and liquid wastes.*

The proposed project will facilitate the maintenance of public health and sanitation standards with regard to the disposal of MSW and refuse.

Although the proposed project does not in itself involve recycling, the City & County of Honolulu, through its Solid Waste Integrated Management Plan identifies recycling and materials recovery efforts to reduce Oʻahu's overall dependency on the need for landfills.

The City & County of Honolulu has promoted the investigation and adoption of technology based methods that have been proven to be efficient and economic in the reduction and treatment of solid waste. Examples of City led efforts include the use of a solids digester facility at the Sand Island Wastewater Treatment Plant and recent efforts to upgrade the H-POWER facility.

> *Section 226-104 (b) Priority guidelines for regional growth distribution and land resource utilization:*
> *(2) Make available marginal or non-essential agricultural lands for appropriate urban uses while maintaining agricultural lands of importance in the agricultural district.*

The proposed project involves the use of agricultural land that has not been classified by the Agricultural Lands of Importance to the State of Hawaiʻi (ALISH) system as indicated in Section 8.3 of this document. The non-essential agricultural nature of the land can be considered as a use that would allow for the maintenance of more important agricultural lands in the agricultural district.

> *Section 226-104 (b)(9) Direct future urban development away from critical environmental areas or impose mitigating measures so that negative impacts on the environment would be minimized.*
> *(12) Utilize Hawai'i's limited land resources wisely, providing adequate land to accommodate projected population and economic growth needs while ensuring the protection of the environment and the availability of the shoreline, conservation lands, and other limited resources for future generations.*
> *(13) Protect and enhance Hawaii's shoreline, open spaces, and scenic resources.*

The proposed project has been evaluated with regard to the potential for adverse effects to critical environmental features or habitat. There are no known threatened or endangered species present and as appropriate, mitigative measures are proposed to minimize, mitigate, or otherwise reduce the potential for adverse environmental impacts.

An important factor that supports the utilization of the proposed site involves the existing landfill use of the site, and the capacity and ability of Waimānalo Gulch to continue to support O'ahu's refuse disposal requirements for the next approximately 15 year timeframe. This use of the site would support and preempt the use of other locations on the Island of O'ahu until such time that the present site has reached capacity.

As noted, this EIS document identifies the appropriate application of mitigative measures and practices to avoid the potential for adverse environmental impacts as a result of development for the area of lateral expansion.

8.2. State Functional Plans

The State Functional Plans are mandated by Chapter 226, HRS. Together with the Hawai'i State Plan, they are intended to guide the implementation of state and county actions in the areas of agriculture, conservation lands, education, employment, energy, health, higher education, historic preservation, housing, human services, recreation, tourism, transportation, and water resources development.

The major theme of the Functional Plans is a focus on balanced growth in the use of the state's limited resources. The plans were last subject to legislative approval in the early 1990s and have not since been subject to substantive legislative review and update. Accordingly, many of the plans' *implementing actions* are in need of revision. However, the *objectives* and *policies* contained in the functional plans reflect many of the same values that are as important today as they were in the 1990s.

The proposed project is considered to be consistent with the State Functional Plans in the areas of Energy and Recreation.

8.2.1. Energy Functional Plan

Objective B of the Energy Functional Plan calls for the displacement of oil and fossil fuels through alternate and renewable energy sources.

The WGSL is a generator of naturally occurring methane and other landfill gasses that are planned to be recovered for the generation of electricity through a landfill gas to energy (LFTGE) system. Although the landfill has been in operation since 1989, it is only recently that the landfill has matured enough to merit the recovery of combustible gas. The recent installation of a landfill gas recovery system in conjunction with the efforts of WMH and HECO will initiate the tapping of this alternative energy resource.

The proposed project also supports the displacement of oil and fossil fuels through the provision of a location for the disposal of H-POWER ash and residue that cannot be further recycled or reused. This supports the operation of H-POWER in the conversion of waste to energy and promotes the conservation of fossil fuel resources that would otherwise need to be imported for the generation of electricity.[1]

---

[1] The facility is capable of processing 2,160 tons-per-day of municipal solid waste into refuse derived fuel (RDF) for combustion, while generating up to 57 megawatts of energy from this renewable

8.2.2. Recreation Functional Plan

Policy I-A(4) of the Recreation Function Plan calls for the development of areas mauka of existing beach parks to increase their capacities and to diversify and encourage activities away from the shoreline.

The proposed project is anticipated to be used as a municipal sanitary landfill for a finite period of time. At the end of this period the landfill will be closed in accordance with a specified closure plan reviewed and approved by the EPA and State Department of Health. Monitoring of the landfill is mandated for a period of 30 years to ensure the environmental safety and security of the site. During this period the landfill surface will stabilize and be revegetated to blend in with the surrounding landscape.

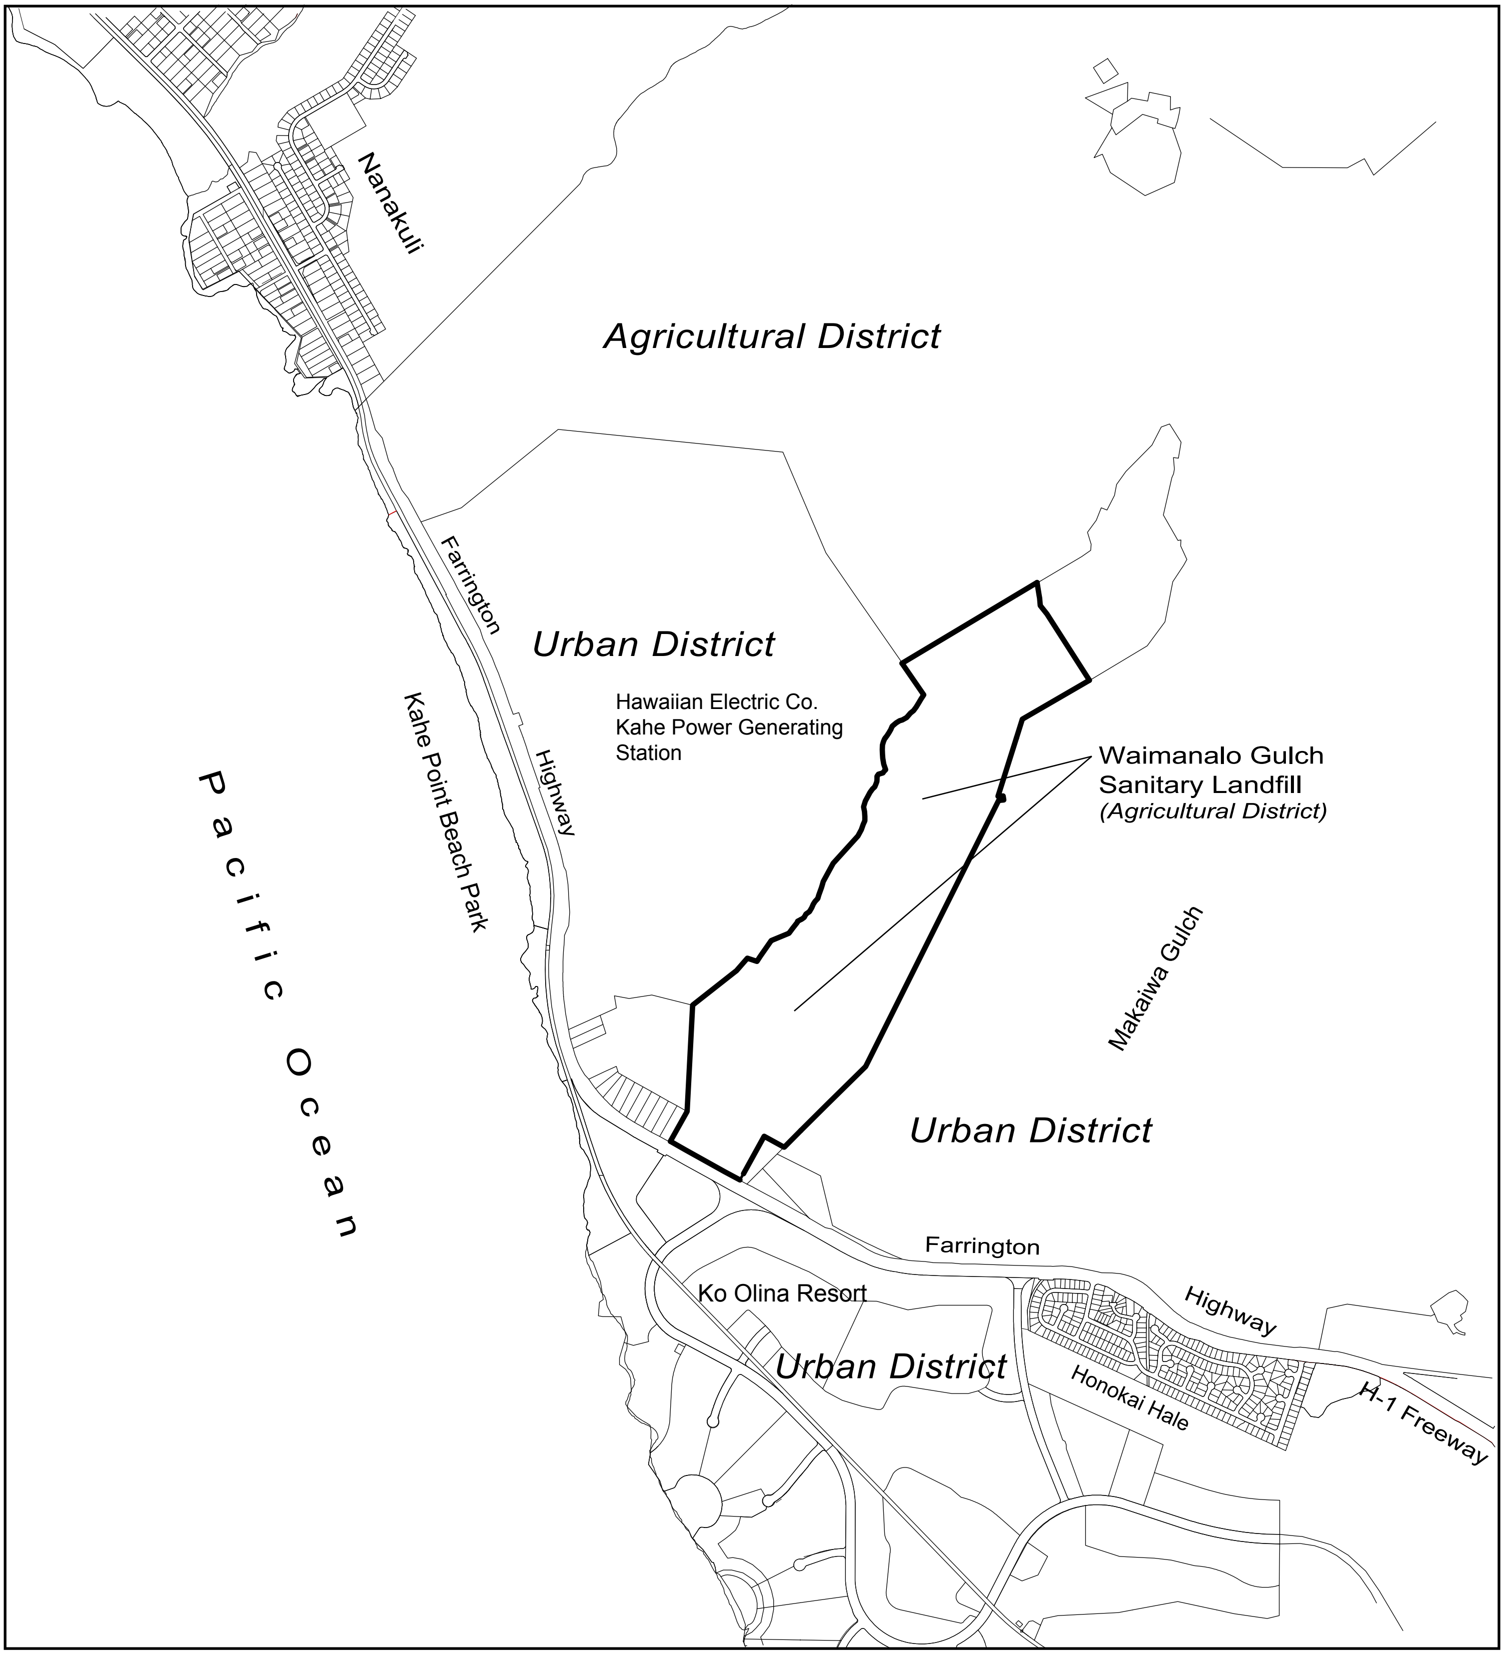
Although several years will be required, it will be possible to recover the use of the site for other purposes that include outdoor recreation. This reuse and recovery of the land is consistent with historical practice in the recovery of former landfill sites that include the Kakaako Waterfront Park, Sand Island State Recreational Area, and portions of the Ala Moana Park.

8.3. State Land Use Law

The State Land Use Commission classifies all lands in the State of Hawaiʻi into one of four land use designations: Urban, Rural, Agricultural, and Conservation. The proposed project is located within the State Agricultural District (**Figure 8-1**, **State Land Use District**).

---

source. It has been estimated that as much as 10 million barrels of imported oil has been conserved by H-POWER (http://www.honoluluhpower.com/About.asp#Content).



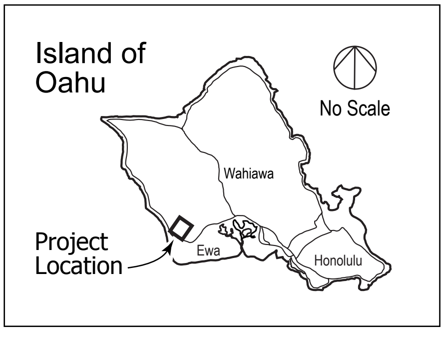


Figure 8-1
State Land Use District Map
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

R.M. TOWILL CORPORATION

May 2008

According to the Agricultural Lands of Importance (ALISH) to the State of Hawaiʻi system the subject site is not classified as one of three types of agricultural land: Prime Agricultural Land, Unique Agricultural Land and Other Important Agricultural Lands. (**Figure 8-2**, **ALISH Map**).

Because of the location of the project in the State Agricultural District, if the land use designation of the subject property is not changed via a Boundary Amendment proceeding, a State Special Use Permit must be obtained for the proposed expansion through the City & County of Honolulu, Department of Planning and Permitting and the State Land Use Commission. Alternatively, a change of the State Land Use District designation from the Agricultural to the Urban District could be sought by the filing of a Land Use District Boundary Amendment proceeding with the Land Use Commission as an alternative means of obtaining the necessary land use approvals.

8.4. Special Management Area

The State and City & County of Honolulu has established land use controls on development in coastal areas to avoid the permanent loss of valuable coastal resources and the foreclosure of management options. Special Management Area (SMA) boundaries have been set by the City to delineate coastal zone areas subject to regulation. According to the City & County of Honolulu's SMA Boundary Map for the Ewa area, the proposed project site is located outside of the SMA and is therefore not subject to SMA regulation.

The relationship of the SMA boundary to the project site is provided in **Figure 8-3, SMA Boundary**.

8.5. Coastal Zone Management Program

The State of Hawaiʻi designates the Coastal Zone Management Program (CZMP) to manage the intent, purpose and provisions of the federal Coastal Zone Management Act, and HRS, Chapter 205(A)-2, as amended, for the areas from the shoreline to the seaward limit of the State's jurisdiction, and any other area which a lead agency may designate for the purpose of administering the Coastal Zone Management Program.

The following is an assessment of the project with respect to the CZMP objectives and policies set forth in Section 205(A)-2.

1. Recreational resources

Objective: Provide coastal recreational opportunities accessible to the public.

Policies:

A) Improve coordination and funding of coastal recreational planning and management; and B) Provide adequate, accessible, and diverse recreational opportunities in the coastal zone management area by:

(i) Protecting coastal resources uniquely suited for recreational activities that cannot be provided in other areas;

(ii) Requiring replacement of coastal resources having significant recreational value including, but not limited to, surfing sites, fishponds, and sand beaches, when such resources will be unavoidably damaged by development; or requiring reasonable monetary compensation to the State for recreation when replacement is not feasible or desirable;

(iii) Providing and managing adequate public access, consistent with conservation of natural resources, to and along shorelines with recreational value;

(iv) Providing an adequate supply of shoreline parks and other recreational facilities suitable for public recreation;

(v) Ensuring public recreational uses of county, state, and federally owned or controlled shoreline lands and waters having recreational value consistent with public safety standards and conservation of natural resources;

(vi) Adopting water quality standards and regulating point and nonpoint sources of pollution to protect, and where feasible, restore the recreational value of coastal waters;

(vii) Developing new shoreline recreational opportunities, where appropriate, such as artificial lagoons, artificial beaches, and artificial reefs for surfing and fishing; and

(viii) Encouraging reasonable dedication of shoreline areas with recreational value for public use as part of discretionary approvals or permits by the land use commission, board of land and natural resources, and county authorities; and crediting such dedication against the requirements of section 46-6.

Discussion:

The proposed facility is not located on the coastline or shoreline and does not involve the use of coastal resources. The site is not in a location suitable for the development of new shoreline recreational opportunities or to dedicable shoreline areas with recreational value. It is anticipated however, that with the eventual exhaustion of space within the WGSL that future recreational park opportunities may one day become available through the reclamation of the site. Although not shoreline dependent, the relative location of the site mauka and above coastal Waiʻanae, would allow open space recreational uses to complement and enhance the existing public beach and park facilities of the area.

2. Historic resources

Objective: Protect, preserve, and, where desirable, restore those natural and manmade historic and prehistoric resources in the coastal zone management area that are significant in Hawaiian and American history and culture.

Policies:

(A) Identify and analyze significant archaeological resources;

(B) Maximize information retention through preservation of remains and artifacts or salvage operations; and

(C) Support state goals for protection, restoration, interpretation, and display of historic resources.

Discussion:

Archaeological investigation of the site has been completed in accordance with the provisions of Chapter 6E, HRS. Three stone uprights were discovered in early 2007 as a result an archaeological inventory survey. The uprights were found to be in a cluster located near the southwestern edge of the WGSL in an area that would be affected by the lateral expansion. According to Cultural Surveys Hawaiʻi (Cultural Surveys Hawaiʻi, March 7, 2008):

> *The single historic property (SIHP # 50-80-12-6903) that was documented during the archaeological inventory survey was found near the southwest edge of the Waimānalo Gulch*

> *Sanitary Landfill expansion area. This resource is comprised of three rock uprights designated Features A-C, which, based on available information are naturally upright standing. These stone uprights rest on a steep southeast facing slope, are spaced 50-60 meters apart, and are situated on exposed outcrops. Feature A and Feature B are along the same outcrop, while Feature C is located on a higher outcrop upslope. This resource is interpreted as traditional Native Hawaiian, and may have functioned as trail or boundary markers. No additional feature components were observed near this location. In consultation with the State Historic Preservation Division (SHPD), this historic property is recommended eligible to the Hawai'i Register of Historic Places (Hawai'i Register) under criterion D, for its potential to yield information important in prehistory or history, and under criterion E, for its cultural significance to Native Hawaiians.*

No other significant archaeological resources were discovered as a result of surveying the project's 92.5 acre area of potential effect.

To address the discovery of the uprights: (1) the SHPD was notified to report the find and to ascertain further actions or requirements to ensure no disturbance until an appropriate plan for treatment is determined; and (2) notification and coordination with appropriate parties as determined by SHPD that includes the Office of Hawaiian Affairs (OHA) and SHPD designated cultural informants from the area.

The process of coordination to develop an appropriate treatment plan and to ascertain further the purpose and function of the uprights is in progress. The owner of the site, the City & County of Honolulu, intends to work with the SHPD and the community to provide an appropriate level of treatment to preserve the stone uprights. All required provisions of Chapter 6E, HRS, as well as other provisions of law governing archaeological preservation and protection will be complied with.

Although the specific treatment that will be applied to the uprights has not yet been determined by the SHPD, and implemented by the City, the proposed project will address and meet the State's goals for the "…protection, restoration, interpretation, and display of historic resources." Any further actions that will be taken will be based on SHPD direction and guidance~~ will be provided in the project's forthcoming Final EIS~~.

> *3. Scenic and open space resources*
>
> *Objective: Protect, preserve, and, where desirable, restore or improve the quality of coastal scenic and open space resources.*
>
> *Policies:*
>
> *(A) Identify valued scenic resources in the coastal zone management area;*
>
> *(B) Ensure that new developments are compatible with their visual environment by designing and locating such developments to minimize the alteration of natural land forms and existing public views to and along the shoreline;*
>
> *(C) Preserve, maintain, and, where desirable, improve and restore shoreline open space and scenic resources; and*
>
> *(D) Encourage those developments that are not coastal dependent to locate in inland areas.*

Discussion:

The majority of the proposed project will not be visible from most vantage points along the Farrington Highway in the Wai‘anae or Kahe Point directions. The existing Kahe Point ridge line provides screening of views of the landfill, including the proposed expansion area.

The general area that fronts Waimānalo Gulch (i.e. from the Kai Lani subdivision to Ko Olina Beach Club) will be most impacted from the proposed project. Because this area has an unobstructed view into the gulch, continued activities will be seen from areas within this “view corridor”. Anticipated view impacts will be similar to existing conditions at the site consisting of periodic views of vehicles in transit to and from active landfill cells. Due to the existing height of the berm in the area of MSW Cell 1, the majority of daily landfill activities in the expansion area will be obstructed from view.

Mitigation to reduce visual impacts associated with existing operations has been initially implemented and will be modified to incorporate the proposed expansion area. The existing sanitary landfill has a 400-foot-wide vegetative buffer strip along the eastern portion of the site with a north-south separation of 800 to 1,000 feet. The approved landfill area has been hydromulched to begin the growth of grasses in the filled areas. The landscaping effort, once established, will resemble vegetation on adjoining hillsides and follow similar growth cycles. In time, plant species in the surrounding areas are expected to spread into the closed areas of the landfill through the natural seeding process.

Views of Coastal Waiʻanae are not expected to be affected based on the location of the WGSL mauka and upgradient from the Farrington Highway.

4. Coastal ecosystems
Objective: Protect valuable coastal ecosystems, including reefs, from disruption and minimize adverse impacts on all coastal ecosystems.
Policies:
(A) Exercise an overall conservation ethic, and practice stewardship in the protection, use, and development of marine and coastal resources;
(B) Improve the technical basis for natural resource management;
(C) Preserve valuable coastal ecosystems, including reefs, of significant biological or economic importance;
(D) Minimize disruption or degradation of coastal water ecosystems by effective regulation of stream diversions, channelization, and similar land and water uses, recognizing competing water needs; and
(E) Promote water quantity and quality planning and management practices that reflect the tolerance of fresh water and marine ecosystems and maintain and enhance water quality through the development and implementation of point and nonpoint source water pollution control measures.

Discussion:
The proposed project is not expected to have any adverse effects on coastal or marine coastal ecosystems. This is due to the location of the project mauka of the shoreline and the Farrington Highway.

During construction, all construction activities will be covered under an NPDES permit to address proper treatment of storm water discharges. Measures to reduce and prevent sediment discharges in storm water runoff will be in place and functional before project activities begin and will be maintained throughout the construction period. Runoff and discharge pollution prevention measures will be incorporated into a site-specific Construction Stormwater BMPs plan by the project contractor. An NPDES permit application addressing discharges of storm water associated with industrial activities will also be filed with DOH for the expansion area to ensure proper operation of the facility.

5. Economic uses
Objective: Provide public or private facilities and improvements important to the State's economy in suitable locations.
Policies:
(A) Concentrate coastal dependent development in appropriate areas;
(B) Ensure that coastal dependent development such as harbors and ports, and coastal related development such as visitor industry facilities and energy generating facilities, are located, designed, and constructed to minimize adverse social, visual, and environmental impacts in the coastal zone management area; and
(C) Direct the location and expansion of coastal dependent developments to areas presently designated and used for such developments and permit reasonable long-term growth at such areas, and permit coastal dependent development outside of presently designated areas when:
(i) Use of presently designated locations is not feasible;
(ii) Adverse environmental effects are minimized; and
(iii) The development is important to the State's economy.

Discussion:

Although the proposed project is not a coastal dependent facility, the location of the project site was based on selection criteria and governmental regulations that establish the suitability of the site for use as a municipal sanitary landfill.

The proposed project property is owned by the City & County of Honolulu and is designated for a landfill. The use of the site for this purpose is not expected to affect the location or expansion of future coastal dependent developments.

> *6. Coastal hazards*
> *Objective: Reduce hazard to life and property from tsunami, storm waves, stream flooding, erosion, subsidence, and pollution.*
> *Policies:*
> *(A) Develop and communicate adequate information about storm wave, tsunami, flood, erosion, subsidence, and point and nonpoint source pollution hazards;*
> *(B) Control development in areas subject to storm wave, tsunami, flood, erosion, hurricane, wind, subsidence, and point and nonpoint source pollution hazards;*
> *(C) Ensure that developments comply with requirements of the Federal Flood Insurance Program; and*
> *(D) Prevent coastal flooding from inland projects.*

Discussion:

The potential for hazards from storm wave, tsunami, hurricane, wind, flood erosion, subsidence, and point and nonpoint source pollution will be addressed by the proposed project through adherence to the landfill site operating manual and through adherence to all required regulatory permit authorizations and controls.

The development of the project will also be in compliance with the requirements of the Federal Flood Insurance Program, the City & County of Honolulu Drainage, Grading and Development standards for Flood Hazard Districts, and the LUO, Section 21-9.10, Flood Hazard Districts.

Coastal flooding is not anticipated based on the location of the project inland and upgradient of the Farrington Highway.

7. Managing development
Objective: Improve the development review process, communication, and public participation in the management of coastal resources and hazards.
Policies:
(A) Use, implement, and enforce existing law effectively to the maximum extent possible in managing present and future coastal zone development;
(B) Facilitate timely processing of applications for development permits and resolve overlapping or conflicting permit requirements; and
(C) Communicate the potential short and long-term impacts of proposed significant coastal developments early in their life cycle and in terms understandable to the public to facilitate public participation in the planning and review process.

Discussion:
The project site is within the State Agricultural Land Use District. Land uses within this designation are subject to regulation by the State and City & County of Honolulu. The county's zoning designation is AG-2, Agricultural.

All improvement activities will be conducted in compliance with State and County environmental rules and regulations. This subject document is prepared to identify and, where necessary, propose mitigation measures to address the potential for impacts anticipated from the construction and operation of the project. This document will be published for public review in compliance with procedures set forth in HRS, Chapter 343.

8. Public participation;
Objective: Stimulate public awareness, education, and participation in coastal management.
Policies:

(A) Promote public involvement in coastal zone management processes;

(B) Disseminate information on coastal management issues by means of educational materials, published reports, staff contact, and public workshops for persons and organizations concerned with coastal issues, developments, and government activities; and

(C) Organize workshops, policy dialogues, and site-specific mitigation to respond to coastal issues and conflicts.

Discussion:

Public involvement in the project will consist of public notification of the project as provided in the Office of Environmental Quality Control (OEQC) Bulletin. See Section 13, Organizations, Agencies, and Public Parties Consulted in the Environmental Impact Statement Process, for a list of agencies, organizations and individuals consulted for this project. All written public comments will be provided with a written response. Where appropriate, mitigation measures will be developed to address issues and concerns raised during public review of the project.

9. Beach protection;

Objective: Protect beaches for public use and recreation.

Policies:

(A) Locate new structures inland from the shoreline setback to conserve open space, minimize interference with natural shoreline processes, and minimize loss of improvements due to erosion;

(B) Prohibit construction of private erosion-protection structures seaward of the shoreline, except when they result in improved aesthetic and engineering solutions to erosion at the sites and do not interfere with existing recreational and waterline activities; and

(C) Minimize the construction of public erosion-protection structures seaward of the shoreline.

Discussion:

The proposed project is not located along the shoreline or beach. No structures are proposed seaward of the shoreline. Control of erosion will be based on conformance to standards of the City & County of Honolulu regulating the control of erosion.

The proposed project is anticipated to have potential impacts that include the migration of landfill associated odor, windblown litter migrating to area beaches and parks, and visual impacts. While the potential for impacts are not necessarily related to the policies associated with Item 9. Beach Protection, appropriate mitigative measures as provided in Section 6.10.2. Potential Impacts and Mitigation Measures (for Parks and Recreation) will be applied to the project to reduce the potential for adverse effects to public use and recreational activities at area beaches.

10. Marine resources

Objective: Promote the protection, use, and development of marine and coastal resources to assure their sustainability.

Policies:

(A) Ensure that the use and development of marine and coastal resources are ecologically and environmentally sound and economically beneficial;

(B) Coordinate the management of marine and coastal resources and activities to improve effectiveness and efficiency;

(C) Assert and articulate the interests of the State as a partner with federal agencies in the sound management of ocean resources within the United States exclusive economic zone;

(D) Promote research, study, and understanding of ocean processes, marine life, and other ocean resources in order to acquire and inventory information necessary to understand how ocean development activities relate to and impact upon ocean and coastal resources; and

(E) Encourage research and development of new, innovative technologies for exploring, using, or protecting marine and coastal resources.

Discussion:

The proposed project does not involve or utilize marine resources. However, as required by law all necessary permit applications and environmental and building permit approvals will be secured prior to the initiation of construction activities.

8.6. City & County of Honolulu General Plan

The General Plan of the City & County of Honolulu is a comprehensive statement of objectives and policies which sets forth the long-range aspirations of O‘ahu's residents and the strategies or actions to achieve them. It is the focal point of a comprehensive planning process that addresses physical, social, economic and environmental concerns affecting the City & County of Honolulu. Since adoption of the General Plan in 1977, the last amendment to the Plan was completed in 2002. Although the Plan has sustained a number of changes since its adoption the basic themes and directions for growth remain valid[2].

The proposed project is consistent with the General Plan objectives and policies that relate to the following:

> *"I. Population*
> *Objective B: To plan for future population growth.*
> *Policy 1: Allocate efficiently the money and resources of the City and County in order to meet the needs of Oahu's anticipated future population.*
> *Policy 2: Provide adequate support facilities to accommodate future growth in the number of visitors to Oahu."*

Although the proposed project does not directly influence future population growth, it represents an important public facility serving the island of O‘ahu by providing a location and means for the disposal of municipal refuse. In this regard the project is a necessary

---

[2] General Plan, City & County of Honolulu. Website reference: http://honoluludpp.org/planning/GeneralPlan/GPIntro.pdf

use of City resources that will meet future population needs and accommodate growth in the number of visitors to O‘ahu.

> *"III. Natural Environment*
> *Objective A: To protect and preserve the natural environment.*
> *Policy 1: Protect Oahu's natural environment, especially the shoreline, valleys, and ridges, from incompatible development.*
> *Policy 2: Seek the restoration of environmentally damaged areas and natural resources.*
> *Policy 4: Require development projects to give due consideration to natural features such as slope, flood and erosion hazards, water- recharge areas, distinctive land forms, and existing vegetation."*

The development of the Waimānalo Gulch Sanitary Landfill occurred in 1989 prior to the rapid growth currently occurring in the ‘Ewa region. Surrounding land uses were largely limited to industrial activities including the James Campbell Industrial Park and the HECO Kahe Power Generating Station. Today, with the development of the adjoining Ko Olina Resort, Nānākuli Homesteads, Honokai Hale, Makakilo, Kapolei, and other subdivisions, the area has experienced major development and population growth. Although the proposed project will require an expansion of use of the existing facility and require transformation of the existing Waimānalo Gulch into space that will be used for landfilling, such use will be limited by the remaining space that is available at the site. With the eventual closure of the site, the land upon which the facility is located is expected to be reclaimed for other public purposes that may be considered more compatible with area surroundings. These uses may include, but are not limited to, open space for park and recreational activities not unlike the Kaka‘ako Community Park, which once served as a landfill in Honolulu. This practice will seek to restore use of the land for a public purpose and benefit.

> *"V. Transportation & Utilities*
>
> *Objective B: To meet the needs of the people of Oahu for an adequate supply of water and for environmentally sound systems of waste disposal.*
>
> *Policy 3: Encourage the development of new technology which will reduce the cost of providing water and the cost of waste disposal.*
>
> *Policy 4: Encourage a lowering of the per-capita consumption of water and the per-capita production of waste.*
>
> *Policy 5: Provide safe, efficient, and environmentally sensitive waste-collection and waste-disposal services.*
>
> *Policy 6: Support programs to recover resources from solid-waste and recycle wastewater.*
>
> *Policy 7: Require the safe disposal of hazardous waste."*

The proposed project is designed to serve as an environmentally sound method for the disposal of municipal solid waste and ash. The development of new technology based solutions, while promising, have and will continue to be evaluated by the City based on feasibility and a demonstrated operating record of performance for municipalities similar to the City & County of Honolulu. At this time however, there are no new technologies with proven feasibility of performance or that would completely eliminate the generation of waste by-products that would require disposal (see **Appendix K**).

The recovery of resources from solid waste is already occurring through the recycling of waste materials into energy through the City's H-POWER facility. The operating record of H-POWER has been proven through over a decade of performance that has benefited the City in reducing the amount of waste requiring landfilling. Based on this performance, plans for the expansion of the H-POWER have been proposed by the City.

It is possible in the future that as new and emerging technologies demonstrate similar proven levels of performance and feasibility of application for the City that such technologies will be adopted. At this time, however, there are no technology based alternatives that could by itself address the need for landfilling.

While the WGSL does not accept hazardous waste, the City supports the safe handling and disposal of all hazardous wastes.

> *"VIII. Public Safety*
> *Objective B: To protect the people of Oahu and their property against natural disasters and other emergencies, traffic and fire hazards, and unsafe conditions.*
> *Policy 2: Require all developments in areas subject to floods and tsunamis to be located and constructed in a manner that will not create any health or safety hazard.*
> *Policy 8: Provide adequate search and rescue and disaster response services."*

Waimānalo Gulch Sanitary Landfill has other important functions in addition to its daily use for a municipal sanitary landfill. In the event of a public emergency involving a natural disaster such as a hurricane, tsunami, or earthquake, the facility will serve as a repository for disposal of disaster debris. This use will promote public safety by ensuring that a facility is available to handle disposal of debris that could otherwise accumulate in populated areas throughout the island, including along communities of the Waiʻanae Coastline.

8.7. City & County of Honolulu ʻEwa Development Plan (ʻEwa Sustainable Communities Plan)

The ʻEwa Development Plan (DP), was adopted by the City in August 1997 and is currently undergoing a required five-year review and update. The date of completion of the review and update of the plan is not known at this time. As appropriate during the preparation of the project EIS, and upon completion of the five-year review, the proposed project will be evaluated for consistency with the updated ʻEwa DP.

The project site is depicted on the ‘Ewa DP within the Preservation District on the plan’s illustrative Open Space and Phasing Maps. The ‘Ewa DP discusses the analysis and recommendations of the Solid Waste Integrated Management (SWIM) Plan, prepared by the Department of Public Works and adopted by the Honolulu City Council in 1995. The Ewa DP states that the SWIM Plan identified the Waimānalo Gulch as having potential for expansion; however, siting and/or expansion of sanitary landfills should be analyzed and approved based on islandwide studies and siting evaluations (such as the Chapter 343, HRS, EIS process which is the subject of this document).

The Development Plan Public Facilities Map also depicts a symbol for the existing landfill facility, but does not delineate the boundaries of the landfill.

8.8. City & County of Honolulu Zoning Law

The zoning designation of the project site is AG-2 General Agricultural District (See **Figure 8-4**, **Zoning Map**). According to the Land Use Ordinance, development of a landfill is a permitted use in the AG-2 district. A determination of permitting requirements for this project pursuant to the zoning of the site will be completed with the Department of Planning and Permitting (DPP). It is anticipated that the existing facility and the proposed expansion will be considered a “public use” under the Land Use Ordinance. A Conditional Use Permit is not anticipated to be required.

Section 9

Alternatives to the Proposed Action

9.1. Introduction

In March 2008, the Alternatives Analysis for Disposal of Municipal Refuse report was completed for the subject EIS by Pacific Waste Consulting Group (PWCG) (**Appendix K**). This report was subsequently updated with additional information in September 2008, which is included in this section. The following includes a summary of the report and evaluation.

~~The following alternatives to the proposed project were evaluated:~~

9.2. O'ahu Refuse Disposal - General background information is provided pertaining to the composition of waste disposal for the Island of O'ahu.

Alternatives to the proposed project consist of the following:

9.~~2.~~3. No Action - Landfilling at the Waimānalo Gulch Sanitary Landfill would cease on November 1, 2009, with no alternative site or technology available.

9.~~3.~~4. Delayed Action - The action on the permit would be delayed. Given the time needed to process the permits, the delayed and no action alternatives have the same effect.

9.~~4.~~5. Transshipment - O'ahu's MSW would be baled and transported to a mainland landfill for disposal. Even with this alternative, not all MSW can be transshipped.

9.~~5.~~6. Alternative Technologies - Technologies other than landfilling that could reduce the amount of material requiring disposal and generate electricity or another beneficial reuse product. Alternative technologies that were considered include:

- Thermal and non-thermal technologies;

- Enhanced recycling;
- Addition of a third unit to H–POWER; and
- Alternative methods of landfilling, such as co-disposal of ash and MSW and use of a bioreactor landfill.

9.~~6.~~7. Alternative Sites - Alternative sites on O‘ahu for the landfill. The five alternative landfill sites considered in the analysis were:

- Ameron Quarry;
- Mā‘ili Quarry;
- Makaiwa Gulch;
- Nānākuli B; and
- Waimānalo Gulch Sanitary Landfill.

The analysis was performed for each of the alternatives. The examination of alternative technologies involved a review of currently operating facilities and includes information describing the technologies.

All alternatives were compared to criteria or guidelines established by the City & County of Honolulu for alternative technologies, alternative landfill sites, and transshipment. The requirements for alternative sites are based on the work of the Mayor’s Advisory Committee on Landfill Site Selection which was concluded in December 2003. The Committee was established as an independent panel advisory to the Mayor comprised of citizens and legislators from several areas of the Island of O‘ahu.

The requirements for alternative technologies were established by the City in its January 16, 2007 Notice to Bidders.[1] The transshipment alternative requirements were established by the City in its January 22, 2008 Notice to Bidders.[2]

[2] City and County of Honolulu, Notice to Bidders, Shipping of City Provided MSW, Competitive Sealed Proposals (CSP No. 037). January 22, 2008.

9.2. O‘ahu Refuse Disposal

9.2.1. Introduction

Information is provided for the composition of refuse received at the City's H-POWER and WGSL facilities for general background information. Due to the preparation schedule for this EIS and the schedule for the City's Solid Waste Integrated Management Plan Update (SWIMP), data from the November 2007 draft update is provided.

9.2.2. Composition of Waste Stream

The composition of the disposed waste is based on hand-sorting randomly selected samples of the waste from garbage trucks. In 2006, the City studied the composition of the waste received at H-POWER, WGSL, and the Keehi Transfer Station. Sampling took place at H-POWER on September 18–21, 2006, WGSL on September 11–14, 2006, and at the Keehi Transfer Station on September 15–16, 2006.

Table 9-A, Aggregate Overall Waste Characterization Results - 2006, shows the composition of Oahu’s waste from H-POWER and the Waimanalo Gulch Sanitary Landfill combined.

Table 9-B, Waimanalo Gulch Landfill Waste Characterization Results - 2006, shows the composition of waste being disposed of at the WGSL. The majority of waste going into the landfill is from commercial and self-haul sources, rather than residential sources. 90 percent of the residential waste goes to H–POWER.

TOTAL	**100.00%**		**183,866**	

[*] There was no auto fluff or sludge in the samples sorted for this study. As such, standard deviation and the lower and upper bounds of the confidence interval are not applicable. The WGSL is known to accept auto fluff and sludge. The average composition for these materials was obtained from sources outside the PWCG study.

The results in **Table 9-B** are adjusted because the samples of waste for the waste characterization report were taken when H–POWER was in full operation and not diverting waste to the landfill. Waste from H–POWER is diverted to the landfill when H-POWER is unable to accept waste due to maintenance or capacity limitations. Because no waste was diverted, the composition at the landfill would have overstated the amount of some types of material. For example, if the landfill had 100 tons of material coming in and 50 tons were "X," the waste would be 50 percent "X". If an additional 30 tons of material were diverted from H–POWER, the total tonnage would have been 130 tons and "X" would have been 38 percent. The annual amount of waste received at the landfill was reduced by the amount of the material diverted from H–POWER so that the relative proportion of the remaining material was correct.

Table 9-C, H-POWER Waste Characterization Results - 2006, shows the composition of waste being disposed at H-POWER. Approximately half of the waste going into H–POWER is from residential sources and about half is commercial waste. The types and amounts of material shown reflect potential material for recycling programs.

~~9.2. No Action Alternative~~

9.3. No Action Alternative

This alternative involves taking no further action to extend the use of the site, or to select an alternative technology or new landfill site upon closure of the WGSL on or before November 1, 2009, in compliance with a State Special Use Permit amendment issued in March 2008.

The following would be expected as a result:

- There would be no landfill to accept the waste currently going to the Waimānalo Gulch Sanitary Landfill, leaving about 800 TPD of MSW requiring disposal.

Table 9-C

[*] There was no auto fluff or sludge in the samples sorted for this study. As such, standard deviation and the lower and upper bounds of the confidence interval are not applicable. The WGSL is known to accept auto fluff and sludge. The average composition for these materials was obtained from sources outside the PWCG study.

- Because the garbage could not be disposed, it could not be collected, requiring people to hold it at their homes and residences; resulting in health and safety problems.
- Ash disposal from H-POWER would cease as no other landfill on the Island of O‘ahu is permitted to accept this material.
- Eliminating ash disposal would stop the operation of H-POWER.
- Businesses would be closed to avoid health issues with improperly managed garbage.

Taken together, these actions would result in an unacceptable health, safety, and economic impact to all the communities of the island of O‘ahu.

~~9.3. Delayed Action Alternative~~
9.4. Delayed Action Alternative

The Delayed Action Alternative involves delaying further effort to extend the use of the WGSL; replace the use of the WGSL with an alternative technology based solution; or propose a new landfill site.

The Delayed Action and No Action Alternatives would have similar results. Given the complexity of the landfill permitting process in Hawai‘i and the limited time that is available, it is possible that delayed action would prevent the City from filing and processing ~~an amendment to the~~ a new State Special Use Permit (SUP) and/or a State Land Use District Boundary Amendment prior to ~~its~~ the current SUP's expiration on November 1, 2009, when the WGSL would be prohibited from accepting any further MSW. For this reason, the Delayed Action Alternative is not considered viable.

~~9.4. Transshipment of Waste Off-Island~~

~~9.4.1. Introduction~~

9.5. Transshipment of Waste Off-Island

9.5.1. Introduction

Waste transshipment involves the packaging of MSW for shipment to a disposal site located off-island.

On August 23, 2006, the U. S. Department of Agriculture (USDA) through its U. S. Animal and Plant Health Inspection Services (APHIS) announced its decision to allow the transshipment of MSW to the continental United States from Hawaii.[3] Transshipment will be allowed only under certain circumstances. Wastes by federal regulation that would be restricted from transshipment include hard-to-handle wastes, such as white goods, sewage sludge, auto fluff (auto upholstery & foam padding), and precluded waste including green and agricultural wastes (not more than three percent of the bale weight would be allowed). (PWCG, 2008).

Three transshipment firms have shown interest in shipping O‘ahu’s waste to the Roosevelt Landfill in Washington State. Two of the three have submitted initial proposals to the City to ship a portion of O‘ahu’s MSW to the mainland for disposal. Both proposals would shrink-wrap the waste prior to shipping. (PWCG, 2008).

On January 22, 2008 the City provided a notice to bidders that it would entertain proposals for transshipping waste to the mainland for disposal.

~~9.4.2. City & County of Honolulu Requirements for Transshipment of Waste~~

9.5.2. City & County of Honolulu Requirements for Transshipment of Waste

The City established the following requirements for the transshipment of MSW in its January 22, 2008 notice to bidders (PWCG, 2008):

---

[3] Federal Register volume 71, number 163, published August 23, 2006.

- Permits, compliance letters, certifications, environmental assessments, and other documents, related to services needed to carry out the contract, must be current for the transshipment contractor.
- The proposed methods and measures to fulfill each requirement of the contract must be identified.
- A site plan displaying existing facilities, equipment, traffic conditions, and a description of operations must be provided.
- A back-up plan for equipment maintenance, failure, or other disruption, to minimize landfill disposal must be provided.
- A back-up plan for barge-loading obstruction or other disruptions of exporting operations to minimize landfill disposal must be provided.
- A copy of facility agreements between the bidder and facility, barging, or disposal operators must be provided if the bidder is not the director/operator of each.
- The bidder must provide a property easement for the placement of a City-owned scale, scale house, and associated equipment.

~~9.4.3. Transshipment Methodology~~
9.5.3. Transshipment Methodology

Two of the three interested transshipment firms have submitted applications to the State for modifications to the transfer stations they currently have permitted to handle MSW. Modifications include adding the equipment needed to transship MSW to the Roosevelt Landfill in Washington State or a landfill in Idaho. The transshipment vendors would shrink-wrap the waste to avoid shipment of pests and control nuisance impacts. The approach is described in the risk assessment prepared by APHIS for its regulatory action.[4] (PWCG, 2008).

---

[4] *The Risk of Introduction of Pests to the Continental United States via Plastic-Baled Municipal Solid Waste from Hawaii,* United States Department of Agriculture, Animal and Plant Health Inspection Service, March 2006.

The process for handling the waste in Honolulu is specified in the final Compliance Agreement between the USDA and Hawaii Waste Systems, LLC (HWS). The procedures for handling the waste and transporting it to the landfill for disposal are detailed[5] as follows (PWCG, 2008):

> *"…Garbage and Regulated (domestic) Garbage collected by refuse trucks shall be delivered to the HWS facility at HWS Transfer Station …Trucks of agricultural waste shall not be accepted. Waste materials, containers, and bins associated with Foreign Garbage are strictly prohibited and shall not be accepted. The ground surface of the all areas for handling the Garbage and Regulated (domestic) Garbage should be level, solid, and impervious surface of asphalt or cement.*
>
> *The risk assessments for the movement of Garbage and Regulated (domestic) Garbage were conducted based on the specific details provided by HWS. These details included the exclusion of incinerator ash and the removal of all hazardous and liquid waste prior to baling. HWS will notify PPQ (USDA, APHIS local office) if the company plans change to include such materials so that the proper risk assessments can be conducted…*
>
> *The waste transfer station will receive only household and commercial waste acceptable for disposal at Roosevelt Regional Landfill. Collection trucks will deliver waste picked up from existing collection routes. After waste is tipped onto the tipping floor it will be inspected for unacceptable waste including yard waste, (other than incidental amounts not to exceed 3% of the total waste stream pursuant to 7 CFR Part 330), agricultural waste, industrial waste, infections waste, loads of predominantly of [C&D] waste and regulated hazardous waste. Any segregated unacceptable waste will be separated for further processing. Loads consisting predominately of [C&D] waste will be transferred to a C&D handling facility. Other waste will be drummed or otherwise contained and arrangements made for its proper transportation and disposal. Notwithstanding the foregoing, it is acknowledged and agreed that follow-up inspection of the route that was the source of the unacceptable waste will be conducted to try to locate the source and correct the waste handling process that allowed unacceptable waste to be collected.*

---

[5] Final Compliance Agreement between Hawaiian Waste Systems, LLC, and the United States Department of Agriculture relating to the Regulated Article "Garbage and Regulated (domestic) Garbage from Honolulu, Hawaii." January 19, 2007. Pages 4-7.

Each load of waste received at the facility will be weighed and the date, time, company, driver name, truck number (i.e., company fleet number), weight (loaded), weight (empty), and origin of load, will be recorded. Records will be kept for a minimum of three years.

Step-by-step waste receiving and processing description is as follows:

- *Waste is delivered by collection truck to the HWS Transfer Station. The truck is weighed and then proceeds to the baling facility where it tips its waste onto the tipping floor. The collection truck is weighed again as it exits the site and continues on its collection routes. A weigh ticket is generated and kept on file.*
- *A loader operator inspects the waste and segregates any non-household or on-commercial waste. Household and commercial waste is pushed onto the in-feed conveyor by the loader. Segregated waste is set aside and handled separately as described previously.*
- *Garbage and Regulated (domestic) Garbage moves along the conveyor to the intake feed of the baler. The baler operator introduces waste into the baler where it is compressed using a compactor that produces bale densities of approximately 1000 kg per cubic meter for the most waste materials.*
- *The compacted bale moves from the baler via conveyor belt to the plastic wrapper. The plastic wrapper automatically wraps the bale with a minimum of 4 layers of pre-stretched, mastic-backed polyethylene plastic, of at least 16 micrometers thickness, and extrudes it onto a roller conveyor. The baler operator or loader operator will inspect each bale for integrity of the plastic wrap. Any bale with unsatisfactory wrapping will be re-sent through the wrapper.*
- *The wrapped bale moves down the roller conveyor and is removed by a loader with a special attachment that picks up the bale by squeezing it between two hydraulically operated smooth faced arms, or another piece of equipment designed to handle the bales without tearing or damaging them in any way. The smooth faced arms prevent damage to the plastic wrap.*
- *The loader moves the bale onto the bale storage area – which has a solid, impervious (concrete or asphalt) surface that is kept free of soil or other contaminants – or directly onto a flat bed truck, if one is available.*

- *Bales that are placed onto the bale storage area will be loaded onto flat bed trucks as they become available.*
- *Flat bed trucks will haul the bales to Barber's Point where they will be unloaded and stacked in the Staging Area. The same type of loader attachment (or equivalent equipment) will be used for unloading to prevent damage to the plastic wrap. The loader operator will inspect each bale of damage to the plastic wrap. If damage is found it will be returned to a wrapping area for rewrapping.*
- *Bales cannot be loaded onto the barge until they have been staged for at least five days. After five days, the bales are considered ready for transport and the area will be designated the Transport Area. HWS will maintain a clear separation between those bales ready for transport and those bales in the staging process.*
- *Bales at the Barbers Point Harbor facility will be stored until a barge is ready to be loaded. Barge loading will occur approximately monthly. When a barge is ready for loading, the bales in the Transport Area will be transferred onto the barge, again using squeeze-arm hydraulic equipment or other comparable, appropriate lifting equipment to prevent damage to the plastic wrap. The loading supervisor will inspect each bale once the bale is loaded onto the barge. Any damaged bale will be returned to the Transfer Station for rewrapping and restaging or be rewrapped and restaged on site at Barber's Point.*
- *When the barge is fully loaded it will proceed to its destination at the Roosevelt Regional Landfill in Washington State.*

  The compression settings on the baler shall be 1,000 kg per cubic meter or more. Records indicating the size and weigh to each bale shall be maintained.

Garbage and Regulated (domestic) Garbage which has fallen apart from an unwrapped compressed bale, or has been otherwise improperly compressed shall be set aside for a subsequent compression cycle.

The unwrapped, compressed bales shall be bound with plastic or metal clamps, netting, or strapping devices to retain its shape.

Compressed bales that do not hold together shall be rejected and set aside for a subsequent compression cycle. Records of re-compressed bales shall be maintained by HWS and available for monitoring by PPQ [local office of USDA, APHIS]…"

~~9.4.4. Other Jurisdictions Using Waste Transshipment~~

9.5.4. Other Jurisdictions Using Waste Transshipment

New Jersey and other areas of the U. S. use shrink-wrapping of MSW for shipment of waste to a disposal site. It has also been used in Europe for as long as 10 years. The Roosevelt Landfill in Washington receives MSW, not only from Washington State, but from Oregon, Canada, Idaho, and Alaska.[6] However, most of these operations do not use the shrink-wrap technology. (PWCG, 2008).

~~9.4.5. Physical, Regulatory, and Environmental Requirements~~

9.5.5. Physical, Regulatory, and Environmental Requirements

The requirements for the shipping of waste from Hawaii to the mainland U. S. are established in federal regulations[7] with approval of the specific requirements promulgated in the Federal Register[8]. Waste subject to transshipment would be considered "Regulated Garbage." Any waste commingled with regulated garbage would be considered Regulated Garbage and would have to be shrink-wrapped and handled according to federal requirements. The primary regulator of transshipment is the U.S. federal government through APHIS. (PWCG, 2008).

Compliance Agreement

All parties involved with transshipment must enter into a Compliance Agreement with the USDA before any waste can be transshipped. All parties must comply with conditions within the Compliance Agreement, as well as all provisions in 7 CFR 330.400–403 and 9CFR 94.5. (PWCG, 2008).

---

[6] Washington State Department of Ecology, Solid Waste and Financial Assistance Program, “Solid Waste in Washington State Fifteenth Annual Status Report”, December 2006.

[7] 7CFR 330.400 and 9CFR 94.5.

[8] Federal Register volume 71, number 163, published August 23, 2006.

Transshipment Regulations

The requirements for shipping waste are in the Compliance Agreement and in other federal rules and regulations relating to transportation of materials by barge. (PWCG, 2008).

Receptacles

MSW transported from Hawaii to the mainland must be stored in specified receptacles. If the MSW is to be sent by watercraft, the receptacles must be contained within the guard rails of that watercraft. Receptacles must be tight, leak-proof, and covered while being transported.[7] Removal of receptacles must be under the direction and supervision of an inspector from APHIS and taken to an approved facility.

An approved facility is a facility certified by an appropriate government official as complying with environmental protection laws. The Administrator of APHIS must deem the equipment and procedures adequate to prevent the widespread contamination of plants and livestock.

The shrink-wrap technology used to contain the MSW before it is transshipped uses plastic film wrapping material that must be impermeable and made of low density polyethylene at least 16 micrometers in thickness. It is to be coated on one side with a non-hardening mastic/adhesive. Bales are mechanically wrapped to achieve airtight seals and kill the insects and pests entrained in the bale. In a 10-month study, DEKRA Umwelt, an international service provider, determined that the filmed bale environment is made up of 1 percent oxygen and more than 50 percent methane; that within 24 hours, any insects captured during baling of the MSW died from lack of oxygen. The film contracts once it is wound around the MSW. This ensures that during transshipment and disposal no materials or insects are leaked[9].

---

[9] USDA, APHIS, March 2006.

Disposal

Disposal of MSW must take place at an approved facility. The Roosevelt Landfill has a permit issued pursuant to the federal Subtitle D regulations and would be considered an approved facility.

~~9.4.6. Potential Issues with Waste Transshipment~~

9.5.6. Potential Issues with Waste Transshipment

A shipping strike would create potential problems for Oʻahu in the transshipment of MSW to the mainland U. S. Assuming a transit time of 14 to 21 days, even short strike would threaten to cause the shipper to exceed the 75 day time limit from baling to disposal as required by the USDA. While the USDA Compliance Order requires the company to re-wrap the bales if they are held longer than 75 days doing so would be costly and, Oʻahu could be faced with the inability or significantly reduced ability to transship MSW during a shipping strike. This could potentially result in a health and safety issue, leaving Oʻahu with no place to dispose of its waste. (PWCG, 2008).

According to the DOT, there is existing congestion in the harbor that would need to be addressed.[10]

According to the Chief Executive Officer of HWS,[11] bales can be stacked two high. The space they have at the port facility will allow for storage of 30,000 tons of MSW. Assuming that the company handles 100,000 TPY, it is possible to store about two months of shrink-wrapped MSW (allowing for transit time to the mainland, processing at the mainland port, transport to the landfill, and disposal). The agreement for barge services allows management of the barge company, if required, to operate the equipment needed to transship the waste in the event of a strike due to the need to maintain public health and safety (PWCG, 2008). This assumes that the management will be sufficiently trained in the operation of the equipment, and that there will be enough management personnel available to maintain a reasonable level of operation.

---

[10] EISPN Comment Letter from DOT, December 28, 2006.

[11] Meeting on December 14, 2006, Jim Hodge and Mark White held in Sacramento, California.

Green and agricultural wastes—as well as household hazardous wastes—are not permitted to be commingled with MSW and transshipped. Incidental amounts, less than three percent of the total amount of MSW shipped, however, are permitted (PWCG, 2008). Therefore, the MSW must first be sorted and the unpermitted waste separated from the MSW stream prior to shrink wrapping and shipment.

Transshipment of MSW makes the City &County of Honolulu dependent on external factors that could become beyond its ability to control. Transshipment would also result in the loss of high BTU value waste that would otherwise go to H–POWER. Transferring the disposal of a portion of the City's waste reduces the generating capacity of H-POWER, which currently provides power for approximately 45,000 homes.[12] To compensate for the loss of H-POWER supplied electricity, other methods of generating electricity would need to be found. The alternative is for the increased use of oil and/or coal to make up for the loss of generating capacity. (PWCG, 2008).

~~9.4.7. Impact on City Solid Waste Management System~~

9.5.7. Impact on City Solid Waste Management System

The environmental effects of transshipment through the HWS system are anticipated to include:

> Refuse transfer, baling, shrink-wrapping, and loading will be required at a permitted transfer station.
>
> The material will be contained within a system that has received approval from the federal government based on the system's ability to prevent the unexpected discharge of waste or plant pests to the environment.

The conclusion of how transshipment would affect the City's current system and financing of solid waste collection and disposal remains unclear at this time. If transshipment removes 100,000 tons per year (TPY), tip fees and revenues from

---

[12] H-POWER. http://www.honoluluhpower.com, March 11, 2008.

electrical production and processing of MSW at H-POWER would be lost to the City. In as much as these revenues support the refuse collection system, the City would need to find other sources of funding to offset the losses.

H-POWER currently processes approximately 600,000 TPY of solid waste. With a reduction of 100,000 TPY of MSW to fuel the facility it would effectively operate at about half of its capacity, reducing the amount of energy and homes served by the facility. This loss would affect HECO because the utility would need to make up for the electrical energy with increased use of fossil based fuels (this assumes that there is excess generation capacity available from HECO).

~~9.4.8. Consistency with City & County of Honolulu Requirements~~
9.5.8. Consistency with City & County of Honolulu Requirements

The City & County of Honolulu guidelines regarding the transshipment of MSW off-island were established in its January 22, 2008 Notice to Bidders.

In addition, not all waste can be shipped off-island. Items such as flocked Christmas trees, sewage sludge, auto fluff, out of date medicines, and other hard-to-handle wastes cannot be shipped without special arrangements to dispose of these materials. The transshipment alternative only accepts materials from a specific waste stream and does not eliminate the need for a landfill.

~~9.4.9. Global Warming Considerations~~
9.5.9. Global Warming Considerations

PWCG performed an analysis to ascertain the potential generation of greenhouse gases (GHG) from transshipment compared to landfilling the same amount of waste in the WGSL, or burning it in H-POWER (see **Appendix K, Attachment C**). The purpose of the analysis was to evaluate the potential for broader cumulative effects to the environment given growing concern over global warming and climate change.
The assumptions and general conditions in the analysis included:

- The basis for the transshipment involved the transport of 100,000 TPY.
- The use of commonly accepted emission factors used to calculate the emissions.
- Where actual data was unavailable to define the logistical details of the transshipment process necessary to quantify emissions (e.g., physical considerations in port facilities, the time needed to move the wrapped waste onto and off the barge), a report prepared for the City to estimate the cost of transshipment was used as a resource.[13]
- Manufacturer's data was used to estimate electrical use by a baler and a shrink wrap machine as data was unavailable on the equipment that had been proposed for transshipment.
- Information on the fuel use on a tug boat and the time required for a load to be moved from O'ahu to the mainland was obtained from shipping industry contacts.[14]

The results of the comparison are summarized as follows:

Disposal Location	Emissions Million Tons CO_2 Equivalent
H-POWER	-28,711
WGSL	-3,686
Roosevelt Landfill	3,978

Note: The emissions at H-POWER and the WGSL are negative because GHG emissions resulting from the power they generate are more than offset by the reduction in emissions from burning coal or oil to produce the same amount of energy in other power plants on O'ahu.

The results indicate the lowest emissions of GHG would be from H-POWER, followed by WGSL, and the Roosevelt Landfill. It is expected that as with the Roosevelt Landfill, that transshipment to any landfill located on the mainland U. S., would result in similar

---

[13] RW Beck, Draft Integrated Solid Waste Management Plan Update, November 2007. See Appendix C Trans-Shipment of Waste Analyses.

[14] PWCG-Personal communication with a representative of Young Brothers.

GHG levels based on the need to travel long distances across the Pacific Ocean and to the landfill site.

~~9.4.10. Conclusion Regarding Transshipment~~

9.5.10. Conclusion Regarding Transshipment

Waste transshipment is a potential alternative that can reduce the need for a municipal waste sanitary landfill for the disposal of MSW, but cannot completely replace it. Major issues involved with waste transshipment include:

- Green waste and other unacceptable wastes would be excluded from transshipment. These forms of waste would require disposal in an acceptable facility such as a municipal waste sanitary landfill.
- Waste transshipment would be vulnerable to the effects of a shipping strike. If the strike were lengthy and exceed the approximately 75 day limit to hold the shrink-wrapped bales, O‘ahu would have no location for the disposal of the bales and would need to seriously consider the use of the landfill[15].
- Costs associated with transshipment would be based on a negotiated tip fee, fuel, and labor costs that would not be in the control of the City & County of Honolulu.
- Tip fees and the generation of energy from H-POWER would be reduced by the amount of waste that is transshipped. The City would have to make up the shortfall in revenues and energy provided from H-POWER. HECO would also be affected since it would have to make up the shortfall in electrical generating capacity.
- Transshipment involves an increase in the generation of greenhouse gasses when compared to landfilling and the use of H-POWER, but does

---

[15] The Courts could intervene in such a situation and order the parties involved to maintain the transshipment of waste based on public health and safety concerns.

have the potential to reduce the amount of capacity of the WGSL needed for landfilling.

- The loss of tip fees at WGSL would also contribute to a loss of revenue for the City and County, which is used to support the collection programs. Revenue from other sources would be needed to support the City's programs.

~~9.5. Alternative Technologies to Refuse Disposal~~

~~9.5.1. Introduction~~

9.6. Alternative Technologies to Refuse Disposal

9.6.1. Introduction

This section discusses the alternative technology approaches that may be able to reduce the demand for landfilling. There are currently no alternatives that have been proven to completely eliminate the need for a landfill. Alternative technologies reduce the demand for a landfill, but some residue will need to be disposed of in a landfill. (PWCG, 2008).

The evaluation of a combination of smaller alternative technologies was considered but not included in this EIS because the situation is similar to the evaluation of multiple smaller landfill sites with less capacity. This same issue was discussed by the 2002 Mayor's Advisory Committee on Landfill Site Selection. The Committee questioned whether the impacts of the landfill would be lessened if several smaller landfills were located around the island instead of at one location at Waimanalo Gulch. It was noted:

> "The Committee decided to limit its consideration to sites that had more than 10 years of capacity based on: the assumption that demand projections from the City remain unchanged; the City's experience with the length of time needed to implement new and feasible waste reduction technologies; and the cost and time required to identify and permit a new landfill site." (See Appendix K, Section 3.4).

The lead time and resources necessary to evaluate a combination of smaller scale technologies would be substantial and include:

- Detailed evaluation of the feasibility and cost of the technology or technologies using a different set of qualifying criteria than currently considered by the City, in that because a combination of technologies would have to be capable of processing the volume of waste accepted at the WGSL, several smaller facilities employing the same or different technologies would be used. This evaluation would need to include the detailed implementation plan identifying the planned construction scheduling and capital costs associated with the technology used.

- Several potential alternative sites would need to be identified, evaluated with the public and governmental agencies concerning environmental and land use effects, selected, and purchased. The number of alternative sites and magnitude of the public and governmental agency coordination needed would be a function of the number of technologies selected. Mitigative measures to address potential environmental effects associated with each technology would need to be developed.

- An estimate of the time needed for environmental and land use permitting would also need to be factored in to the project schedule.

In addition, for each alternative technology selected: (1) any waste by-products generated as a result of the technology process or processes used, would need to be at a scale that would not require landfilling; (2) would be required to have a market for the product resulting from the technology; and (3) be a feasible, proven, and reliable technology, used in a municipality similar in requirement to the City & County of Honolulu.

The City has the fiduciary and management responsibility to select only technologies that are proven to work on MSW with costs similar to the public cost of disposal and operations at WGSL. Factors that are not in favor of the evaluation of several smaller alternative technology facilities are:

- The expected lengthy period commitment of resources needed to research and develop a comprehensive package of small alternative technology facilities. This is reasonably expected to last more than a year and could take several years. The exhaustive process to select the technology for the third boiler at H–POWER took approximately a year to complete and was for a technology already proven in the City & County of Honolulu. The evaluation of one or more newer technologies could reasonably be expected to last much longer.

- The use of several smaller facilities is not efficient and cost effective. This is because the economies of scale normally present in an appropriately sized facility is not necessarily present at a smaller scale. This would lower the efficiency of waste disposal, potentially requiring in total size a greater combined number of facilities than would be provided by a single, appropriately sized facility.

Thus, the evaluation of a combination of alternatives is not considered feasible and would have significantly extended the time required beyond the November 1, 2009 SUP deadline to allow for the same or similar disposal capacity as available at the WGSL.

Factors important to ~~this~~ the analysis conducted by PWCG include:

> The City encourages alternatives to waste disposal that includes H–POWER. This facility converts about 40 percent of the MSW produced on Oʻahu into electricity. By-products are ash, residue, and unprocessible materials that require landfilling.

The City also contracts with a private vendor to operate a sludge pelletizing facility at the Sand Island Waste Water Treatment Plant. The facility converts sewage sludge previously disposed of at the WGSL into a fertilizer product. At the current time, the fertilizer product is not being marketed.

Both facilities share several characteristics:

- All were operated for many years using waste material similar to that produced on O‘ahu.
- The risk of operational problems was minimized because of the history of operations and the availability of firms to design, build, and operate the plants that have long term demonstrated operating results.
- The environmental impacts of the technologies were well understood and all had long histories of operating in compliance with regulations.
- The total cost of the technology was well understood.
- H-POWER has resulted in the significant reduction of the volume of material disposed of in the landfill.
- The City has continued its search for additional alternatives. Other areas of the U. S. and other countries are evaluating landfill alternatives and have observed some progress. Some of the results of those evaluations are used in this analysis to identify the advantages and disadvantages of the alternatives and compare them to the City’s criteria, also listed in this section.

The alternatives fall into several categories:

- Thermal processes which use heat to reduce the waste to other reusable products or a fuel. Pyrolysis and hydrolysis are examples of thermal processes.
- Non-thermal processes that produce a material, such as compost, that is sold.
- Enhanced recycling.
- Expansion of H-POWER.

Each of these alternatives has potential for reducing the amount of waste disposed of at the WGSL. However, each process produces a residue that, at this time, can only be landfilled for disposal.

~~9.5.2. City & County Requirements for Alternative Technologies~~
9.6.2. City & County Requirements for Alternative Technologies

The consideration of alternative technologies has been ongoing by ENV for many years. Those efforts have included implementing new recycling programs, bans on disposing certain recyclable materials in the landfill, and issuance of an RFP for Alternative Technologies or the addition of another boiler at H–POWER. It has since selected the addition of a third boiler at H-POWER to increase diversion of waste from the landfill.

The City identified the following six minimum requirements[16] for the use of alternative technologies (PWCG, 2008):

- *There exists at least one (1) operational facility processing municipal solid waste that over the past two (2) years has been operating at a rate of at least five hundred (500) TPD.*
- *Such facility has been operated successfully for the past two (2) years and has been fully operational eighty five percent (85%) of this time while meeting all performance and environmental compliance requirements.*
- *The facility without major modification or equipment changes, other than for the acceptable application of good engineering practice for scale up or scale down, would substantially represent the system proposed for Honolulu.*
- *The product produced at the facility has for the past two (2) years been marketed and resulted in the beneficial reuse of energy. The Offeror shall provide descriptions and documentation of the beneficial reuse.*

  For an Offeror to be able to claim an ability to contract for electric power to a utility, the Offeror must demonstrate that it has power purchase contracts on going and that the utility or energy customer, to which the power is to be sold,

---

[16] City and County of Honolulu, Notice to Bidders, Project to Construct and Operate Alternative Energy Facility and/or H–POWER Facility. Competitive Sealed Proposals (CSP) NO. 037, January 16, 2007.

provides evidence in writing that it shall enter into a power purchase contract based on its understanding of the proposed facility's ability to produce such power.

- *The proposed Facility shall be commercially available such that: (1) The design is proven and the proposed facility is not the first of its kind; (2) The equipment proposed has operated successfully at least eighty-five percent (85%) of rated capacity while at the same time operating for at least eighty-five percent (85%) of the time during the past twenty-four (24) month period; (3) The equipment is regarded as being reliable and not subject to excessive maintenance, operational problems, or requires major re-designs; (4) The facility has processed a minimum of five hundred (500) TPD of municipal solid waste while operating in accordance with all environmental permits.*
- *Certification that the ash slag and residue by products from the proposed facility have met all environmental requirements for either marketing or landfill disposal including passage of the [Toxicity Characteristic Leaching Procedure (TCLP)] test and classification as non-hazardous materials, or, if deemed hazardous certification from the final disposal site that materials have been properly disposed of and how it would be disposed of for this project.*

In its RFP, the City encouraged both thermal and non-thermal technologies. With thermal technologies the by-product is steam or electricity which can be sold. The by-products of non-thermal technologies are materials that require development of a market (i.e., building material, or compost). Technologies that produce a product that must be sold into a market (other than an energy market) will be more difficult in Honolulu. For example, a market does not currently exist for an alternative technology that produces an MSW compost product. The reason is that the market for MSW compost is restricted on the mainland and has faced controversy in Honolulu.[17] The proponent of a technology that produces a solid MSW fuel would need to find a fuel user and there are only two solid fuel users, H-POWER and the AES coal fired power plant. The current H-POWER facility is operating at capacity. To handle an MSW fuel at AES would probably require a revision to its operating facility and the acquisition of new

---

[17] Leone, Diana. *Waianae Compost Plan Hits Turbulence*. Star-Bulletin. August 17, 2006.

permits, a lengthy and expensive process, provided AES wished to pursue it. (PWCG, 2008).

~~9.5.3. Non Thermal Technologies~~

9.6.3. Non Thermal Technologies

Non-thermal or non-combustion technologies are those that do not require or produce large quantities of heat. Non-thermal technologies evaluated for the PWCG analysis are digestion and hydrolysis.

~~9.5.3.1. Anaerobic Digestion~~

9.6.3.1. Anaerobic Digestion

Anaerobic digestion is the decomposition of MSW without the introduction of oxygen. End by-products tend to be liquid, gas, and solid materials. The organic fractions of MSW are converted into single-celled proteins, which can be used for compost and fertilizers. Due to the length of time required for anaerobic digestion, greater land area is required to process the MSW. Examples of anaerobic technologies include: ArrowBio; Orgaworld; and Organic Waste Systems' DRANCO Dry Anaerobic Digestion. (PWCG, 2008).

This section provides information obtained for the ArrowBio process. ArrowBio has an operating 200 TPD plant using naturally occurring microbes to break down the organic faction of MSW. Other anaerobic methods will have different approaches and equipment, but produce similar products. (PWCG, 2008).

Currently, Orgaworld has two operating facilities, each with a capacity of 96 TPD, while Organic Waste Systems' facilities process up to 137 TPD. Both are significantly less than the City's minimum requirements and the Orgaworld and Organic Waste Systems are not discussed further. (PWCG, 2008).

Methodology

This process uses a separation-dissolving tank to separate organic and inorganic materials based on buoyancy. Heavier inorganic materials, such as metal and glass, sink to the bottom of the tank and are taken for further separation and then are recycled or disposed. Plastics, which remain floating, are separated pneumatically, while the remaining organic fraction is shredded and more water is introduced to further the biodegrading process. The remaining organic material is treated in acetongenic and methanogenic reactors producing fertilizer and biogas. The biogas, made up of approximately 75 percent methane, can be sold as clean, green energy for use in transportation and power facilities, or used internally to power the facility. The technology vendor is responsible for the disposal of these residues. (PWCG, 2008).

A demonstration facility, located in Hadera, Israel, processed more than 30 TPD of MSW and operated from 1996 to 1999. The facility was designed to process 11 TPD of MSW. One full scale ArrowBio facility located at the Hiriya transfer station in Tel Aviv, Israel has been in operation since 2002. The facility processes approximately 210 TPD of MSW and generates biogas sufficient to produce three MW.[18] (PWCG, 2008).

Use by Other Jurisdictions

The only ArrowBio facility currently in operation is at the Hiriya transfer station in Tel Aviv, Israel. ArrowBio technology may soon be added as part of Australia's Macarthur Resource Recovery Park, a proposed integrated waste facility on the current Jacks Gully landfill site.[19] (PWCG, 2008).

Physical, Regulatory, and Environmental Requirements

The ArrowBio facility at the Hiriya transfer station in Israel has one 200 TPD module and requires approximately two acres of land, with an additional one-half to one acre for long-term storage of materials. If it were sized up to meet the 500 TPD requirement of

---

[18] Arrow Ecology www.arrowecology.com, March 11, 2008.

[19] Marshall, A.T. and Morris, J.M., "A Watery Solution," Chartered Institute of Waste Management Journal, August 2006.

the City & County of Honolulu, an estimated six acres of land would be needed. (PWCG, 2008).

This facility would require 0.05 MW of electricity per ton of MSW processed, which could be met with the generation of biogas. Water consumption data is not readily available; however, ArrowBio claims the consumption is low due to moisture in the MSW. Additional water is required for the separation/dissolving tank. (PWCG, 2008).

ArrowBio claims no negative environmental impacts. There is no significant odor potential as the MSW is immediately placed into the separation-dissolving tank. The treatment takes place in enclosed tanks, also reducing potential odors. Water used throughout the process is reused in the separation-dissolving tank, which results in low water consumption. A small amount of wastewater is generated from the process, but is expected to be suitable for release into the sanitary sewer system. (PWCG, 2008).

The company provided no information regarding economic benefits associated with the technology.[20]

Potential Issues

Potential issues with anaerobic digestion include (PWCG, 2008):

- There may be size-up issues unless units of the same size as the existing facility are used.
- A market will need to be developed for the MSW compost which may be difficult. MSW compost is not currently marketed on O‘ahu so it may be challenging and time consuming to develop the market.
- A market will be needed for biogas or it will need to be used to generate electricity and sold to HECO.

---

[20] *Evaluation of New and Emerging Solid Waste Management Technologies,* New York City Economic Development Corporation and New York City Department of Sanitation, September 16, 2004.

Consistency with City & County of Honolulu Requirements

The anaerobic digestion facilities do not meet the City's requirements (PWCG, 2008):

- The existing facilities either process less than the City's minimum waste stream (the existing ArrowBio facility 210 TPD of MSW, 300 TPD less than what the City requires) or they process source-separated organics. ArrowBio could use multiple units to meet the City requirement.
- The facility design for the ArrowBio is the first fullsize facility.
- There is no proven market for the MSW compost product.

~~9.5.3.2. Aerobic Digestion~~

9.6.3.2. Aerobic Digestion

Aerobic digestion is the decomposition of MSW with the introduction of air. Vendor examples of aerobic digestion include Mining Organics, Real Earth Technologies, and the Herhof Environmental MBT Process. Due to the lack of readily available information on Mining Organics and Real Earth Technologies, a generic explanation of the Herhof Environmental MBT Process is provided. Different vendors use different approaches and equipment, but produce similar products. (PWCG, 2008).

Methodology

The aerobic digestion process can be either wet or dry. Dry aerobic digestion is similar to in-vessel aerobic composting (New York City Economic Development Corporation and New York City Department of Sanitation, 2004). Inorganic materials, such as glass, metals, and plastics are removed from the MSW prior to recycling. The remaining material is shredded, mixed, and put into a vessel with a controlled amount of air and heat. Liquid is removed thereby reducing the volume. The mixture is aerated, mixed, and depending on the reactor used, heated.[21] (PWCG, 2008).

---

[21] Kumar, Surendra, Shashi and Salman Zafar. "Composting Technology." *MSW Management, The Journal for Municipal Solid Waste Professionals*. May/June 2006.

Wet aerobic digestion removes inorganic materials, such as glass, metals, and plastics, and pulps the organic materials from the MSW. The slurry is then mixed, aerated, and heated. Heating dries some of the organic material, reducing the total volume. Microbes are then introduced, which reduce the slurry to solid and liquid soil amendments for use in fertilizers (New York City Economic Development Corporation and New York City Department of Sanitation, 2004). The technology vendor is responsible for the marketing these materials. (PWCG, 2008).

Use by Other Jurisdictions

Composting of kitchen, food, and green waste scraps is well established in Europe. Germany has more than 500 biochemical treatment facilities processing more than eight million TPY of food and green wastes; the majority are aerobic compost facilities. However, these facilities are not processing MSW.[22] Vancouver, Canada has a 30 TPD demonstration plant by Herhof in operation processing separated food and other organic wastes (New York City Economic Development Corporation and New York City Department of Sanitation, 2004). There are currently seven commercial MSW Herhof plants in operation in Germany, Belgium, and Italy, with one proposed for the United Kingdom that will use the solid fuel produced by the MBT Process in a combustion plant. (PWCG, 2008).

Physical, Regulatory, and Environmental Requirements

These requirements are unknown as there are currently no aerobic facilities that meet the requirements of the City & County of Honolulu. (PWCG, 2008).

Potential Issues

The process results in compost that would have to be sold and no markets have been demonstrated in Honolulu. Even with a solid fuel by-product, Honolulu does not have an existing, market for the fuel. (PWCG, 2008).

---

[22] Oaktech Environmental, http://www.oaktech-environmental.com/, March 11, 2008.

The process requires source-separated organics; it does not process mixed MSW. (PWCG, 2008).

Consistency with City & County of Honolulu Requirements
None of the Herhof Environmental plants currently in operation process more than 500 TPD of MSW. However, Herhof Environmental states their MBT Process is capable of processing up approximately 1,095 TPD.[23]

~~9.5.3.3. Hydrolysis~~

9.6.3.3. Hydrolysis

Hydrolysis is a chemical reaction in which water and another substance react, forming two or more new substances. With the hydrolysis of MSW, the reaction is between water and the cellulose fraction of the waste to produce sugars. To obtain the cellulose fraction of the MSW, glass, metals, and other inorganic materials must first be removed. (PWCG, 2008).

Several types of hydrolysis technologies exist. The description by Arkenol Fuels is provided as an example for discussion. Another technology is the Masada Oxynol process. (PWCG, 2008).

Methodology
Arkenol Fuel technology, also named Concentrated Acid Hydrolysis, uses the source-separated fraction of MSW. The process first sorts out recyclable materials. The remaining material is ground for further processing. Sulfuric acid decrystallizes the material and breaks the organic fraction into its component sugars (cellulose and hemicellulose). The material is then hydrolyzed; the chemical bonds are broken, producing hexose and pentose sugars required for commercial fermentation. Insoluble materials are filtered for processing for other uses. The entire process runs on biomass, including agricultural residues, crops grown specifically for use as biomass, paper,

---

[23] http:// www.herhof.com/en/, March 11, 2008.

wood, and green waste (New York City Economic Development Corporation and New York City Department of Sanitation, 2004).

The pilot facility for Arkenol Fuels is in Orange, California, and processed one TPD of MSW. This facility operated for five years beginning in 1992.[24] (PWCG, 2008).

The only commercialized Arkenol Fuel facility is in Izumi, Japan. It has been in operation since 2002, using waste wood chips as feedstock.[25] (PWCG, 2008).

Use by Other Jurisdictions

There are no hydrolysis facilities currently in operation that process MSW as feedstock and none of the size that the City & County of Honolulu requires.[26] (PWCG, 2008).

Physical, Regulatory, and Environmental Requirements

A Masada Oxynol facility that could process about 600 TPD is expected to require 10-acres. The environmental impacts include emissions from the process, waste water discharges, and other impacts. The facility will need to satisfy the State’s regulatory and environmental process for MSW processing plants. (PWCG, 2008).

Potential Issues

The use of MSW as feedstock has not successfully been demonstrated except at a pilot facility scale, although Masada Oxynol proposes development of a commercial facility (New York City Economic Development Corporation and New York City Department of Sanitation, 2004).

A market for the ethanol produced is expected to exist in the City & County of Honolulu, but has not been proven. According to Arnold Klann, President, and Chief Executive Officer for Arkenol, Inc., an uncertain market for ethanol is believed to be one of the reasons an Arkenol Fuel project failed (CIWMB, 2006).

---

[24] Arkenol Fuels, http://www.arkenol.com/, March 11, 2008.

[25] California Integrated Waste Management Board, Session Summary: Emerging Technology Forum, Brief summary of presentations by Rick Diederich prepared by CIWMB staff, April 17–18, 2006.

[26] Interstate Waste Technologies, http://www.iwtonline.com/, March 11, 2008.

Consistency with City & County of Honolulu Requirements
Hydrolysis is inconsistent with the City's requirements because there has not yet been a successful facility at the size required capable of operating on MSW. (PWCG, 2008).

~~9.5.4. Thermal Technologies~~

9.6.4. Thermal Technologies

Thermal or combustion technologies produce a significant amount of heat. During the processes, both organic and non-organic materials are combusted while the non-combustible materials can be recycled either before or after combustion. Common thermal technologies are gasification, plasma arc, pyrolysis, and incineration. Examples of thermal technologies include (PWCG, 2008):

- Covanta Energy - the City's H-POWER facility (described in this section as a proven technology currently in use by the City)
- Rigel Resource Recovery - Westinghouse Plasma Gasification
- Dynecology - Gasification with Briquetting of Refuse Derived Fuel (RFD)/Coal/Sewage Sludge
- Ebara Corporation - Fluidized Bed Gasification with Ash Vitrification
- GEM America - GEM Thermal Cracking Technology (Gasification)
- Global Energy Solutions - Thermal Converter Technology (Gasification and Vitrification)
- Interstate Waste Technologies - Thermoselect Gasification
- Pan American Resources - Destructive Distillation Lantz Converter
- Pratt Industries/VISY Paper (RDF)
- Comprehensive Resources, Recovery, & Reuse, Inc. (RDF)
- Takuma Mass Burn Renaissance System
- Resource Recycling, L.L.C. (Mass Burn)

~~9.5.4.1. Plasma Arc~~
9.6.4.1. Plasma Arc

This technology uses large carbon rods in a sealed vessel to generate a high temperature arc that converts the materials in the vessel into plasma (ionized air). Heat generated by the arc melts the inorganic fractions into a glass and vaporizes the organic fractions, which become a synthetic fuel gas. The waste glass can be disposed of in a landfill or may be used for beneficial purposes such as for replacement of imported sand for sand blasting. The synthetic gas is cleaned and burned to produce power. (PWCG, 2008).

There are several vendors of plasma systems, including Westinghouse and other project developers. A four TPD plasma system once operated near the H–POWER plant to process medical waste. (PWCG, 2008).

The City Council Public Works and Economic Development Committee heard from some plasma system representatives during its review of potential landfill sites.[27] The representatives that addressed the Committee were identified in the report as (PWCG, 2008):

> "…. the following companies with the plasma gasification technology have made presentations or submitted materials to the Committee on Public Works and Economic Development ..:
> (1) JDI/Geoplasma, LLC;
> (2) Environmental Solutions Corporation representing the Solena Group;
> (3) EnviroDyne;
> (4) Startech Environmental Corporation;
> (5) Scientific Utilization, Inc./Waste To Energy; and

---

[27] November 16, 2004 memorandum from Councilmember Rod Tam to Concerned Citizens of Oahu transmitting the report titled "Committee on Public Works and Economic Development's Summary Report on its Landfill Site Selection Process."

(6) Phoenix Consulting Group International, LLC, for Biomass Conversion Technology, LLC".

Methodology

Plasma arc technology gasifies MSW with high pressure air and an electric arc that produces very high temperatures (up to 8,000 degrees Fahrenheit). These temperatures virtually vaporize the waste into its elemental components creating syngas, which can be used to generate electricity. (PWCG, 2008).

Use by Other Jurisdictions

There are two operating plasma arc facilities that process MSW. The longest running, that is not a demonstration plant, is the Eco Valley Utashinai facility located in Utashinai, Japan. The facility processed more than 270 TPD of MSW and 130 TPD of automobile shredder residue and generates approximately 4,700 KWh of salable energy in fiscal year 2005.[28] (PWCG, 2008).

The City of St. Lucie, Florida has begun negotiations for a plasma arc facility. The Georgia-based company, Geoplasma, has agreed to build and operate the facility and claims the facility will process 2,000 TPD of MSW and 1,000 TPD of MSW mined from a landfill while producing 120 MW of electricity.[29] (PWCG, 2008).

Geoplasma has agreed to build and operate the facility, estimating that within the next 15 to 18 years the facility will have disposed of all the current waste in the landfill. Ron Roberts, the Assistant Solid Waste Director in St. Lucie, estimates the plant will be finished within 25 to 30 months.[30] (PWCG, 2008).

---

[28] Shigehiro, Michiaki, General Manager of Eco Valley Utashinai.

[29] Sladky, Lynne. "Florida county plans to vaporize landfill trash." USA Today. September 9, 2006 and Margasak, Gabriel. "Trash zapper in St. Lucie County gets shot in arm from Crist", TCPalm, November 10, 2007.

[30] Miller, Dan. "State-of-the-art plant makes trash vanish into thin air." County News Online. National Association of Counties, Washington, D.C., October 2, 2006.

A second plasma plant operating on MSW started operation in late January 2008 in Ottawa, Canada. It is a demonstration project. The information about the plant was obtained from news sources.[31] which stated (PWCG, 2008):

> "A demonstration waste-to-energy plant in Ottawa has finally turned its first load of trash into power…"
>
> "…the $27 million plant uses a process called plasma gasification to decompose waste under high heat and low oxygen into a gas mixture called syngas, and a glass-like material that can be turned into asphalt or concrete…"
>
> "Once the plant is running at full capacity, it is to divert 85 tonnes of waste a day from the city's landfills while generating enough electricity to run the facility and power 3,600 homes..."
> "Plasco hopes its demonstration plant in Ottawa will persuade other cities to buy the technology…"
>
> "Construction of the plant started in September 2006. It was to run as a two-year pilot project…"

The PLASCO plant was partially funded by the Canadian government (PWCG, 2008):

> "This brings to over C$90 million the equity invested in PlascoEnergy since August 2005. The Company had nominal debt and a modest cash position prior to this issue, and is well funded for development of commercial facilities next year," said Rod Bryden, PlascoEnergy President and CEO.
>
> "Commitment of funding from Sustainable Development Technology Canada ("SDTC") to the Ottawa demonstration project was a key factor in bringing the PlascoEnergy technology to reality and to attracting private

---

[31] Information from http://www.cbc.ca/technology/story/2008/02/07/ot-plasco-080207.html, March 12, 2008

> capital that will fund its future commercial use around the world. SDTC has committed a non-repayable contribution of C$9.5 million," he said.[32]

Physical, Regulatory, and Environmental Requirements

The Eco-Valley Utashinai facility is the only plasma arc facility of its kind that has been operating. If a similar facility were built on Oʻahu, it would have to meet the same requirements of both State and Federal regulations as any new alternative technology (PWCG, 2008).

The actual treatment record of the Utashinai plant in FY 2005 is provided in **Table 9-1, Actual Treatment Record, Utashinai, Japan**, as follows[33]:

Table 9-1, Actual Treatment Record, Utashinai, Japan

Month	Receipt of Waste (Tons)		Treatment of Waste (Tons)		Slag (Tons)	Electric Power (MWh)			Operating (day)

---

[32] Information from PLASCO new release dated December 12, 2007, http://www.plascoenergygroup.com/?News/23/2007-12-03:First_Reserve_leads_PlascoEnergy_equity_funding, March 12, 2008.

[33] Nomura, Akira. Hitachi Metals. Actual Treatment Record for Utashinai Eco Valley. 2005. Correspondence to Wilma Namumnart, Department of Environmental Services, August 10, 2006.

Potential Issues

The experience with plasma operating on MSW has been limited to one full-scale plant. The cost of the facility is believed to be $425,000,000.[34] The actual cost of operations is not known. (PWCG, 2008).

Consistency with City & County of Honolulu Requirements

Plasma arc technology does not currently meet City & County of Honolulu requirements (PWCG, 2008):

- One of the two operating facilities has required maintenance for the furnace reflectors and the other started operations this year.[30]
- The Eco Valley Utashinai facility processes 270 TPD of MSW, 230 TPD short of the City's requirements. The Ottawa facility at 85 metric TPD is also short of the requirements.
- The facilities are the only ones operating on MSW.

~~9.5.4.2. Gasification/Pyrolysis~~
9.6.4.2. Gasification/Pyrolysis

Gasification is the process of reducing MSW to a synthesis gas. Pyrolysis is similar to gasification and often considered a type of gasification technology. The by-products of gasification are syngas and vitrified material (slag), and pyrolysis by-products are solid carbon and liquid fuel. Pyrolysis generally takes place during the first steps of gasification. Examples of gasification technologies are (PWCG, 2008):

- Dynecology - Gasification with Briquetting of Refuse Derived Fuel (RDF)/Coal/Sewage Sludge.
- Ebara Corporation - Fluidized Bed Gasification with Ash Vitrification.
- GEM America - GEM Thermal Cracking Technology (Gasification).

---

[34] Waste Age Magazine, September 13, 2006. “Florida county to generate energy by vaporizing solid waste”. Also their web page at http://wasteage.com/news/Geoplasma/?cid=most-popular, March 11, 2008.

- Global Energy Solutions - Thermal Converter Technology (Gasification and Vitrification).
- Interstate Waste Technologies - Thermoselect Gasification.
- Pan American Resources - Destructive Distillation Lantz Converter.

Methodology

Dynecology's Gasification with Briquetting of RDF/Coal/Sewage Sludge technology processes MSW into RDF and then blends RDF and dewatered sewage sludge together with coal making briquettes. The briquettes are then introduced to the gasifier, or high-pressure, fixed-bed reactor. The inorganic fraction melts and is removed from the bottom of the chamber as slag and the synthesis gas is removed from the top. Dynecology has no facilities currently operating on MSW. (PWCG, 2008).

GEM America's GEM Thermal Cracking technology processes unsorted MSW. Recyclable materials, such as metals, glass, and cardboard are separated and the remaining materials are shredded, dried, and granulated. The MSW is then gasified and converted into synthesis gas. The synthesis gas can be used to generate electricity. GEM America has no commercial facilities currently in operation, but has two demonstration plants processing 73 TPD that have been in operation since 2000. (PWCG, 2008).

Ebara Corporation's Fluidized Bed Gasification with Ash Vitrification technology introduces shredded MSW into a fluidized bed reactor vessel. Gasification takes place in the reactor at atmospheric pressure. The ash and synthesis gas enter into a second chamber where the materials are heated again at higher temperatures. Fine particles are collected on the walls and become molten slag collected at the bottom of the chamber and cooled to form a vitrified granulate. The synthesis gas is used to produce energy. The largest Ebara plant is the Kawaguchi City reference plant which processes 462 TPD of MSW. (PWCG, 2008).

With Global Energy Solutions' Thermal Converter technology (Gasification and Vitrification), unsorted MSW is introduced into the gasification reactor. Preheated air is then introduced and the MSW is passed to a conversion chamber and then to a second conversion chamber. The secondary chamber cleans the gases and vitrifies the residue using a bed of molten material. The synthesis gas produced is used in a boiler to produce steam or generate electricity. (PWCG, 2008).

Interstate Waste Technologies uses a waste treatment process called Thermoselect Gasification. The system compacts unsorted MSW thereby removing most of the air and evenly distributing the moisture content. The compacted waste is pushed through a high temperature chamber where the inorganic waste turns molten and the organic waste converts into gas. The organic gases enter a lower temperature chamber and are shock cooled to avoid the formation of dioxins or furans. The gases are then shuttled through scrubbers to remove sulfur, heavy metals and other toxins. The resulting synthesis gas can be used for energy production or as a base material for chemical synthesis. The molten inorganic waste is also shock cooled and results in reusable mineral substances and metals. The water condensed during the different phases of the gas treatment is fed into the water treatment chambers where it undergoes a multiple-stage treatment. The processed water is then used for cooling purposes.[35] (PWCG, 2008).

Use by Other Jurisdictions

Global Energy Solutions has 14 facilities in operation in Japan, Asia, and Europe. Two facilities operating in Japan only process MSW.

Interstate Waste Technologies has the following facilities (PWCG, 2008):

- Fondotoce, Italy, operated the demonstration Thermoselect facility for six years, with commercialization commencing in 1994, from 1992-1998. The plant was decommissioned in 1999.

---

[35] http://www.iwtonline.com/docs/Thermoselect_process_description.pdf, March 12, 2008.

- Karlsruhe, Germany, operated a Thermoselect facility from 1999 until 2004, when it was closed due to “general business strategy decisions.” The facility processed 225,000 TPY of waste from surrounding towns and rural districts.
- Thermoselect has seven facilities operating in Japan. Three of the facilities operate on MSW. Commercialization of the Matsu facility began in 2003 and currently processes 140 TPD. The Nagasaki and Tokushima facilities commenced operations in 2005, with the Nagasaki facility processing 300 TPD and the Tokushima facility processing 120 TPD of MSW.

Physical, Regulatory, and Environmental Requirements

Global Energy Solutions states that their Thermal Converter technology exceeds all known emission standards worldwide and that there are no odors due to the storage of MSW inside a building. Global Energy Solutions also states that their technology requires less land than traditional incinerators; however, no documentation of land requirements was found.[36]

The synthesis gas produced is sufficient to power the Thermoselect facility. Water consumption is 560 gallons/ton of MSW. Wastewater is treated and reused. (PWCG, 2008).

Potential Issues

Potential issues with gasification/pyrolysis include (PWCG, 2008):

- Global Energy Solutions’ Thermal Converter technology vitrified residual by-product requires a market.
- Interstate Waste Management’s Thermoselect technology requires a market for the metal pellet and vitrified granulate by-products.

---

[36] Global Energy Solutions. http://www.teamges.com/, March 11, 2008.

Consistency with City & County of Honolulu Requirements

Global Energy Solutions' Thermal Converter technology might be consistent with the City's requirements; there is no information readily available regarding how long either of the two MSW facilities has been in operation in Japan. The by-product residual requires a market that is not proven on O'ahu. (PWCG, 2008).

Interstate Waste Management's Thermoselect technology is inconsistent with the City's requirements. Although there are seven Thermoselect facilities in Japan, only three operate on MSW and none at the size the City requires (the Matsu facility processes 140 TPD, the Nagasaki processes 300 TPD, and the Tokushima facility processes 120 TPD). All facilities have been in operation for more than two years. The market for the metal pellets and vitrified granulate by-products would have to developed on O'ahu. (PWCG, 2008).

~~9.5.5. Waste to Energy~~

9.6.5. Waste to Energy

H-POWER is a working example of the waste-to-energy (WTE) alternative technology. It is proven in long-term operation in Honolulu where it converts MSW into energy, with residues of ash, by-passed material, and unacceptable waste. An expansion of H-POWER was approved by the Mayor on January 18, 2008. The expansion is included as an alternative that will reduce but not replace the need for a landfill. (PWCG, 2008).

Methodology

There are two general approaches to WTE, mass burn and RDF. In a RDF plant (the H-POWER facility is an RDF plant) MSW is processed through shredders and screens, through which dirt, glass, and other recyclable and non-burnable materials are sorted out. The remaining material is incinerated, resulting in the creation of ash (approximately ten percent of the original volume), residue, and steam used to generate electricity. Metals are separated in the pre-combustion processing and from the ash post-combustion, and are recycled. (PWCG, 2008).

Mass burn plants combust MSW without pre-processing. Waste is introduced into the furnace after being unloaded from the collection vehicle. The waste combustion creates steam, which is used to make electricity. By-products are ash and residual waste. Metals are separated from the ash and are recycled. (PWCG, 2008).

The project host and technology vendor are responsible for the disposal of ash and residual waste. (PWCG, 2008).

The H-POWER facility in Kapolei is a RDF plant and is capable of processing 2,160 TPD of MSW. It generates approximately seven percent of O‘ahu’s energy, enough electricity to support 45,000 homes. Residual waste and ash are disposed at the Waimānalo Gulch Sanitary Landfill. (PWCG, 2008).

Use by Other Jurisdictions

WTE is a proven technology with facilities found throughout the United States. Covanta, the operator of H–POWER, operates plants in Alabama, California, Connecticut, Florida, Indiana, Hawaii, Maryland, Massachusetts, Michigan, Minnesota, New Jersey, New York, Oregon, Pennsylvania, and Virginia. WTE is used in many other countries where it has been operating for more than 75 years.[37]

H-POWER has been in continuous operation since 1989.

Physical, Regulatory, and Environmental Requirements

The physical, regulatory, and environmental requirements of a third boiler at H-POWER are well understood based on the existing plant in operation. Environmental controls and regulatory requirements are met with the existing facility. Land is available at the H-POWER site for expansion. (PWCG, 2008).

---

[37] Covanta Holding, http://www.covantaholding.com/, March 11, 2008.

Potential Issues

WTE requires a landfill for the disposal of ash and residual waste. The market for H-POWER electricity is already contracted with HECO and the technology and environmental operating characteristics are well understood.

Consistency with City & County of Honolulu Requirements

WTE is consistent with the City's requirements as provided in Section 9.~~5.~~6.2. City & County Requirements for Alternative Technologies.

~~9.5.6. Expanded Recycling~~

9.6.6. Expanded Recycling

Expanding current recycling infrastructure within the City would not eliminate the need for landfills but can decrease the amount of refuse disposed of in landfills[38]. Expanded recycling could include the expansion of the number of sites that accept materials from the HI5 beverage container program, the addition of more sites to the school drop-off program, increasing the frequency of curbside collection of residential green waste, and adding a program to collect other recyclables from residences at curbside. (PWCG, 2008).

~~9.5.6.1. Improvements to Recycling Infrastructure~~

9.6.6.1. Improvements to Recycling Infrastructure

~~Current r~~Recycling infrastructure consists of a pilot program to evaluate weekly MSW collection with weekly curbside recycling and green waste collection, community recycling bins, recycling support for schools, HI5 redemption sites, and curbside green waste recycling. The overall goal is to reduce the amount of waste disposed at the WGSL. The community recycling bin program is supported by participating schools. The program uses a 40 cubic-yard recycling roll-off bin, divided into sections for mixed

---

[38] The market for recyclables is limited and not all waste products are feasible for recycling. Waste materials that cannot be recycled or reused would need to be landfilled.

containers and paper. Students, their family members, the community, and school employees drop-off their recyclable materials. The host school receives revenues for the recycled materials collected in their bin(s). Since the program began in 1990, more than $1,000,000 has been paid to the participating schools. (PWCG, 2008).

Schools are also receiving additional support through assistance programs, in which the City offers 96-gallon wheeled toters labeled for aluminum, glass, plastic, and newspaper. Fundraising materials, such as banners, graphics, lists of recycling companies, collection services, and redemption centers are also provided to help advertise a recycling event. The schools use these events as fundraisers. Currently, there are 75 to 80 schools and 35 non-profit organizations participating in this program. A new contract that began in March 2008 will add 40 additional sites for multi-material recycling. (PWCG, 2008).

The City also provides, through the contract, ten HI5 event bins. These 40 cubic yard bins are used at special school or community events for recyclables. The City's contractor removes the bin after the event and the school or community group receives the redemption value from the HI5 containers. (PWCG, 2008).

Another current effort is the expansion of the number of HI5 redemption sites. The HI5 redemption sites are privately-operated for residents to drop-off their recyclable cans, plastic, aluminum, and glass HI5 containers for a 5 cent cash refund. The City also provides curbside green waste pick-up to its residents. The City picks up green waste twice a month on the day following garbage collection days. Approximately 10,000 tons of green waste is collected annually from residences. The collected green waste is turned into mulch and offered to residents at no cost.[39]

The City established a pilot curbside recycling/green waste collection program in the fall of 2007 to evaluate the efficacy of waste collection once per week (rather than the current twice-per-week schedule) and collect either containers and paper, or green

---

[39] Department of Environmental Services www.opala.org, March 11, 2008.

wastes on the second collection day (that is green waste one week and containers and paper the next). That program is to be expanded island-wide starting in the fall of 2008. (PWCG, 2008).

~~9.5.6.2. Recycling to Energy~~

9.6.6.2. Recycling to Energy

Recycling materials into products, as is done with the green waste program (mulch and compost) and the collection of bottles and paper (made into new bottles and paper products) is one form of recycling that will be expanded by the City. Recycling to energy (conversion of the waste to energy) is another. (PWCG, 2008).

WTE, such as H-POWER, is a technology of choice based on direct benefits of energy production and reduction in waste disposal volume. Approximately 90 percent of the residential garbage and 77 percent of the commercial waste collected on O‘ahu is disposed of at the H-POWER facility and is turned into energy that powers approximately 45,000 homes.[40] Incinerating 90 percent of the garbage that goes through the H-POWER facility means only one-tenth, by volume, remains to be landfilled. Expanding the H-POWER facility or will be most beneficial to the City in reducing the amount of waste sent to the landfill. (PWCG, 2008).

~~9.5.7. Wet Cell Landfill~~

9.6.7. Wet Cell Landfill

Wet cell, or bioreactor landfills, use accelerated decomposition to create additional landfill gas for conversion to energy and recover landfill space as the waste decomposes. The wet cell would enhance energy recovery from the landfilled waste and extend the life of the landfill. (PWCG, 2008).

---

[40] City and County of Honolulu Department of Environmental Services. Solid Waste Integrated Management Plan. Updated: November 2007. Table 63a, Table 63b and Table 2-7.

There are three forms of wet cell landfills: aerobic, with the presence of oxygen; anaerobic, without the presence of oxygen; or a combination of the two. Both processes accelerate the decomposition of waste. Conventional landfills take 30 to 50 years for the waste to decompose, while wet cell landfills take approximately five to ten years.[41] (PWCG, 2008).

Methodology

Aerobic wet cell landfills collect leachate from the bottom layer of the landfill and pump it into a storage unit. Water is added, if required, and the liquids are then redistributed into the landfill. Air is injected to encourage aerobic decomposition and stabilization of the waste (PWCG, 2008).

Anaerobic wet cell landfills add moisture to the landfill through re-circulated leachate and other sources to achieve optimal moisture levels, but do not add air. A biogas is produced comprised mostly of methane, carbon dioxide, and volatile organic compounds. The gas can be used to create electricity. (PWCG, 2008).

Hybrid wet cell landfills use both aerobic and anaerobic processes to rapidly accelerate biodegradation and decomposition of the landfilled waste. Biogas can also be collected from hybrid wet cell landfills; this by-product occurs much earlier than during the anaerobic process. (PWCG, 2008).

Use by Other Jurisdictions

The Environmental Protection Agency (EPA) is conducting case studies of bioreactor landfills within its Project XL, which started in 1995. Project XL provides flexibility to regulated entities to conduct pilot projects demonstrating the ability to "achieve superior environmental performance.” Since September 2001, 51 pilot experiments have been implemented. Of those 51, four have been approved to operate as wet cell landfills. The landfills are Buncombe County Landfill Project, North Carolina; the Maplewood Landfill

---

[41] County of Yolo Planning and Public Works Department Division of Integrated Waste Management, EPA Project XL, Final Project Agreement for the Yolo County Accelerated Anaerobic & Aerobic Composting (Bioreactor) Project, September 14, 2000.

and King George County Landfill, Virginia; and the Yolo County Bioreactor Landfill, California. The EPA is evaluating the advantages and disadvantages of bioreactor landfills. The studies are expected to be completed between 2006 and 2026. (PWCG, 2008).

Physical, Regulatory, and Environmental Requirements

A wet cell landfill requires a different liner design, leachate collection system, and monitoring system than used for a conventional sanitary landfill. One concern regarding wet cell landfills is the increased of leachate to facilitate biodegradation and decomposition. Therefore, one of the EPA's requirements for their case study involves a liner design that addresses increased production of leachate.[42] The Yolo County Module D Bioreactor proposes a liner over five feet thick with earth and clay layers alone, as well as a collection system that would recycle the leachate and reintroduce it to the landfill. The permitting process for wet cell landfills is also different. Only the EPA through its XL project program grants permits for wet cell landfills. The expansion space at the WGSL could have cells that could be used for wet cell landfilling; however, major changes in site design, and potentially site life, would be required. The benefit to justify such an expense has not been shown with only four test sites in operation. (PWCG, 2008).

Potential Issues

The cost of the wet cell and potential environmental effects has not been determined for the WGSL. The wet cell technology must also be demonstrated in relation to current plans for use of the WGSL expansion area.

Consistency with City & County of Honolulu Requirements

The wet cell is a variant of traditional landfilling practice and could be consistent with City & County of Honolulu requirements. The cost and environmental implications of using the technology would have to be evaluated by the City and landfill operator. (PWCG, 2008).

---

[42] United States Environmental Protection Agency. http://www.epa.gov/

~~9.5.8. Co-Disposal~~
9.6.8. Co-Disposal

Co-disposal is the disposal of MSW and ash together in a landfill, where the ash replaces the dirt cover and fills the voids in the MSW. Combining the two materials would result in the more efficient use of landfill space since ash requires less space for disposal than compacted MSW and would replace the use of soil for cover. (PWCG, 2008).

Methodology
At the end of the operating day, the ash would be used as alternate daily cover to replace the soil cover now used. (PWCG, 2008).

Physical, Regulatory, and Environmental Requirements
The State DOH approved the use of H-POWER ash as ADC at the Waimānalo Gulch Sanitary Landfill provided that a number of requirements are followed[43] (PWCG, 2008):

- A six-month demonstration project to evaluate the performance of ADC in meeting the requirements of daily cover
- Ash must be used within 24 hours of its creation
- Ash must contain less than 25% moisture
- Ash can only be used between 3 and 5 p.m.
- No more than 300 tons of ash can be used per day
- Equipment must not be used on ash, a two foot depth and 15-foot buffer must be in place to protect the general public
- Equipment operators must use positive pressure cabs, while spotters must wear personal protective gear
- Warning signs must be posted to inform the general public

---

[43] Hawaii State Department of Health. Response to Comments on the Draft Conditions for the Use of H-POWER MST Ash as Alternative Daily Cover at the Waimānalo Gulch MSW Landfill. April 12, 2001.

- A wind shut-down trigger must be in place (to be determined from the six-month demonstration project)
- A rain shut-down trigger must be in place to prevent ash from entering the storm water system
- Total metals must be tested quarterly
- An engineering study evaluating the landfill's static and seismic stability is required
- A lime depletion study is required

Potential Issues
Operational issues associated with the DOH requirements may preclude the co-disposal option.

Consistency with City & County of Honolulu Requirements
Co-disposal is consistent with the City &County of Honolulu requirements.

~~9.5.9. Conclusion Regarding Alternative Technologies~~
9.6.9. Conclusion Regarding Alternative Technologies

The information presented for this section provides a comprehensive review and analysis of a number of alternative technologies or methods to either significantly reduce or eliminate the disposal of refuse in a municipal sanitary landfill. Major issues involved with the use of alternative technologies or methods include:

- A number of emerging new or existing technology based approaches show promise for use in the City & County of Honolulu. The approaches evaluated included thermal, nonthermal, WTE, expanded recycling, wet cell or bioreactor landfilling, and co-disposal. None of the approaches that were evaluated are capable of completely eliminating the need for a municipal landfill. Each of the processes reviewed result in the generation of waste byproducts that cannot be further reused, recycled, or otherwise recovered for either a commercial or other beneficial public use while meeting the performance requirements of the City & County of Honolulu for demonstrated feasibility.

- Some alternative technologies, such as hydrolysis (generation of process wastewater and other byproducts), involves the potential for environmental impacts that would require further examination to ensure public and environmental safety.
- A number of the technologies that produce a secondary product, e.g., fuels for the generation of electricity or recovered plastic, metal, or glass products, do not have established commercial markets in the State of Hawaiʻi. New markets and users for these products would need to be established to ensure viability of the waste technology. Failure of the technology after start up would otherwise be borne by Oʻahu's residents through: (1) financial subsidization of the alternative technology in order to avert closure of the facility; or (2) the need for additional landfill capacity to handle the MSW stream that would otherwise be processed.
- Certain alternative technologies are viable when considered as part of the City's waste management system. An existing technology, WTE, has benefited the City & County of Honolulu: (1) WTE does not completely eliminate, but does significantly reduce the volume of waste requiring landfilling by a factor of approximately 90 percent; (2) WTE provides a beneficial recyclable product in the form of electricity from refuse that would otherwise be disposed of; and (3) WTE is based on known environmental factors and potential effects which are or have been mitigated by the City as part of its existing operation of H-POWER. It is expected that other technologies and approaches will be developed as they mature and demonstrate feasible application in other municipalities.

~~9.6. Alternative Sites for a Municipal Landfill~~

~~9.6.1. Introduction~~

9.7. Alternative Sites for a Municipal Landfill

9.7.1. Introduction

This section assesses potential landfill sites as alternatives to the proposed lateral expansion of the WGSL. The alternative sites were previously identified in the December 2003 report by the Mayor’s Advisory Committee on Landfill Site Selection (Advisory Committee). The alternative sites considered by the Advisory Committee is useful to this assessment based on the following (PWCG, 2008):

- It used a committee of professionals as well as residents, from the areas most likely to be the location of a future landfill, to identify the screening criteria for evaluation of the new landfill site. The Advisory Committee represented a broad range of interests and expertise and relied on the consultant and ENV staff for technical input. The Advisory Committee made all the decisions relative to inclusion or exclusion of the sites.
- The inventory of potential sites that was the starting point for the Advisory Committee analysis was comprehensive, drawn from reports and other work between two and 28 years old (at the time of the Advisory Committee work in 2003). The Advisory Committee members, were asked, but had no additional sites of sufficient capacity that could be added to the list. In fact, the list of potential sites was reduced substantially due to land use development that encroached on some sites.
- The Advisory Committee focused its evaluations on the community perspective and most of their criteria were community–based considerations. While technical issues were considered, the Committee placed most of its emphasis on potential landfill impacts on the community where the sites were located. These potential impacts are also assessed as part of this EIS.

- The Advisory Committee recommendations were submitted to the Honolulu City Council on December 1, 2003.

The work of the Advisory Committee was considered in the review of potential landfill sites by the City Council Committee on Public Works and Economic Development. The Committee Chair, Mr. Rod Tam, reported the results of his Committee's evaluation to the full Council on November 16, 2004.[44] According to the evaluation:

> "…Landfills, in my view, should no longer be considered our primary depository of unwanted waste. We should be making every effort to divert all of our solid waste to recycling and reprocessing into energy or other useful products. Our goal should be to initially process all our solid waste in some form or fashion so that what ends up in our landfills is only the by-products of that initial processing that has no current use. This will reduce significantly the volume of waste going into our landfills thereby extending its useful life…."

The Committee conducted meetings on the Leeward and Windward sides of the island to receive public input. The memorandum reporting the results[44] made no recommendation regarding a specific site, but provided background for the final site selection. Information gathered in Councilmember Tam's investigation has been used in this analysis (PWCG, 2008).

The following discusses the landfill site selection process, the features of the sites recommended by the Advisory Committee that caused them to have different scores on the evaluation process, and discuses the City's general requirements for a landfill site.

---

[44] November 16, 2004 memorandum from Councilmember Rod Tam to Concerned Citizens of Oahu transmitting the report titled "Committee on Public Works and Economic Development's Summary Report on its Landfill Site Selection Process."

~~9.6.2. City & County Requirements for a Landfill~~

9.7.2. City & County Requirements for a Landfill

The City & County of Honolulu has not published its “requirements” for a potential landfill site but uses the following general prerequisites (PWCG, 2008):

- Environmental - The site must not have physical features that make it more difficult to minimize environmental impacts. For example, if two sites were otherwise equal, the one with the lesser impact on wetlands would be preferred.
- Landfill capacity or life span - A site needs to accommodate at least 10 years of disposal to justify the time and expense of permitting it. A landfill with a long life also minimizes environmental impacts compared to landfilling at smaller landfill sites. The longer the life of a landfill the more waste it can accept, thus reducing disposal cost.
- Disaster debris - Having the space and equipment to mange and temporarily store disaster debris will be important. A potential landfill site needs to have space for disaster debris storage or disposal to preserve public health, safety, and welfare.
- Reasonable cost - The City provides the lowest cost, environmentally sound means for disposal of municipal refuse to benefit the taxpayer.
- Proximity to the H-POWER facility - The contract with Covanta to operate H-POWER provides for a price increase for ash transportation if the landfill is more than 12 miles from the plant site. In addition, the more miles traveled by trucks transporting ash, the greater the opportunity for accidents.

In addition to the above, the City considered (1) the use of two more landfill sites for MSW and ash and residue, as well as (2) the use of two or more landfill sites to separately handle MSW in one landfill and ash and residue in another. As in 2002 when the prior City administration sought the expansion of the WGSL, the use of two or more landfill sites was considered by ENV for the proposed project, but was not selected for consideration based on the following (FSEIS, Waimānalo Gulch Sanitary Landfill Expansion, 2002):

1. Land resources on O‘ahu are finite and limited. Use of more than one landfill site for the disposal of MSW and/or ash and residue would foreclose or limit other alternative land uses that might otherwise be provided.

2. Potential for negative environmental impacts associated with the development of any landfill requires major effort to ensure mitigation. Development of two or more landfill sites would increase potential for negative environmental impacts and costs necessary to mitigate such impacts.

3. Economies of scale from an appropriately sized facility would generally result in more efficient use of land than two smaller facilities that may not be as easily planned from a landfill development perspective. The economies of scale would also allow for lower refuse disposal costs than two or more smaller landfills.

~~9.6.3. Mayor's Advisory Committee on Landfill Site Selection~~
9.7.3. Mayor's Advisory Committee on Landfill Site Selection

The Mayor's Advisory Committee on Landfill Site Selection was formed in response to Condition No. 1, of the approved State Special Use Permit[45] calling for the formation of a "Blue Ribbon Site Selection Committee". The Committee started with the reports of studies done by the City over the past approximately 30 years to identify potential

---

[45] Decision and Order Approving Amendment to State Special Use Permit, Docket No. SP87-362, Waimānalo Gulch Sanitary Landfill, June 5, 2003.

landfill sites. ENV and the Advisory Committee consultant assembled a list of 45 potential sites for the Advisory Committee to consider from the following prior reports:

(1) Inventory of Potential Sanitary and Demolition Landfill Sites, August 1977.
(2) Supplement to Inventory of Potential Sanitary and Demolition Landfill Sites, November 1979.
(3) Revised Environmental Impact Statement for Leeward Sanitary Landfill at Waimānalo Gulch Site and Ohikilolo Site, 1984.
(4) Solid Waste Integrated Management Plan Update, Final Report, 1995.
(5) Final Supplemental Environmental Impact Statement, Waimānalo Gulch Sanitary Landfill Expansion, December 2002.

The following discusses how the Advisory Committee evaluated the 45 sites, provides the specific criterion used for their evaluation, and summarizes the recommendations of the Committee to the City Council.

~~9.6.3.1. Sites Considered~~
9.7.3.1. Sites Considered

The sites that were considered as potential landfill sites are listed in **Table 9-2, Potential Landfill Sites**. The table shows the site name, tax map key (TMK), estimated acreage, estimated volume, and the landfill life (the number of years the landfill could provide disposal capacity at the estimated disposal needs for the City & County of Honolulu.) The estimated disposal need is provided in **Table 9-7, Estimate of Landfill Capacity Needs**. (PWCG, 2008).

Table 9-2, Potential Landfill Sites

Site Name	TMK	Size (Acres)	Capacity (MM cy)*	Life (Years)

* Million cubic yards (cy)

** Information has been updated since the Mayor's Committee Report. The current lateral expansion acreage is approximately 92.5 acres. The actual area of use may be changed as the design is refined and reviewed by government regulatory agencies.

Note: Based on Final EIS for Waimanalo Gulch Expansion, December 2002.

~~9.6.3.2. Site Evaluation Process~~

9.7.3.2. Site Evaluation Process

The Advisory Committee first developed siting criteria to quantitatively compare the characteristics of one site to another and allow identification of the "best" site. The siting criteria were divided into three groups: exclusionary, evaluation, and Advisory Committee criteria. (PWCG, 2008).

The Exclusionary Criteria included:

- EPA siting criteria as promulgated in the Resource and Conservation Recovery Act, Subtitle D (RCRAD).
- Sites located in areas which have since been developed or are closed landfills with no further expansion potential.
- The Honolulu Board of Water Supply (BWS) evaluation governing whether a site should be protected in consideration of its proximity to the Groundwater Protection Zone and Underground Injection Control (UIC) Line zone; and
- The Advisory Committee's capacity criterion stating that the site must have a minimum life of more than 10 years.

For the qualitative evaluation of the potential sites, the Advisory Committee developed 31 Screening Criteria following extensive discussion and deliberation. After applying the criteria, the Advisory Committee used the numeric scores for the sites, which compared one site to another on the basis of community, economics, land use, and technical considerations. (PWCG, 2008).

The Advisory Committee members applied their own insights regarding each site as the final step in the siting evaluation.

After application of all of the criteria, the Advisory Committee deliberated on the remaining sites and arrived at its recommendations for the Mayor and City Council by vote.

Table 9-3, Sites Eliminated at Each Stage in the Evaluation, shows the number of potential sites eliminated at each step in the evaluation process. (PWCG, 2008).

Table 9-3, Sites Eliminated at Each Stage in the Evaluation

Phase of Evaluation	Number of Sites	
	Before Application of Criteria	After Application of Criteria
Exclusionary Criteria		
RCRA Subtitle D Criteria	45	40
Sites in Developed Areas or Closed Landfills w/No Expansion Potential	40	34
BWS Staff Review and Evaluation	34	16
Committee Evaluation Process		
Landfill Capacity Requirement [46]	16	8
31 Screening Criteria	8	8
Committee Vote	5	4

An initial list of 45 sites was assembled by ENV and the consultant after review of prior work completed by the City in the siting and evaluation of MSW landfills. The *Exclusionary Criteria,* which included EPA criteria and local exclusionary criteria, were applied to the initial list of 45 potential landfill sites. Sixteen of the 45 sites remained after application of the Exclusionary Criteria. The *Landfill Capacity* criterion was applied to the 16 sites remaining with eight remaining for further evaluation. The Advisory Committee's 31 *Screening Criteria* were applied to the remaining eight reducing the number of sites to five and putting them in order of usefulness as a landfill. Up to this point in the evaluation, the Advisory Committee had acted by consensus. At this point in

---

[46] The capacity evaluation was completed before the Committee's site evaluations.

the process, the Committee voted to remove the Waimānalo Gulch Sanitary Landfill from consideration.[47] (PWCG, 2008).

This next section contains a description of *Exclusionary Criteria, Landfill Capacity,* and *Screening Criteria* used by the Advisory Committee to rank the sites and identify the five alternative sites appropriate for landfilling.

~~9.6.3.3. EPA Exclusionary Criteria~~
9.7.3.3. EPA Exclusionary Criteria

The EPA Exclusionary Criteria as promulgated in 40 CFR 258, include:

> **Airport Restriction** – Owners/operators must demonstrate that the landfill site does not constitute an aircraft bird strike hazard if the facility is located within 10,000 feet of the end of any airport runway used by turbojet aircraft, or within 5,000 feet of any airport runway used only by piston driven aircraft.
>
> If the owner/operator proposes construction of a landfill or expansion of an existing landfill within five miles of any airport, the airport and the Federal Aviation Administration (FAA) must be notified.
>
> **Floodplains** – Landfills located within a 100-year floodplain cannot restrict storm flows within the floodplain, reduce the temporary water storage capacity of the floodplain, or allow the washout of solid waste.
>
> **Wetlands** – Owners/operators of a proposed landfill may not build or expand into wetlands. An exception to this rule may be permitted by the EPA-approved permitting programs to construct or expand a landfill only if the following can be demonstrated:
>
> - No other siting alternative is available.

---

[47] The capacity evaluation was completed before the Committee's site evaluations.

- Construction and operation of the landfill will not violate applicable State regulations governing water quality or discharges of toxic or hazardous effluent; jeopardize threatened or endangered species, or critical wildlife habitat; or, violate protection of a marine sanctuary.
- The landfill will not contribute to the significant deterioration of the wetland.
- Steps are taken to achieve no net loss of wetlands by avoiding potential for impacts where possible, sufficiently minimizing unavoidable impacts; or, making proper compensation; for example, through the restoration of damaged wetlands or the creation of manmade wetlands.

Fault Areas – New landfills or landfill expansions are generally prohibited within 200 feet of fault areas that have shifted since the last Ice Age. However, the DOH may permit an alternative setback distance of less than 200 feet if the owner/operator can demonstrate that the landfill will maintain structural integrity in the event of a fault displacement.

Seismic Impact Zones – Landfills located in a seismic impact zone must demonstrate that the facility including, but not limited to, its liners, leachate collection system, surface water control system, and other engineering features have been designed to resist the effects of ground motion due to earthquakes.

Unstable Areas – All owners/operators must demonstrate that the structure of their units will not be compromised during geologically destabilizing events including:

- Debris flows resulting from heavy rainfall or storm conditions.
- Fast formation of sinkholes caused by excessive groundwater withdrawal.
- Rockfalls that are initiated by explosives or sonic booms.
- The sudden liquefaction of soil after prolonged periods of repeated wetting and drying.

Application of the EPA exclusionary criteria reduced the number of sites under consideration from 45 to 40. **Table 9-4, Site Evaluation with EPA Exclusionary Criteria**, identifies the sites that did not meet the criteria (PWCG, 2008).

~~9.6.3.4. Local Exclusionary Criteria, Developed Areas~~

9.7.3.4. Local Exclusionary Criteria, Developed Areas

In the several decades that have elapsed since most of the sites on the table were identified, many of the original landfill locations have been developed, primarily with residential housing. Some locations that were previously considered possible landfill sites may either have buildings on-site, or are so close to developed areas that a landfill would now be an incompatible land use. The City therefore determined that it would not propose new landfills within such developed areas (PWCG, 2008).

The City also reviewed potential sites that were expansions of closed landfills. Landfills on the original list that have been filled to capacity and closed were removed from further consideration.

This step reduced the potential site list from 40 to 34. **Table 9-5, Site Evaluation with Developed Area Criteria**, indicates the sites eliminated by application of the local exclusionary criterion (PWCG, 2008).

~~9.6.3.5. Local Exclusionary Criteria, Groundwater Restrictions~~

9.7.3.5. Local Exclusionary Criteria, Groundwater Restrictions

Local exclusionary criteria include restrictions on the possibility of adverse effects to groundwater. Groundwater resources on O‘ahu are protected through the State DOH, UIC program, and the BWS Groundwater Protection Zones.

The UIC program was established in 1984. The purpose of the program is to protect the State’s drinking/potable groundwater resources from pollution by subsurface wastewater disposal. The program regulations are accompanied by UIC maps that demarcate a boundary line known as the “UIC Line.” Landfills are restricted on lands that are landward of the UIC Line. Lands seaward of this line, however, are not restricted from subsurface wastewater disposal by underground injection (**Figure 9-1**). Sanitary landfills and waste disposal facilities may therefore be sited makai of this zone. (PWCG, 2008).

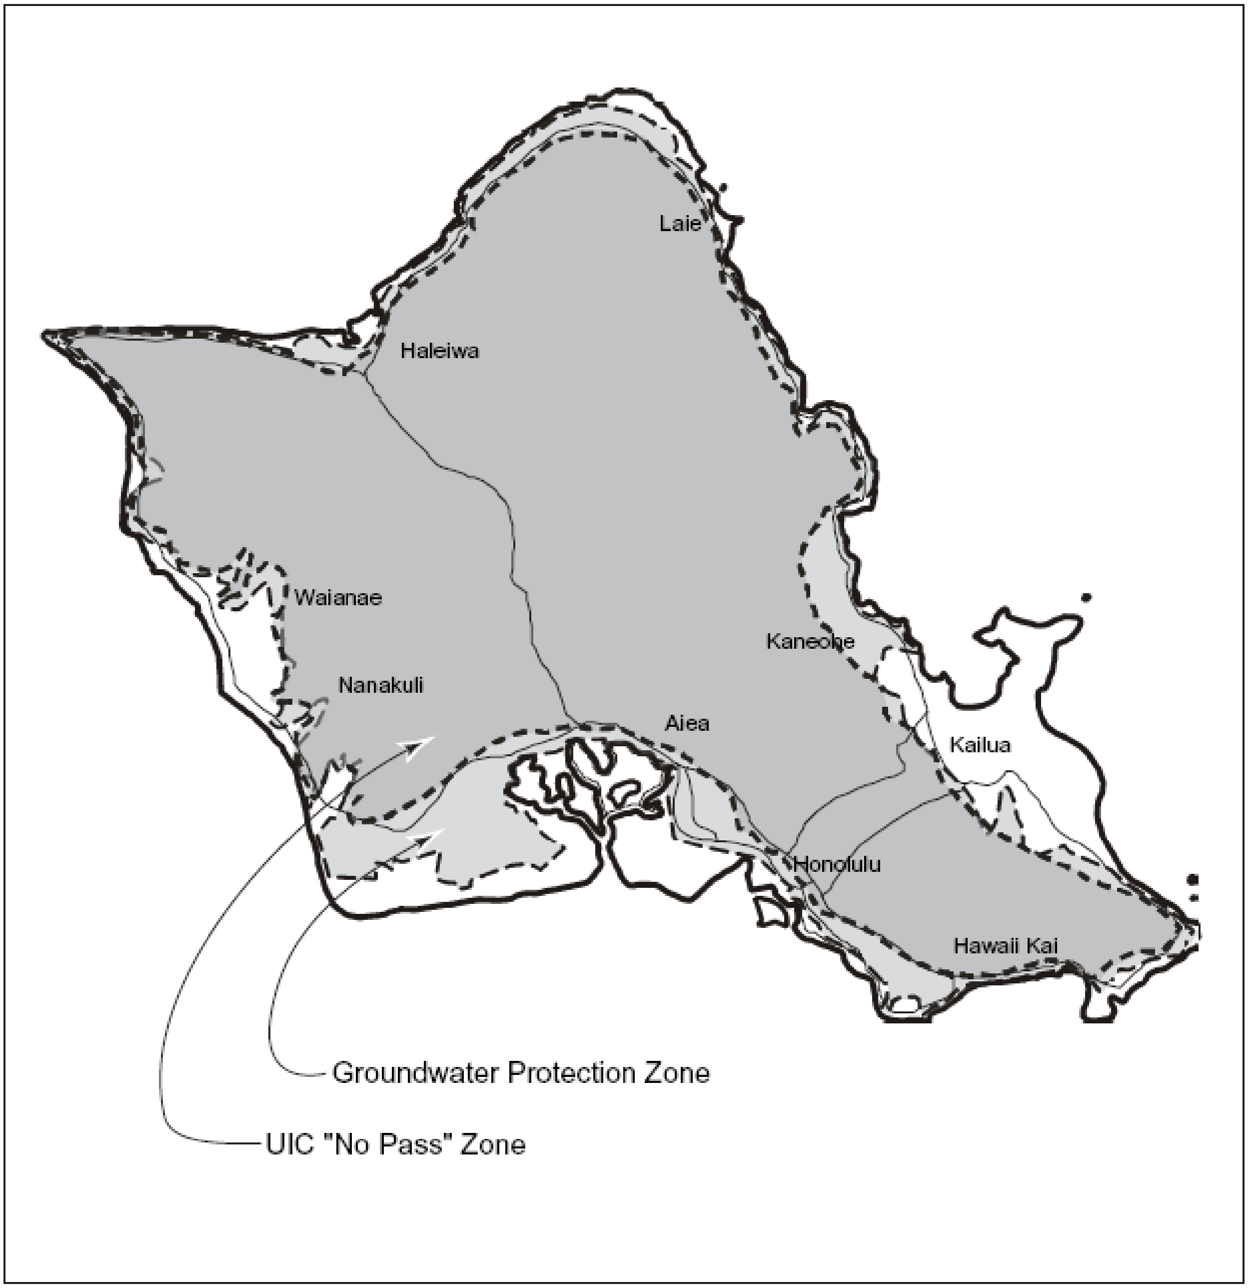
Underground Injection Control (UIC) Zone
Island of O‘ahu



Prior to 1987, groundwater recharge areas for the Island of O‘ahu were identified by BWS. Since 1987, the State DOH has administered the No Pass Program (also shown in **Figure 9-1**). The BWS Groundwater Protection Zones identifies areas of groundwater recharge, areas of brackish groundwater supplies, and additional areas that may be acceptable for landfill development. Areas that are considered critical for groundwater recharge have been designated within the "No Pass Zone." Within this area sanitary landfill and waste disposal systems are generally not permitted. All other areas are identified as within the "Pass Zone" and have been determined to be areas where landfills and shallow waste disposal systems may be permitted. These facilities are limited to a maximum depth of 30 feet. (PWCG, 2008).

Regulatory protection of ground and surface water, and air quality, from facilities such as sanitary landfills, is through the existing environmental permit process. Protection of ground and surface waters are delegated by EPA to the State DOH under provisions of the Federal Safe Drinking Water Act and Clean Water Act. These federal regulations enable the State DOH to protect Hawaii's drinking and surface waters from the siting of facilities, such as sanitary landfills, through Hawaii Administrative Rules, Chapter 11–23, UIC; Chapter 11–55, Water Pollution Control, and the National Pollution Discharge Elimination System Permit program. Regulation of air quality standards are similarly delegated from EPA to the State DOH, through the Clean Air Permit. (PWCG, 2008).

The State DOH has provided some guidance about what might be needed to establish a landfill outside the UIC line.[48] In part, that guidance stated (PWCG, 2008):

> "Should a solid waste permit applicant propose to site a landfill over drinking water resources, the permittee will be required to demonstrate that the proposed project is protective of our groundwater resource. As seen in other states, the design of this landfill will likely be at a minimum a double composite liner system. In addition, other requirements, such as screening and monitoring, may become more stringent. Needless to say, siting a landfill over drinking water resources will

---

[48] Letter dated May 23, 2002, from Dr. Bruce Anderson, Director, State Department of Health, to Mr. Timothy Steinberger, Director, City Department of Environmental Services.

> increase our scrutiny over the design and operation of the landfill, as well as significantly increase the cost to design, construct, and operate the landfill."

After application of the Groundwater Exclusionary Criteria, the potential list of sites decreased from 34 to 16. **Table 9-6, Site Evaluation with Groundwater Criteria**, shows the sites that were eliminated after review by the BWS staff and their comments on each of the 34 sites reviewed.

~~9.6.3.6. Landfill Capacity~~

9.7.3.6. Landfill Capacity

The City & County of Honolulu and Advisory Committee established 10 years of landfill capacity as the lower limit for a site to be considered. The capacity of each site was determined from the earlier siting reports. The capacity calculations were done with topographic data of varying levels of detail and used requirements for landfill design and operation that preceded RCRAD, which made major changes to earlier landfill practice. As a result, the capacity evaluation would likely be different if recalculated with more detailed topographic information following current landfill practice. (PWCG, 2008).

In addition to the comments regarding the capacity calculations made earlier, it should be noted that the WGSL has been designed after extensive evaluations of information such as (PWCG, 2008):

- Civil engineering design supported by geotechnical investigations and soils evaluations so that the landfill will provide environmentally sound containment of the waste and maximize the capacity at the site
- The engineering design calculations that account for slope stability considerations so that the filled areas are stable under normal loading and potential seismic conditions
- Balancing the soil needed for cover with the excavation needed to maximize the landfill capacity is a complex engineering calculation that accounts for sequencing of fill at the landfill and other site specific factors

Table 9-6, Site Evaluation with Groundwater Criteria

Site Name	BWS Evaluation Notes	Sites Failing Review
Auloa	Very little to no groundwater resources. Within a rock complex. BWS does not consider feasible for use.	
Ameron Quarry	Dike type rocks associated with caldera complex. Very little groundwater resources.	
Bellows	No potable resources. Non-potable irrigation developed. BWS does not consider feasible for use.	
Halawa A	Site within BWS groundwater resource.	X
Halawa B	Site within BWS groundwater resource.	X
Heeia Uka	Site outside BWS designed groundwater resource zone.	
Honouliuli	Site just outside BWS designated groundwater resources zone, but within area considered subject to groundwater impact.	X
Kaaawa	Very little to no groundwater resources. BWS does not consider feasible for use.	
Kahe	BWS plans to use site for future desalination facility.	X
Kalaheo (landfill reuse)	Very little to no groundwater resources. BWS does not consider feasible for use.	
Kaloi	Groundwater resources present or nearby.	X
Kapaa No. 1	Very little to no groundwater resources. BWS does not consider feasible for use.	
Kaukonahua	Site within BWS groundwater resource.	X
Koko Crater	Very little to no groundwater resources. BWS does not consider feasible for use.	
Kunia A	Groundwater resources present or nearby.	X
Kunia B	Groundwater resources present or nearby.	X
Maili Quarry	Brackish groundwater present but BWS does not consider feasible for use.	
Makaiwa Gulch	No potable resources. BWS does not consider feasible for use.	
Makakilo Quarry	Groundwater resources present or nearby.	X
Makua	Groundwater resources present or nearby.	X
Mililani	Site within BWS groundwater resource.	X
Nanakuli A	Very little to no groundwater resources. BWS does not consider feasible for use.	
Nanakuli B	Very little to no groundwater resources. BWS does not consider feasible for use.	
Ohikilolo	Only half of site available for development where there is very little to no groundwater resources in the lower half of property. BWS does not consider feasible for use.	
Poamoho	Groundwater resources present or nearby.	X
Punaluu	Groundwater resources present or nearby.	X
Waiahole	Groundwater resources present or nearby.	X
Waianae Expansion	Groundwater resources present or nearby.	X
Waihee	Groundwater resources present or nearby.	X
Waikane	Groundwater resources present or nearby.	X
Waimanalo Gulch Expansion	Very little to no groundwater resources. BWS does not consider feasible for use.	
Waimanalo North	Very little to no groundwater resources. BWS does not consider feasible for use.	
Waimanalo South	Groundwater resources present or nearby.	X
Waipio	Very little to no groundwater resources. BWS does not consider feasible for use.	

These costly analyses can be completed only after a landfill site has been selected and they all impact the amount of capacity, and therefore, the number of years a site can be used as a landfill. The information available for the WGSL reflects these calculations, whereas the information available for the alternative sites does not. As such, one must expect that the estimates of capacity for the alternative sites are subject to much more variability than for the WGSL. (PWCG, 2008).

The amount of capacity needed was estimated using 2003 disposal data updated with the results of the November 2007 draft Update of the Solid Waste Integrated Management Plan. This data provides realistic information to estimate site life. The estimated volume that would be used for the estimated tonnage disposed is calculated below. The volume estimate includes the waste material as compacted before it is covered and the amount of dirt used to cover the waste. The estimated capacity needed assumes that the landfill will be excavated as needed to provide the dirt needed for covering the waste and to create part of the volume to be filled. The key assumptions in estimating the volume are (PWCG, 2008):

- MSW is compacted to a density of approximately 1,600 pounds per cubic yard
- An additional 20 percent of the MSW and ash volume is added as cover material
- The H-POWER ash is covered[49]. It has a density of 2,000 pounds per cubic yard.

Table 9-7, Estimate of Landfill Capacity Needs (TPY) (City & County of Honolulu, November 2007) provides the calculation of estimated volume needed.

Using the estimates from Table 9-7*,* the total landfill volume required for 10 years is 6,712,670 cubic yards (10 times the estimated annual requirement).

---

[49] H-POWER ash is required to be covered with intermediate cover material.

Table 9-7, Estimate of Landfill Capacity Needs (TPY)

Year	Landfill	H-Power	Additional WTE *	Landfill w/o Additional WTE	Ash/ Residue **	Total Landfilled	Total Waste
2009	359,980	610,000		359,980		359,980	969,980
2010	379,070	610,000		379,070		379,070	989,070
2011	400,330	610,000	150,000	250,330	37,500	287,830	1,010,330
2012	403,270	610,000	300,000	103,270	75,000	178,270	1,013,270
2013	425,010	610,000	300,000	125,010	75,000	200,010	1,035,010
2014	447,010	610,000	300,000	147,010	75,000	222,010	1,057,010

* Mass burn facility: See Mayor's Press Release January 18, 2008.

** Assumed that the expansion would be operational at mid-year and 25 percent of Additional WTE becomes ash/residue that is landfilled.

This estimate of need will vary with waste flow changes. For example, if a natural disaster occurs there will be an increase in the material entering the landfill and the estimated life of the site will decrease. If the residential curbside recycling program is more successful than expected and the curbside yard waste program is expanded to weekly, the material needing disposal will decrease and the site life will increase. (PWCG, 2008).

The amount of landfill capacity needed will also vary if new means to process MSW prior to disposal are implemented. This Alternatives Analysis includes several technologies that could reduce the need for a landfill. It also discusses the approved addition of a third boiler to H-POWER to reduce the volume of waste that needs disposal. The use of transshipment could divert 100,000 tons per year or more to a landfill off island, reducing the need for a local landfill. Implementation of any of these programs, or economic changes that decrease or increase waste production, will change the estimate of volume needed and change the expected life of the landfill. (PWCG, 2008).

This evaluation assumes that the landfill site is used to its capacity, with the necessary excavation and lateral expansion. Excavation is needed to take advantage of the capacity of the site and minimize the cost and environmental impact of landfilling.

Changes to the site capacity reported in this EIS assume that the landfill will be excavated.

The application of the capacity criterion is shown in **Table 9-8, Results of Application of Landfill Capacity Criterion**. The 16 sites evaluated were reduced to eight after the 10-year site life was considered. (PWCG, 2008). The capacity of the Waimanalo Gulch Sanitary Landfill was based on calculations that are updated as the design of the expansion is being done. As a result, the capacity of the expansion will be revised during the processing of this EIS.

Table 9-8, Results of Application of Landfill Capacity Criterion

Site Name	Landfill Life (years)	Capacity Less Than 10 Years
Auloa	4.7	X
Ameron Quarry	15.0	
Bellows	12.5	
Heeia Uka	4.0	X
Kaaawa	9.3	X
Kalaheo (landfill reuse)	7.2	X
Kapaa No. 1	5.1	X
Koko Crater	9.2	X
Maili	15.3	
Makaiwa	25.0	
Nanakuli A	6.7	X
Nanakuli B	15.6	
Ohikilolo	26.0	
Waimanalo Gulch Expansion	15.0	
Waimanalo North	16.0	
Waipio	4.2	X

Note: Estimates of capacity for all alternative landfill sites were prepared based on information provided by WMH and ENV. The site life for WGSL as prepared for the 2003 Mayor's Advisory Committee assumed no excavation and provided an estimate of landfill capacity only. The results of engineering analysis of soils and site conditions to calculate the quantity of excavation material from WGSL was performed in 2008 by GeoSyntec Consultants. See Section 4.1.3. Waste Stream, Soil Excavation, and Soil Usage. Detailed engineering calculations to obtain excavation quantities for the other landfill sites was not performed.

~~9.6.3.7. Other Considerations~~
9.7.3.7. Other Considerations

Two of the sites shown in the table above were also disqualified based on input from other governmental bodies that had control of the sites. **Table 9-9, Sites Considered After Capacity Criterion Applied**, lists the sites for which input from other agencies was sought. (PWCG, 2008).

Table 9-9, Sites Considered After Capacity Criterion Applied

Site Name	TMK	Acreage	Million Tons Capacity	Years of Capacity
Ameron Quarry	4-2-15:01	391	9.0	15.0
Bellows	4-1-15: por. 01	173	7.5	12.5
Māʻili	8-7-10:por. 03	200	9.2	15.3
Makaiwa	9-2-3: por. 02	338	15.0	25.0
Nānākuli B	8-7-9: pors. 1 & 7	432	9.4	15.6
Ohikilolo	8-3-1: 13	353	7.8	13.0
Waimānalo Gulch Expansion	9-2-3: 72 & 73	60	12.0	20.0
Waimānalo North	4-1-8: 13	171	9.6	16.0

Comments were received from the U. S. Marine Corps regarding the Bellows site and from the State regarding the Waimānalo North site.

- The Bellows Air Force Base site is in federal control and cannot be condemned. A reply from the Marine Corps further indicated that the site is not available.
- The Waimānalo North site was designated as a State Forest Preserve, according to a letter the City received from the State Department of Land and Natural Resources. The State will not support its use for a landfill and the City cannot condemn state land.

Several Advisory Committee members had reservations about the Ohikilolo site. The site was removed from further consideration based on these reservations (PWCG, 2008):

- The site had the strong possibility of significant archeological and cultural resources (although studies had not been done to confirm the resources).
- It is remote from where the waste is collected and would require trucks to travel long stretches of road through the Wai‘anae and Leeward Coast communities (where frequent accidents have occurred) to get to the site. This thoroughfare (Farrington Highway) is the only road providing access to the site.
- There were potential Native Hawaiian title issues regarding use of this site.
- It is one of very few remote coastal areas left on O‘ahu and is considered culturally sensitive by the community.

Eight sites were on the list before the Advisory Committee discussed its *other considerations*. Five remained on the list after the other considerations were reflected and are shown in **Table 9-10, Potential Sites to Which Advisory Committee Siting Criteria Applied**. (PWCG, 2008).

Table 9-10
Potential Sites to Which Advisory Committee Siting Criteria Applied

Site Name	TMK	Acreage	Million Tons Capacity	Years of Capacity
Ameron Quarry	4-2-15:01	391	9	15
Mā‘ili	8-7-10:por. 03	200	9	15
Makaiwa	9-2-3: por. 02	338	15	25
Nānākuli B	8-7-9: pors. 1 & 7	432	9	16
Waimānalo Gulch Expansion	9-2-3: 72 & 73	200	9	15

~~9.6.3.8. Advisory Committee Siting Criteria~~

9.7.3.8. Advisory Committee Siting Criteria

The criteria discussed in the previous sections relate to general limitations on locating landfills. The Advisory Committee considered local community concerns to be highly important and not adequately reflected in the above exclusionary criteria. Therefore, Screening Criteria were established to compare potential sites using factors considered important to the Advisory Committee. The Screening Criteria allow numerical comparisons of the different factors (the Advisory Committee identified 31 of them) for different sites to rank the sites in order of suitability for use as a landfill. (PWCG, 2008).

The site evaluations were done using a “double blind” process. That is, the Advisory Committee assigned the amount of "weighting" for each of the factors that would be evaluated without the City or consultant’s knowledge. The consultants evaluated the sites and assigned point values without the Committee's knowledge of which sites were being evaluated. When the two parts of the evaluation were combined, the resulting site scores were insulated from undue influence or bias from any party. (PWCG, 2008).

The Screening Criteria were identified in five categories:

- Community
- Environmental and Land Use
- Economic
- Technical
- Other Considerations (that included employment and access to the sites)

~~9.6.3.9. Screening Criteria Development~~

9.7.3.9. Screening Criteria Development

The general approach to developing local Screening Criteria involved identifying the impacts a landfill could have in a region and a method to numerically measure those impacts. These criteria were organized into two parts: *Point Value* and *Weighting Factor*: (PWCG, 2008).

- The *Point Value* measured how well a potential site satisfied a criterion.
- The *Weighting Factor* reflected the Advisory Committee’s assessment of how important one criterion was compared to the other criteria. The *Weighting Factor* was multiplied by the *Point Value* to calculate the score for each criterion.

The sum of the criterion scores was the site score. The higher the final score for a site, the more appropriate it was for a landfill site.

The *Point Values* ranged from one to three. The higher the *Point Value* the better a site met a criterion. For example, a good landfill should be in an area with low rainfall. A site with annual rainfall of more than 60 inches received one point; a site with 20 to 60 inches of rain received two points; and a site with less than 20 inches of rain received three points.

The *Weighting Factor*s also varied from one to three with a *Factor* of three giving the best score.

The *Weighting Factors* were determined by the Committee members. Each member voted on the 10 criteria most important to them. There were 31 criteria. Criteria that received the most votes were assigned a *Weighting Factor* of three. The votes fell into three distinct groupings. Six criteria received the most votes and were assigned a *Weighting Factor* of three; seven had a *Weighting Factor* of two; and 18 had the fewest votes and were assigned a *Weighting Factor* of one. Several criteria received no votes and were also assigned a Weighting Factor of one. (PWCG, 2008).

The higher the product of the *Weighting Factor* and the *Point Value*, the better the site's characteristics are for use as a landfill.

The Screening Criteria and Weighting Factor assigned to each are shown in **Table 9-11, Screening Criteria**. The type of criteria is shown in the table for convenience. The type of criteria had no influence on the site screening. (PWCG, 2008).

~~9.6.3.10. Site Scoring~~
9.7.3.10. Site Scoring

The five sites listed in **Table 9-10**, **Potential Sites to Which Advisory Committee Siting Criteria Applied**, were scored using the Screening Criteria. Each criterion had a specific method to assess the *Point Value* of the criterion. The information needed to make the assessment was gathered by observation at the site, through review of technical literature, or by calculation from known data. The methods to evaluate the *Point Value* of some of the criterion required the use of general information. For example, the soil data was in soil reports that provide only rough guidance. The criterion relating to cost used the best information available at the time. (PWCG, 2008).

Table 9-11, Screening Criteria

	Criterion	Weighting Factor
	Community	
1	Displacement of residences and businesses	1
2	Distance to nearest residence, school or business	3
3	Wind direction relative to populated areas	2
4	Population density near the site	3
5	Proximity to parks and recreational facilities	1
	Environmental and Land Use	
6	Zoning	1
7	Compatibility with/distance to existing land uses	1
8	Visibility from a general use public road	1
9	Visibility from residences and/or schools.	2
10	Groundwater	3
11	Wetlands	3
12	Flora and fauna habitat	2
13	Site aesthetics	1
14	Residential units along access road	1
15	Schools or hospitals along access road	1
16	Final use of the site when the landfill is closed	1
17	Archeological and/or historical significance	3
	Economic	
18	Cost of site acquisition	1
19	Cost of development	1
20	Cost of operations	1
21	Impact of removal of site on tax base	1
22	Haul distance from H–POWER	2
	Technical	
23	Landfill capacity or site life	3
24	Annual precipitation	2
25	Adequacy of drainage	1
26	Access to fire protection	1
27	Length of haul	2
28	Geology	1
29	Closure and post-closure cost	1
	Other Considerations	
30	Employment	1
31	Access	2

The information for each site was extensive and compiled in several attachments to the Advisory Committee report. A summary of the conditions at each of the five sites is provided in Section 9.~~6.~~7.4. Description of Sites Evaluated.

Table 9-12, Results of Application of Screening Criteria, identifies the scores for each site after application of the criteria. Further detail of the methodology for site scoring for each of the 31 criteria is contained in Attachment C of the Alternatives Analysis for Disposal of Municipal Refuse (PWCG, 2008).

Since the Advisory Committee report was completed, additional information has been provided regarding the cost of acquiring the Ameron Quarry and Makaiwa Gulch sites. In the Advisory Committee report, the cost of acquisition was the assessed value for property purposes. Parties representing Ameron Quarry and Makaiwa Gulch provided information to correct that information in letters appended to a letter from City Councilmember Tam to the State LUC[50].

Mr. Tam's letter reported on a meeting his Committee conducted in which it received testimony from representatives of Ameron Quarry and accepted a letter from the Estate of James Campbell, owner of the Makaiwa Gulch site. Mr. Tam's letter stated that:

> "… A presentation was made by Ameron Hawaii, the lessee of the Kapaa Quarry site, and by the Estate of James Campbell, owner of the Makaiwa Gulch site. Ameron Hawaii cited an economic impact of $109-$133 million should it have to shut down its operations and relocate (full report attached). The Kaneohe Ranch, owner of the Kapaa Quarry site did not testify but offered written testimony which stated its estimate of land acquisition cost to be $22-$46 million as opposed to the City's estimate of $3.7 million (letter attached). The Estate of James Campbell provided testimony suggesting that the economic impact should the Makaiwa Gulch site be chosen would be in the area of $121 million cost to the City …"

---

[50] August 3, 2004 letter from Mr. Rod Tam, Chair Committee on Public Works & Economic Development, City Council, City and County of Honolulu to Mr. Anthony Ching, Executive Officer of the State Land Use Commission.

Table 9-12, Results of Application of Screening Criteria

Criterion	Ameron	Maili	Makaiwa	Nanakuli B	Waimanalo Gulch

Technical					
23 Landfill capacity or site life	6	6	9	6	6
24 Annual precipitation	2	6	4	4	6
25 Adequacy of drainage	1	2	2	2	1
26 Access to fire protection	1	2	2	3	2
27 Length of haul	4	2	6	4	6
28 Geology	2	2	2	2	3
29 Closure and post-closure cost	3	3	2	1	3
Other Considerations					
30 Employment	1	3	2	3	2
31 Access	6	2	4	4	6
Total Site Score	107	102	113	109	131

The cost evaluations used in the Advisory Committee report have been revised to reflect the added costs stated in Mr. Tam's report to the State LUC. The cost of acquiring the site was assessed by criterion number 18, Cost of Site Acquisition. **Table 9-13, Revised Evaluation of Criterion 18, Cost of Site Acquisition**, shows the original calculation of the Point Value for this criterion and the revised calculation using the revised site cost for Ameron Quarry and Makaiwa Gulch. (PWCG, 2008).

Table 9-13, Revised Evaluation of Criterion 18, Cost of Site Acquisition

Item	Ameron	Maili	Makiawa Gulch	Nanakuli B	Waimanalo Gulch
Cost in Advisory Committee Report	$3,184,200	$3,912,500	$16,516,900	$545,200	$0
Years of Life	15	15.33	25	15.7	15
Cost/Year of Life	$212,280	$255,219	$660,676	$34,726	$0
Point Value	2	2	2	3	3
Revised Cost	$46,000,000	$3,912,500	$121,000,000	$545,200	$0
Years of Life	15	15.33	25	15.7	15
Cost/Year of Life	$3,066,667	$255,219	$4,840,000	$34,726	$0
Revised Point Value	1	2	1	3	3

The result of the change is shown in **Table 9-14, Comparison of Site Scores**, which shows the total site score with the original acquisition cost and the revised cost. It also shows that there was no change in the numerical order of the site scores with either acquisition cost. (PWCG, 2008).

Table 9-14, Comparison of Site Scores

Site	Original Acquisition Cost		Revised Acquisition Cost	
	Score	Rank	Score	Rank
Ameron Quarry	97	4	96	4
Mā‘ili	90	5	90	5
Makaiwa Gulch	99	2	98	2
Nānākuli B	97	3	97	3
Waimānalo Gulch	113	1	113	1

The detailed changes resulting from the change in site scoring for criterion number 18 is shown in **Table 9-15, Results of Application of Screening Criteria with Revised Cost of Acquisition**. The only change in this table is in criterion number 18. The number of points for Ameron Quarry and Makaiwa Gulch changed from six to three when using the increased cost numbers provided in Councilman Tam’s report to the State LUC. (PWCG, 2008).

Table 9-15

~~9.6.4. Description of Sites Evaluated~~
9.7.4. Description of Sites Evaluated

Information for this section is based on data collected and analyzed as part of the Report of the Mayor's Advisory Committee on Landfill Site Selection, December 1, 2003 and **Appendix K, Alternatives Analysis** (PWCG, 2008).

~~9.6.4.1. Ameron Quarry~~
9.7.4.1. Ameron Quarry

Description

The Ameron Quarry comprises approximately 391 acres and is located on the windward side of Oʻahu, within the Kapaʻa watershed. (**Figure 9-2**). The site is capable of holding nine million cubic-yards of MSW. The site was once the caldera of an ancient volcano, making the rock almost completely impermeable and of high quality for construction purposes.[51] Due to the fine grained materials of the quarry, such as Alaeloa and Helemano silty clays, there are no sensitive or endangered flora and fauna habitat found inside and within a half-mile of the quarry. Archaeological and/or historical significance is low due largely to late twentieth century land disturbances. However, thirty-one sites of known archaeological and/or historical importance are located within one mile of the quarry.

Landfill Infrastructure: On-Site

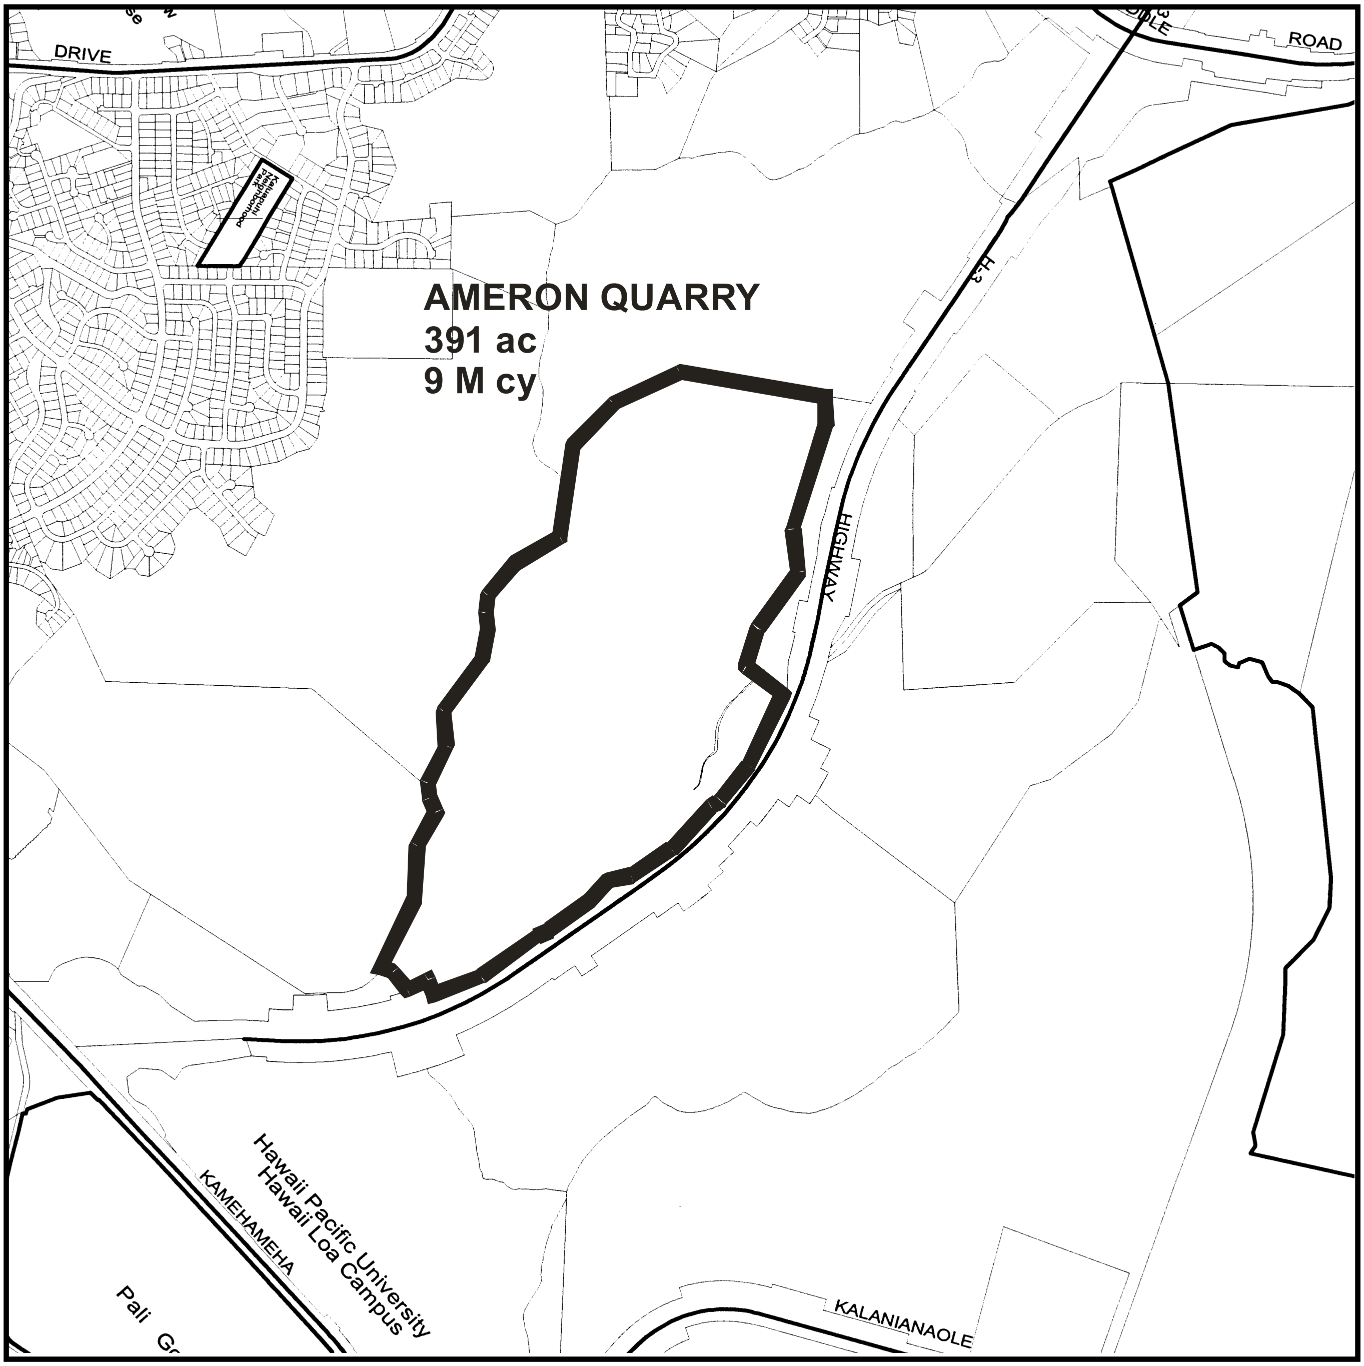
Ameron Quarry currently does not have landfilling infrastructure on-site and there is no space on-site for that infrastructure. As the site currently operates as a rock quarry, the existing infrastructure would need to be modified for the quarry to operate as a landfill, but much of the heavy equipment services needed for the quarry could also be used for the landfill.

Landfill Infrastructure: Off-Site

The area within the quarry is used for the necessary infrastructure and for landfilling; space would be needed off-site for offices and other support facilities.

---

[51] KBAC Streamwalks, http://www.kbac-hi.org/, March 11, 2008.



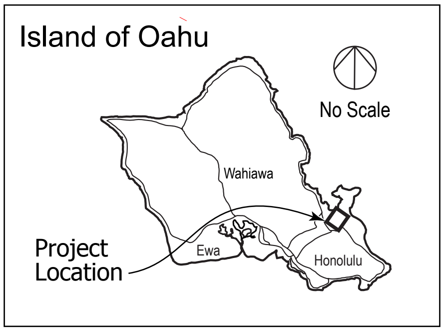


Figure 9-2
Ameron Quarry Alternative
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

R.M. TOWILL CORPORATION May 2008

Capacity

Ameron Quarry has an estimated 15-year life span as a landfill. The site life was estimated from existing information and does not reflect current landfilling practices. The landfill life was estimated based on data available in existing reports. The life should be recalculated to reflect current landfilling practices, allowing for an adequate buffer around the site boundary, and filling to the natural grade.

Opportunities and Constraints

Ameron Quarry has some major advantages as a landfill:

- It has significant capacity in an area where the City has operated a landfill. It will be closer to the point of waste generation for Windward Oʻahu than the WGSL.
- The site has existing infrastructure for quarry operations that could be used for a landfill, reducing startup costs.
- Roadways are wide enough and designed to carry heavy trucks.
- The site geology includes Alaeloa and Helemano silty clays that will help protect against leakage. Under State regulations, a landfill liner would be installed.
- The quarry operation has created a hole that may need to be filled.

Constraints associated with the use of Ameron Quarry as a landfill:

- The quarry receives more than 60 inches of precipitation annually, making this site the wettest of the five alternatives. However, landfills operated in wetter areas on the mainland must do so under stringent EPA Subtitle D regulations.
- The site is the furthest from the H–POWER facility and population centers
- The cost of acquisition is likely to be significantly more than shown in the Advisory Committee siting report. In addition, the land owner has stated

there will be costs associated with moving the operation to another location.[52]

- The Council Committee on Public Works & Economic Development (PWED) commented in its report on the review of sites that: "The PWED Committee has received testimony in opposition to siting a landfill at the Ameron Quarry site including testimony in opposition from the landowner Kaneohe Ranch, the lessee Ameron Hawaii, the Kailua Neighborhood Board and various city and State elected officials. No testimony has been received in support of a landfill at the Ameron Quarry site."
- The loss of construction material resources would be significant, according to the quarry operator. According to the operator, approximately 10 years of capacity remain at the quarry, but would be lost if the site were converted to a landfill, when the Advisory Committee report was issued in December 2003.

~~9.6.4.2. Māʻili Quarry~~

9.7.4.2. Māʻili Quarry

Description

Māʻili Quarry comprises approximately 200 acres and is capable of holding about 9.2-million cubic-yards of MSW. The site is located in the Waiʻanae District of Leeward Oʻahu (**Figure 9-3**). The site is 3,500 feet mauka of Farrington Highway, four miles northwest of Nānākuli, and three miles south of Waiʻanae. Elevation of the site averages approximately 40 feet above mean sea level (MSL). The soils are predominantly sand and gravel materials of the quarry including Lualualei clay and Mamala stony silty clay loam. Sensitive and endangered flora and fauna are not known to exist inside the quarry, nor within a half-mile distance. No archaeological or historical areas of significance have been documented within the site, however, 16 cultural sites do exist within a quarter-mile of the site boundaries; eight sites between a quarter-mile and half-mile; and six sites between a half-mile and mile.

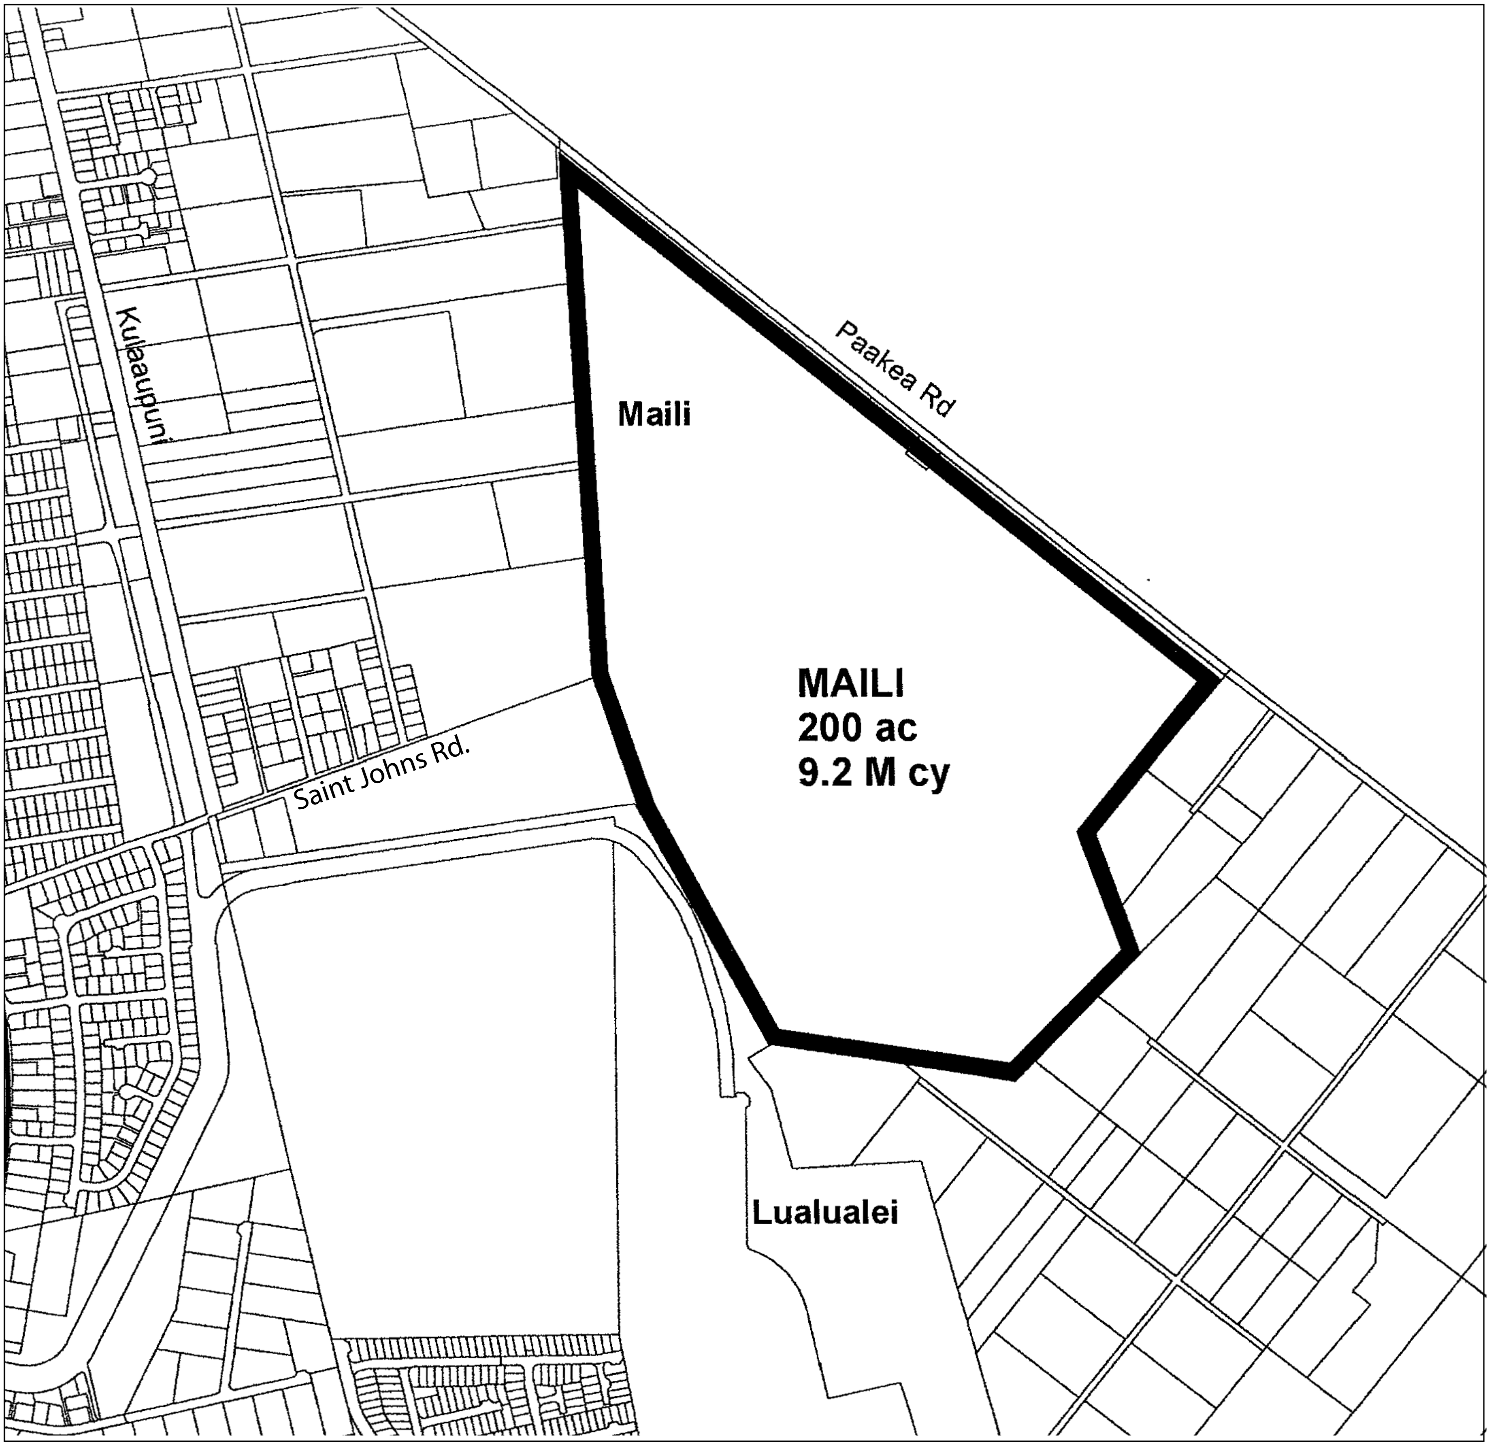
[52] Letter, Mr. Rod Tam to Mr. Anthony Ching, Executive Officer, State Land Use Commission, August 3, 2004, and Memorandum, Mr. Rod Tam to Concerned Citizens of Oʻahu, Summary Report, Landfill Site Selection Process, November 16, 2004



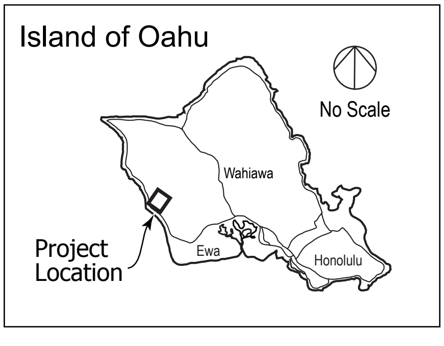


Figure 9-3
Ma'ili Quarry Alternative
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

R.M. TOWILL CORPORATION May 2008

Landfill Infrastructure: On-Site

Māʻili Quarry currently has infrastructure on-site to support the existing quarrying operation. However, there is space available on-site for necessary landfill infrastructure. As the site currently operates as a recycler of concrete, improvements and modifications to the existing concrete recycling infrastructure may be necessary for Māʻili Quarry to operate as a landfill.

Landfill Infrastructure: Off-Site

No facilities are needed off-site as space appears to be available on-site.

Capacity

Māʻili Quarry has an estimated 15.33 year life span. This equates to an estimated capacity for the disposal of approximately 9.2-million cubic-yards of waste. The landfill life was estimated based on data available in existing reports. The life should be recalculated to reflect current landfilling practices, allowing for an adequate buffer around the site boundary and filling to the natural grade.

Opportunities and Constraints

The advantages of using Māʻili Quarry as a landfill are:

- Availability of on-site cover
- On-site brackish well for dust control
- Consistent zoning in the State Agricultural District
- Utilities on-site
- Low precipitation
- Close proximity to H-POWER

Constraints to the use of Māʻili Quarry as a landfill are:

- The distance to residents, schools, and businesses. The site is located 1,139 feet from Māʻili Elementary School and 875 feet from the nearest residence. It is just over 100 feet from single-family residential units, and the Waiʻanae Coast Comprehensive Health Center is located along the access road to the quarry.

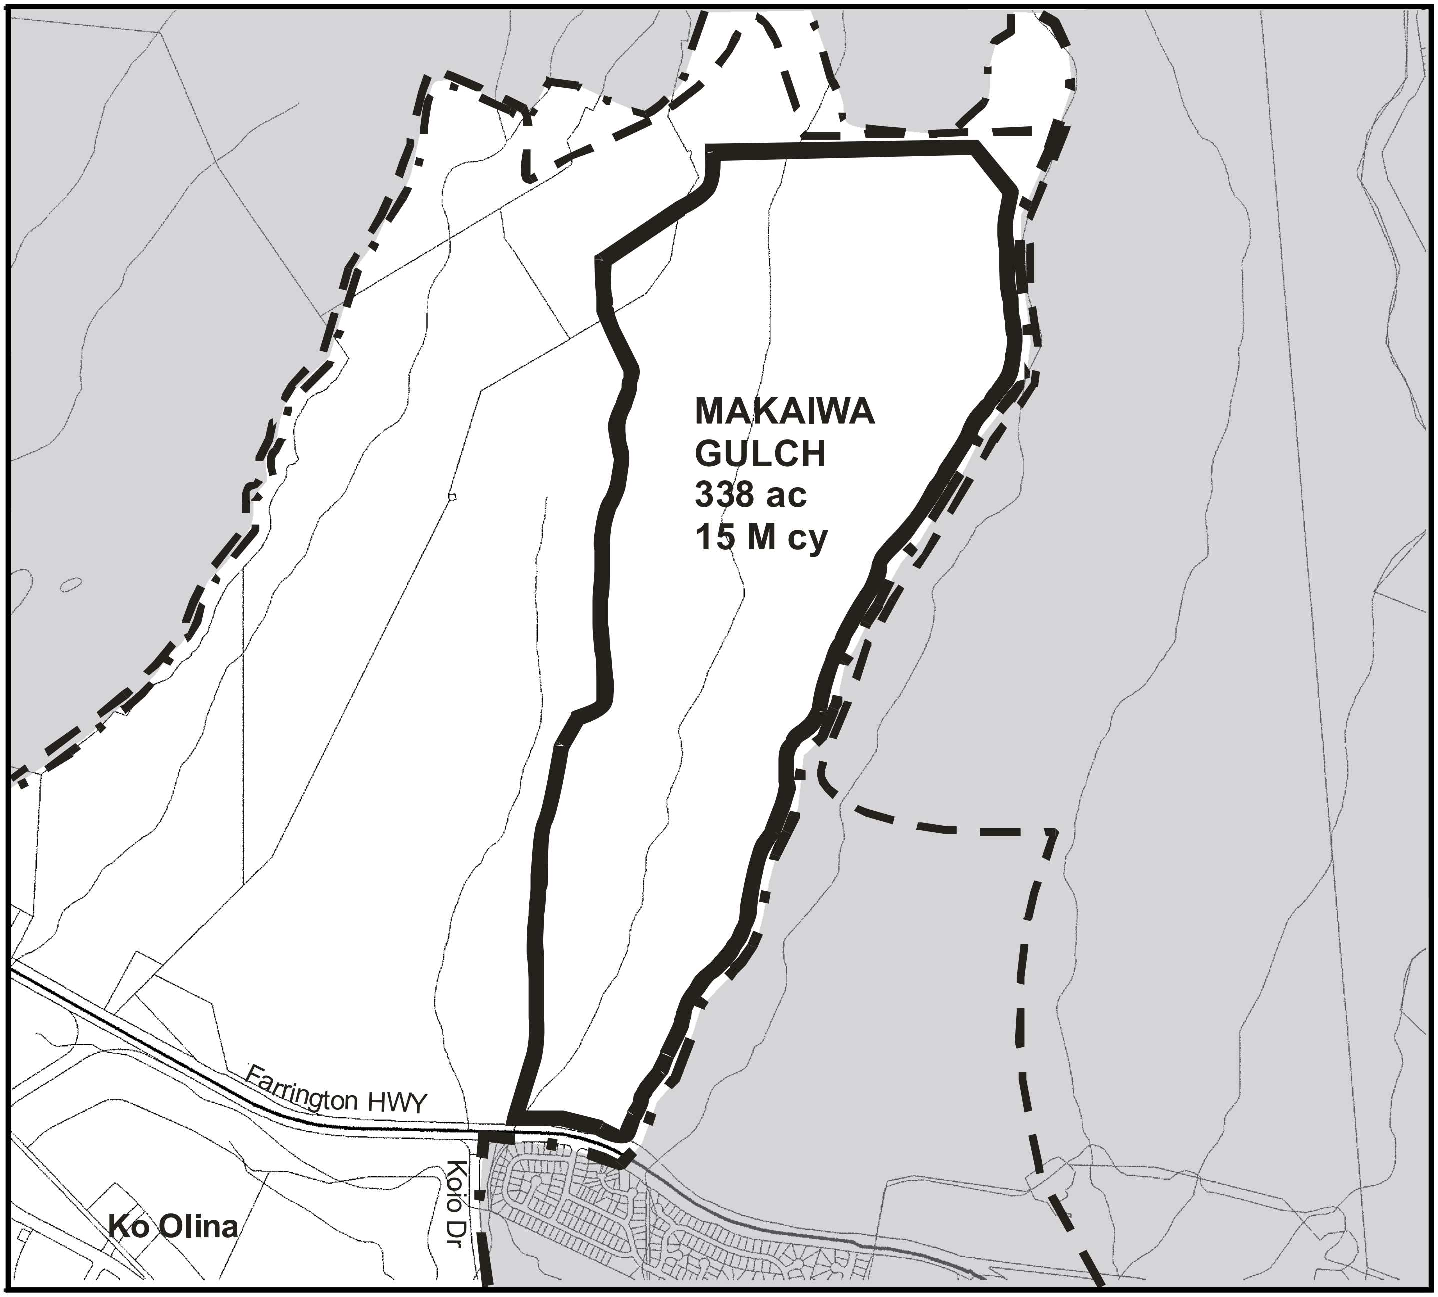
- Traffic accidents cause major delays; only one road access
- Significant pedestrian cross-traffic
- Access road privately owned
- Only coral quarry on-island
- In its report on its review of potential sites the Council Committee on Public Works and Economic Development commented: "The PWED Committee has received testimony in opposition to a landfill at the Māʻili site and anywhere on the Leeward coast in general. No testimony has been received in support of a landfill at the Māʻili site.

~~9.6.4.3. Makaiwa Gulch~~

9.7.4.3. Makaiwa Gulch

Description

Makaiwa Gulch is located next to the WGSL and comprises 338-acres (**Figure 9-4**). The site is capable of holding approximately 15 million cubic yards of MSW (25-years capacity). The site is 1.5 miles northwest of Puu Palailai, north of Farrington Highway, 1.6 miles south of Puu Manawahua, and 1.3 miles east of Kahe Point. Elevation ranges from approximately 120 feet to over 600 feet above MSL. Soils are predominantly sand and gravelly materials associated with the gulch including Stony steep land, Lualualei extremely stony clay, Helemano silty clay, and Mahana-Badland complex soils. Sensitive and endangered flora and fauna are not known to exist within the site but do exist at distances greater than a half-mile away. Seven sites of archaeological and/or historical significance are located within and on the edge of the site. Twenty-three sites are located within one mile, fourteen within a quarter-mile (although only two have been evaluated as possibly meriting preservation), four between a quarter-mile and a half-mile, and five sites are between a half-mile and one mile. Makaiwa Hills, LLC, has ~~submitted~~ an accepted Final EIS for the development of a residential community on 1,781 acres of undeveloped land in ʻEwa, Oʻahu; the same land proposed as an alternative landfill site. ~~The notice is available on the Office of Environmental Quality Control (OEQC) web page.~~ The FEIS was published on November 8, 2007, and the zone change for the project was approved on September 29, 2008, as Ordinance 08-26 (Bill 47, FD1).



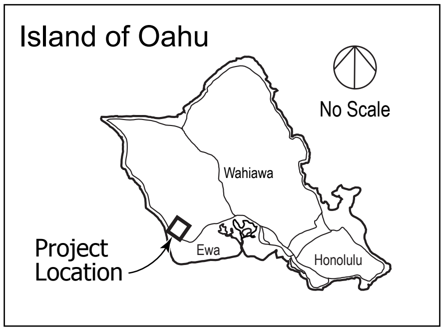


Figure 9-4
Makaiwa Gulch Alternative
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

R.M. TOWILL CORPORATION May 2008

Landfill Infrastructure: On-Site

There is space available on-site for the construction of landfill infrastructure.

Landfill Infrastructure: Off-Site

Construction of infrastructure off-site is not anticipated to be required.

Capacity

Makaiwa Gulch has an estimated 25 year life as a landfill, or disposal ability to process 15-million cubic-yards of waste. The landfill life was estimated based on data available from existing reports. The life should be recalculated to reflect current landfilling practices, allowing for an adequate buffer around the site boundary, and filling to the natural grade. With evaluations based on current practice, it is likely that significantly more life is available at this site than the estimate identified for the EIS.

Opportunities and Constraints

The Makaiwa Gulch site has several advantages:

- It has a significant amount of capacity – 25 years
- Access is potentially available off of Farrington Highway
- Consistent zoning in the State ~~Agricultural~~ Urban District
- The property is currently not being used, although development for a residential subdivision has been proposed
- It is the shortest distance of the alternative sites from the H-POWER facility and close to a major service population (short haul distance)
- Extensive archeological/flora/fauna surveys have been completed
- The area has low precipitation, which will mean less water from rainfall that must be managed at the landfill

There are several major constraints:

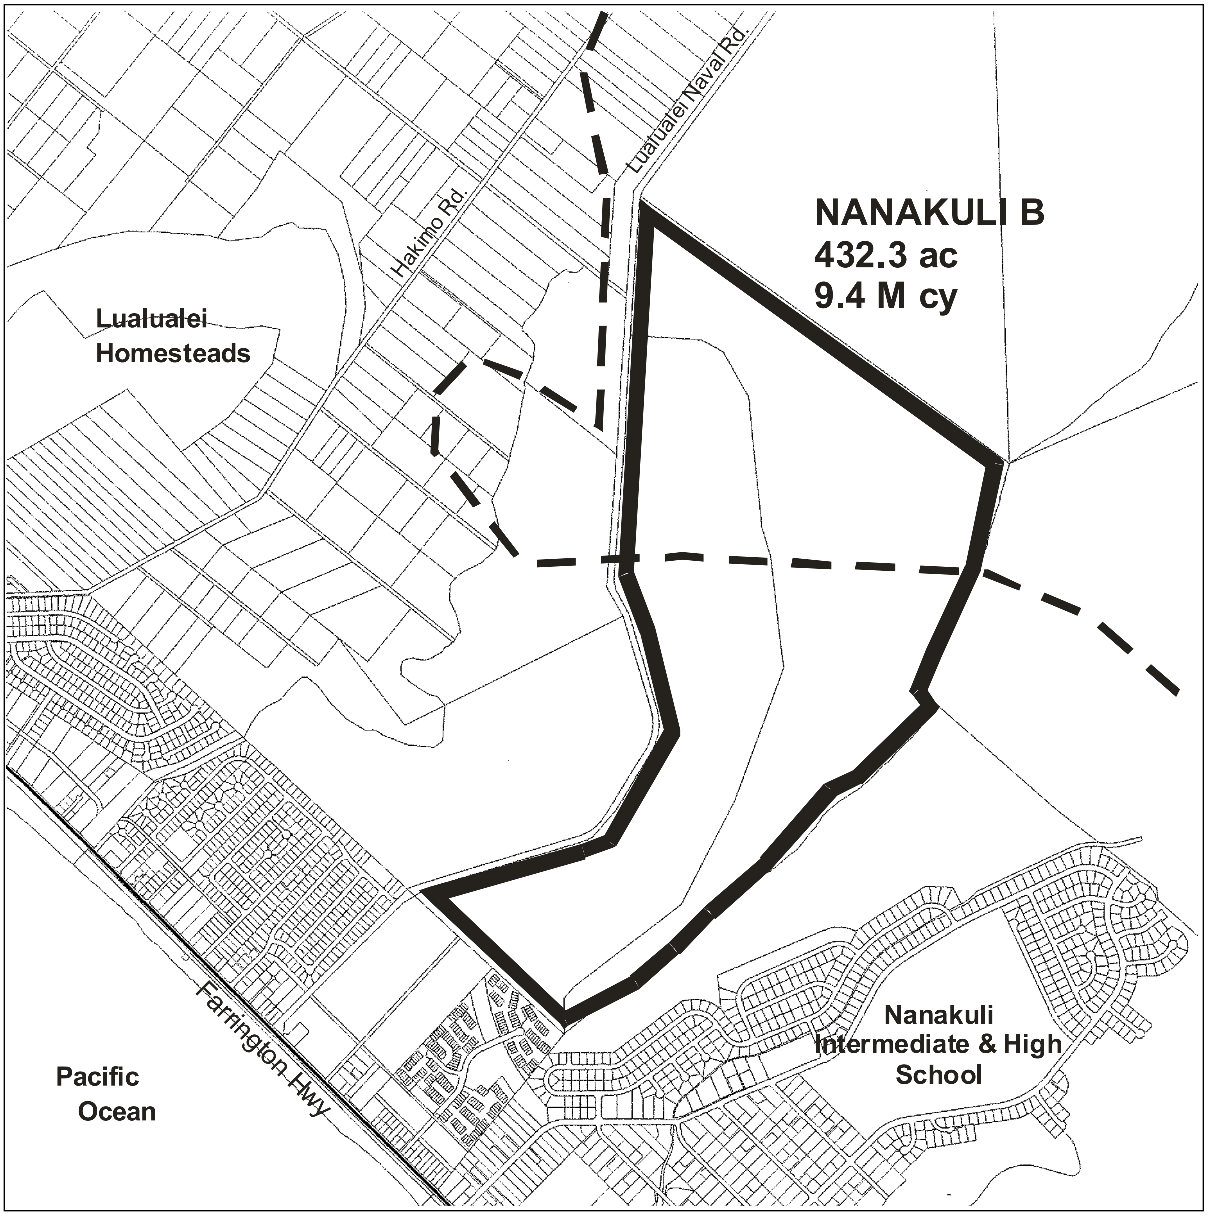
- The project has completed its FEIS for residential development which would preclude its use for a landfill.
- Acquisition costs are likely to be high
- Upwind from heavily populated residential and resort areas
- No on-site utilities or access road

- Rockfall hazards may exist along the highway to Makaiwa Gulch
- Not consistent with the development plan which is for residential subdivision development
- Close to a transition between H-1 and Farrington Highway
- Power lines (138 KV) cross the site
- View planes readily seen
- Perception that a landfill would create a major economic impact that would “close down” residential and resort development
- Close to center of area of major population growth
- In its report on its review of potential sites the Council Committee on Public Works and Economic Development commented: “The PWED Committee has received testimony in opposition to a landfill at the Makaiwa Gulch site including testimony in opposition from the landowner and also testimony was received in opposition to siting a landfill anywhere on the Leeward coast in general. No testimony has been received in support of a landfill at the Makaiwa Gulch site.”

~~9.6.4.4. Nānākuli B~~
9.7.4.4. Nānākuli B

Description

The Nānākuli B site encompasses 432.3-acres and is capable of holding 9.4 million cubic yards of MSW. The site located in West Oʻahu and south of the Māʻili Quarry (**Figure 9-5**). The site is 2,000 feet mauka of Farrington Highway and Nanaikapono Beach Park, 4,000 feet west of Puu Helakala, and 4,000 feet east, southeast of Puu O Hulu Uka. Elevation ranges from approximately 40 feet to over 300 feet above MSL. Nānākuli B borders a critical habitat area for sensitive and endangered flora and fauna. Although the potential landfill site does not contain any archaeological and/or historical sites within its boundaries, sixty-two archaeological and/or historical sites can be found within one mile of the site boundaries; with the majority of the sites located closer to one mile out. Three of the archaeological sites are less than a quarter-mile from the site boundary; nine are located between one-quarter and one-half mile, while fifty are located between one-half and one mile distant.



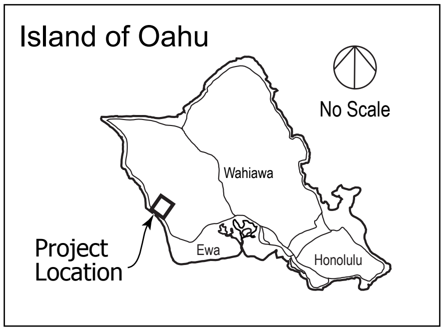


Figure 9-5
Nanakuli B Alternative
Waimanalo Gulch Sanitary Landfill Expansion
Department of Environmental Services

R.M. TOWILL CORPORATION May 2008

Leeward Land, LLC, has submitted an EISPN for the construction and operation of an MSW landfill and composting facility on an approximate 172 acre site at Nanakuli B. The notice was submitted May 23, 2006, and is located on the State OEQC web page.

Landfill Infrastructure: On-Site
Nānākuli B currently does not have landfilling infrastructure on-site; however, space is expected to be available.

Landfill Infrastructure: Off-Site
Off-site space is not anticipated to be required for infrastructure.

Capacity
Nānākuli B has an estimated 15.6 year life, or capacity of 9.4 million cubic yards. The landfill life was estimated from data available in existing reports. The life should be recalculated to reflect current landfilling practices, allowing for an adequate buffer around the site boundary, and filling to the most advantageous grade.

Opportunities and Constraints
The Nānākuli B site has several advantages:

- The zoning is consistent.
- The area gets low precipitation.
- The landfill would be close to existing C&D landfill.
- Utilities are readily accessible.
- The site is not currently being used.
- The acquisition costs relatively low.
- Brackish wells are available on-site for water for dust control.

The disadvantages of this site include:

- Hazardous rockfalls on highway to site.

- Traffic accidents cause major delays on Farrington Highway and could slow access to the site.
- Pedestrian cross traffic on Farrington Highway and the access road.
- The Navy owns the access road, which may necessitate the City paying for access.
- Upwind of Māʻili Elementary School and residences. It is surrounded by single-family residences less than 300 feet away, on the southern and western boundaries. Nānākuli Elementary is 1,372 feet away, Nanaikapono Elementary is 2,190 feet away, and the Pacific Shopping Mall is 1,335 feet away. Residences are located on the far west side of Lualualei Naval Road.
- Dust could impact nearby homes.
- Trucks would pass schools and medical facilities to get to site.
- In its report on its review of potential sites the Council Committee on Public Works and Economic Development commented: “The PWED Committee has received testimony in opposition to a landfill at the Nānākuli B site and anywhere on the Leeward coast in general. No testimony has been received in support of a landfill at the Nānākuli B site.

~~9.6.4.5. Waimānalo Gulch~~
9.7.4.5. Waimānalo Gulch

Description

Waimānalo Gulch Sanitary Landfill is a 200-acre site with approximately 92.5 acres remaining for expansion. The site was preliminarily identified to be capable of holding 9 million cubic yards of MSW. Waimānalo Gulch is owned by the City & County of Honolulu and operated under contract by Waste Management of Hawaiʻi, Inc. The site currently receives the H-POWER facility’s ash and residual wastes. It is also the landfill site for commercial MSW that exceeds the capacity at H–POWER.[53] The site adjoins

---

[53] Waste Management, Keeping Hawaii Clean, http://www.keepinghawaiiclean.com/Waimānalo.htm, March 11, 2008.

Farrington Highway. To the northwest is the Hawaiian Electric Kahe Power Generating Station. South of the site is the Ko Olina Resort, while southeast of the site is the Honokai Hale residential subdivision.

The on-site soils including Rock land, Stony steep land, Lualualei extremely stony clay, and Mahana-Badland complex, provide an improved barrier between surface and groundwater. Sensitive and endangered flora and fauna habitat are not known to exist within the boundaries or within a half-mile of the site. Archaeological and/or historically significant sites are not found within the majority of the landfill site. An archaeological site comprised of three stone uprights was recently discovered. Mitigation to address the find is underway with the State Historic Preservation Division and community informants to identify an appropriate and culturally sensitive means of preserving the stones. No other sites are known within the property. Surrounding the site, 30 sites of potential archaeological and/or historical significance can be found between a quarter-mile and half-mile of the site boundaries.

Construction and operating practices at the WGSL are consistent with state and City & County of Honolulu requirements for site and soils stability and environmental compliance. The operation of the landfill had been the subject of DOH action regarding a notice of violation and fine. The DOH and WMH, the site operator, have agreed to a settlement.

Landfill Infrastructure: On-Site
WGSL currently has landfill infrastructure in place as well as additional space available for expansion of such infrastructure. The area permitted ~~for landfilling~~ by the current SUP is 107.5 acres of the total 200 acre site.

Landfill Infrastructure: Off-Site
Major new infrastructure facilities are not needed off-site.

Capacity

WGSL has a minimum estimated 15 year life, or ability to dispose of nine million cubic-yards of waste (This capacity is anticipated to be adjusted as required based on updated technical evaluation performed by WMH).

Opportunities and Constraints

The use of the WGSL offers the following opportunities:

- Least costly site to acquire and operate as it is owned by the City & County of Honolulu and the necessary infrastructure is already in place
- Close to H-POWER
- The technical information needed to design the landfill is known. With the other sites, a significant amount of technical information will be needed before they can be designed and permitted.
- Road access acceptable
- Close to the service population centers – shorter haul distance than all alternative sites, except Makiawa Gulch.
- Low precipitation
- It is good policy to use a resource, such as the WGSL property, until it is no longer capable of providing the service.
- In its report on its review of potential sites the PWED Committee commented: “There was some testimony received in favor of including the Waimānalo Gulch Landfill as one of the sites under consideration by the City Council and some testimony received supporting the continued use of the Waimānalo Gulch Landfill including testimony from the current operator, Waste Management Hawaii."

There are several disadvantages to the continued use of the WGSL including:

- It is located upwind and visible from a major resort area
- Further effort involving landscaping is needed to reduce viewplanes of the landfill facing Farrington Highway and Ko Olina

- Developers' representatives have claimed there would be major economic impact on residential development and resort development with continued operation of the Waimānalo Gulch Sanitary Landfill
- Trucks are visible traversing on-site and along Farrington Highway
- The site is located close to the center of population growth
- In its report on its review of potential sites the PWED Committee commented: "The PWED Committee has received testimony in opposition to continued use of the Waimānalo Gulch Landfill and also testimony in opposition to siting a landfill anywhere on the Leeward coast in general."

~~9.7. Preferred Alternative~~
9.8. Preferred Alternative

There are several alternative technologies and the transshipment of waste that show promise toward reducing the need for landfills. The generation of MSW that exceeds the processing capacity of H-POWER as well as the generation of ash and residue, however, requires that facilities such as a municipal waste landfill be a part of the City's long term waste management system. (PWCG, 2008).

The time between preparation of this EIS and the date of compliance with the State LUC Order, November 1, 2009, is insufficient for the administrative processes to permit another alternative for all of the MSW and H-POWER refuse being disposed of at the WGSL. The State LUC Order calling for a halt to the acceptance of any further MSW deliveries to the WGSL will come into effect on November 1, 2009. Even if this timeframe were extended the schedule for preparation and approval of a new alternative site can be expected to take several years. In order for any alternative to be viable it must address several considerations (PWCG, 2008):

- It must provide for the health and safety of Honolulu's residents and visitors by properly managing the waste produced on the island.

- Any alternative, whether based on new or existing technology, another site, or based on off-island transshipment, will need to be put under contract, permitted, and made operational by November 1, 2009.
- Because of the complexity of siting requirements in Hawaiʻi and the limited availability of land resources for facilities such as a landfill, a significant amount of time is expected to be required for an alternative to become operational. This would involve the need for community consultation, and the environmental and land use permitting process.

The WGSL is the only alternative currently available to dispose of MSW and H–POWER ash and residue. Continued use of the WGSL until it has been filled to its physical capacity to accept waste is the Preferred Alternative. (PWCG, 2008).

Waimānalo Gulch Sanitary Landfill
The WGSL has the capacity to handle MSW including H-POWER ash and residue for at least 15 years. The site provides this service today, but only within the limits of its currently permitted area.

Waste Transshipment Alternative
Transshipment alone cannot handle all of the waste that is generated. Transshipment of waste additionally transfers the responsibility for stewardship of the land to a mainland landfill that disposes of the transshipped waste. However, operation of transshipment in conjunction with the continued use of the WGSL; expansion of recycling alternatives; and addition of a third boiler to H–POWER, offers the City another viable option for reducing the volume of material requiring landfilling.

The regulatory process for transshipment is anticipated to be lengthy. It will involve and require federal approval of the transshipment of waste materials from Honolulu to the mainland, and state and City approval of the facilities used to prepare the waste for shipment.

Three companies have expressed interest in transshipping Honolulu's waste. At this time, Hawaiian Waste Services has received the federal approvals needed to ship the waste from its point of arrival on the mainland up the Columbia River to the Roosevelt Landfill in Washington State. [54]/[55]

Transshipment may offer near term advantages to the City in reducing the disposal of refuse at the WGSL. However, transshipment offers an alternative for reducing only a major part of the MSW stream. There are still portions of the waste stream that cannot be shipped due to federal restrictions; some items cannot be accepted due to the process used; and financial and solid waste management considerations are anticipated to limit transshipment to a selected portion of the waste stream.

The continued use of the WGSL offers a means to handle materials that could otherwise not be shipped and offers an essential safety net should a shipping strike occur, interrupting the flow of barges.

It is noted that with transshipment that the generation of greenhouse gasses (GHG) should be considered. Transshipment would produce approximately 72.6 percent more GHG emissions than disposal at the WGSL. The difference in emissions compared to taking the waste to H–POWER is even more dramatic. H–POWER shows a reduction in island-wide emissions (or negative emissions) of 28,557 metric tons per year (MTY) of CO_2 equivalent compared to a positive generation from transshipment of 19,982 MTY. While the WGSL is not expected to be capable of being replaced by transshipment, the amount of MSW needing on-island landfill disposal could be significantly reduced by the volume of waste transshipped.

---

[54] United States Department of Agriculture (USDOA), Animal and Plant Health Inspection Service (APHIS), Plant Protection and Quarantine. Compliance Agreement with Roosevelt Landfill. January 10, 2007.

[55] USDOA APHIS, Plant Protection and Quarantine. Compliance Agreement with the State of Hawaii. January 19, 2007.

Technology Alternative

Technology has continued to advance since the last EIS was prepared for the Waimānalo Gulch in 2002. The references used for this evaluation note that alternative technologies have operated in Europe and Japan processing MSW for two or more years. Other alternatives are showing promise and other jurisdictions including New York City and Los Angeles County are investing a significant amount of time and money studying technologies and evaluating proposals to provide a technology based solution.

The jurisdictions considering alternative technologies rely on the presence of a landfill within reasonable distance by rail or truck transport to provide backup if the technology does not perform as expected. This is not applicable for Honolulu, making the use of an alternative technology and closure of the WGSL both unwise and inappropriate.

None of the technology based approaches described in the alternatives analysis meets all of the City requirements as cited in Section 9.~~5.~~6.2. (see also Appendix K). In addition, none of the alternative technologies can have the environmental, land use, permitting, and administrative contracting completed before the November 1, 2009, State LUC deadline.

Expansion of recycling offers advantages for reducing waste going into the WGSL. It should be pursued but cannot be relied upon to completely eliminate the need for the landfill because of recycling residue that cannot be further processed or reused. The recycling residue that is in compliance with disposal regulations is landfilled.

Addition of a third boiler to H–POWER will reduce the amount of material needing disposal and generate energy needed on the island. However, landfill capacity is needed for disposal of ash and non-processible residual materials. In addition, the environmental, land use, permitting and administrative contracting cannot be completed before the November 1, 2009, State LUC deadline.

Alternative Landfill Sites

There are no alternative landfill sites that offer the same positive attributes as the WGSL. Because it is an operating site with remaining capacity, it has many benefits the others do not have. Assuming that the State LUC and DOH both extend the existing permits, there will be no significant delay in the proposed use.

The four alternative sites considered in the analysis have the capacity and other important features that make them reasonable candidates. However:

- Representatives for the Ameron Quarry and the James Campbell Estate, owner of the Makaiwa Gulch site, have both provided estimates of significantly increased cost to acquire the sites and have highlighted several additional complicating issues. Using either of these two sites as a landfill will require potentially protracted action to obtain the site in addition to lengthy time for the environmental, land use, and permitting processes. In addition, the Makaiwa Gulch site is already in the process of development of the site.
- The other two sites, the Māʻili Quarry and Nānākuli B are both located further within Coastal Waiʻanae, which would probably result in increased opposition from the community. Also, the Nānākuli B site has been proposed as a landfill by a private developer, so the cost of acquiring the site should be expected to be greater than estimated.

Section 10
Irreversible and Irretrievable Commitment of Resources and The Relationship Between Local Short-Term Uses of the Environment and the Maintenance and Enhancement of Long-Term Productivity

10.1 Irreversible and Irretrievable Commitment of Resources

The proposed expansion of the Waimānalo Gulch Sanitary Landfill will require the irreversible and irretrievable commitment of a number of resources. These resources include materials, capital, manpower and energy needed to plan, construct, operate, and maintain the proposed lateral expansion of the landfill.

The commitment of the additional 92.5 acres of land to expand the site will be irreversible and irretrievable, but will not constitute a land use that is inconsistent with the present use of the site for a municipal sanitary landfill. The use of the site for landfilling will eliminate it from other uses for a ~~period of approximately~~ minimum of 15 years, following acquisition of the required environmental and development permits. Thereafter, the site will be closed and monitored for a period of not less than 30 years to maintain the safety and security of the site, and in accordance with EPA regulations. The WGSL property is already limited in potential uses, permitted or otherwise.

The proposed expansion will result in the use of soils for landfill cover material which will be an irretrievable loss of this resource. However, the surface of the completed landfill will be sloped and covered with a final engineered cover layer that will be revegetated to promote soil retention and ensure a visual appearance compatible with the existing dry, lowland scrub vegetation found surrounding the project site. All work related to the closure of the landfill will be in accordance with federal, state and City & County of Honolulu laws and regulations. Accordingly, whether or not used as municipal sanitary landfill, the project site will involve the reestablishment of revegetation and set aside of the site for future use as open space, with opportunities for recreational uses similar to other closed landfills on O‘ahu.

Implementation of the project will not result in the significant adverse loss of natural or cultural resources.

The site is not a significant wildlife habitat. There are no federal or state listed endangered species known to inhabit the area. While there is a known archaeological and historic site present within the project boundary, proposed mitigation measures will ensure against potential for negative adverse impacts.

Site preparation and development will utilize fiscal, manpower, and material resources for planning, engineering and design, construction, and operations and maintenance (O&M) purposes. Expenditure of these resources will not be recoverable. Capital expenditures will be required for management and the expansion of facilities and utilities over the proposed period of use.

The site will be limited in the number of feasible uses which may be available upon closure of the proposed expansion area. The long-term stabilization of the landfill site and potential generation of landfill gases will further preclude development of the site for near term residential, recreational, or other related urban purposes. It is possible, however, that with future long term stabilization of the site that some uses may be permitted including parkland or recreational facilities. This practice has successfully been applied to other sites previously used for landfilling purposes including Kakaʻako Waterfront Park, and the Sand Island State Recreational Park.

10.2 Relationship Between Local Short-Term Uses Of The Environment And The Maintenance And Enhancement Of Long-Term Productivity

This EIS provides information on many promising methods for the reduction, recycling, and reuse of various components of the municipal solid waste stream. All technology based solutions including waste transshipment, however, involves the generation of waste or waste by-products that cannot now be feasibly disposed of by methods other than landfilling.

A safe, efficient, and feasible means of disposal of municipal solid waste, therefore, must continue to be made available for the broader island community of O‘ahu. The proposed project is at this time the most viable method for the disposal of municipal solid waste in Honolulu.

Potential for negative adverse impacts to the community and environmental resources will be addressed through the use of appropriate mitigation measures as described in this document. Mitigation to address potential for impacts to area residents will include operational procedures and practices, use of new equipment, and management measures involving coordination with the community to address concerns and issues involving landfill operational practices. A major effort that is currently on-going involves the WGSL Advisory Oversight Committee established by the present City Administration to provide direct input and community consultation over issues or concerns involving landfill operating practices and procedures. The advice and guidance of the WGSL Advisory Oversight Committee will continue to be sought to allow for a responsive and well run facility.

ENV, as supported by the Administration and City Council, will also continue to develop feasible new technologies and practices to further reduce the volume of waste requiring disposal in a municipal sanitary landfill. Effort in this direction has been already implemented with the construction of a waste digester at Sand Island Wastewater Treatment Plant that has significantly reduced the need for the disposal of raw sewage sludge.

Potential for contamination of non-potable/non-drinking groundwater resources is a long-term concern since leachate migration could occur during landfill operations as well as during post closure of the landfill. The project site, however, is permitted within an area located over a groundwater region that is not suitable for drinking water uses.

There is concern that the underlying non-potable/non-drinking brackish water supply may be withdrawn in the future and desalinated to produce a potable/drinking water resource. However, on-going water quality monitoring as indicated that the landfill is currently within the allowable standards for the protection of water quality as regulated by the State Department of Health. In addition, if and when desalination is implemented, there are other locations on Oʻahu where non-potable/non-drinking brackish water can be withdrawn. Although there are no definitive future plans for the withdrawal of non-potable/non-drinking water from the area for desalination and potable/drinking use, the proposed project will be designed in accordance with federal, state, and City & County of Honolulu laws and regulations governing the protection of Hawaiʻi's groundwater resources. All practicable measures to minimize and mitigate against contamination from leachate or unmanaged stormwater discharges, therefore, will be maintained.

The proposed project will not result in the significant loss of environmental resources. Although implementation of the project will preclude the use of the site for other purposes for the duration of the project, existing conditions and land use regulations governing the site already restrict other uses.

The proposed expansion of the site will require the irretrievable use of the land from other purposes for the duration of the proposed project. As a result, other potentially feasible uses will be limited. However, the project will promote the maintenance and enhancement of long-term productivity through maximizing the use of an existing public land resource for a municipal sanitary landfill. The project will fulfill an essential public service and provide for the desired social and economic growth of the broader islandwide population of Oʻahu.

Section 11
Unresolved Issues

11.1 Preservation of Stone Uprights

The final preservation of the three stone uprights discovered at the project site are presently in the process of review and coordination with the SHPD, Office of Hawaiian Affairs, and the SHPD identified community cultural informants to develop and define an appropriate course of preservation.

While the location of the stone uprights in the southwestern edge of the WGSL would affect planned construction activities in that portion of the site, other portions of the landfill property also could be affected depending on the need for site adjustments to accommodate the area containing the uprights. This effect on the landfill design is expected to be known only after the SHPD decision regarding the preservation plan for the uprights. As applicable, this decision will be factored into the final design and engineering, and construction drawings that will be prepared for the proposed project.

11.2 Final Engineering and Construction Details

The detailed final landfill phasing and engineering plans will be prepared by the operator of the site, Waste Management of Hawaii, Inc. Although the final phasing and design documents for the project are not yet complete, the overall site that will be prepared for active landfill cells is approximately ~37 acres within the planned 92.5 acres of lateral expansion. The remaining areas of the 92.5 acre not planned for active landfill cells will be used for stockpiling of landfill cover material, utilities including access roadways and drainage controls, landscaping, and related landfill associated purposes.

Final landfill boundary areas will be examined to ensure that sufficient slope and grades can be designed within appropriate engineering standards to maintain stability of the site. Once the final boundary has been determined a landfill phasing plan, and construction plans will be prepared. All final plans and specifications will be reviewed for conformance with federal, state, and City & County of Honolulu laws and regulations to ensure the landfill is operating in a safe and secure manner.

11.3 Release of Crushed Rock from the Site

The proposed project will result in the generation of recovered soil, cobbles and boulders from excavation and grading of the site. Soils suitable use as cover material will be stockpiled and used for landfill cover. The landfill cover will be used for establishment of vegetative cover, landscaping, intermediate cover, and eventual final covering of the completed landfill surface.

Cobbles (rocks less than approximately 10 pounds in weight) and boulders will be used for various purposes including feed for rock crushing operations to produce aggregate, and for landscaping. The completed crushed rock or aggregate will later be used onsite to facilitate operations within the landfill or for use by the City & County of Honolulu for other projects that require material.

A decision regarding the release or possible sale of any excess material has not yet been determined. The City & County of Honolulu, however, retains the ownership rights to any excavated materials. On May 30, 1991, the City received bids for the material excavated, processed, and removed from Waimanalo Gulch Sanitary Landfill. Since August 1, 1991, the City has received royalties for any excavated and processed material removed from the WGSL. Until the final design has been approved, it will be difficult to determine the volume of excess materials that could be removed from the site.

11.4. EPA Finding and Notice of Violation (NOV)

On April 5, 2006, the EPA announced by press release that WMH and the City & County of Honolulu were alleged to have violated certain provisions of the Clean Air Act at WGSL. The EPA's Finding and Notice of Violation ("EPA NOV") contained an allegation that that WMH violated EPA's regulations by failing to meet certain deadlines for designing and installing a landfill gas collection and control system (GCCS). WMH has addressed that alleged violation by installing and now operating the WGSL's GCCS.

In addition, EPA alleged that the WGSL continues to operate in violation of EPA regulations because the WGSL's wellhead gas temperatures exceed 131°F in some of the landfill gas wells. WMH continues to monitor and evaluate the potential causes of the elevated gas temperatures and is working with DOH and EPA to demonstrate that the Landfill can be safely operated at these higher temperatures, as discussed in Section 11.5. Elevated Temperatures.

11.5 Elevated Temperatures

Due to a complex combination of naturally occurring biological and chemical processes, the gas temperatures of some of the wells at the WGSL exceed the standard operational temperature (131°F) established by the EPA for municipal solid waste landfills. Federal regulations allow the owner or operator of a landfill to establish a higher operating temperature at a particular well of the gas collection and control system ("GCCS") if the owner or operator demonstrates that the elevated temperature does not cause fires or significantly inhibits anaerobic decomposition by killing methanogens. Many landfills have made such demonstrations for operating temperatures higher than 131°F.

WMH has been carefully monitoring and evaluating the landfill since the elevated temperatures were first detected, and has been regularly submitting monitoring data to

EPA and DOH to confirm the continued environmentally safe operation of the landfill. The wells with temperatures above 131° F average approximately 165° F. One well has had an isolated temperature reading of 184° F, which is the highest recorded temperature of any well at the landfill. Extensive scientific investigation has confirmed that the higher temperatures are not the result of subsurface combustion or fire. As allowed by federal regulations, WMH has prepared and submitted information to the EPA and DOH demonstrating that the elevated temperatures have not caused a subsurface fire within the landfill and that the landfill can be safely operated at the elevated landfill temperatures. WMH will continue to coordinate appropriate measures to maintain compliance with all regulations as required by law.

11.6 Appeals of Decisions to Extend SUP

On February 12, 2008, Colleen Hanabusa and Ko Olina Community Association (collectively, “Intervenors”) filed a Notice of Appeal to Circuit Court, appealing the Planning Commission’s Findings of Fact, Conclusions of Law, and Decision and Order dated January 16, 2008, and naming the Planning Commission and ENV as appellees. See Ko Olina Community Association v. Planning Commission, Circuit Court of the First Judicial Circuit, State of Hawaii, Civil No. 08-1-0313-02 (Agency Appeal). On February 15, 2008, Intervenors filed an Amended Notice of Appeal to Circuit Court, adding DPP as an appellee. This appeal challenges the Planning Commission’s decision to extend the deadline for acceptance of waste at WGSL from May 1, 2008, to May 1, 2010, or until the approved area reaches its permitted capacity, whichever occurs first.

On April 10, 2008, Intervenors filed a Notice of Appeal to Circuit Court, appealing the Findings of Fact, Conclusions of Law, and Decision and Order adopting with Modifications, the City and County of Honolulu Planning Commission’s Recommendation to Approve Amendment to Special Use Permit dated March 14, 2008, and naming the LUC and ENV as appellees. See Ko Olina Community Association v. Land Use Commission, Circuit Court of the First Judicial Circuit, State of Hawaii, Civil No. 08-1-0727-04 (Agency Appeal). This second appeal challenges the LUC’s decision to extend the deadline for acceptance of waste at WGSL from May 1, 2008, to November 1, 2009, or until the approved area reaches its permitted capacity, whichever occurs first.

The two appeals were consolidated on June 25, 2008. On October 1, 2008, the Circuit Court heard oral argument from the parties on the consolidated appeals. On October 3, 2008, the court entered its order affirming the LUC's decision in Civil No. 08-1-0727-04, and dismissing as preliminary and not appealable the Planning Commission's decision in Civil No. 08-1-0313-02, but maintaining the consolidated appeals and records on appeal. On October 7, 2008, the court entered an amended order correcting two internally inconsistent errors in its October 1, 2008 order. Final judgment had not been entered as of October 8, 2008.

Section 12
Permits and Regulatory Approvals That May Be Required

Except as otherwise noted, the following permit and regulatory approval applications are planned to be filed for the proposed project upon completion of the EIS process.

12.1. Federal

EPA, Title V, Clean Air Act, Covered Source Permit
Federal Communications Commission (FCC) License, Radio Station Authorization (Land Module Control Station - 4 frequencies, site radios) This authorization has been approved.

12.2. State of Hawai‘i

Department of Agriculture (DOA), License for Commercial Measuring Devices (scale). This license has been approved.
Department of Health (DOH), Solid Waste Management Permit
National Pollutant Discharge Elimination System (NPDES) Permits
  Notice of Intent (NOI) Form C, Construction Stormwater Permit
  NOI Form B, Industrial Stormwater Permit
State Land Use Commission, State Land Use District Boundary Amendment (or State Special Use Permit, see below[1])

12.3. City & County of Honolulu

Department of Planning and Permitting (DPP)
  State Special Use Permit (SUP) Amendment[2]

---

[1],[2] The filing of a new SUP or a new Land Use District Boundary Amendment (LUDBA) constitutes a viable means of addressing the use of the site for a municipal landfill.

Building Permits (for various miscellaneous improvements including electrical, pump, scale, and related facilities)
Grubbing, Grading, Stockpiling Permits

Section 13

Organizations, Agencies, and Public Parties Consulted in the Environmental Impact Statement Process

13.1. Federal Agencies

Environmental Protection Agency, Pacific Islands Contact Office (PICO)
U.S. Air Force Palehua Solar Observatory
Department of the Army, Corps of Engineers
U.S. Fish and Wildlife Service

13.2. State Agencies

- Department of Agriculture
- Department of Business, Economic Development and Tourism
- Department of Defense
- Department of Hawaiian Home Lands
- Department of Health
  - Environmental Management Division
    - Clean Air Branch
    - Clean Water Branch
    - Solid and Hazardous Waste Branch
    - Office of Environmental Quality Control
- Department of Land and Natural Resources
  - Historic Preservation Division
  - Land Division
- State Land Use Commission
- Office of Hawaiian Affairs
- Department of Transportation
- University of Hawai‘i

13.3. City & County of Honolulu

Board of Water Supply
Department of Planning and Permitting
Department of Transportation Services
Honolulu Fire Department
Honolulu Police Department

13.4. Private and Community Organizations and Elected Officials

Hawaiian Electric Company
Honolulu Star-Bulletin and Advertiser
Sun Press
State Senator Will Espero, 20th Senate District, 'Ewa Beach, 'Ewa by Gentry, Ocean Pointe, 'Ewa Villages, West Loch, Honoʻuliʻuli, Lower Waipahu
State Senator Colleen Hanabusa, 21st Senate District, Ko 'Olina, Kahe Point, Nānākuli, Ma'ili, Wai'anae, Mākaha, Makua, Ka'ena Point
State House Representative Maile S. L. Shimabukuro, 45th House District, Waiʻanae, Mākaha, Makua
State House Representative Karen Leinani Awana, 43rd House District, Honokai Hale, Nānākuli, Lualualei, Maile
State House Representative Rida T.R. Cabanilla, 42nd House District, Waipahu, Honoʻuliʻuli, West Loch, ʻEwa
Honolulu City Councilman Todd K. Apo, District 1, ʻEwa, Kapolei, Waiʻanae Coast
Honolulu City Council
Makakilo-Kapolei-Honokai Hale Neighborhood Board No. 34
Waiʻanae Coast Neighborhood Board No. 24

Section 14

Significance Criteria

In accordance with the content requirements of HRS, Chapter 343, and the thirteen significance criteria in HAR, Section 11-200-12 of Title 11, Chapter 200, it is anticipated that this project will have no significant adverse environmental impact. All anticipated potential impacts will be addressed through the use of mitigation measures and practices as set forth in this EIS document.

According to the significance criteria:

> *Criteria 1 - Involves an irrevocable commitment to loss or destruction of any natural or cultural resource;*

The proposed project is not expected to result in the adverse loss of natural or cultural resources. There are no known threatened or endangered species of plants and wildlife present or which utilize the site for habitat.

An archaeological inventory survey of the project site found the presence of three stone uprights that have been identified as a historic resource. The uprights were found in a cluster located near the southwestern edge of the WGSL in an area that would be affected by the lateral expansion. No other significant archaeological resources were discovered as a result of surveying the project's 92.5 acre area of potential effect.

To address the discovery of the uprights: (1) the SHPD was notified to report the find and to ascertain further actions or requirements to ensure no disturbance until an appropriate plan for treatment is determined; and (2) notification and coordination with appropriate parties as determined by SHPD that includes the Office of Hawaiian Affairs (OHA) and SHPD designated cultural informants from the area.

The process of coordination to develop an appropriate treatment plan and to ascertain further the purpose and function of the uprights is in progress. The owner of the site, the City & County of Honolulu, intends to work with the SHPD and the community to provide appropriate treatment to ensure protection and preservation of the stone uprights. All required provisions of Chapter 6E, HRS, as well as other provisions of law governing archaeological preservation and protection will be complied with to prevent the irrevocable loss of this resource.

> *Criteria 2 - Curtails the range of beneficial uses of the environment;*

The proposed project site is located on undeveloped land within the existing Waimānalo Gulch property owned by the City & County of Honolulu. The planned area of expansion is presently unused, with rocky soil and little vegetation. Development of the site is not anticipated to significantly detract from the function or use of the environment. Potential for negative adverse environmental impacts will be addressed through adherence to the mitigation measures and practices as described in this document.

> *Criteria 3 - Conflicts with the State's long-term environmental policies or goals and guidelines as expressed in Chapter 344, HRS;*

The project proposal is consistent with the environmental polices, goals, and guidelines expressed in Chapter 343, HRS. Potential sources of adverse impacts have been identified and appropriate measures have been developed to either mitigate or minimize the potential for impacts.

> *Criteria 4 - Substantially affects the economic or social welfare of the community or State;*

The potential for negative adverse socioeconomic impacts was reviewed in a Socioeconomic Impact Assessment (SIA) prepared for the proposed project by SMS Research (SMS Research, 2008). Based on the findings of the SIA appropriate treatment to minimize, mitigate, or reduce the potential for adverse effects associated with the economic or social welfare of the community and State, were prepared for the EIS document.

Economic Impacts - The fiscal impact of continuing operations of the WGSL, and City & County of Honolulu costs and revenues for solid waste disposal, are expected to result in no new, secondary, or cumulative impacts. The proposed project is expected to make possible the conditions necessary for economic growth and development through providing an essential public facility used by all the communities on O‘ahu for the safe and efficient disposal of municipal waste.

Public Facilities and Services Impacts - The SIA considered the potential impact of the project on the continued provision of police, fire, public education, library, medical, emergency, recreation and public transportation services. The proposed project is not anticipated to adversely affect the continued provision of these services. The potential for nuisance impacts associated with odor, windblown litter, and visual aesthetics, are described and discussed in the subject EIS. Where appropriate, mitigative measures are proposed to reduce or ameliorate the potential for adverse effects.

Social Impacts - Continued operation of the landfill, once all required permits are obtained will assure effective near-term management of solid waste on O‘ahu and allow time for development of new waste disposal technologies and/or a new municipal solid waste landfill site. In addition, the operation of the landfill will be modified or augmented according to the mitigative measures and practices developed in the course of the EIS process. These measures and practices are intended to promote and facilitate a well run facility.

Overall Mitigation Measures - The proposed lateral expansion of the WGSL is expected to have a beneficial effect on the economic and social welfare for all communities in the City & County of Honolulu. The lateral expansion will meet existing and future needs of the Island of Oʻahu for the safe and efficient disposal of MSW and H-POWER ash and residue. Any potential for adverse effects will be addressed through the application of the mitigation measures as described in the EIS document.

Criteria 5 - Substantially affects the public health;

Factors affecting public health, including air quality, water quality, litter, noise levels, and other items were assessed and are addressed through the application of appropriate mitigation measures and practices. Mitigation measures and practices have been included in the design, operation, and maintenance of the proposed lateral expansion to avoid potential for negative adverse impacts to public health and safety of the community and City & County of Honolulu.

Criteria 6 - Involves substantial secondary impacts, such as population changes or effects on public facilities;

Development of the proposed project will not result in substantial secondary or cumulative impacts to the natural or built environment or to the social and economic community. The proposed project will not stimulate unexpected change in population, but will accommodate the current and anticipated future needs of the population of the Island of Oʻahu. The proposed lateral expansion will utilize portions of an existing public facility, including access roads and utilities, but will not place significant additional burden on those facilities as the project transitions to the use of currently unused portions of the Waimānalo Gulch.

Criteria 7 - Involves a substantial degradation of environmental quality;

Analysis of air and water quality, geology, flora and faunal resources, and land use associated with the construction, operation and maintenance of the proposed expansion project has determined that environmental quality will not be substantially degraded.

A number of the environmental studies undertaken for the proposed project are provided as appendices to this EIS document. Where the analyses are not provided as appendices, the documents are cited as references.

> *Criteria 8 - Is individually limited but cumulatively has considerable effect upon the environment or involves a commitment for larger actions;*

The proposed project will be developed in accordance with federal, state, and City & County of Honolulu laws, regulations, and policies. The proposed facility is under development by the City & County of Honolulu to provide for the safe and efficient disposal of municipal waste. The proposed lateral expansion project is designed to meet existing and anticipated future needs within O‘ahu for waste disposal within the anticipated period of use, and will not result in cumulative effects upon the environment nor involve a commitment for larger actions. The eventual closure of the landfill however, is anticipated to require that new methods and technologies for the disposal of municipal waste be identified in conjunction with the identification of a new landfill site.

> *Criteria 9 - Substantially affects a rare, threatened, or endangered species, or its habitat;*

The investigation of the project site for rare, threatened, or endangered botanical and faunal species has been completed. No species were identified as present that are listed as rare, threatened, or endangered by the State of Hawai‘i or federal government.

> *Criteria 10 - Detrimentally affects air or water quality or ambient noise levels;*

Short-term impacts to air quality and ambient noise levels will result from construction activities; however, potential for negative adverse impacts are anticipated to be minimal and will cease when construction is complete. Due to specific care taken in the design (including mitigation measures and practices) no detrimental long-term effects to the environment are expected or anticipated.

> *Criteria 11 - Affects or is likely to suffer damage by being located in an environmentally sensitive area such as a flood plain, tsunami zone, beach, erosion-prone area, geologically hazardous land, estuary, fresh water, or coastal waters;*

The project site is located mauka or inland from coastal waters and is within an area determined by the Federal Emergency Management Agency to be outside of the 500-year flood zone. The proposed expansion will be developed and built according to federal and state standards, regulations, and laws for sanitary waste disposal facilities.

> *Criteria 12 - Substantially affects scenic vistas and view planes identified in County or State plans or studies;*

The project site is not located within any scenic vista or view plane as identified in state or City & County of Honolulu Plans. The existing administrative building is designed with a two-story roof line. Closure of each landfill cell will be accompanied with a final cover including vegetation similar to that found along the slopes which adjoin the site. Any potential visual impact associated with initial construction of landfill cells will be temporary. The potential for visual impacts during operation of the landfill will be minimized and mitigated with vegetative controls including the use of hydromulching, and plantings of grass, dryland shrubs, and trees, as provided in the project's landscaping plan. Careful placement of access roadways will also be practiced to reduce the potential for visual impacts to the adjoining Ko Olina Resort.

> *Criteria 13 - Requires substantial energy consumption.*

Construction associated with the proposed lateral expansion project will require the use of energy during activities that include grading, excavation, application of landfill cover materials, and during implementation of landscaping. It is anticipated that use of energy for the operation of machinery, equipment, and administrative buildings will utilize the same or less energy than the existing facility.

Daily operational activities are not anticipated to result in a substantial burden to the available power supply. The electrical energy required from Hawaiian Electric Company will involve a continuation of existing service.

Future plans will call for the generation of electricity from the landfill. This can be considered a positive benefit based on the use of an existing resource.

Section 15
Comments and Responses to the Environmental Impact Statement Preparation Notice

~~This Final EIS has been prepared and modified to address comments received during the 30-day public comment period for the Environmental Impact Statement Preparation Notice (EISPN). As appropriate project mitigation measures have been proposed to address substantive concerns.~~

A list of the comment letters received for the EISPN is provided in **Table 15-1**. The comments and the written responses prepared for the comments are attached and included in this section.

Attention: Wilma Namumnant

Gentlemen:

Subject: Environmental Impact Statement Preparation Notice for Waimanalo Gulch Sanitary Landfill Expansion, Kahe, Oahu, Tax Map Key: (1) 9-2-3:72 and 73

Thank you for the opportunity to review and comment on the subject matter. The Department of Land and Natural Resources' (DLNR) Land Division distributed or made available a copy of your report pertaining to the subject matter to the DLNR Divisions for their review and comment:

Engineering Division
Division of Water Resource Management
Land Division – Oahu District

Based on the attached responses, the Department of Land and Natural Resources has no comment to offer on the subject matter. Should you have any questions, please feel free to call our office at 587-0433. Thank you.

Sincerely,

Russell Y. Tsuji
Administrator

COMMENTS

(X) **We confirm that the project site, according to the Flood Insurance Rate Map (FIRM), is located in Zone D. The National Flood Insurance Program (NFIP) does not have any regulations for development within Zone D.**

( ) Please take note that the project site, according to the Flood Insurance Rate Map (FIRM), is located in Zone ___.

( ) Please note that the correct Flood Zone Designation for the project site according to the Flood Insurance Rate Map (FIRM) is ___.

( ) Please note that the project must comply with the rules and regulations of the National Flood Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44CFR), whenever development within a Special Flood Hazard Area is undertaken. If there are any questions, please contact the State NFIP Coordinator, Ms. Carol Tyau-Beam, of the Department of Land and Natural Resources, Engineering Division at (808) 587-0267.

Please be advised that 44CFR indicates the minimum standards set forth by the NFIP. Your Community's local flood ordinance may prove to be more restrictive and thus take precedence over the minimum NFIP standards. If there are questions regarding the local flood ordinances, please contact the applicable County NFIP Coordinators below:

( ) Mr. Robert Sumimoto at (808) 523-4254 or Mr. Mario Siu Li at (808) 523-4247 of the City and County of Honolulu, Department of Planning and Permitting.
( ) Mr. Kelly Gomes at (808) 961-8327 (Hilo) or Mr. Kiran Emler at (808) 327-3530 (Kona) of the County of Hawaii, Department of Public Works.
( ) Mr. Francis Cerizo at (808) 270-7771 of the County of Maui, Department of Planning.
( ) Mr. Mario Antonio at (808) 241-6620 of the County of Kauai, Department of Public Works.

( ) The applicant should include project water demands and infrastructure required to meet water demands. Please note that the implementation of any State-sponsored projects requiring water service from the Honolulu Board of Water Supply system must first obtain water allocation credits from the Engineering Division before it can receive a building permit and/or water meter.

( ) The applicant should provide the water demands and calculations to the Engineering Division so it can be included in the State Water Projects Plan Update.

( ) Additional comments: ______________________________

( ) Other: ______________________________

Should you have any questions, please call Ms. Alyson Yim of the Planning Branch at 587-0259.

Signed: ______________________________

Dear Mr. Tsuji:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated January 2, 2007 concerning the subject project. We appreciated the comments of your Engineering Division, Division of Water Resource Management, and Land Division. The following is prepared in response.

Engineering Division
We acknowledge that the Waimanalo Gulch landfill is located in Zone D and that the National Flood Insurance Program (NFIP) does not have any regulations for development within this zone.

Division of Water Resource Management
We acknowledge that this division has no comments at this time.

Land Division
We acknowledge that this division has no comments and no objection to the proposed project.

Thank you for this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Very truly yours,

Eric S. Takamura

Dear Dr. Takamura:

Subject: Environmental Impact Statement Preparation Notice
Chapter 343, Hawaii Revised Statutes
Waimanalo Gulch Sanitary Landfill Expansion
TMK: (1) 9-2-003: 072 and 073

We have the following initial comments on the proposed landfill expansion as described in the EIS Preparation Notice (EISPN):

1. The EISPN discussed alternative actions involving transporting refuse to another landfill facility outside of Hawaii. If one of the alternatives involves possible use of facilities at the State harbors, particularly Honolulu or Kalaeloa Barbers Point Harbor, to collect and stage refuse before shipping, further EIS evaluation should fully analyze the impacts to handling refuse at the harbors, including the congestion already being experienced at the harbors.

2. The EISPN stated that a traffic assessment report is being prepared. The report should address traffic conditions and ingress/egress at the landfill facility. Prior situations or events involving vehicle movements at the access on Farrington Highway should be reviewed, especially for incidents or conditions where improvements at and around the entry intersection may be needed. The report should also cover having sufficient on-site queue area for vehicle waiting lines to avoid any back ups at or onto the highway.

We appreciate the opportunity to provide our comments. We request that we receive at least five (5) copies of the forthcoming draft environmental impact statement report for our further review and comment of the landfill project.

Very truly yours,

Francis Paul Keeno

Mr. Brennon Morioka, P.E.
Director of Transportation
State of Hawaii
Department of Transportation
869 Punchbowl Street
Honolulu, Hawaii 96813-5097

Dear Mr. Morioka:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 28, 2006, concerning the subject project. The following is prepared in response to your comments (your comments have been italicized for reference):

1. *The EISPN discussed alternative actions involving transporting refuse to another landfill facility outside of Hawaii. If one of the alternatives involves possible use of facilities at the State harbors, particularly Honolulu or Kalaeloa Barbers Point Harbor, to collect and stage refuse before shipping, further EIS evaluation should fully analyze the impacts to handling refuse at the harbors, including the congestion already being experienced at the harbors.*

The investigation of alternatives in the Draft EIS (DEIS) will include waste transshipment and the potential for impacts to harbor facilities under jurisdiction of the Department of Transportation (DOT). We appreciate there is congestion already present at the harbors and will note this in the DEIS. The full assessment of traffic impacts, however, should be investigated by the party or parties responsible for the transshipment of waste from Oahu for the specific locations where it is proposed.

2. *The EISPN stated that a traffic assessment report is being prepared. The report should address traffic conditions and ingress/egress at the landfill facility. Prior situations or events involving vehicle movements at the access on Farrington Highway should be reviewed, especially for incidents or conditions where improvements at and around the entry intersection may be needed. The report should also cover having sufficient on-site queue area for vehicle waiting lines to avoid any back ups at or onto the highway.*

We confirm the traffic assessment will investigate traffic conditions and ingress/egress at the facility, review vehicular movement along Farrington Highway from and to the facility, and provide recommendations concerning vehicle queuing to avoid congestion at or onto the highway.

We appreciate your review of the subject document. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

Subject: Waimanalo Gulch Sanitary Landfill Expansion
Environmental Impact Statement Preparation Notice (EISPN)
TMK(s): (1) 9-2-003: 072 and 073
Honouliuli, Ewa, Island of Oahu

Thank you for sending the Office of Planning the EISPN for the above referenced project.

The Office of Planning will be coordinating the State's position on areas of crosscutting State concern. I am writing to request that the Draft EIS consider the impacts of the proposed project on the following issues:

1. **Ocean Resources** – The State has an affirmative duty to project Hawaii's nearshore waters. Please discuss how stormwater and wastewater generated by the project will be prevented from reducing the quality of nearshore water.

2. **Water Supply** – Water resource protection is a critical State issue. The proposed project is within a designated Water Management Area. Please include information on the drinking water and non-potable water sources that will be utilized for the project.

3. **Public Health** – If the project will have a potential to generate hazardous materials or result in the possible contamination of the air, soil, or water, please discuss how public health and safety will be protected.

4. **Cultural/Historic Resources** – Please include an inventory survey of cultural and historic sites, with monitoring and preservation plans approved by the State Historic Preservation Division. Please discuss how access for Native Hawaiians for traditional and customary practices will be preserved to include visual landmarks if applicable.

5. **Environmental, Recreational and Scenic Resources** – Please include an inventory of flora and fauna on the project site and any required protections. Consider in the design of your field observations including both wet and dry season surveys to capture the fullest range of flora and fauna. Please include a description of recreational uses on or near the project site. In addition, a description of scenic resources should also be included.

6. **Coastal Zone Management** – The State oversees protection of natural, cultural, and economic resources within the coastal zone. Please discuss how the proposed project will balance the competing values of economic development and preservation of coastal resources, including protection from hurricane, storm surge, flood hazard, volcano, and soil erosion as applicable.

The Office of Planning looks forward to receiving the DEIS with the potential impacts and mitigation measures for the above issues addressed. If you have any questions, please call Scott Derrickson in the Land Use Division at 587-2805.

Sincerely,

Laura Thiel

Ms. Mary Lou Kobayashi, Acting Director
Office of Planning
State of Hawaii
Department of Business, Economic Development & Tourism
P.O. Box 2359
Honolulu, Hawaii 96804

Dear Ms. Kobayashi:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 29, 2006 concerning the subject project. The following is prepared in response to your comments (your comments have been italicized for reference):

"1. Ocean Resources - The State has an affirmative duty to project Hawaii's nearshore waters. Please discuss how stormwater and wastewater generated by the project will be prevented from reducing the quality of nearshore water."

The Draft EIS (DEIS) will provide information on environmental management of stormwater and wastewater associated with the proposed project. Potential for impacts and proposed mitigation measures will be described to prevent degradation of nearshore state waters.

"2. Water Supply - Water resource protection is a critical State issue. The proposed project is within a designated Water Management Area. Please include information on the drinking water and non-potable water sources that will be utilized for the project."

And,

"3. Public Health - If the project will have a potential to generate hazardous materials or result in the possible contamination of the air, soil, or water, please discuss how public health and safety will be protected."

"4. Cultural/Historic Resources - Please include an inventory survey of cultural and historic sites, with monitoring and preservation plans approved by the State Historic Preservation Division. Please discuss how access for Native Hawaiians for traditional and customary practices will be preserved to include visual landmarks if applicable."

And,

"5. Environmental, Recreational and Scenic Resources - Please include an inventory of flora and fauna on the project site and any required protections. Consider in the design of your field observations including both wet and dry season surveys to capture the fullest range of flora and fauna. Please include a description of recreational uses on or near the project site. In addition, a description of scenic resources should also be included."

Information relating to water supply, public health, and cultural/historic resources is under investigation and will be provided as a part of the DEIS.

"6. Coastal Zone Management - The State oversees protection of natural, cultural, and economic resources within the coastal zone. Please discuss how the proposed project will balance the competing values of economic development and preservation of coastal resources, including protection from hurricane, storm surge, flood hazard, volcano, and soil erosion as applicable."

The relationship of the proposed project to these concerns will be provided in the DEIS.

We appreciated the time you have taken to review the subject document. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S Takamura

FROM: MELVIN N. KAKU, DIRECTOR

SUBJECT: WAIMANALO GULCH SANITARY LANDFILL EXPANSION

Thank you for your November 8, 2006 letter, requesting our review of and comments on the Environmental Impact Statement (EIS) Preparation Notice for the subject project. We have the following comments for your consideration as you prepare the draft EIS:

1. The draft EIS should identify which roadways will be providing access to the project site during construction of the landfill expansion.
2. Comments should be requested from the State Department of Transportation (SDOT) because access to the landfill is from Farrington Highway, which is under SDOT jurisdiction.

We look forward to reviewing the draft EIS. Should you have any questions regarding these comments, please contact Ms. Faith Miyamoto of the Transportation Planning Division at Local 8350.

Dear Mr. Takamura:

SUBJECT: Waimanalo Gulch Sanitary Landfill Expansion
Environmental Impact Statement Preparation Notice

Thank you for the opportunity to review and provide comments on this document. The Solid Waste Section (SWS) offers the following comments:

It is noted on page 2-5 that a 100-foot buffer will be maintained between landfill activities and the property line will be maintained. We note that the Makaiwa Hills residential development is proposed on land adjacent to the landfill. Ideally, buffers would be able to contain the impacts of landfill activities, such as odor and windblown litter, entirely within facility boundaries. We are concerned that the proposed buffers are not sufficient to minimize impacts on housing and/or associated land uses.

The SWS also notes that the proposed landfill expansion requires a solid waste management permit, and will address all other issues through the permit application process.

If you have any questions regarding this letter, please contact Lane Otsu of our Solid Waste Section at (808) 586-4226.

Sincerely,

STEVEN Y.K. CHANG, P.E., CHIEF
Solid and Hazardous Waste Branch

Department of Health
P.O. Box 3378
Honolulu, Hawaii 96801-3378

Dear Mr. Chang:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated February 9, 2007 concerning the subject project. The following is prepared in response to your comments (your comments are italicized for reference):

1. *"It is noted on page 2-5 that a 100-foot buffer will be maintained between landfill activities and the property line will be maintained. We note that the Makaiwa Hills residential development is proposed on land adjacent to the landfill. Ideally, buffers would be able to contain the impacts of landfill activities, such as odor and windblown litter, entirely within facility boundaries. We are concerned that the proposed buffers are not sufficient to minimize impacts on housing and/or associated land uses."*

The area of buffer is intended to remain free of actual landfilling and placement of waste. As required, other measures to reduce the potential impacts of nuisance concerns including odor and windblown litter will be described in the Draft EIS (DEIS).

2. *"The SWS also notes that the proposed landfill expansion requires a solid waste management permit, and will address all other issues through the permit application process."*

We acknowledge that a solid waste management permit application will be required for the proposed project and look forward to further working with you to address the requirements of the Solid and Hazardous Waste Branch.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Reference: Current proposal to expand and extend the life of Waimanalo Gulch Sanitary Landfill at Kahe Point.

To Whom It May Concern:

As a representative of the Au Family, who has property interest in this area, we would like to voice opposition to the current proposal to expand and extend the life of Waimanalo Gulch Landfill at Kahe Point.

We have endured many hardships with this landfill:

1. A fire that originated from the landfill burned down one of our homes, and we will now have to go through the new building permit procedures to have it established again.

2. We feel that the health qualities of living in this area are compromised, and that property values have been suppressed because of the current environment that the landfill has created. Through the years of its existence, the smell, dust, and trash carried over by the wind from the landfill needs to end.

3. We feel that the environment has been jeopardized:
    (1) A study should be done on the impact of Hawaii Electric's Kahe Power Plant and Waimanalo Gulch Landfill on the fresh water table in this area and the long term effects to our island. This has been an ongoing issue for sometime. Please note that the pre-existing water line was changed to allow this landfill to be legal during the 1980's

    (2) To our understanding, this Kahe valley (Waimanalo Gulch) has a 10 year flood plane prior to the creation of the landfill. There is a stream bed with a bridge under this landfill which is a good indication what can happen at this location.
    We are very concern about this potential, now and in the future.

4. We feel that the original premise for this landfill has not been honored. It was presented to the public as a solid waste Waimanalo Gulch landfill, at a certain size, and set time limitation for it existence. The City has expanded and change these factors twice, and are now trying to do it again. These tactics have miss led and manipulated the public. It is time that agreements are honored, and not changed at the City's convenience.

DEC-27-2006 02:56PM FAX: ID:CC HNL ENV REFUSE PAGE:001 R=96%

5. The landfill is part of a historical sight. Fort Arizona is located on top of a mountain ridge at Kahe Point adjacent to and part of "Waimanalo Gulch Landfill". It is being mired with the stigma of this landfill. This Fort housed the main canon for the US Arizona, which was removed from the ship and placed at this Fort. Its purpose was to protect that area of the island during World War II. President Roosevelt slept there during a visit and inspection to Fort Arizona. Currently, to get to it, one has to drive through the landfill. So why is there still a landfill at a historical sight?

There is one special note on the naming of Waimanalo Gulch Landfill. Prior to its existence, the property tax assessments always listed it as Kahe Point.

Respectfully, submitted as testimony.

Sincerely,

Robert Au

IN REPLY REFER TO:
RA 08-076

Mr. Robert Au
1715 Anapuni Street, #H
Honolulu, Hawaii 96822

Dear Mr. Au:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 26, 2006, concerning the subject project. We have prepared the following in response to your comments (your comments have been italicized for reference):

"1. A fire that originated from the landfill burned down one of our homes, and we will now have to go through the new building permit procedures to have it established again."

We are not aware of a fire from the landfill causing the loss of the home that you describe. We ask that you contact us concerning this matter so that it can be properly investigated. Please contact Ms. Wilma Namumnart, of our office at 692-5358.

"2. We feel that the health qualities of living in this area are compromised, and that property values have been suppressed because of the current environment that the landfill has created. Through the years of its existence, the smell, dust, and trash carried over by the wind from the landfill needs to end."

A number of environmental factors will be investigated as part of the Draft EIS (DEIS). This will include air, hydrology and geology, flora and fauna, and socioeconomic factors associated with use of the site for the proposed project. Potential for adverse environmental effects will be researched and as appropriate, mitigation measures will be recommended to minimize or ameliorate the potential for impacts.

"3. We feel that the environment has been jeopardized:"

"(1) A study should be done on the impact of Hawaii Electric's Kahe Power Plant and Waimanalo Gulch Landfill on the fresh water table in this area and the long term effects to our island. This has been an ongoing issue for sometime. Please note that the pre-existing water line was changed to allow this landfill to be legal during the 1980's"

> "(2) *To our understanding, this Kahe valley (Waimanalo Gulch) has a 10 year flood plane [sic] prior to the creation of this landfill. There is a stream bed with a bridge under this landfill which is a good indication what can happen at this location. We are very concern [sic] about this potential, now and in the future."*

Although the City does not operate the Kahe Point Power Generating Station, the DEIS for the proposed Waimanalo Gulch Sanitary Landfill Expansion project will provide water quality and hydrogeological information on surface and ground water resources that may be affected by the use of the landfill. This research will be undertaken by a licensed professional. Data collected from the course of the study will be included as part of the DEIS.

Information concerning storm water drainage and planned drainage control features to ensure short- and long-term protection of the land and nearshore waters will also be provided.

> "4. *We feel that the original premise for this landfill has not been honored. It was presented to the public as a solid waste Waimanalo Gulch landfill, at a certain size, and set time limitation for it [sic] existence. The City has expanded and change [sic] these factors twice, and are now trying to do it again. These tactics have miss led and manipulated the public. It is time that agreements are honored, and not changed at the City's convenience."*

Please refer to Section 1 of the EISPN that provided important information that establishes why the City must act at this time to provide a solid waste refuse facility for use by all the communities of Oahu.

> "5. *The landfill is part of a historical sight [sic]. Fort Arizona is located on top of a mountain ridge at Kahe Point adjacent to and part of "Waimanalo Gulch Landfill". It is being mired with the stigma of this landfill. This Fort housed the main canon for the US Arizona, which was removed from the ship and paced at this Fort. Its purpose was to protect that area of the island during World War II. President Roosevelt slept there during a visit and inspection to Fort Arizona. Currently, to get to it, one has to drive through the landfill. So why is there still a landfill at a historical sight [sic]."*

Your recognition of the Battery Arizona site is noted. For clarification, we note that the Battery Arizona bunker complex lies within the landfill property, however, the location of the turret is within the adjacent Hawaiian Electric Company property. An examination of this site as well as other potentially important historical sites and features will be further described in the DEIS. As appropriate, mitigation measures will be recommended to ensure against adverse effects.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

MEMORANDUM

TO: DR. ERIC S. TAKAMURA, PH.D., P.E., DIRECTOR
DEPARTMENT OF ENVIRONMENTAL SERVICES

FROM: HENRY ENG, FAICP, DIRECTOR
DEPARTMENT OF PLANNING AND PERMITTING

SUBJECT: ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN) WAIMANALO GULCH SANITARY LANDFILL EXPANSION

We have reviewed the subject EISPN and have the following comments:

1. Pg. 1-1, paragraphs 2 and 3: Condition 12 of the Land Use Commission's Decision and Order date June 9, 2003 states:

   Within five (5) years from the date of this Special Use Permit Amendment approval or date of the Solid Waste Management Permit approval for this expansion, whichever occurs later but not beyond May 1, 2008, the 200-acre property shall be restricted from accepting any additional waste material and be closed in accordance with an approved closure plan.

   We interpret the above condition to mean that the landfill cannot accept all forms of waste, including H-POWER ash, residue, and unacceptable wastes.

   On paragraph 3, we suggest the word 'accepted' be used instead of 'approved'.

2. Pg. 1-2, paragraph 1: The date the Special Use Permit amendment is approved is the date the Land Use Commission's Order is effective, June 9, 2003. The footnote should be revised accordingly. Also, please delete the word 'municipal' in the last sentence.

3. Pg. 1-13, paragraphs 1 and 2: The site should be consistently described as being located in Waimanalo Gulch, Honouliuli, Ewa, Oahu. Please make the necessary changes to all references on location. The DEIS should avoid unnecessary confusion as to the project's location.

   When the landfill received its Special Use Permit (SUP) approval on April 20, 1987, the approved landfill area was 60.5 acres. On October 31, 1989, the Land Use Commission (LUC) approved a 26-acre addition to the original approved area to include support areas of the area approved for landfilling. Thus, at the time when the landfill began initial operations, the landfill and support areas was limited to 86.5 acres and should not be described as being 200 acres.

4. Pg. 2-3, paragraph 1: Please indicate what uses are proposed for the 100-foot buffer. Also, will there be any part of the 200-acre property left undisturbed or as it was prior to landfilling operations? If so, please describe and map these areas.

5. Pg. 2-4, paragraph 4: Condition 12 of the LUC Decision and Order of June 9, 2003, applies to the entire 107.5-acre approved area, not just the 21-acre expansion area.

6. Pg. 2-15, paragraph 1: The Draft Environmental Impact Statement (DEIS) should indicate that portions of the 92.5-acre proposed expansion area was graded, for what purpose, when, and whether these areas are still being disturbed for landfill operations.

7. Pg. 3-1, Section 3.2.: This section should state whether regulated hazardous waste is accepted, examples of unacceptable waste and all types of residue, the quantity and frequency of sewer sludge and related sewage residue accepted, and whether delivery of wastes after normal business hours also include other processes involving spreading, compacting, covering, relocation, or other waste disposal/landfilling processes normally associated with operations during regular business hours.

8. Pg. 3-4, Section 3.3.: Detailed information on irrigation for landscaping/revegetation should be provided in the DEIS.

9. The DEIS should describe existing and proposed cell construction, reclamation, revegetation, closure, monitoring, and reuse across the entire 200-acre property and what will be/have been disposed in each cell, the order in which each cell has been/will be completed and reclaimed/revegetated/reused.

10. The DEIS should disclose how the expansion area will be integrated into its overall phasing of operations, from cell construction to reuse, and whether phasing such operations would outweigh the benefits, if any, of maintaining portions of its operations at the makai portion of the property, i.e., support services and ash monofils.

Discussions regarding whether impacts to the community and the environment could be minimized by closing/reclaiming/reusing the completed portions of the existing landfill closest to Farrington Highway and relocating its operations further into the gulch should be included in the DEIS. This could include relocation of the scale house, maintenance operations, and other noxious activities since much of the 92-acre expansion area is located at the northern portion of the property.

11. Details should be provided as to what drainage and berming techniques will be applied at the property's mauka boundary since the gulch extends further mauka of the property line.
12. The DEIS should include a timeline showing all permit processing timeframes, start of construction within the expansion area, projected closure and reclamation of completed cells within the entire 200-acre property.
13. The DEIS should include a visual analysis of the landfill from current conditions to closure and reclamation by cells/monofils from public vantage points such as Ko Olina, Farrington Highway, Makaiwa Hills, and Honokai Hale.
14. A detailed landscape plan showing screening along Farrington Highway and proposed vegetation/topographic features on completed cells/monofils/other waste disposal site on the 200-acre property.
15. Initial construction activities for the expansion of the existing landfill may require grubbing, grading and stockpiling permits. Furthermore, a grading permit may be required for the final cover that will be placed prior to landfill closure.
16. A drainage report may be required at a later date.
17. The DEIS should include a current (imaged in 2007) high resolution aerial photo of the entire 200-acre property.

Should you have any questions, please contact Raymond Young of our staff at 527-5839 or by email at: ryoung@honolulu.gov.

SUBJECT: ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN) WAIMANALO GULCH SANITARY LANDFILL EXPANSION

Thank you for your memorandum dated December 26, 2006 concerning the subject project. The following is prepared in response to your comments (your comments have been italicized for reference):

1. *"Pg. 1-1, paragraphs 2 and 3: Condition 12 of the Land Use Commission's Decision and Order date June 9, 2003 states: Within five (5) years from the date of this Special Use Permit Amendment approval or date of the Solid Waste Management Permit approval for this expansion, whichever occurs later but not beyond May 1, 2008, the 200-acre property shall be restricted from accepting any additional waste material and be closed in accordance with an approved closure plan."*

   "We interpret the above condition to mean that the landfill cannot accept all forms of waste, including H-POWER ash, residue, and unacceptable wastes. On paragraph 3, we suggest the word 'accepted' be used instead of 'approved'."

This recommendation is noted. However, in reviewing the OEQC's requirements for the preparation of EIS documents, the term "approved" is correct in usage.

2. *"Pg. 1-2, paragraph 1: The date the Special Use Permit amendment is approved is the date the Land Use Commission's Order is effective, June 9, 2003. The footnote should be revised accordingly. Also, please delete the word 'municipal' in the last sentence."*

This recommendation is noted and will be addressed in the DEIS.

3. *"Pg. 1-13, paragraphs 1 and 2: The site should be consistently described as being located in Waimanalo Gulch, Honouliuli, Ewa, Oahu. Please make the necessary changes to all references on location. The DEIS should avoid unnecessary confusion as to the project's location."*

"When the landfill received its Special Use Permit (SUP) approval on April 20, 1987, the approved landfill area was 60.5 acres. On October 31, 1989, the Land Use Commission (LUC) approved a 26-acre addition to the original approved area to include support areas of the area approved for landfilling. Thus, at the time when the landfill began initial operations, the landfill and support areas was limited to 86.5 acres and should not be described as being 200 acres."

This recommendation is noted and will be addressed in the DEIS.

4. *"Pg. 2-3, paragraph 1: Please indicate what uses are proposed for the 100-foot buffer. Also, will there be any part of the 200-acre property left undisturbed or as it was prior to landfilling operations? If so, please describe and map these areas."*

The area of buffer is intended to remain free of actual landfilling and placement of waste. Other locations encompassed by the 92.5 acres where uses are known at this time will be provided in the DEIS. Some of the proposed uses include landscaping, access roads, grading, environmental monitoring and stockpiling of excavated materials that will be reused on-site for cover material.

5. *"Pg. 2-4, paragraph 4: Condition 12 of the LUC Decision and Order of June 9, 2003, applies to the entire 107.5-acre approved area, not just the 21-acre expansion area."*

and,

6. *Pg. 2-1 5, paragraph 1: The Draft Environmental Impact Statement (DEIS) should indicate that portions of the 92.5-acre proposed expansion area was graded, for what purpose, when, and whether these areas are still being disturbed for landfill operations.*

This recommendation is noted and will be addressed in the DEIS.

---

7. *Pg. 3-1, Section 3.2.: This section should state whether regulated hazardous waste is accepted, examples of unacceptable waste and all types of residue, the quantity and frequency of sewer sludge and related sewage residue accepted, and whether delivery of wastes after normal business hours also include other processes involving spreading, compacting, covering, relocation, or other waste disposal landfilling processes normally associated with operations during regular business hours.*

The types of waste that are accepted at the landfill will be provided in the DEIS. Processed sewage solids deliveries have recently been reduced in volume and frequency with the operation of the Synagro waste digester at the Sand Island Wastewater Treatment Plant. Other landfill associated practices will be described in the DEIS.

8. *Pg. 3-4, Section 3.3.: Detailed information on irrigation for landscaping/revegetation should be provided in the DEIS.*

and,

9. *The DEIS should describe existing and proposed cell construction, reclamation, revegetation, closure, monitoring, and reuse across the entire 200-acre property and what will be/have been disposed in each cell, the order in which each cell has been/will be completed and reclaimed/revegetated/reused.*

The DEIS will provide information on operational practices and site development that will include the proposed location of cells, infrastructure, and landscaping for the proposed project. Other points of detail including the order of use of the cells, or the waste content of the cells, or the final reuse across the 200 acre site have not yet been fully determined. As much as possible, the information that is available for the proposed project will be provided.

10. *The DEIS should disclose how the expansion area will be integrated into its overall phasing of operations, from cell construction to reuse, and whether phasing such operations would outweigh the benefits, if any, of maintaining portions of its operations at the makai portion of the property, i.e., support services and ash monofils.*

Discussions regarding whether impacts to the community and the environment could be minimized by closinglreclaiminglreusing the completed portions of the existing landfill closest to Farrington Highway and relocating its operations further into the gulch should be included in the DEIS. This could include relocation of the scale house, maintenance operations, and other noxious activities since much of the 92-acre expansion area is located at the northern portion of the property.

Preliminary site and engineering plans of the relationship of the proposed project to the existing area of use will be provided in the DEIS. The specific phasing plan has not yet been developed. However, the project phasing will be designed to minimize the potential for environmental impacts due to operation of the landfill.

11. Details should be provided as to what drainage and berming techniques will be applied at the property's mauka boundary since the gulch extends further mauka of the property line.

A discussion of drainage and geotechnical soils stability controls that will be implemented for the proposed project will be provided in the DEIS.

12. The DEIS should include a timeline showing all permit processing timeframes, start of construction within the expansion area, projected closure and reclamation of completed cells within the entire 200-acre property.

The schedule for the proposed lateral expansion of the site will commence upon approval of all required permits and land use approvals. The status of these approvals will be provided in the DEIS.

The rate of use of the proposed landfill cannot be precisely projected. This is because the capacity available will continue to be influenced by (1) the rate at which refuse is disposed of due to economic and population conditions, and (2) the rate at which refuse diversion efforts are successful.

13. "The DEIS should include a visual analysis of the landfill from current conditions to closure and reclamation by cells/monofils from public vantage points such as Ko Olina, Farrington Highway, Makaiwa Hills, and Honokai Hale."

A visual analysis will be undertaken to assess the potential for adverse viewplane impacts associated with the proposed expansion of the site. This information will be provided in the DEIS.

14. "A detailed landscape plan showing screening along Farrington Highway and proposed vegetation/topographic features on completed cells/monofils/other waste disposal site on the 200-acre property."

Proposed mitigative measures that will include landscaping will be provided in the DEIS.

15. "Initial construction activities for the expansion of the existing landfill may require grubbing, grading and stockpiling permits. Furthermore, a grading permit may be required for the final cover that will be placed prior to landfill closure."

The permits that may be required for the expansion of the site will be provided in the DEIS.

16. "A drainage report may be required at a later date."

This is acknowledged. Information concerning stormwater drainage will be provided in the DEIS.

17. "The DEIS should include a current (imaged in 2007) high resolution aerial photo of the entire 200-acre property."

A current aerial photograph will be provided in the DEIS.

We appreciate your review of the subject document. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Very truly yours,

Eric S. Takamura

Kapolei, HI 96707

Re: Environmental Impact Statement Preparation Notice
Chapter 343, Hawaii Revised Statutes

Dear Dr. Takamura and Ms. Namumnart:

In accordance with the provisions of Hawai`i Revised Statutes §§ 343-1 *et.seq* ("HRS 343") and Title 11 Chapter 200 of the Department of Health State of Hawai`i Environmental Impact Statement Rules ("EIS Rules"), I hereby respectfully request to be "a consulted party" and "make written comments regarding the environmental effects of the proposed action" to the Environmental Impact Statement Preparation Notice ("EISPN") dated November 2006. (EIS Rules § 11-200-15).

Though the EISPN is not a Draft EIS or the Final EIS, it does set forth what appears to be the outline that you will be following in the preparation of yet another Supplemental Draft or Final EIS on the Waimanalo Gulch Sanitary Landfill ("WGSL"). In this light, the comments are as follow:

At the outset, I incorporate by reference my comments set forth in a letter of August 30, 2006 which is found in the EISPN Appendix A. The EISPN fails to address the comments made therein and the Draft and/or Final EIS must do so to comply with the laws.

For ease of reference, my comments of the EISPN will be made by its Sections.

Section 1 Project Background

This Section fails to address whether the FSEIS prepared in December 2002 was a "shibai." Clearly it was inadequate and remains a subject to challenge in the Courts. Though a discussion is made about the Landfill Site Selection Process, the EISPN does not address how the preparer of the this document, as well as the consultant for the Landfill Site Selection Process can conclude that the service life of WGSL is fifteen (15) more years. This is especially troubling when the preparer of the EISPN was also the consultant to the site selection committee and the criteria was NO EXCAVATION. There should be a concern as whether this consultant is in a conflict of interest given the differing reports. Moreover, there must be a clear statement as to who is paying for the preparation of the various documents and studies required in the EIS process. If, for example, Waste Management is paying then the Final EIS will not truly be that of the City and/or the Department of Environmental Services which should have the general public's interest as its primary goal.

The public needs to know whether any representation made by a Mayor and/or City Council is binding on subsequent administrations. This is especially critical when looking at the Decision and Order of the State of Hawai`i Land Use Commission ("LUC Order") and State of Hawai`i Department of Health's Notice of Violations and Order ("DOH NVO"). The culpability, remedial action and cause of these violations must be discussed.

A detailed discussion is necessary as to the consequence of the LUC Order and the DOH NVO for the decision maker to have sufficient information to fully consider the proposed action. In that the Operator was selected in 1999; and there have obviously been problems with the manner in which they have performed, there should be a discussion as to whether that contract will be honored or should be honored. The Contract must be made public and the legal rights of all parties addressed.

Section 2 Introduction

This introductory section is presented as if this issue is new. The expansion of the WGSL and the larger issue of disposal of municipal solid waste on this island are far from a new issue. This section also begs the issue of the problems with the operations and the operator of the WGSL.

Section 3 Project Description

This Section of the EISPN is in most parts verbatim from the FSEIS of December 2002. It would appear that given the difference in the slope and other physical characteristics of the expansion that this critical point should have been discussed versus a rehashing of the prior FSEIS.

For example the proposed expansion will be primarily in the rRK soil type. This means rock over a large percentage of the surface. There must be a more detailed discussion as to the slope differential for WGSL in the proposed expansion area.

The expansion will clearly be where the land is steepest and will require excavation. It is, therefore, curious that this EISPN fails to address the amount of native soil and rock which will have to be removed; a fact which has been discussed in prior Draft EISs and the 1999 Contract with Waste Management.

There needs to be a discussion as to the extent of that construction activity; its impact on the neighbors; and more importantly where will the materials go. The cost of such an activity must be calculated to do a true cost benefit analysis. The rights to the native soil (rock, etc.) must also be addressed. It is believed that with the present operation, the contractor who does the excavation is permitted to sell the rock and soil and keep the funds. If this is the case, the practice must change and the benefit should be to the taxpayers.

There needs to be an honest discussion as to whether the expansion of WGSL will require almost a 2 to 1 removal of the native soils. That is to say for 2 cubic feet of air space, 1 cubic feet of native soils will have to be removed. If that is not the case then the assumptions made in the Waste Management contract of 1999 require additional discussion.

Section 4 Environmental Setting

Given the recent decisions by the Hawai`i Supreme Court, it is necessary to discuss the concept of public trust. This is especially true when looking at the waters of this State. What occurred with the operations of WGSL and the leachate is inexcusable and a violation of that public trust. Note that the leachate was disposed of, for most part, in the Waianae Sewage Treatment Plant.

In this light, there is inadequate discussion of the leachate. This is especially troubling given the DOH NVO. This requires a discussion as to the how the build up of the leachate affected or could affect the integrity of liner and the stability of the landfill. It must also be addressed in light of the expansion and the stress it will have upon the liner and the stability of the landfill.

It is unacceptable for government to rely upon Waste Management's consultants or experts for stability calculations. This is not acting in the best interest of the public.

The recent construction of the rock berm wall or as some call it the "Great Wall of Waimanalo," requires discussion as to why it was constructed and how it is necessary for the structural integrity of the landfill. The berm wall is not to be used as a retaining wall and/or the basis for height expansions in the existing landfill.

It is a given fact that the height limitations in certain parts of the WGSL have been exceeded. Yet, to date, not hearings have been held on the height expansion. There needs to be a discussion as to capacity and how the City and Waste Management continue to operate the WGSL and address the violations set forth in the DOH NVO.

Prior EISs have not acknowledged the cultural significance of the pathway to Palehua which Waimanalo Gulch served as. Also lacking is a discussion as to the environmental impact to the natural preserves for various native birds which Waimanalo Gulch serves as a habitat.

The visual impact of WGSL has not been adequately addressed especially with the construction of the rock berm wall. How is this area going to be restored to its original state with a rock berm wall?

Odors continue for those who live by the WGSL.

The role that Ko Olina plays as it relates to the economic growth for West Oahu is significant. While no one would consider placement of a landfill near Waikiki, the City does not hesitate to continue a landfill operations directly across the street from Ko Olina.

Given the concern of the stability of the landfill and the recent earthquake on the Big Island, a discussion must be had as to what can be done if such a natural disaster caused the landfill to slip onto Farrington Highway. This discussion must look to the fact that expansion will be at steepest part of the footprint of the parcel of land and the stress it will place on the existing landfill. The people of the Waianae Coast have only one way in and one way out.

There is no discussion as to how the expansion of WGSL continues to dump on and places the burden on the Waianae Coast. There needs to be a discussion of the concept of environmental justice.

Section 5 Relationship to Land Use Plans, Policies And Controls of the Potentially Affected Area

The Legislature is presently developing a plan on Sustainability for the year 2050. It is without any basis that the EISPN arrives at the conclusion that the expansion of WGSL is in conformance with the General Plan. The analysis which led to this conclusion is needed.

The discussion of the Land Use Policies of the area cannot be made without a discussion of the LUC's D&O on the SUP. The D&O states that no later than May 1, 2008, the area shall be "restricted from accepting any additional waste material and be closed in accordance with an approved closure plan." This is the controlling Land Use Order on the site of the proposed expansion.

The issue of the protection of the aquifer requires further discussion. The EPA has a map which includes WGSL in the aquifer area. The Board of Water Supply has a map of convenience as it addresses WGSL. These maps must be explained.

Section 6 Alternatives to the Proposed Action

This discussion in the FSEIS and other documents has been inadequate and continues to be so. After all these years, the City must have a better response on alternative technologies, transshipment and other sites than what is provided. Again, it appears that it is simply easier to continue to the existing landfill; and therefore all attempts to address alternatives in good faith will never be a reality. In that a private landfill is also proposed, the City's position on the landfill and how it will impact on the flow of trash needs discussion.

Section 7 Permits and Regulatory Approvals that May be Required

The State Land Use Commission is a State agency not within the City & County of Honolulu. There is also a requirement to secure the DOH permits.

Section 8 Organizations, Agencies and Public Parties Consulted In the Preparation of the Environmental Impact Statement Preparation Notice

Honolulu, Hawaii 96813

Dear Senator Hanabusa:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 26, 2006 concerning the subject project. We acknowledge your request to be a consulted party to the EIS process for the proposed project. The following is prepared in response to your comments (your comments havebeen italicized for reference):

1. *"At the outset, I incorporate by reference my comments set forth in a letter of August 30, 2006 which is found in the EISPN Appendix A. The EISPN fails to address the comments made therein and the Draft and/or Final EIS must do so to comply with the laws."*

A response to your letter of August 30, 2006 has also been prepared and will be forwarded to you concurrently with this reply. Our response to your August 30th letter is incorporated by reference in this letter.

2. *Section 1 Project Background. "This Section fails to address whether the FSEIS prepared in December 2002 was a "shibai." Clearly it was inadequate and remains a subject to challenge in the Courts. Though a discussion is made about the Landfill Site Selection Process, the EISPN does not address how the preparer of the this [sic] document, as well as the consultant for the Landfill Site Selection Process can conclude that the service life of WGSL is fifteen (15) more years. This is especially troubling when the preparer of the EISPN was also the consultant to the site selection committee and the criteria was NO EXCAVATION. There should be a concern as whether this consultant is in a conflict of interest given the differing reports. Moreover, there must be a clear statement as to who is paying for the preparation of the various documents and studies required in the EIS process. If, for example, Waste Management is paying then the Final EIS will not truly be that of the City and/or the Department of Environmental Services which should have the general public's interest as its primary goal."*

We offer the following clarification to the above: (1) we acknowledge that your lawsuit concerning the 2002 Final Supplemental Environmental Impact Statement remains the subject of litigation. We do note however that Section 1 contains important information that establishes why the City must act at this time to provide a solid waste refuse facility for use by all the communities of Oahu; (2) The service life of the landfill as presented to the Mayor's Advisory Committee in 2004 was twenty (20) years. The capacity for the current project will be discussed in the Draft EIS (DEIS); (3) The no excavation remark that you cite comes from the Waimānalo Gulch Expansion, Potential Landfill Site Data Sheets, prepared for the Mayor's Advisory Committee on Landfill Siting, October 2003. The specific reference is to information provided for Criteria No. 23, Landfill Capacity or Site Life. According to the data sheet, "The volume was calculated assuming a 100 foot buffer around the site boundary, 30 acres for infrastructure facilities, no excavation, and filling to the natural grade." The rationale for not incorporating excavation as a factor involved the following:

A. It was not in the consultant's scope of work to do field studies including drilling borings to obtain subsurface information. This is typically the case when doing preliminary siting studies both due to difficulty in gaining access to the property and the high cost of doing field studies. Without these studies, it is not possible to determine excavation depths or difficulty with any degree of certainty. Therefore, it is typical to assume minimal or no excavation in order to compare site capacities;

B. Criteria No. 23, therefore, was established to provide an estimate of capacity only based on: an area adjusted with an approximately 100 foot buffer around the perimeter of the site; the use of 30 acres for infrastructure to operate the facility; no detailed engineering calculations incorporating soils conditions to produce information on excavation; and filling of the site to the natural grade of the terrain of the finished site. It is incorrect to conclude or imply on the basis of information from the data sheet alone that in the course of developing a landfill site that no excavation would be required.

(4) The City Department of Environmental Services and Waste Management of Hawaii, Inc., are financing the preparation of the EIS. The interest of the general public, and the responsibility for and integrity of the document rests with the City and County of Honolulu.

3. *"The public needs to know whether any representation made by a Mayor and/or City Council is binding on subsequent administrations. This is especially critical when looking at the Decision and Order of the State of Hawai'i Land Use Commission ("LUC Order") and State of Hawai'i Department of Health's Notice of Violations and Order ("DOH NVO"). The culpability, remedial action and cause of these violations must be discussed."*

Representations of officials may become law and be binding when appropriately enacted into law, or through other acts that have the force and effect of law. Subsequent Mayors and/or City Councils may, however, change prior law through appropriate legal processes.

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved-the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved.

4. *"A detailed discussion is necessary as to the consequence of the LUC Order and the DOH NVO for the decision maker to have sufficient information to fully consider the proposed action. In that the Operator was selected in 1999; and there have obviously been problems with the manner in which they have performed, there should be a discussion as to whether that contract will be honored or should be honored. The Contract must be made public and the legal rights of all parties addressed."*

Please refer to our comment above regarding the NVO. The contract between the City and Waste Management of Hawaii is a public document. The City has monitored the performance of Waste Management under this contract and has taken appropriate action to protect the public interest. As a result, significant improvements to landfill operations have occurred. The City intends to continue to administer the contract to ensure that the rights and responsibilities of the parties involved are addressed and the public interest is protected.

5. *Section 2 Introduction. "This introductory section is presented as if this issue is new. The expansion of the WGSL and the larger issue of disposal of municipal solid waste on this island are far from a new issue. This section also begs the issue of the problems with the operations and the operator of the WGSL."*

The use of Waimanalo Gulch is not new and as indicated in the EISPN the site has been in use since 1989, approximately 19 years ago. The NVO will be discussed in the DEIS.

6. *Section 3 Project Description. "This Section of the EISPN is in most parts verbatim from the FSEIS of December 2002. It would appear that given the difference in the slope and other physical characteristics of the expansion that this critical point should have been discussed versus a rehashing of the prior FSEIS."*

"For example the proposed expansion will be primarily in the rRK soil type. This means rock over a large percentage of the surface. There must be a more detailed discussion as to the slope differential for WGSL in the proposed expansion area."

According the Office of Environmental Quality Control (OEQC), "The EISPN does not give full detail of the proposal but defines the scope of analysis that will be covered in the subsequent environmental impact statement." (A Guidebook for the Hawaii State Environmental Review Process, June 2004). In this regard the EISPN is not intended to itself serve as the full disclosure document as required by Chapter 343, Hawaii Revised Statutes (HRS). The proposed grades and use of the site including details and information will be provided as a part of the DEIS.

7. *"The expansion will clearly be where the land is steepest and will require excavation. It is, therefore, curious that this EISPN fails to address the amount of native soil and rock which will have to be removed; a fact which has been discussed in prior Draft EISs and the 1999 Contract with Waste Management."*

The anticipated amount of soils excavation that will be necessary will be described in the DEIS. As indicated in the EISPN, "Information concerning these construction details and discussion of potential impacts and recommended mitigation measures relating to construction associated noise, odor, airborne litter, and storm water erosion will be provided in the DEIS."

8. *"There needs to be a discussion as to the extent of that construction activity; its impact on the neighbors; and more importantly where will the materials go. The cost of such an activity must be calculated to do a true cost benefit analysis. The rights to the native soil (rock, etc.) must also be addressed. It is believed that with the present operation, the contractor who does the excavation is permitted to sell the rock and soil and keep the funds. If this is the case, the practice must change and the benefit should be to the taxpayers."*

The extent of construction, its potential impact on adjoining property owners, and where and how the excavated materials will be utilized will be a part of the DEIS. The owner of the property, the City and County of Honolulu, retains the ownership rights to the excavated materials. Since August 1, 1991, the City has received royalties for any excavated and processed material removed for Waimanalo Gulch Sanitary Landfill.

9. *"There needs to be an honest discussion as to whether the expansion of WGSL will require almost a 2 to 1 removal of the native soils. That is to say for 2 cubic feet of air space, 1 cubic feet of native soils will have to be removed. If that is not the case then the assumptions made in the Waste Management contract of 1999 require additional discussion."*

The final design of the proposed project, including the height and elevation of the expansion area of the landfill and use of excavated materials, will follow the general guidelines set forth in the 1999 contract. The final design will be based on the use of sound engineering practices and compliance with environmental protection and regulatory requirements.

10. *Section 4 Environmental Setting. "Given the recent decisions by the Hawai'i Supreme Court, it is necessary to discuss the concept of public trust. This is especially true when looking at the waters of this State."*

"What occurred with the operations of WGSL and the leachate is inexcusable and a violation of that public trust. Note that the leachate was disposed of, for most part, in the Waianae Sewage Treatment Plant."

There has been no violation of the public trust. Leachate that is accepted by the plant operator for disposal at the Waianae Wastewater Treatment Plant was, and continues to be in accordance with regulatory requirements to ensure public health and safety. Leachate management and monitoring will be a part of the Solid Waste Management Permit application.

11. *"In this light, there is inadequate discussion of the leachate. This is especially troubling given the DOH NVO. This requires a discussion as to the how the build up of the leachate affected or could affect the integrity of liner and the stability of the landfill. It must also be addressed in light of the expansion and the stress it will have upon the liner and the stability of the landfill."*

An explanation of the leachate that is generated by the landfill will be provided in the DEIS. A discussion concerning the leachate collection and removal system design, including liner integrity and landfill stability, associated with the generation of leachate will be provided.

12. *"It is unacceptable for government to rely upon Waste Management's consultants or experts for stability calculations. This is not acting in the best interest of the public."*

The consultants involved with the design of the Waimanalo Gulch Sanitary Landfill do work for both public and private organizations, are registered professional engineers, and are recognized experts in landfill design and stability analysis. Their work has been peer reviewed by outside experts to ensure the work meets professional engineering standards. All of the work completed is available for public review including all analyses completed during the design.

13. *"The recent construction of the rock berm wall or as some call it the "Great Wall of Waimanalo," requires discussion as to why it was constructed and how it is necessary for the structural integrity of the landfill. The berm wall is not to be used as a retaining wall and/or the basis for height expansions in the existing landfill."*

The stability berm that is referred to was reviewed and approved by the DOH for construction under the current Solid Waste Management Permit. The purpose of the berm is to ensure that the ash monofil area of the landfill meets or exceeds regulatory and engineering design standards.

14. *"It is a given fact that the height limitations in certain parts of the WGSL have been exceeded. Yet, to date, not [sic] hearings have been held on the height expansion. There needs to be a discussion as to capacity and how the City and Waste Management continue to operate the WGSL and address the violations set forth in the DOH NVO."*

Our request to seek a height modification was submitted to DOH in February 2006. The height modification was approved by DOH on February 20, 2008. A discussion of the capacity of the site and the NVO will be provided in the DEIS.

15. *"Prior EISs have not acknowledged the cultural significance of the pathway to Palehua which Waimanalo Gulch served as. Also lacking is a discussion as to the environmental impact to the natural preserves for various native birds which Waimanalo Gulch serves as a habitat."*

We have forwarded this information to Cultural Surveys of Hawaii, our archaeological and cultural consultant, which is preparing the Cultural Impact Assessment report for further investigation. Their findings will be provided in the DEIS. The potential for impacts to habitat for native flora and fauna will also be provided in the DEIS.

16. *"The visual impact of WGSL has not been adequately addressed especially with the construction of the rock berm wall. How is this area going to be restored to its original state with a rock berm wall?"*

An assessment of the potential visual impacts of the proposed project will be provided in the DEIS. This will include the investigation of views from both the landfill as well as from selected points along Farrington Highway and other locations.

Landscaping will be provided to improve the aesthetics of the site. However, given the nature of use of the site involving landfilling, it will not be possible to return the site to its original condition.

17. *"Odors continue for those who live by the WGSL."*

The management and mitigation of odors associated with the use and operation of the landfill will be addressed in the DEIS.

18. *"The role that Ko Olina plays as it relates to the economic growth for West Oahu is significant. While no one would consider placement of a landfill near Waikiki, the City does not hesitate to continue a landfill operations directly across the street from KO Olina."*

The City does not discount the importance of economic growth wherever it is occurring on the Island of Oahu. While there are no viable landfill sites near Waikiki we do note that places such as Ala Moana Park and the Kakaako Waterfront Park once served as landfills, and that various parts of Windward Oahu once supported landfills.

19. *"Given the concern of the stability of the landfill and the recent earthquake on the Big Island, a discussion must be had as to what can be done if such a natural disaster caused the landfill to slip onto Farrington Highway. This discussion must look to the fact that expansion will be at steepest part of the footprint of the parcel of land and the stress it will place on the existing landfill. The people of the Waianae Coast have only one way in and one way out."*

A discussion about the stability of the landfill in relation to the potential for natural disasters will be provided in the DEIS.

20. *"There is no discussion as to how the expansion of WGSL continues to dump on and places the burden on the Waianae Coast. There needs to be a discussion of the concept of environmental justice."*

A discussion of the environmental justice of siting the proposed project at Waimanalo Gulch will be provided in the DEIS.

21. *Section 5 Relationship to Land Use Plans, Policies And Controls of the Potentially Affected Area. "The Legislature is presently developing a plan on Sustainability for the year 2050. It is without any basis that the EISPN arrives at the conclusion that the expansion of WGSL is in conformance with the General Plan. The analysis which led to this conclusion is needed."*

The sustainability for our island State is important. The use of Waimanalo Gulch promotes sustainability through the use of an on-island facility that has remaining but unused capacity. Without Waimanalo Gulch, new land, a precious resource, would need to be prematurely used when there is remaining capacity at this existing public facility.

The basis for the conformity of the proposed project with the General Plan is stated in the EISPN. It is noted that the Waimanalo Gulch Sanitary Landfill is in accordance with the Ewa Sustainable Communities Plan (Development Plan), and that this proposed project can only be implemented if it is in accordance with the General Plan.

22. *"The discussion of the Land Use Policies of the area cannot be made without a discussion of the LUC's D&O on the SUP. The D&O states that no later than May 1, 2008, the area shall be "restricted from accepting any additional waste material and be closed in accordance with an approved closure plan." This is the controlling Land Use Order on the site of the proposed expansion."*

Necessary approvals, including those of the Land Use Commission and others, will be sought to allow for the proposed project. Further discussion of this item will be provided in the DEIS.

23. *"The issue of the protection of the aquifer requires further discussion. The EPA has a map which includes WGSL in the aquifer area. The Board of Water Supply has a map of convenience as it addresses WGSL. These maps must be explained."*

The DEIS will identify the agencies with jurisdiction for the establishment of the Groundwater Protection Zone (GPZ) and Underground Injection Control (UIC) Line. A discussion of the relationship between the proposed project and the regulation of the GPZ, UIC, and other water resource requirements will be provided.

24. *Section 6 Alternatives to the Proposed Action. "This discussion in the FSEIS and other documents has been inadequate and continues to be so. After all these years, the City must have a better response on alternative technologies, transshipment and other sites than what is provided. Again, it appears that it is simply easier to continue to the existing landfill; and therefore all attempts to address alternatives in good faith will never be a reality. In that a private landfill is also proposed, the City's position on the landfill and how it will impact on the flow of trash needs discussion."*

Alternative technology, transshipment, and other on-island landfill sites will be discussed in the DEIS. The City acknowledges a proposed private landfill in Nānākuli. However, the Waimānalo Gulch Sanitary Landfill is considered the most viable site for O'ahu's future landfill needs for the next approximately 15 years, or until an alternative becomes available that would completely replace the need for a landfill on island.

25. *Section 7 Permits and Regulatory Approvals that May be Required. "The State Land Use Commission is a State agency not within the City & County of Honolulu. There is also a requirement to secure the DOH permits."*

The reference to the State Land Use Commission is based on their participation in the decision making for the State Special Use Permit administered by the City Department of Planning and Permitting. Department of Health administered permit applications including the Solid Waste Management Permit application will be filed for this project.

26. *"In the preparation of the Draft Supplemental EIS for this proposed expansion, it is critical that the decision maker and the general pubic are made to understand why the promises of government need not be kept. There must also be a discussion as to how much money the City and County makes in the landfill business."*

The DEIS will include a discussion of the past history of events related to the future of the landfill, and provide information as to how the decision to propose expansion of the landfill, rather than closure, was reached. Please also see our response to Item No. 3, above.

The City combines tip fee revenue from City transfer stations and the landfill. The revenue for FY06 was $14,051,214 as reported in the City and County of Honolulu Operating Budget, Detailed Statement of Revenues and Surplus, Solid Waste Special Fund (250) Disposal Charges.

A small portion of the tip fee revenue is attributed to commercial accounts disposal at transfer stations. Most of the tip fee revenue is generated by commercial accounts disposal at the landfill. In accordance with Chapter 9, Section 9-4.2, Revised Ordinances of Honolulu (ROH), only businesses, and federal and state agencies accounts are charged a landfill tip fee. Homeowners and eleemosynary organizations pay no fees.

27. *"What is also lacking is the fact that in a few years, the status of H Power will also be an issue. If the City decides to re purchase H Power, then that cost must be made known and its impact on the cost of solid waste disposal."*

And,

28. *"If a private landfill operation is permitted and the transshipment of rubbish is also approved, then the impact of such action must also be discussed in terms of the environmental impacts to the public."*

As noted, the City acknowledges a proposed private landfill in Nānākuli but considers the Waimānalo Gulch Sanitary Landfill a more viable alternative. The consideration of the Nānākuli site and waste transshipment will be provided in the DEIS.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura, Ph.D., P.E.

RE: Comments for EIS preparation on the Expansion of Waimanalo Gulch Sanitary Landfill

To the Department of Environmental Services, Refuse Division:

The following are my comments which will set forth issues and concerns pertinent to the preparation of an EIS for this project.

Standard To Be Met.

The EIS process is governed by HRS §343. An EIS is:

> §343-2 Definitions. As used in this chapter unless the context otherwise requires: . . .
>
> "Environmental impact statement" or "statement" means an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects.

The statute also sets forth what the Rules must contain, at minimum. HRS §343-6. The legal effect of administrative rules are well settled in this jurisdiction. Administrative Rules are to be followed and given the full effect of law. ***Williams v. Hawaii Medical Service Association,*** 71 Haw. 545, 549, 7984 P.2d 442, 444 (1990). The Supreme Court has clearly stated that arbitrary and

---

capricious application of the Rules will not be tolerated. ***Windward Marine Resorts v. Sullivan,*** 86 Haw. 171, 948 P.2d 592 (ICA 1997).

HAR §11-200-14 through 23 are the requirements in the preparation of Draft and Final Environmental Impact Statements. The "General Provisions" highlight the expectation of the EIS process.

I have grave concerns that you will comply with what is required of an EIS.

The following standard set in ***Life of the Land v. Ariyoshi,*** 59 Haw. 156, 164-165, 577 P.2d 1116 (1978) for a court to determine the sufficiency of an EIS:

> In making such a determination the court is guided by the "rule of reason," under which an EIS need not be exhaustive to the point of discussing all possible details bearing on the proposed action but will be upheld as adequate if it has been compiled in good faith and sets forth sufficient information to enable the decision-maker to consider fully the environmental factors involved and to make a reasoned decision after balancing the risks of harm to the environment against the benefits to be derived from the proposed action, as well as to make a reasoned choice between alternatives. County of Suffolk v. Secretary of Interior, 562 F.2d 1368, 1375 (2d Cir. 1977), cert. den., 434 U.S. 1064, 98 S. Ct. 1238, 55 L. Ed. 2d 764 (1978). [Emphasis added.]

The condition precedent to all EISs is that it be compiled in "good faith" and sets forth sufficient information. The past practice of the City has shown that EISs have not been compiled in good faith and nor does it provide sufficient information.

At the very minimum the City must take its past EISs and explain the discrepancies that have now been found and set forth whatever information it now relies upon to justify its change in position.

The best place to begin is with the discussion as to why we in the community have no rights to rely upon the representation of government that the WGSL will close. This is the position of the community that the WGSL should close.

What Was Represented As To The Closure.

At the outset, the City must explain why it has changed its position from an expansion of only 5 years to now an additional 15 years. I have heard comments from the City that there was never a "promise" to close the WGSL in 5 years; however, this is contrary to the statements made under oath to the Land Use Commission during their hearings on the conditional use permit as well as statements made in the Final Supplemental Environmental Impact Statement (FSEIS) for the 5 year expansion. The LUC was very clear in its questioning as to what the City intended to do. How does the City explain its statement under oath and the change in the FSEIS. A discussion should be had as to whether the City can be bound by its statements under oath like a person.

The EIS must address the following.

1. Waste Management's Contract

An EIS is "meaningless" if it is self-serving and rationalizes an outcome. The contract between Waste Management, Inc. and the City for the operation of WGSL was entered into in 1999 for 15 years. This was two years before the first Draft EIS in 2000; and three years before the FSEIS. At the very minimum, this shows the decision to expand WGSL was a done deal in 1999. Explain this contract and why the City entered into it in 1999. Also explain what was done after the City said the expansion would be for only 5 years. Was the contract amended?

2. Alternatives.

HRS §343-2 defines an EIS as one that discloses, among other items, the "alternatives to the action and their environmental effects."

HAR §11-200-17 addresses the requirement as to alternatives as follows:

> F. The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks. Examples of alternatives include: . . . (Emphasis added.)

Money is not the paramount criteria in arriving at a decision which is environmentally sound.

HAR §11-200-17 F. 5 states that "For any agency actions, the discussion of alternatives shall include, where relevant, those alternatives not within the existing authority of the agency." In ***Westlands Water District v. U.S. Dept. of Interior,*** 376 F.3d 853, 866 (9th Cir. 2004), the Ninth Circuit recently reaffirmed that alternatives must be rigorously explored and that "reasonable alternatives" include those not within the jurisdiction of the lead agency. ***Westlands, supra,*** at 868. The Ninth Circuit went on to say that "[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate." ***Id.***, citing to ***Morongo Band of Mission Indians v. FAA,*** 161 F.3d 569, 575 (9th Cir. 1998).

3. Failure to Comply with the City's Ordinance.

Ordinance 9-1/1(a)(6)(b)(1) states that by the year 2000, at least 75 percent of the solid waste generated shall be recycled, reused, composted, or otherwise diverted from incineration or placement in the landfill. What is the status and what is the consequence of this non-compliance?

4. Sludge

A major source of "odor" for the landfill is sludge. What is the City's treatment of sludge and for what period of time will it continue to be dumped in the landfill.

5. Purpose and Need.

HAR §11-200-17 D requires the Draft SEIS to "contain a separate and distinct section that includes a statement of purpose and need for a proposed action." It is a similar provision under NEPA, which is looked upon to guide the discussion on alternatives. ***Westlands, supra,*** at 866. In ***Westlands,*** the Ninth Circuit looked to whether the preparers had "arbitrarily and capriciously" narrowed the scope of the statement, thereby affecting the discussion on the alternative.

There is an application for a private landfill pending and also the fact that the Department of Agriculture will now permit the transshipment of MSW. These points must be addressed in discussing any need of the expansion, especially in light of the prior statements that there will be no need for landfills in 5 years.

6. Excavation

The City must address the discrepancies in all the draft EISs along with the reports provided by RM Towill to the Blue Ribbon Commission which was tasked with siting the new landfill. The criteria was no excavation. RM Towill determined that WGSL had a life of 20 more years with the criteria. This is in direct conflict with other EISs also prepared by RM Towill. What does the City intend to do about this obvious misrepresentation? How does the City explain this discrepancy.

The extreme slope of WGSL for the proposed expansion and the newly constructed rock berm are related. What is the stability of the expansion? How much native soil will have to be removed? Where will it be removed to? Will the excavated materials be sold?

---

7. Stability of the Slope

In light of the concern over the stability of slope as evidenced by the construction of the rock berm wall, how will the community be assured about its stability? How is the integrity of the liner tested? Will the rock berm wall act as the retaining wall to justify and increase in the slope?

8. The Violations of the Existing Permit

The Notice and Finding of Violation ("Notice and Finding") and Order dated January 31, 2006, of the Department of Health ("DOH") as to the operations of WGSL must be addressed. The first point of discussion is why the City had no oversight and permitted these activities to go unchecked. These violations resulted in the largest fine in the history of the State of Hawai`i.

The following violations are the most critical and must be addressed, though all violations should be addressed:

1. Since 2003, the City has placed ash above the 2002 grades and exceeded the design grades for over a year from discovery in January 2004.
2. The control of leachate and the monitoring was discovered. The DOH found 16.3 feet of leachate on the liner and 22 feet and 3 inches in the sump area. More troubling is no monitoring has been conducted since October 26, 2003. This was attributed to the ash monofill landfill.
3. As for the MSW landfill, in April 2005 and May 2005, 74 feet of leachate was measured. This was in an area where the sump was installed in November, 2003 (MSW Cell E-1). There was a gross failure to monitor the leachate
4. The leachate level in the area of 4B was unavailable because no monitoring had taken place since May.
5. The removal of soil and its impact on stability. DOH has found that in January of 2005, they were notified of the fact that grades were exceeded. The City knew that the ash had exceeded the approved grades by January, 2004 as to the ash landfill

6. Disposal of asbestos is a major concern. DOH found that the City and its operator accepted asbestos at the landfill but do not have any logs as to where it has been buried.
7. Surface Water Management. There are no surface water management plans as required by the permit for the years 2003-2004.
8. DOH found a failure to control dust.
9. DOH found a failure to control litter.
10. DOH found that there has been no monitoring of methane gas at the landfill.

The DOH Order entered in this action demonstrates the seriousness of the violations and its agency's (including County's) responsibility to monitor. There are also additional violations that were not included in the DOH Order, such as the applicant's failure to submit a revised Closure and Post-Closure Plan no later than May 1, 2005, which was finally submitted on February 22, 2006 and the operators unauthorized night work preparing a new cell for receiving waste.

9. How the Public Trust Is Being Met

The recent Hokulia case makes clear the State's public trust for the waters of our State. How has this trust obligation been met?

10. Cumulative Effects

This EIS cannot merely address the proposed expansion. It must address the cumulative effects of the operation of WGSL since the 1980s in addition to the proposed expansion on the Coast, including the disposal of leachate off site at the Waianae Wastewater Treatment plant.

11. Environmental Justice

The EIS must address the concept of environmental justice and how the City's use of this landfill and others in the Waianae Coast affect the community.

These are concerns and issues which must be addressed in the EIS. It continues to remain my position that WGSL must close. I continue to be perplexed as to how the City can change its position without any sense of obligation of keeping its word to its people.

Sincerely,

Colleen Hanabusa

IN REPLY REFER TO:
RA 08-053

May 12, 2008

The Honorable Colleen Hanabusa
President of the Senate
21st District
State Capitol, Room 409
415 South Beretania Street
Honolulu, Hawaii 96813

Dear Senator Hanabusa:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated August 30, 2006, concerning the subject project. The following is prepared in response to your comments (as appropriate your comments have been italicized for reference):

Standard To Be Met

We appreciate your references to our legal responsibilities under the Hawaii EIS law. Please also refer to Section 1 of the EISPN thatcontains information that establishes why the City must act at this time to provide a solid waste refuse facility for use by all the communities of O'ahu.

What Was Represented As To The Closure

Prior representations concerning the closure of Waimanalo Gulch have been identified in the EISPN. This information will also be provided in the Draft EIS (DEIS).

"The EIS must address the following:

"1. Waste Management's Contract
An EIS is "meaningless" if it is self-serving and rationalizes an outcome. The contract between Waste Management, Inc. and the City for the operation of WGSL was entered into in 1999 for 15 years. This was two years before the first Draft EIS in 2000; and three years before the FSEIS. At the very minimum, this shows the decision to expand WGSL was a done deal in 1999. Also explain what was done after the City entered into it in 1999. Also explain what was done after the City said the expansion would be for only 5 years. Was the contract amended?"

The contract amendment dated May 1, 1999, provided for the expansion of the Waimānalo Gulch site. Subsequently, the prior administration decided on a five-year limit for the use of the site. The contract was not amended to a shorter term because the exact date of termination could not have been determined. Although the contract was not amended, the City retains control of the contract and can terminate it at any time when it is in the best interest of the City. As provided in Contract Special Provision 29, the contract can be terminated,". . .in whole or in part, whenever the Director shall determine that termination of the contract, in whole or in part, is in the best interest of the City."

"2. Alternatives
"HRS §343-2 defines an EIS as one that discloses, among other items, the "alternatives to the action and their environmental effects.""

"HAR §11-200-17 addresses the requirement as to alternatives as follows:"

"F. The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhanceenvironmental quality of avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks. Examples of alternatives include: . . . (Emphasis added.)"

"Money is not the paramount criteria in arriving at a decision which is environmentally sound."

"HAR §11-200-17 F. 5 states that "For any agency actions, the discussion of alternatives shall include, where relevant, those alternatives not within the existing authority of the agency." In Westlands Water District v. U.S. Dept.of Interior, 376 F.3d 853, 866 (9th Cir. 2004), the Ninth Circuit recently reaffirmed that alternatives must be rigorously explored and that "reasonable alternatives" include those not within the jusidiction of the lead agency. Westlands, supra, at 868. The Ninth Circuit went on to say that "[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate." Id., citing to Morongo Band of Mission Indians v. FAA, 161 F.3d 569, 575 (9th Cir. 1998)."

An examination of alternatives that include other potential landfill sites, waste transshipment, and technology based solutions, will be provided in the DEIS. This will include the consideration of factors that do not involve funding as the major criteria for evaluation.

"3. Failure to Comply with the City's Ordinance"
"Ordinance 9-1/1(a)(6)(b)(1) states that by the year 2000, at least 75 percent of the solid waste generated shall be recycled, reused, composted, or otherwise diverted from incineration or placement in the landfill. What is the status and what is the consequence of this non-compliance?"

The City acknowledges that it was not possible to increase recycling, reuse, composting and waste diversion to a level that could support up to a 75 percent reduction by 2002. At the same time, ENV is committed to pursuing all reasonable and feasible options that can contribute to reducing our dependency on the use of landfilling. Recent actions involve the establishment of pilot programs for waste recycling and a major decision to expand the capacity of HPOWER to promote recycling through the generation of energy from municipal refuse. We will continue to pursue these and other options with the City Council as well as O'ahu's communities.

"4. Sludge"

"A major source of "odor" for the landfill is sludge. What is the City's treatment of sludge and for what period of time will it continue to be dumped in the landfill."

Major improvements in the City's handing of sludge at the Sand Island Wastewater Treatment Plant have occurred since the initial start up of the recently constructed waste digester. These improvements have significantly reduced odors and the requirement for the disposal of untreated sewage sludge. We expect that as the facility becomes fully operational that further improvements will result.

"5. Purpose and Need"

"HAR §11-200-17 D requires the Draft SEIS to "contain a separate and distinct section that includes a statement of purpose and need for a proposed action. "It is a similar provision under NEPA, which is looked upon the guide the discussion on alternatives. Westlands, supra, at 866. In Westlands, the Ninth Circuit looked to whether the preparers had "arbitrarily and capriciously" narrowed the scope of the statement, thereby affecting the discussion on the alternative."

"There is an application for a private landfill pending and also the fact that the Department of Agriculture will now permit the transshipment of MSW. These points must be addressed in discussing any need of the expansion, especially in light of the prior statements that there will be no need for landfills in 5 years."

We appreciate your citation of prior case law concerning the purpose and need for the EIS. The application for the private landfill in Nānākuli and the potential for transshipment as methods to eliminate the need for the proposed Waimanalo Gulch Sanitary Landfill lateral expansion will be provided in the DEIS.

"6. Excavation"

"The City must address the discrepancies in all the draft EISs along with the reports provided by RM Towill to the Blue Ribbon Commission which was tasked with siting the new landfill. The criteria was no excavation. RM Towill determined that WGSL had a life of 20 more years with the criteria. This is in direct conflict with other EISs also prepared by RM Towill. What does the City intend to do about this obvious misrepresentation? How does the City explain this discrepancy."

The no excavation remark that you cite comes from the Waimānalo Gulch Expansion, Potential Landfill Site Data Sheets, prepared for the Mayor's Advisory Committee on Landfill Siting, October 2003. The specific reference is to information provided for Criteria No. 23, Landfill Capacity or Site Life. According to the data sheet, "The volume was calculated assuming a 100 foot buffer around the site boundary, 30 acres for infrastructure facilities, no excavation, and filling to the natural grade." Criteria No. 23, therefore, was established to provide an estimate of capacity only based on: an area adjusted with an approximately 100 foot buffer around the perimeter of the site; the use of 30 acres for infrastructure to operate the facility; no detailed engineering calculations incorporating soils conditions to produce information on excavation; and filling of the site to the natural grade of the terrain of the finished site. It is incorrect to conclude on the basis of information from the data sheet alone that in the course of developing a landfill site that no excavation would be required.

The 2002 Final Supplemental EIS for the Waimānalo Gulch Expansion, as well as other prior Waimānalo Gulch EIS documents, were prepared by our consultants based on civil engineering design studies supported by geotechnical investigations and/or soils evaluations that are referenced in the EIS documents. The engineering information for the 2002 EIS was provided by Waste Management of Hawai'i, Inc., who utilized licensed professionals to conduct the studies. The factors that can result in different capacities or life of the site would include refinements to the planned design of the site, knowledge of how the soils conditions or topographic changes would affect the design, or adjustments to the site to accommodate new infrastructure or stability features in order to maintain safety or improve the efficient use of the site.

There are other factors that can affect capacity or life of the site that will be provided in the DEIS for the proposed project.

> *"The extreme slope of WGSL for the proposed expansion and the newly constructed rock berm are related. What is the stability of the expansion? How much native soil will have to be removed? Where will it be removed to? Will the excavated materials be sold?"*

A discussion of the anticipated excavation requirements for the proposed project will be provided in the DEIS. This will include an estimate on how much soil will need to be excavated, and the stability of the site. The soils removed from the site that will be used for cover material will be stored on site.

A decision regarding the release or possible sale of any cover material cannot be made at this time based on the status of the project within the EIS process. The owner of the property, the City and County of Honolulu, however, retains the ownership rights to the excavated materials. Since August 1, 1991, the City has received royalties for any excavated and processed material removed for the Waimānalo Gulch Sanitary Landfill.

"7. Stability of the Slope"

"In light of the concern over the stability of slope as evidenced by the constuction of the rock berm wall, how will the community be assured about its stability? How is the integrity of the liner tested? Will the berm wall act as the retaining wall to justify and increase the slope?"

The DEIS will provide information concerning engineering design standards and practices that ensure the stability of the site. The most recent test of the site's stability involved the recent earthquake event of October 15, 2006, when a magnitude 6.7 earthquake occurred about 10 miles north-northwest of Kailua-Kona. According to our site operator, Waste Management of Hawai'i, Inc., an inspection following the earthquake indicated there was no failure or damage to the landfill and its supporting infrastructure as a result

The stability berm that is referred to was reviewed and approved by the DOH for construction under the current Solid Waste Management Permit. The purpose of the berm is to ensure that the ash monofill area of the landfill meets or exceeds regulatory and engineering design standards, including those for soil retention.

> *"8. The Violations of the Existing Permit"*
> *"The Notice and Finding of Violation ("Notice and Finding") and Order dated January 31, 2006, of the Department of Health ("DOH") as to the operations of WGSL must be addressed. The first point of discussion is why the City had no oversight and permitted these activities to go unchecked. These violations resulted in the largest fine in the history of the State of Hawai'i."*
>
> *"The following violations are the most critical and must be addressed, though all violations should be addressed:"*
>
> *"1. Since 2003, the City has placed ash above the 2002 grades and exceeded the design grades for over a year from discovery in January 2004.*
> *2. The control of leachate and the monitoring was discovered. The DOH found 16.3 feet of leachate on the liner and 22 feet and 3 inches in the sump area. More troubling is no monitoring has been conducted since October 26, 2003. This was attributed to the ash monofill landfill.*
> *3. As for the MSW landfill, in April 2005 and May 2005, 74 feet of leachate was measured. This was in an area where the sump was installed in November, 2003 (MSW Cell E-1). There was a gross failure to monitor the leachate"*
> *4. The leachate level in the area of 4B was unavailable because no monitoring had taken place since May.*
> *5. The removal of soil and its impact on stability. DOH has found that in January of 2005, they were notified of the fact that grades were exceeded. The City knew that the ash had exceeded the approved grades by January, 2004 as to the ash landfill*
> *6. Disposal of asbestos is a major concern. DOH found that the City and its operator accepted asbestos at the landfill but do not have any logs as to where it has been buried.*
> *7. Surface Water Management. There are no surface water management plans as required by the permit for the years 2003-2004.*
> *8. DOH found a failure to control dust.*
> *9. DOH found a failure to control litter.*
> *10. DOH found that there has been no monitoring of methane gas at the landfill."*

> *"The DOH Order entered in this action demonstrates the seriousness of the violations and its agency's (including County's) responsibility to monitor. There are also additional violations that were not included in the DOH Order, such as the applicant's failure to submit a revised Closure and Post-Closure Plan no later than May 1, 2005, which was finally submitted on February 22, 2006 and the operators unauthorized night work preparing a new cell for receiving waste."*

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved.

> *"9. How the Public Trust Is Being Met"*
> *"The recent Hokulia case makes clear the State's public trust for the waters of our State. How has this trust obligation been met."*

A discussion of state waters and efforts that have been taken by the City and Waste Management to ensure the protection of this important resource will be provided in the DEIS.

> *"10. Cumulative Effects"*
> *"The EIS cannot merely address the proposed expansion. It must address the cumulative effects of the operation of WGSL since the 1980s in addition to the proposed expansion on the Coast, including the disposal of leachate off site at the Waianae Wastewater Treatment plant."*

A discussion of cumulative effects as a result of the proposed project will be provided in the DEIS.

> *"11. Environmental Justice"*
> *"The EIS must address the concept of environmental justice and how the City's use of this landfill and others in the Waianae Coast affect the community."*

A discussion of the concept of environmental justice and its relationship to the proposed project will be provided in the DEIS.

> *Final Comment*
> *These are the concerns and issues which must be addressed in the EIS. It continues to remain my position that WGSL must close. I continue to be perplexed as to how the City can change its position without any sense of obligation of keeping its word to its people.*

We acknowledge your opposition to the proposed project and have included you as a consulting party to the EIS process for this project.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

RE: Environmental Impact Statement Preparation Notice (EISPN)
Chapter 343, Hawaii Revised Statutes

Dear Director Takamura:

Thank you for the opportunity to submit additional comments regarding the proposed Waimanalo Gulch Sanitary Landfill Expansion Environmental Impact Statement via the EISPN Comment period.

Per portions of HRS 343 and Title 11 Chapter 200 of the Department of Health, State of Hawai`I Environmental Impact Statement Rules, I am respectfully requesting to be "a consulted party" and make these additional written comments to complement those submitted on August 29, 2006 and published in the EISPN Appendix A.

This EISPN falls short of accurately representing past statements made about the location of this proposed expansion. In the 1984 EIS, approximately 56+/- acres were identified as being available for a landfill with the rest of the property being labeled as having slopes (8-18%) which limit the useful area to be used for landfills. The topography has not changed but it is being proposed that the area is now useful for landfills. How has this happened? There has not been an overt statement made that we are making land available for a landfill by manipulating the land (creating a hole to receive material). If this is the case, the EISPN should include a section on a soils analysis and evaluation being done or planned and scheduled to demonstrate the safety factor of manipulating the soils structure found in the area.

There should also be included how this proposed EIS addresses the State Land Use Commission Decision and Order which calls for the closure of the WGSL in May 2008 (which implies no further waste will be accepted at WGSL). This was the date presented by the previous City and County of Honolulu administration.

Considering the current facility is still out of compliance with the last EIS/permit which allowed for the expansion of the facility by another 21 acres and a height limitation which has been exceeded, the document should include how the current violations will be mitigated prior to the request for further expansion of the active landfill site.

The discussion on water flow and direction is inadequate. While it addresses underground water and discusses flow direction, it does not address any affects on the near shore waters. The near shore waters off the Leeward Coast have been severely impacted over the years and any addition to the burdens felt on the near shore waters need to be considered and discussed. How does the storm water run-off affect the near shore waters? What about the underground water movement and its' contents affect the near shore

---

waters? How is that being considered? Then again, what about the leachate? The leachate levels as related in the February State Dept. of Health Notice of violations identified a significant amount of leachate that exceeded permit limitations. Most of that leachate was disposed of at the Wai`anae Wastewater Treatment Plant. What were the affects of the leachate being added to normal processes with disposal in off-shore waters?

There does not appear to be any discussion regarding the noise consideration being given to the location of the newest expansion and how it might impact the Makaiwa Hills development being proposed. While there is no development currently in the region, there will, in all likelihood, be housing built near the boundary where the landfill will be operating in the near future. There should be a discussion about what the impacts will be to those new neighbors. This discussion should also extend to litter and odor mitigation. The affects of the landfill expansion should include these considerations as a prudent course of discussion since the plans to develop the area are known at this time.

While there is a discussion regarding the visual impacts of the landfill from the makai side of the landfill, there is no discussion regarding the visual impact of the landfill from the Wai`anae direction. Currently, the landfill construction of the cells for the permitted expansion is visible over the ridgeline from the Wai`anae direction. The landfill should preserve the integrity of the visual planes and is currently not doing so. How will that be handled?

Regarding the traffic situation and ingress and egress onto Farrington Highway, although the State Dept. of Transportation is responsible for maintenance of Farrington Highway, there needs to be some discussion about the responsibility of the operator to keep mud and dirt on the landfill property and not allow it to be deposited on Farrington Highway. It has been the norm more than the exception that the merge lane from trucks turning onto Farrington Highway headed toward Honolulu is covered with dirt or mud deposited there from those same trucks making the area less safe for regular vehicles utilizing Farrington Highway.

The City's Solid Waste Integrated Management Plan (SWIMP) has Waimanalo Gulch Sanitary Landfill as a critical integral part of the plan. Unfortunately, the plan is now significantly behind schedule. The new plan should not only include the landfill but also include a serious discussion about alternatives to landfills and therefore, could have an impact on whether or not the expansion should be for the amount of time being proposed or be reduced or eliminated. This should be discussed further in the EIS.

The EISPN talks about the lack of time with which to pursue other alternatives to the landfills but fails to state that the time to pursue other alternatives actually started from 2002, when the City committed to the communities that other methods would be pursued and no landfills would be needed after 2008. A more comprehensive discussion should be included as to actions already taken and why there was a failure to find any alternatives that could have been implemented to make the five year target.

There is no discussion regarding the contract commitments to both H-POWER and Waste Management, Inc. This is significant to making an informed decision as to whether an expansion of the landfill is required if the City believes it is needed, the real length of time that makes sense for the proposal of an expansion.

The proposed EIS for this expansion of WGSL needs to be as comprehensive as today's knowledge base allows us to have considering the consequences of the action proposed will continue to have effects on our residents for many years to come. The EISPN should do no less and should address all issues brought up in the scoping meetings and via written comments.

Mr. Eric Takamura
December 26, 2006
Page 3

The submittal of these comments should not be construed as support for the expansion of Waimanalo Gulch Sanitary Landfill but should be viewed as open concerns that continue to not be fully addressed and should be in both the EISPN and EIS.

Sincerely,

Cynthia K L Rezentes

IN REPLY REFER TO:
RA -08-052

Ms. Cynthia K. L. Rezentes
87- 149 Maipela Street
Waianae, Hawaii 96792-3154

Dear Ms. Rezentes:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 26, 2006 concerning the subject project. We acknowledge your request to be a consulted party to the EIS process for the proposed project. The following is in response to your comments (your comments have been italicized for reference):

1. *"This EISPN falls short of accurately representing past statements made about the location of this proposed expansion. In the 1984 EIS, approximately 56+/- acres were identified as being available for a landfill with the rest of the property being labeled as having slopes (8 - 18%) which limit the useful area to be used for landfills. The topography has not changed but it is being proposed that the area is now useful for landfills. How has this happened? There has not been an overt statement made that we are making land available for a landfill by manipulating the land (creating a hole to receive material). If this is the case, the EISPN should include a section on a soils analysis and evaluation being done or planned and scheduled to demonstrate the safety factor of manipulating the soils structure found in the area."*

Since 1984 there have been various permitted changes to the project site as a result of changing technology, the characteristics of the solid waste disposed of, and the regulatory framework associated with operating the site. Practical on-site experience has also maximized the efficient use of the site. The capacity and the proposed development of the planned expansion area will be described in the Draft EIS (DEIS). This will include a discussion of the soils and stability of the site.

2. *"There should also be included how this proposed EIS addresses the State Land Use Commission Decision and Order which calls for the closure of the WGSL in May 2008 (which implies no further waste will be accepted at WGSL). This was the date presented by the previous City and County of Honolulu administration."*

Necessary approvals, including those of the Land Use Commission and others, will be sought by the City to allow for the lateral expansion of the landfill footprint. Further discussion of this item will be provided in the DEIS.

> *3. "Considering the current facility is still out of compliance with the last EIS/permit which allowed for the expansion of the facility by another 21 acres and a height limitation which has been exceeded, the document should include how the current violations will be mitigated prior to the request for further expansion of the active landfill site."*

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved.

The Environmental Protection Agency's (EPA) Notice of Violation (NOV) concerning the landfill's gas collection system is currently under discussion amongst the EPA, the City and Waste Management. Until those negotiations are concluded, there can be no final determination as to the validity of the alleged violations. The NOV will be discussed in the DEIS.

> *4. "The discussion on water flow and direction is inadequate. While it addresses underground water and discusses flow direction, it does not address any affects on the near shore waters. The near shore waters off the Leeward Coast have been severely impacted over the years and any addition to the burdens felt on the near shore waters need to be considered and discussed. How does the storm water run-off affect the near shore waters? What about the underground water movement and its' [sic] contents affect the near shore waters? How is that being considered? Then again, what about the leachate? The leachate levels as related in the February State Dept. of Health Notice of violations identified a significant amount of leachate that exceeded permit limitations. Most of that leachate was disposed of at the Wai'anae Wastewater Treatment Plant. What were the affects of the leachate being added to normal processes with disposal in off-shore waters?"*

According to the Office of Environmental Quality Control (OEQC), "The EISPN does not give full detail of the proposal but defines the scope of analysis that will be covered in the subsequent environmental impact statement." (<u>A Guidebook for the Hawaii State Environmental Review Process, June 2004</u>). In this regard the EISPN is not intended to itself serve as the full disclosure document as required by Chapter 343, Hawaii Revised Statutes (HRS).

Accordingly, a detailed description and discussion of surface and groundwater characteristics and the potential for impacts will be addressed in the DEIS.

The leachate that is accepted by the operator of the Waianae Wastewater Treatment Plant was, and continues to be, in accordance with regulatory requirements to ensure public health and safety. Leachate management and monitoring will be part of the Solid Waste Operating Permit application. As noted in a memorandum to ENV from the operators of the Waianae Wastewater Treatment Plant, the leachate accepted by the plant for processing has had very little or no impact on the wastewater effluent quality that is being discharged to the ocean outfall (see attached memorandum dated October 2, 2007).

> *5. "There does not appear to be any discussion regarding the noise consideration being given to the location of the newest expansion and how it might impact the Makaiwa Hills development being proposed. While there is no development currently in the region, there will, in all likelihood, be housing built near the boundary where the landfill will be operating in the near future. There should be a discussion about what the impacts will be to those new neighbors. This discussion should also extend to litter and odor mitigation. The affects of the landfill expansion should include these considerations as a prudent course of discussion since the plans to develop the area are known at this time."*

The DEIS will include a discussion of the potential for environmental impacts to the proposed Makaiwa Hills development as a result of the proposed expansion of Waimanalo Gulch. This will include consideration of potential impacts and proposed mitigative measures not only for the Makaiwa Hills project, but other adjoining land owners that include Ko Olina.

> *6. "While there is a discussion regarding the visual impacts of the landfill from the makai side of the landfill, there is no discussion regarding the visual impact of the landfill from the Wai'anae direction. Currently, the landfill construction of the cells for the permitted expansion is visible over the ridgeline from the Wai'anae direction. The landfill should preserve the integrity of the visual planes and is currently not doing so. How will that be handled?"*

Further visual or view plane analyses will be provided in the DEIS. This will include the investigation of views from both the landfill as well as from selected points along Farrington Highway and other locations. It is noted that landscaping will be provided to improve the aesthetics of the site.

> *7. "Regarding the traffic situation and ingress and egress onto Farrington Highway, although the State Dept. of Transportation is responsible for maintenance of Farrington Highway, there needs to be some discussion about the responsibility of the operator to keep mud and dirt on the landfill property and not allow it to be deposited on Farrington Highway. It has been the norm more than the exception that the merge lane from trucks turning onto Farrington Highway headed toward Honolulu is covered with dirt or mud deposited there from those same trucks making the area less safe for regular vehicles utilizing Farrington Highway."*

Traffic concerns that involve the off-site vehicle tracking of debris from the site will be discussed in the DEIS. This will include a description of maintenance and preventive measures.

8. "The City's Solid Waste Integrated Management Plan (SWIMP) has Waimanalo Gulch Sanitary Landfill as a critical integral part of the plan. Unfortunately, the plan is now significantly behind schedule. The new plan should not only include the landfill but also include a serious discussion about alternatives to landfills and therefore, could have an impact on whether or not the expansion should be for the amount of time being proposed or be reduced or eliminated. This should be discussed further in the EIS."

An update of the Solid Waste Integrated Management (SWIM) Plan is on-going by the City. As much as possible the preparation of the SWIM Plan is being coordinated as the DEIS is being prepared. Alternatives to landfilling will be provided in the DEIS.

9. "The EISPN talks about the lack of time with which to pursue other alternatives to the landfills but fails to state that the time to pursue other alternatives actually started from 2002, when the City committed to the communities that other methods would be pursued and no landfills would be needed after 2008. A more comprehensive discussion should be included as to actions already taken and why there was a failure to find any alternatives that could have been implemented to make the five year target."

Further discussion of the efforts taken by the City to manage solid waste will be provided in the DEIS.

10. "There is no discussion regarding the contract commitments to both H-POWER and Waste Management, Inc. This is significant to making an informed decision as to whether an expansion of the landfill is required if the City believes it is needed, the real length of time that makes sense for the proposal of an expansion."

Although no discussion of the contractual agreements between the City and the operators of the H-POWER and Waimanalo Gulch landfill was provided in the EISPN, we note that the contracts are public documents. The role of H-POWER and landfilling to better manage our solid waste will be provided in the DEIS.

11. "The proposed EIS for this expansion of WGSL needs to be as comprehensive as today's knowledge base allows us to have considering the consequences of the action proposed will continue to have effects on our residents for many years to come. The EISPN should do no less and should address all issues brought up in the scoping meetings and via written comments."

And,

12. "The submittal of these comments should not be construed as support for the expansion of Waimanalo Gulch Sanitary Landfill but should be viewed as open concerns that continue to not be fully addressed and should be in both the EISPN and EIS."

We have directed our consultant to address the issues raised during the EISPN public comment period as required under Chapter 343, HRS. As you are aware, these issues have been documented and will be discussed in the DEIS.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura, Ph.D., P.E.
Director

Athan K. Adachi

FROM: ATHAN K. ADACHI, CHIEF
DIVISION OF ENVIRONMENTAL QUALITY

SUBJECT: WAIMANALO GULCH LANDFILL LEACHATE DISCHARGE
TO THE WAIANAE WASTEWATER TREAMENT PLANT FACILITY

Current leachate discharge to the Waianae WWTP has been minimal, approximately 16,000 gallons per day, once a week. The plant treats on average approximately 3,250,000 gallons per day of domestic raw wastewater. Our monitoring data shows that the leachate has not changed the water quality near the outfall and the sampling at the outfall shows all are in compliance with State Department of Health regulation. The plant has continuously met minimum State and Federal water quality requirements. Overall, the additional loading of leachate had very little or no impact on the wastewater effluent quality being discharge to the ocean outfall.

Should you have any questions on this matter, please contact Jerome Ababa of our Monitoring and Compliance Branch, Division of Environmental Quality at 768-3255.

RE: COMMENTS ON EISPN FOR WAIMANALO GULCH SANITARY LANDFILL

The Sierra Club O`ahu Group respectfully desires to be a consulted party on this project pursuant to Haw. Rev. Stat. ("HRS") Chapter 343.

In order to fully inform decision makers regarding the impacts of this project we recommend that the following matters be addressed in detail in both the DEIS and FEIS:

ALTERNATIVE ANALYSIS, INCLUDING IMPLEMENTATION OF WASTE DIVERSION STRATEGIES

This analysis should look a review of pursuing other alternative, including the use of other sites and implementing comprehensive waste reduction and recycling strategies. An in-depth review of the strengths and weakness of the current contemplated site cannot be done without an extensive comparison of the alternative approaches.

ENVIRONMENTAL JUSTICE

Any analysis should consider the connection between continued use of the landfill and the social issues of discrimination, poverty, and the general distribution of environmental risks. In a nutshell, is a particular community bearing a disproportionate burden of the island's pollution problem because of the government's failure to apply environmental laws, regulations, and policies in a fair manner across all segments of the population?

♻ *Recycled Content*

IMPACTS ON SURROUNDING RESIDENTIAL AREAS, INCLUDING THE PROPOSED MAKAIWA HILLS DEVELOPMENT

Residents in surrounding areas have long complained about odors, plastic bag litter, and other nuisances and environmental hazards from Waimanalo Gulch Landfill. Future housing may be built in the immediate vicinity of the landfill, including the proposed Makaiwa Hills development of nearly 5000 units by Campbell Estate / Makaiwa Hills LLC. A detailed analysis of all anticipated and potential impacts of the Waimanalo Gulch Sanitary Landfill on this housing should be included in the DEIS and FEIS.

CUMULATIVE IMPACTS

Hawaii Administration Rules ("HAR") § 11-200-2 defines cumulative impact as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-17 requires that an EIS discuss "significant beneficial and adverse impacts (including cumulative impacts and secondary impacts)."

Present and future volume of truck traffic, the levels of odor, gas emissions, fugitive dust and debris, and runoff from the existing land fill has affected the water, air and life quality of nearby residential and commercial properties, and the extent to which the proposed expansion of the landfill itself, will further affect these parameters.

The relatively undisturbed forested Palehua and Hono`uli`uli areas surrounding the Waimanalo Gulch landfill are home to a number of rare and endangered plants, mollusks and birds. Sections of these land areas are recognized as critical habitat for what is may be the last remaining population of the O`ahu *elepai`o*. It is probable that the upper areas of the proposed project could also be a part of the habitat utilized by this bird species.

Very thorough studies must be undertaken to determine the presence of any native and endemic animals and plants, both listed and non-listed, within the boundaries of the project and in areas immediately adjacent to it, particularly those *mauka* of the project that are contiguous with the Palehua and Hono`uli`uli land areas. Continuity between these land areas must be maintained to promote the survival and recovery of those native endemic biota. A plan for restoration of the native forest cover should be developed, particularly for the *mauka* areas of the project, and should extend into the adjacent parcels to join with the existing "natural" forest cover in the Hono`uli`uli forest reserve area.

WATER QUALITY

The DEIS should include sufficient baseline data for meaningful analysis of the adverse impact of runoff and other anthropogenic inputs related to existing and proposed landfill activities. For instance, what are the current levels of inorganic nutrients and pesticides that enter the soils, ephemeral water sources, and subterranean aquifers from those existing developments, both mauka and makai of the landfill, and the affects of the proposed chemical pollutant load?

The EIS should include a report by a hydrologist discussing how water flows through the project area into local aquifers, ephemeral water sources and weather or not it cold impact nearshore ocean waters.

Any water quality plan should spell out in detail any mitigation plan rather than leaving the term ambiguous.

The EIS should include an edaphic study that fully discusses the highly permeable and fragile nature of the soils and the effectiveness of any leachete collection system at the project area.

The EIS should include any calculations or models used to support any conclusion regarding runoff and drainage into local aquifers and erosion of soils from the project and onto adjacent parcels.

A complete EIS will reveal the cumulative impact of all runoff and leaching on local aquifers, adjacent lands and coastal waters. This includes pesticides/biocides (including the impact of the alternative biocides that are lower in toxicity), fertilizers, sedimentation, heavy metals, grease, and other urban runoff. The EIS should study the amount of nonpoint source water pollution associated with similar large sanitary landfill developments and discuss the degradation of aquifers, soils, air quality, and landscapes caused by similar projects. A complete EIS would not glibly assume that mitigation measures would take care of all nonpoint source water pollution problems.

How much contaminated water (by nutrients, pesticides, or other contaminants) can be expected to leach through soil and make its way into local aquifers waters (i.e., not surface runoff, but percolation)? What specific studies of similar areas in West O`ahu does the EIS rely on to support its conclusions?

SCENIC IMPACT

The EIS should use both of the two most useful methodologies of Visual Impact Analysis:

1) Given a structure at point "x," where will it be seen from; and

2) From point "y," what can you see of the development?

PAST VIOLATIONS AND MITIGATION MEASURES

The operators of Waimanalo Gulch Sanitary Landfill was recently fined $2.8 million for various environmental violations. Please discuss steps taken to remedy these violations and ensure that future violations do not occur. Please fully discuss how the public can be assured that any proposed mitigation measures will be performed and will be effective. Please describe the county and state government's monitoring and enforcement programs so that we can be assured that promises made will be kept. Are the staffing levels at the State Health Department's Solid Waste Branch, the City and County's Department of Environmental Services, and the City and County's Planning and Permitting Department sufficient to ensure that promises are kept? How often is the staff expected to visit the site? Please do not argue that it is beyond your ability to answer these questions. Please ask the departments themselves and indicate the response.

The applicant should identify all proposed mitigation measures in a consolidated list. These measures should be written in plain language that is easily enforceable when incorporated into a permit. It is unacceptable, for example, to list as a mitigation measure that "apply pesticides only when and where necessary" since such language is vague and subject to a multitude of interpretations.

HAWAII STATE PLAN

The EIS should mention and fully discuss many key provisions in the Hawaii State Plan:

§226-6(b) To achieve the general economic objectives, it shall be the policy of this State to:
(14) Promote and protect intangible resources in Hawaii, such as scenic beauty and the aloha spirit, which are vital to a healthy economy.

§226-11 (b) To achieve the land-based, shoreline, and marine resources objectives, it shall be the policy of this State to:
  (1) Exercise an overall conservation ethic in the use of Hawaii's natural resources.
  (2) Ensure compatibility between land-based and water-based activities and natural resources and ecological systems.

§226-12 (b) To achieve the scenic, natural beauty, and historic resources objective, it shall be the policy of this State to:
  (1) Promote the preservation and restoration of significant natural and historic resources.
  (3) Promote the preservation of views and vistas to enhance the visual and aesthetic enjoyment of mountains, ocean, scenic landscapes, and other natural features.
  (4) Protect those special areas, structures, and elements that are an integral and functional part of Hawaii's ethnic and cultural heritage.

§226-104 (b) Priority guidelines for regional growth distribution and land resource utilization:
(13) Protect and enhance Hawaii's shoreline, open spaces, and scenic resources.

Mahalo for the opportunity to offer these comments on the Waimanalo Gulch EISPN. Please direct all future correspondence to the Sierra Club, O`ahu Group, PO Box 2577, Honolulu, HI 96803.

Sincerely,

Robert D. Harris

IN REPLY REFER TO:
RA 08-048

Mr. Robert D. Harris
Sierra Club, O'ahu Group
P.O. Box 2577
Honolulu, Hawaii 96803

Dear Mr. Harris:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 26, 2006,concerning the subject project. We acknowledge your request to be a consulted party to the EIS process for the proposed project. The following is in response to your comments (your comments have been italicized for reference):

1. *Alternative Analysis, Including Implementation of Waste Diversion Strategies. "This analysis should look [sic] a review of pursuing other alternative [sic], including the use of other sites and implementing comprehensive waste reduction and recycling strategies. An in-depth review of the strengths and weakness of the current contemplated site cannot be done without an extensive comparison of the alternative approaches."*

An alternatives analysis will be undertaken as part of the Draft EIS (DEIS) that will include other on-island waste reduction and recycling alternatives, as well as transshipment.

2. *Environmental Justice. "Any analysis should consider the connection between continued use of the landfill and the social issues of discrimination, poverty, and the general distribution of environmental risks. In a nutshell, is a particular community bearing a disproportionate burden of the island's pollution problem because of the government's failure to apply environmental laws, regulations, and policies in a fair manner across all segments of the population?"*

A discussion concerning environmental justice will be provided in the DEIS.

3. Impacts on Surrounding Residential Areas, Including the Proposed Makaiwa Hills Development. "Residents in surrounding areas have long complained about odors, plastic bag litter, and other nuisances and environmental hazards from Waimanalo Gulch Landfill. Future housing may be built in the immediate vicinity of the landfill, including the proposed Makaiwa Hills development of nearly 5000 units by Campbell Estate/Makaiwa Hills LLC. A detailed analysis of all anticipated and potential impacts of the Waimanalo Gulch Sanitary Landfill on this housing should be included in the DEIS and FEIS."

The DEIS will include a discussion of the potential for adverse effects to the proposed Makaiwa Hills development as a result of the proposed expansion of Waimanalo Gulch.

4. Cumulative Impacts. "Hawaii Administration Rules ("HAR") §11-200-2 defines cumulative impact as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR §11-200-17 requires that an EIS discuss "significant beneficial and adverse impacts (including cumulative impacts and secondary impacts)."

"Present and future volume of truck traffic, the levels of odor, gas emissions, fugitive dust and debris, and runoff from the existing land fill has affected the water, air and life quality of nearby residential and commercial properties, and the extent to which the proposed expansion of the landfill itself, will further affect these parameters."

"The relatively undisturbed forested Palehua and Hono'uli'uli areas surrounding the Waimanalo Gulch landfill are home to a number of rare and endangered plants, mollusks and birds. Sections of these land areas are recognized as critical habitat for what is may be the last remaining population of the O'ahu elepai'o. It is probable that the upper areas of the proposed project could also be a part of the habitat utilized by this bird species."

"Very thorough studies must be undertaken to determine the presence of any native and endemic animals and plants, both listed and non-listed, within the boundaries of the project and in areas immediately adjacent to it, particularly those mauka of the project that are contiguous with the Palehua and Hono'uli'uli land areas. Continuity between these land areas must be maintained to promote the survival and recovery of those native endemic biota. A plan for restoration of the native forest cover should be developed, particularly for the mauka areas of the project, and should extend into the adjacent parcels to join with the existing "natural" forest cover in the Hono'uli'uli forest reserve area."

The potential for the impacts you identify, including cumulative impacts, will be discussed as part of the DEIS. This will include a study of flora and fauna resources as part of the DEIS.

5. Water Quality. "The DEIS should include sufficient baseline data for meaningful analysis of the adverse impact of runoff and other anthropogenic inputs related to existing and proposed landfill activities. For instance, what are the current levels of inorganic nutrients and pesticides that enter the soils, ephemeral water sources, and subterranean aquifers from those existing developments, both mauka and makai of the landfill, and the affects of the proposed chemical pollutant load?"

"The EIS should include a report by a hydrologist discussing how water flows through the project area into local aquifers, ephemeral water sources and weather [sic] or not it cold [sic] impact nearshore ocean waters."

"Any water quality plan should spell out in detail any mitigation plan rather than leaving the term ambiguous."

"The EIS should include an edaphic study that fully discusses the highly permeable and fragile nature of the soils and the effectiveness of any leachete [sic] collection system at the project area."

"The EIS should include any calculations or models used to support any conclusion regarding runoff and drainage into local aquifers and erosion of soils from the project and onto adjacent parcels."

"A complete EIS will reveal the cumulative impact of all runoff and leaching on local aquifers, adjacent lands and coastal waters. This includes pesticides/ biocides (including the impact of the alternative biocides that are lower in toxicity), fertilizers, sedimentation, heavy metals, grease, and other urban runoff. The EIS should study the amount of nonpoint source water pollution associated with similar large sanitary landfill developments and discuss the degradation of aquifers, soils, air quality, and landscapes caused by similar projects. A complete EIS would not glibly assume that mitigation measures would take care of all nonpoint source water pollution problems."

"How much contaminated water (by nutrients, pesticides, or other contaminants) can be expected to leach through soil and make its way into local aquifers waters (i.e., not surface runoff, but percolation)? What specific studies of similar areas in West O'ahu does the EIS rely on to support its conclusions?"

Hydrogeological information prepared by a licensed geologist will be provided as part of the DEIS. This will include the nature and characteristics of groundwater at the site and how regional and site groundwater flow may potentially affect offshore ocean waters. Stormwater drainage and management controls will also be described.

6. Scenic Impact. "The EIS should use both of the two most useful methodologies of Visual Impact Analysis: 1) Given a structure at point "x," where will it be seen from; and 2) From point "y," what can you see of the development?"

The DEIS will address the potential for visual impacts from various points of reference toward the proposed project site.

7. Past violations and Mitigation Measures. "The operators of Waimanalo Gulch Sanitary Landfill was recently fined $2.8 million for various environmental violations. Please discuss steps taken to remedy these violations and ensure that future violations do not occur. Please fully discuss how the public can be assured that any proposed mitigation measures will be performed and will be effective. Please describe the county and state government's monitoring and enforcement programs so that we can be assured that promises made will be kept. Are the staffing levels at the State Health Department's Solid Waste Branch, the City and County's Department of Environmental Services, and the City and County's Planning and Permitting Department sufficient to ensure that promises are kept? How often is the staff expected to visit the site? Please do not argue that it is beyond your ability to answer these questions. Please ask the departments themselves and indicate the response."

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved.

The Environmental Protection Agency's (EPA) Notice of Violation (NOV) concerning the landfill's gas collection system is currently under discussion amongst the EPA, the City and Waste Management. Until those negotiations are concluded, there can be no final determination as to the validity of the alleged violations. The NOV will be discussed in the DEIS.

> *8. "The applicant should identify all proposed mitigation measures in a consolidated list. These measures should be written in plain language that is easily enforceable when incorporated into a permit. It is unacceptable, for example, to list as a mitigation measure that "apply pesticides only when and where necessary" since such language is vague and subject to a multitude of interpretations."*

Potential impacts and proposed mitigation measures will be described in the DEIS in accordance with Chapter 343, Hawaii Revised Statutes (HRS). Mitigation measures will incorporate comments of appropriate licensed professionals and governmental agencies.

> *9. Hawaii State Plan. "The EIS should mention and fully discuss many key provisions in the Hawaii State Plan: §226-6(b) To achieve the general economic objectives, it shall be the policy of this State to:*
>
> *(14) Promote and protect intangible resources in Hawaii, such as scenic beauty and the aloha spirit, which are vital to a healthy economy."*
>
> *"§226-1 1 (b) To achieve the land-based, shoreline, and marine resources objectives, it shall be the policy of this State to:*
>
> *(1) Exercise an overall conservation ethic in the use of Hawaii's natural resources.*
>
> *(2) Ensure compatibility between land-based and water-based activities and natural resources and ecological systems."*
>
> *"§226-12 (b) To achieve the scenic, natural beauty, and historic resources objective, it shall be the policy of this State to:*
>
> *(l) Promote the preservation and restoration of significant natural and historic resources.*
>
> *(3) Promote the preservation of views and vistas to enhance the visual and aesthetic enjoyment of mountains, ocean, scenic landscapes, and other natural features.*
>
> *(4) Protect those special areas, structures, and elements that are an integral and functional part of Hawaii's ethnic and cultural heritage."*

> *"§226-104 (b) Priority guidelines for regional growth distribution and land resource utilization:*
>
> *(13) Protect and enhance Hawaii's shoreline, open spaces, and scenic resources."*

The above sections of the Hawaii State Plan have been forwarded to our consultant for appropriate action in the preparation of the DEIS.

Thank you for taking the time to share your comments and allowing us this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura, Ph.D. P.E.

Re: Waimanalo Gulch Landfill - Environmental Impact Statement Preparation Notice

Dr. Takamura:

Pursuant to your November 8, 2006 letter enclosing the Environmental Impact Statement Preparation Notice (EISPN), we provide the following comments:

Opening Comments:

- The EISPN fails to address the inadequacies of the 2002 FEIS, and the continued litigation concerning that document. We believe it is an important disclosure as the City moves into a new EIS process for a further expansion of the Waimanalo Gulch Landfill.

- As was part of the complaint against the 2002 FEIS, it appears from the EISPN that the planned process fails to adequately consider the social and economic impacts of the landfill. Clearly, those impacts are greatest at the areas directly surrounding the landfill, including Ko Olina Resort & Marina and the residents within the Resort. However, those impacts also extended to the communities of Kapolei, Honokai Hale, Makakilo and the Leeward Coast.

- The Draft and Final EIS must incorporate the City's Solid Waste Masterplan, which was supposed to be completed by the City in December 2006.

- The EISPN fails to address the Department of Health Notice of Violations, citing a multitude of violations with the operation of the Waimanalo Gulch Landfill. These violations include filling cells beyond the permitted heights and extreme leachate control violations, amounting to 21 feet of leachate being located within the Landfill when only 1 foot is allowable. Beyond the operational issues raised by these violations, the structural integrity of the landfill, based on these two violations alone, must be questioned and specifically and independently investigated. Clearly, the $2.8 million fine demonstrates the extreme nature of these violations, and affects any and all future proposed operations of the Landfill, including its proposed expansion.

92-1480 ALIINUI DRIVE • HONOLULU, HAWAII 96707 • TEL: 808 671-2512 • FAX: 808 671-3640

- The EISPN fails to address the EPA violation concerning the methane gas collection system.

- Given these violations and the concerns raised by them, the EIS must disclose the impacts that would be caused by the structural failure of the Waimanalo Gulch Landfill. Whether by structural deficiency or, as recently experienced, earthquake, because of the landfill's formation within a gulch at the sole entrance to the Leeward Coast, a failure of the landfill sliding across Farrington Highway would have a significant impact that must be disclosed and discussed.

- The EIS must address the well documented and continued escape of waste from the Landfill site. This includes an analysis of the fact that HECO had identified the area as one of the windiest locations on the island and how the proposed expansion to higher elevations will create greater problems for waste being blown off the landfill. These disclosures must also identify where this escaping trash is landing and its impact on the land and, more importantly the ocean. The escaping waste goes much further than the "valley rim" as implied by the EISPN.

Comments Concerning the Background Information Identified in the EISPN:

- The background section fails to identify the specific, sworn statements made by the City at the 2003 Planning Commission Meetings and State Land Use Commission meetings regarding the promised closure of Waimanalo Gulch Landfill, and which resulted in the specific language regarding the Landfill's closure in 2008 being included in both the Planning Commission and Land Use Commission Decision and Orders.

- In describing the process followed by the Mayor's Advisory Committee, the EISPN fails to recognize that the Committee agreed that the "double blind methodology" was to be advisory only to the group, and was not to be used as a means of "ranking" the potential sites. Furthermore, it is inaccurate to state that the results of the methodology caused "a division in the Committee" or a change in the decision making process. Finally, despite the language in Council Resolution 04-348, the EISPN should accurately reflect that the Office of Informational Practices did not rule that the Committee's report was "void due to violations of the sunshine law." OIP does not have the legal authority to void such action or report.

- From the Council's actions in passing Council Resolution 04-348 and Bill 37 (2005), it is clear that the Council's position on the City's policy for its solid waste is to close Waimanalo Gulch Landfill.

Visual and Other Impacts of Waimanalo Gulch Landfill:

- There are many inaccuracies in Section 4.11 of the EISPN. They include the following:
    - A more complete disclosure of the visibility of the Landfill is required. Whether from Farrington Highway, at ground level, or elevated level, the visual impact is much more than a "gray-hued ash fill that resembles a quarry."
    - Vehicles driving on the hillside and higher elevation portions of the landfill can be seen from the ground and from driving along Farrington Highway. It is not only "From sea" that these impacts are visible.
    - Landfill operations vehicles ***CAN*** be visible – not "may be visible."
    - The queuing of vehicles, whether infrequent or not, ***DO*** make the presence of the landfill apparent – not "may" and this does not make the landfill "momentarily apparent." The continued visibility of trucks, machinery and flying waste make the landfill ***continually apparent*** to all who live in the area, visit the area, or drive through the area.
    - As mentioned above, waste being blown off the landfill consists of more than just plastic bags and end up in more places than just the valley rim. Significant amounts of this waste has blown into adjacent properties and into the ocean. Evidence of this has been presented to the City and to Waste Management in the past.

- The EISPN mentioned the hydromulching that has attempted to "landscape" the Landfill. However, it fails to address the less than adequate success of these efforts, and the visible canyons and rivulets created along the face of the landfill during heavy rains as the water erodes the dirt slope of the landfill.

- The EIS must disclose the fact that because of the operator's failure to handle leachate problems at the landfill, large amounts of leachate were pumped in trucks and taken to the Waianae Waste Water Treatment Plant. The amount of that leachate must be disclosed and its true impacts must be investigated. While it has been said that it was allowable, that answer is insufficient. The EIS must disclose how that leachate changed the water discharged from the Treatment Plant, directly into the ocean. This question was raised many times at the Waianae Neighborhood Board.

Examination of Alternatives:

- The EISPN fails to address the significant changes that has occurred in the potential of shipping waste to other landfills since the last EIS. In examining this alternative, the EIS must acknowledge and identify the multitudes of other cities and municipalities throughout the country that truck or ship their waste to other cities and states. Furthermore, the EIS must examine the recent changes in the Federal Rules allowing for the shipping of waste specifically from Hawaii to the mainland.

- In examining alternatives for landfills, the EIS must recognize that ash and MSW landfills do not need to be located together. The impacts from these two types of waste are significantly different and given Honolulu's situation and history, the EIS must examine possible solutions where MSW and ash can be landfilled in different locations. This will increase the potential for possible locations for future landfill sites.

Overall, the EIS must encompass the multitude of comments – formal and informal – that have been received by the City and Waste Management over the last nearly six years, since the City started the attempts to expand the operations at Waimanalo Gulch Landfill. The operational problems at the Landfill, including those cited by the Department of Health in its Notice of Violation, must be directly addressed, as those have shown a clear failure of operations and proved that the concerns and complaints over the last six years were well founded.

All of our members will continue to be directly impacted by the plans and actions concerning Waimanalo Gulch Landfill, and we will continue to be an interested and consulted party throughout this process.

Thank you for the opportunity to provide these comments to you.

Very truly yours,

Ken Williams

Dear Mr. Williams:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 26, 2006 concerning the subject project. The following is in response to your comments (your comments have been italicized for reference):

Opening Comments

1. "The EISPN fails to address the inadequacies of the 2002 FEIS, and the continued litigation concerning that document. We believe it is an important disclosure as the City moves into a new EIS process for a further expansion of the Waimanalo Gulch Landfill."

"As was part of the complaint against the 2002 FEIS, it appears from the EISPN that the planned process fails to adequately consider the social and economic impacts of the landfill. Clearly, those impacts are greatest at the areas directly surrounding the landfill, including Ko Olina Resort & Marina and the residents within the Resort. However, those impacts also extended to the communities of Kapolei, Honokai Hale, Makakilo and the Leeward Coast."

As you note, the 2002 Final Supplemental Environmental Impact Statement is currently the subject of litigation. Although neither the City nor Waste Management of Hawaii may therefore discuss the specific matters at issue in the lawsuit for legal reasons, it is important to note that Section 1 of the EISPN contains important information that establishes why the City must act at this time to provide a solid waste refuse facility for use by all the communities of Oahu.

Concerning the information provided in the EISPN, according the Office of Environmental Quality Control (OEQC), "The EISPN does not give full detail of the proposal but defines the scope of analysis that will be covered in the subsequent environmental impact statement." (A Guidebook for the Hawaii State Environmental Review Process, June 2004). In this regard the EISPN is not intended to itself serve as the full disclosure document as required by Chapter 343,

---

Hawaii Revised Statutes (HRS). Accordingly, a detailed description and discussion of socioeconomic characteristics and the potential for impacts will be addressed in the Draft EIS (DEIS).

2. "The Draft and Final EIS must incorporate the City's Solid Waste Masterplan, which was supposed to be completed by the City in December 2006."

The last Solid Waste Integrated Management (SWIM) Plan was completed by the City in 2004. As much as possible the preparation of the subject DEIS is being coordinated with the SWIM Plan. However, the plan is currently under draft and will be coordinated with the DOH and other appropriate parties for approval. We are hopeful that with the increased attention and importance that solid waste is receiving, that the SWIM Plan will encourage discussion by the City Council and all the communities of Oahu.

3. "The EISPN fails to address the Department of Health Notice of Violations, citing a multitude of violations with the operation of the Waimanalo Gulch Landfill. These violations include filling cells beyond the permitted heights and extreme control violations, amounting to 21 feet of being located within the Landfill when only 1 foot is allowable. Beyond the operational issues raised by these violations, the structural integrity of the landfill, based on these two violations alone, must be questioned and specifically and independently investigated. Clearly, the $2.8 million fine demonstrates the extreme nature of these violations, and affects any and all future proposed operations of the Landfill, including its proposed expansion."

"The EISPN fails to address the EPA violation concerning the methane gas collection system."

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved. The NVO, settlement and grade modification will be discussed in the DEIS.

The Environmental Protection Agency's (EPA) Notice of Violation (NOV) concerning the landfill's gas collection system is currently under discussion amongst the EPA, the City and Waste Management. Until those negotiations are concluded, there can be no final determination as to the validity of the alleged violations. The NOV will be discussed in the DEIS.

4. "Given these violations and the concerns raised by them, the EIS must disclose the impacts that would be caused by the structural failure of the Waimanalo Gulch Landfill. Whether by structural deficiency or, as recently experienced, earthquake, because of the landfill's formation within a gulch at the sole entrance to the Leeward Coast, a failure of the landfill sliding across Farrington Highway would have a significant impact that must be disclosed and discussed."

A discussion of the stability of the landfill in relation to the potential for failure by natural disasters will be provided in the DEIS. This will include a discussion of the standards under which the landfill is designed to ensure against structural deficiency. Concerning the structural integrity of the existing site please refer to Section 4.5.2. Seismic Characteristics, of the EISPN, describing the effects of the recent earthquake. No failure or damage to the landfill and supporting infrastructure occurred as a result of the October 15, 2006, magnitude 6.7 earthquake off the island of Hawaii.

5. "The EIS must address the well documented and continued escape of waste from the Landfill site. This includes an analysis of the fact that HECO had identified the area as one of the windiest locations on the island and how the proposed expansion to higher elevations will create greater problems for waste being blown off the landfill. These disclosures must also identify where this escaping trash is landing and its impact on the land and, more importantly the ocean. The escaping waste goes much further than the "valley rim" as implied by the EISPN."

Discussion of litter management at the site will be provided in the DEIS including measures that will be implemented to mitigate against adverse impacts, such as those of concern to you.

Comments Concerning the Background Information Identified in the EISPN

6. "The background section fails to identify the specific, sworn statements made by the City at the 2003 Planning Commission Meetings and State Land Use Commission meetings regarding the promised closure of Waimanalo Gulch Landfill, and which resulted in the specific language regarding the Landfill's closure in 2008 being included in both the Planning Commission and Land Use Commission Decision and Orders."

The City acknowledges that prior commitments were made by the previous administration to close Waimānalo Gulch by 2008. This is the basis for the inclusion of the information contained in the EISPN.

7. "In describing the process followed by the Mayor's Advisory Committee. The EISPN fails to recognize that the Committee agreed that the "double blind methodology" was to be advisory only to the group, and was not to be used as a means of "ranking" the potential sites. Furthermore, it is inaccurate to state that the results of the methodology caused "a division in the Committee" or a change in the decision making process. Finally, despite the language in Council Resolution 04-348, the EISPN should accurately reflect that the Office of Informational Practices did not rule that the Committee's report was "void due to violations of the sunshine law." OIP does not have the legal authority to void such action or report."

"From the Council's actions in passing Council Resolution 04-348 and Bill 37 (2005), it is clear that the Council's position on the City's policy for its solid waste is to close Waimanalo Gulch Landfill."

The City acknowledges your comments. The final decision making by the Mayor's Advisory Committee was within the purview of its individual members to consider, reject, or ignore the results of the double blind process as it considered the optimal site for a landfill. As was noted in the Report of the Mayor's Advisory Committee (Blue Ribbon Committee) on Landfill Site Selection, December 1, 2003, four of the members of the Committee resigned prior to the taking of a vote to move from consensus decision making to voting. The reasons for the resignations are clearly stated in the Report, as is the results of the voting that led to the removal of the Waimānalo Gulch landfill site.

We acknowledge that information concerning the results of Resolution 04-038 and Bill 37 are documented in the EISPN.

Visual and Other Impacts of Waimanalo Gulch Landfill

8. "There are many inaccuracies in Section 4.11 of the EISPN. They include the following:

- *A more complete disclosure of the visibility of the Landfill is required. Whether from Farrington Highway, at ground level, or elevated level, the visual impact is much more than a "gray-hued ash fill that resembles a quarry."*
- *Vehicles driving on the hillside and higher elevation portions of the landfill can be seen from the ground and from driving along Farrington Highway. It is not only "From sea" that these impacts are visible.*
- *Landfill operations vehicles **CAN** be visible - not "may be visible."*
- *The queuing of vehicles, whether infrequent or not, **DO** make the presence of the landfill apparent - not "may" and this does not make the landfill "momentarily apparent." The continued visibility of trucks. Machinery and flying waste make the landfill **continually apparent** to all who live in the area, visit the area, or drive through the area.*
- *As mentioned above, waste being blown off the landfill consists of more than just plastic bags and end up in more places than just the valley rim. Significant amounts of this waste has blown into adjacent properties and into the ocean. Evidence of this has been presented to the City and to Waste Management in the past."*

The concerns you indicate will be addressed in the DEIS as appropriate.

9. "The EISPN mentioned the hydromulching that has attempted to "landscape" the Landfill. However, it fails to address the less than adequate success of these efforts, and the visible canyons and rivulets created along the face of the landfill during heavy rains as the water erodes the dirt slope of the landfill."

Landscaping that is proposed for the project will be described in the DEIS. Stormwater management controls in compliance with applicable regulations will also be described.

10. "The EIS must disclose the fact that because of the operator's failure to handle leachate problems at the landfill, large amounts of leachate were pumped in trucks and taken to the Waianae Waste Water Treatment Plant. The amount of that leachate must be disclosed and its true impacts must be investigated. While it has been said that it was allowable, that answer is insufficient. The EIS must disclose how that leachate changed the water discharged from the Treatment Plant, directly into the ocean. This question was raised many times at the Waianae Neighborhood Board."

The leachate that is accepted by the operator of the Waianae Wastewater Treatment Plant was, and continues to be, in accordance with regulatory requirements to ensure public health and safety. Leachate management and monitoring will be part of the Solid Waste Operating Permit application. As noted in a memorandum to ENV from the operators of the Waianae Wastewater Treatment Plant, the leachate accepted by the plant for processing has had very little or no impact on the wastewater effluent quality that is being discharged to the ocean outfall (see attached memorandum dated October 2, 2007).

Examination of Alternatives

11. "The EISPN fails to address the significant changes that has occurred in the potential of shipping waste to other landfills since the last EIS. In examining this alternative, the EIS must acknowledge and identify the multitudes of other cities and municipalities throughout the country that truck or ship their waste to other cities and states. Furthermore, the EIS must examine the recent changes in the Federal Rules allowing for the shipping of waste specifically from Hawaii to the mainland."

The DEIS will provide an alternatives analysis that includes the transshipment of waste as an alternative to the continued use of the landfill.

12. "In examining alternatives for landfills, the EIS must recognize that ash and MSW landfills do not need to be located together. The impacts from these two types of waste are significantly different and given Honolulu's situation and history, the EIS must examine possible solutions where MSW and ash can be landfilled in different locations. This will increase the potential for possible locations for future landfill sites."

The alternative of using more than one landfill site will be discussed as part of the DEIS.

12. "Overall, the EIS must encompass the multitude of comments - formal and informal - that have been received by the City and Waste Management over the last nearly six years, since the City started the attempts to expand the operations at Waimanalo Gulch Landfill. The operational problems at the Landfill, including those cited by the Department of Health in its Notice of Violation, must be directly addressed, as those have shown a clear failure of operations and proved that the concerns and complaints over the last six years were well founded."

As noted above, the matter of the NVO has been resolved and will be discussed in the DEIS. The comments that were received for the EISPN will be addressed in the DEIS in accordance with applicable requirements.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura, Ph.D., P.E.
Director

MEMORANDUM

TO: FRANK J. DOYLE, CHIEF
REFUSE DIVISION

Athan K. Adachi

FROM: ATHAN K. ADACHI, CHIEF
DIVISION OF ENVIRONMENTAL QUALITY

SUBJECT: WAIMANALO GULCH LANDFILL LEACHATE DISCHARGE TO THE WAIANAE WASTEWATER TREAMENT PLANT FACILITY

Current leachate discharge to the Waianae WWTP has been minimal, approximately 16,000 gallons per day, once a week. The plant treats on average approximately 3,250,000 gallons per day of domestic raw wastewater. Our monitoring data shows that the leachate has not changed the water quality near the outfall and the sampling at the outfall shows all are in compliance with State Department of Health regulation. The plant has continuously met minimum State and Federal water quality requirements. Overall, the additional loading of leachate had very little or no impact on the wastewater effluent quality being discharge to the ocean outfall.

Should you have any questions on this matter, please contact Jerome Ababa of our Monitoring and Compliance Branch, Division of Environmental Quality at 768-3255.

Testimony in opposition to the planned expansion of the
Waimanalo Gulch Sanitary Landfill, TMK 9-2-03

On behalf of EnviroWatch, Inc. a non profit organization based in Mililani Hawaii, I wish to express our strong opposition to the planned expansion of the Waimanalo Gulch Sanitary Landfill, TMK 9-2-03. This opposition is based a number of concerns related to earlier management practices and the overall operation of the Waimanalo Gulch Sanitary Landfill, which has resulted in an Issuance of Notice and Finding of Violation Docket NO. 05-SHW-SWS-004 consisting of eighteen counts and two hundred and twelve documented incidences supporting the Notice and Finding of Violation.

We are also believe that the City and County of Honolulu's Department of Environmental Services continues to permit the operation of the Waimanalo Gulch Sanitary Landfill in breach of the original contract between the contractor, Waste Management of Hawaii, and the City and County of Honolulu, which is corroborated by the eighteen counts and two hundred and twelve documented incidences supporting the Notice and Finding of Violation. And, we are concerned that the current facility's permit and permit application is inadequate and does not address the concerns of regarding the Surface Water Management System Design and Final Cover Design.

The City and County of Honolulu has failed to meet all of the conditions required by the Land Use Commission. We do not have a curbside recycling program. We are failing to divert a large portion of the municipal and solid waste from the Waimanalo Gulch Sanitary Landfill. This is confirmed in the City and County of Honolulu's routine practice of closing the H-Power Plant in excess of one hundred days per year and diverting the municipal and solid waste to the Waimanalo Gulch Sanitary Landfill.

Finally, we are concerned that the City and County of Honolulu has failed to utilize alternative methods of managing Municipal Solid Waste.

Sincerely,

Carroll E. Cox

May 12, 2008

Mr. Carroll E. Cox
EnviroWatch, Inc.
P.O. Box 89-3062
Mililani, Hawaii 96789

Dear Mr. Cox:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 26, 2006 concerning the subject project. We have prepared the following in response to your comments (your comments have been italicized for reference):

> *1. "I wish to express our strong opposition to the planned expansion of the Waimanalo Gulch Sanitary Landfill, TMK 9-2-03. This opposition is based a [sic] number of concerns related to earlier management practices and the overall operation of the Waimanalo Gulch Sanitary Landfill, which has resulted in an Issuance of Notice and Finding of Violation Docket NO. 05-SHW-SWS-004 consisting of eighteen counts and two hundred and twelve documented incidences supporting the Notice and Finding of Violation."*

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved.

The Environmental Protection Agency's (EPA) Notice of Violation (NOV) concerning the landfill's gas collection system is currently under discussion amongst the EPA, the City and Waste Management. Until those negotiations are concluded, there can be no final determination as to the validity of the alleged violations. The NOV will be discussed in the DEIS.

> *2. "We are [sic] also believe that the City and County of Honolulu's Department of Environmental Services continues to permit the operation of the Waimanalo Gulch Sanitary Landfill in breach of the original contract between the contractor, Waste Management of Hawaii, and the City and County of Honolulu, which is corroborated by the eighteen counts and two hundred and twelve documented incidences supporting the Notice and Finding of Violation. And, we are concerned that the current facility's permit and permit application is inadequate and does not address the concerns of [sic] regarding the Surface Water Management System Design and Final Cover Design."*

The contract between the City and Waste Management of Hawaii is a public document. The City has monitored the performance of Waste Management under this contract and has taken appropriate action to protect the public interest. As noted above, all alleged violations in the NVO have been resolved.

The management of stormwater, surface water runoff, and the use of final cover for the proposed project will be described in the DEIS.

> *3. "The City and County of Honolulu has failed to meet all of the conditions required by the Land Use Commission. We do not have a curbside recycling program. We are failing to divert a large portion of the municipal and solid waste from the Waimanalo Gulch Sanitary Landfill. This is confirmed in the City and County of Honolulu's routine practice of closing the H-Power Plant in excess of one hundred days per year and diverting the municipal and solid waste to the Waimanalo Gulch Sanitary Landfill."*
>
> *"Finally, we are concerned that the City and County of Honolulu has failed to utilize alternative methods of managing Municipal Solid Waste."*

The City has an on-going green waste curbside recycling program and sought public input for a curbside mixed recycling program that is now ongoing. The City has actively sought to increase the use of alternative technologies to reduce dependency on landfilling. In 2007 the City released a request for proposals (RFP) to investigate technology based alternatives, and in early 2008 related a request for proposals for waste transshipment. A discussion of these items as well as efforts taken by the City since 2002 will be provided in the DEIS.

Concerning the State Land Use Commission and the status of the existing State Special Use Permit, an amendment to this permit will be required to allow for the proposed project. Further discussion of this matter will also be provided in the DEIS.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S Takamura

As I have previously testified, I remain opposed to the proposed expansion of the Waimanalo Gulch Sanitary Landfill (TMK s: (1) 9-2-003:072 and 073) - owned by the City and County of Honolulu and operated by Waste Management of Hawaii, Inc.

After reviewing, the preparation notice document and attending the public scoping meetings the following are my comments and concerns regarding the proposed expansion.

The validity of the following mandates for closure is as pertinent today as when they were issued:

- The State of Hawaii Special Use Permit calls for the closure of the landfill by May 1, 2008 barring the facility from accepting municipal waste (excluding H-Power ash, residue and unacceptable waste.
- The planned completion and final closure of the last cell is projected for the end of 5 years from the start of use of the last 14.9-acre expansion area on December 24, 2002.
- Summary report and Council Resolution 04-348, CD1, FD1mandated that the City and County of Honolulu " . . . devote all available resources to ensuring the maximum use of recycling and the development of alternative technologies for disposal of municipal solid waste with the intention to effectively eliminate, to the extent possible, the need for a landfill by 2008;"
- Council Bill 37 (2005), CD2 states "After May 1, 2008, it is in the best interests of the city to comply with the state land use commission's special use permit granted to the city, the terms and conditions of which require that no additional waste be deposited at the facility and that the facility be closed in accordance with an approved closure plan."

  Section 5 of the Bill further directed the City to submit to the Council by December 31, 2006, its plan to comply with the ordinance, noted that at a minimum, the City administration shall include in the plan the strategies for, and costs of compliance.

Any action to further expand the existing Waimanalo Gulch Sanitary Landfill satisfies the description in the Hawaii Administrative Rules, Title 11, Chapter 200 §11-200-12 – *Significance Criteria* as " . . . an action . . . determined to have a significant effect on the environment . . ." Approval of a permit to expand the current Waimanalo Gulch Sanitary Landfill will allow the following adverse environmental acts to occur:

1. Involve an irrevocable commitment to loss or destruction of any natural or cultural resource
2. Conflict with the State's long-term environmental policies or goals and guidelines as expressed in chapter 344, HRS
3. Substantially affect public health
4. Involve substantial degradation of environmental quality

The pending expansion permit application is in direct contradiction to all commitments made to date of the City's intent to systematically reduce and eventually cease operation of the existing Waimanalo Gulch Sanitary Landfill.

While I have many concerns, in the interest of brevity I will detail a few.

Ground water

Of the 18 counts of violation identified in the Department of Health – Notice and Finding of Violation dated January 31, 2006 (Docket No. 05-SHW-SWS-004); five[1] violations related directly to excess leachate[2] levels, and the operators failure to measure and report as required by the existing permit.

Adverse effects on groundwater[3] and aquifers[4] are widely documented, not to mention the direct contamination witnessed on Farrington Highway fronting the landfill site caused by runoff resulting from over saturation during heavy rains (as experienced during March 2006).

Air Quality – including incidences of litter, dust and odors

The existing Solid Waste Management Permit Number LF-0054-02 requires the current facility operator to provide a written plan and relative record keeping documenting the actions taken to minimize free litter through out the landfill facility as well as preventing the occurrence of litter, dust and odors beyond the facility's property line.

The failure of the facility operator to insure these mandates are met is well documented by the Department of Health inspectors as well the public. Citation of these violations can also be found in the Jan 2006 Notice and Finding document.

Traffic hazards

Large trucks and loose debris from the facility are an on-going problem. As mentioned above, litter that makes it way beyond the facility's property line attach to automobile windshields and antennas often-endangering drivers.

Daily, large trucks exiting the facility speed across the two westbound lanes of traffic in an effort to beat on-coming traffic as they make their way to the east bound lanes headed toward Honolulu often creating near miss traffic accidents.

---

[1] Count V – pg. 12; Count VI – pg. 14; Count VII – pg. 15; Count IX – pg. 17; Count XV – pg. 25

[2] Leachate: a solution resulting from the empting; draining, as of soluble components from soil, landfill, etc., by downward percolating ground water: *Leachates in the town's water supply have been traced to a chemical-waste dump.* leachate. (n.d.). *Dictionary.com Unabridged (v 1.1).*

[3] Groundwater comes from rain and snowmelt that seeps into the ground. Gravity pulls the water down through the spaces between particles of soil or through cracks in rocks. Eventually the water reaches a depth where all openings in soil or rock are filled with water. This is called the saturated zone. The water in the saturate zone is called groundwater.

[4] A saturated soil or rock layer with spaces that allow water to move through it is called an aquifer. Aquifers may be separate by layers of rock or clay that do not allow water to move through it.

Trucks, waiting to enter the landfill facility are often forced to line-up along the westbound shoulder of Farrington Highway are documented regularly. While waiting to enter the facility, these trucks often leak and seep sludge and other toxic, odorous liquid.

Assertion that a "NO ACTION" alternative would result in adverse island wide impacts

The City and County of Honolulu's administration; both the Mayor's office and the Department of Environmental Services continue to operate in direct contradiction to every written plan – accepted and proposed mandating that the existing landfill facility located at Waimanalo Gulch on the Leeward Coast of Oahu be closed. Postponing the solicitation and selection of alternative waste processing technologies, refusal to consider transshipment of waste off-island and the failure to complete the long over-due Solid Waste Integrated Management Plan are the short list of examples. In turn, the City and County has done little to identify and expedite the selection and implementation of any number of available alternative waste processing technologies. Resting on the notion that there is expansion potential for the current site – the City and County continues the use of land filling to meet Oahu's Refuse Disposal Requirements.

In conclusion, The General Plan[5] for the City and County of Honolulu, "(*the plan*) is a comprehensive statement of objectives and policies which sets forth the long-range aspirations of Oahu's residents and the strategies of actions to achieve them." The plan further sets forth the following policy statement found in Chapter 5: Transportation and Utilities, Objective B *(five of seven policy statements relate to solid-waste management)*:

> **To meet the needs of the people of Oahu for an adequate supply of water and for environmentally sound systems of waste disposal.**
>
> **Policy 3:** Encourage the development of new technology which will reduce the cost of providing water and the cost of waste disposal.
> **Policy 4:** Encourage a lowering of the per-capita consumption of water and the per-capita production of waste.
> **Policy 5:** Provide safe, efficient, and environmentally sensitive waste-collection and waste- disposal services.
> **Policy 6:** Support programs to recover resources from solid-waste and recycle wastewater.
> **Policy 7:** Require the safe disposal of hazardous waste.

As documented in the preparation notice, when the Waimanalo Gulch Sanitary Landfill was designated in 1989, "there was limited to growth in the Ewa region."

Today, almost 20 years later, the City of Kapolei and the surrounding region known as the Ewa Plain are the most rapidly growing areas on the Island of Oahu. This region is where both city and state officials are directing the majority of future growth on the Island of Oahu,

---

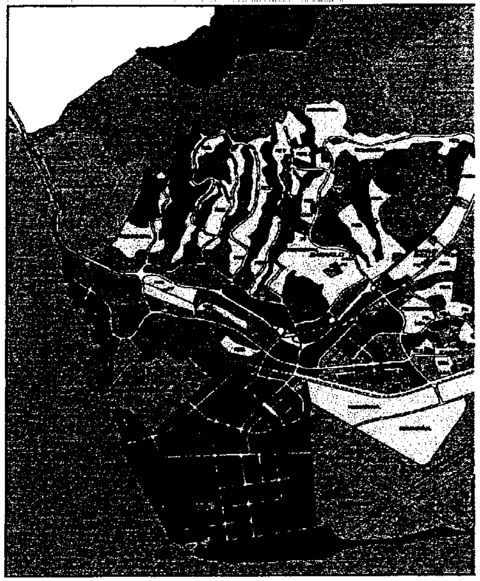
[5] *This revised 1992 edition of the General Plan reinforces this planning concept. It supersedes all previous editions and includes all changes, which were adopted through the end of 1991.* It is the focal point of a comprehensive planning process that addresses physical, social, economic and environmental concerns affecting the City and County of Honolulu. This planning process serves as the coordinative means by which the City and County government provides for the future growth of the metropolitan area of Honolulu. *Since the adoption of the General plan in 1977, a number of amendments were subsequently adopted in 1979, 1982, 1985,1987,1989,1990, 1991, 1992, and 2002. However, in spite of these changes, the basic themes and directions for growth remain valid, and require continued pursuit.*

planned City of Kapolei a resounding success. With no less than 20 major residential communities built, planned or under construction at this time and homes selling as fast as they can be built, Kapolei has truly come of age.

Businesses and services needed to support the rapidly growing community have been moving to the area in unmatched numbers. Recent additions have included nationally known businesses such as The Home Depot, Gannett's $85.0 million dollar newspaper plant, K-Mart, Consolidated Theaters, Ace Hardware, Starbucks, Jamba Juice, Burger King, Wendy's, Jack in the Box, Chili's, McDonald's, KFC, Safeway, Longs Drugs, Blockbuster Video, Payless Shoesource and many more. Over 425 local, regional and national businesses have chosen to make the City of Kapolei their home.

Therefore, based on the blatant and egregious counts identified in the Notice of Violations issued against the City's current landfill operator and the administration's failure to both oversee and monitor their own contractor. Moreover, because of the administration's indurate response to the Honolulu City Council's request that the SWIM plan be completed in a timely manner; it is incumbent on all permit granting agencies to be influenced by the subsequent Environmental Impact Statement and related State Special Use Permit (SUP) Amendment application to deny any further expansion of the existing Waimanalo Gulch Sanitary Landfill facility.

Hawaii's most populous island.



The City of Kapolei was designed as a complete master planned community with the intentions of becoming a major urban center rivaling Downtown Honolulu, providing a place to live, work, shop and enjoy recreational activities, eliminating the need to travel into the densely populated Downtown Honolulu or Waikiki areas.

Complimenting Campbell Estates' efforts is the rapid growth of the adjacent Ko Olina master planned resort area, which provides world-class resort accommodations. Championship golf and spa facilities, hotel and timeshare lodging, a yacht harbor and yacht club, beach clubs and residential resort developments are springing up at unprecedented rates. Not only has the area gained credibility from the international hospitality community, but the area has also become a favored destination by Oahu's residents as a quick get-a-way from the hustle and bustle of Downtown Honolulu.

Kapolei is strategically situated at the intersection of technologies in the Pacific. Globally connected by both fiber-optic cabling and satellite transmissions, Kapolei is well positioned to take forward-thinking businesses into the information age.

Over the past 20 years, Campbell Estates' vision has become a reality and the master

IN REPLY REFER TO:
RA 08-049

May 12, 2008

Mr. Robert H. Kaialau, III
565 Kokea Street, Suite D7
Honolulu, Hawaii 96817

Dear Mr. Kaialau:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 26, 2006 concerning the subject project. The following is in response to your comments (your comments have been italicized for reference):

1. "The validity of the following mandates for closure is as pertinent today as when they were issued:

- *The State of Hawaii Special Use Permit calls for the closure of the landfill by May 1, 2008 barring the facility from accepting municipal waste (excluding H-Power ash, residue and unacceptable waste.*
- *The planned completion and final closure of the last cell is projected for the end of 5 years from the start of use of the last 14.9-acre expansion area on December 24, 2002.*
- *Summary report and Council Resolution 04-348, CDI, FDI mandated that the City and County of Honolulu " . . . devote all available resources to ensuring the maximum use of recycling and the development of alternative technologies for disposal of municipal solid waste with the intention to effectively eliminate, to the extent possible, the need for a landfill by 2008";*
- *Council Bill 37 (2005), CD2 states "After May 1, 2008, it is in the best interests of the city to comply with the state land use commission's special use permit granted to the city, the terms and conditions of which require that no additional waste be deposited at the facility and that the facility be closed in accordance with an approved closure plan.""*

"Section 5 of the Bill further directed the City to submit to the Council by December 31, 2006, its plan to comply with the ordinance, noted that at a minimum, the City administration shall include in the plan the strategies for, and costs of compliance."

The following clarification is provided concerning Resolution 04-348, CD1, FD1, and Bill 37 (2005). Resolution 04-348 called for the selection of Waimanalo Gulch as the City's landfill. The reasons for this selection were provided in the EISPN, Section 1.2.2. Council Resolution 04-348, CD1, FD1, Selecting a Site for a New City Landfill.

Bill 37 was vetoed by the Mayor and did not become law. Please refer to the EISPN, Section 1.2.3.

2. "Any action to further expand the existing Waimanalo Gulch Sanitary Landfill satisfies the description in the Hawaii Administrative Rules, Title 11, Chapter 200 §11-200-12 - Significance Criteria as " . . . an action . . . determined to have a significant effect on the environment. . ." Approval of a permit to expand the current Waimanalo Gulch Sanitary Landfill will allow the following adverse environmental acts to occur:

1. *Involve an irrevocable commitment to loss or destruction of any natural or cultural resource*
2. *Conflict with the State's long-term environmental policies or goals and guidelines as expressed in chapter 344, HRS*
3. *Substantially affect public health*
4. *Involve substantial degradation of environmental quality"*

Your comments regarding regulatory requirements are noted. The potential impacts associated with the lateral expansion of the landfill footprint will be provided in the Draft EIS (DEIS).

3. "The pending expansion permit application is in direct contradiction to all commitments made to date of the City's intent to systematically reduce and eventually cease operation of the existing Waimanalo Gulch Sanitary Landfill."

The DEIS will include discussion of the prior City administration's statements regarding the closing of the landfill within the five-year or 2008 timeframe, as documented in the 2003 State Special Use Permit. The DEIS will provide the history of governmental actions since those earlier statements up to the current DEIS.

4. "Ground water"

"Of the 18 counts of violation identified in the Department of Health - Notice and Finding of Violation dated January 31, 2006 (Docket No, 05-SHW-SWS-004); five[1] violations related directly to excess leachate[2] levels, and the operators failure to measure and report as required by the existing permit."

"Adverse effects on groundwater[3] and aquifers[4] are widely documented, not to mention the direct contamination witnessed on Farrington Highway fronting the landfill site caused by runoff resulting from over saturation during heavy rains (as experienced during March 2006)."

Footnotes:
"[1] Count V - pg. 12; Count VI - pg. 14; Count VII - pg. 15; Count IX - pg. 17; Count XV - pg. 25
[2] Leachate: a solution resulting from the empting; draining, as of soluble components from soil, landfill, etc., by downward percolating ground water: Leachates in the town's water supply have been traced to a chemical-waste dump. leachate, (n.d.). Dictionary.com Unabridged (v1.1).

[3]Groundwater comes from rain and snowmelt that seeps into the ground. Gravity pulls the water down through the spaces between particles of soil or through cracks in rocks. Eventually the water reaches a depth where all openings in soil or rock are filled with water. This is called the saturated zone. The water in the saturate zone is called groundwater.
[4]A saturated soil or rock layer with spaces that allow water to move through it is called an aquifer. Aquifers may be separate by layers of rock or clay that do not allow water to move through it."

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved. The NVO, settlement and grade modification will be discussed in the DEIS.

The Environmental Protection Agency's (EPA) Notice of Violation (NOV) concerning the landfill's gas collection system is currently under discussion amongst the EPA, the City and Waste Management. Until those negotiations are concluded, there can be no final determination as to the validity of the alleged violations. The NOV will be discussed in the DEIS.

5. "Air Quality - including incidences of litter, dust and odors"
"The existing Solid Waste Management Permit Number LF-0054-02 requires the current facility operator to provide a written plan and relative record keeping documenting the actions taken to minimize free litter through out the landfill facility as well as preventing the occurrence of litter, dust and odors beyond the facility's property line."
"The failure of the facility operator to insure these mandates are met is well documented by the Department of Health inspectors as well the public. Citation of these violations can also be found in the Jan 2006 Notice and Finding document."

Please refer to our response to comment no. 4, above. Concerning air quality, the DEIS will provide further information concerning the potential for impacts and mitigation measures associated with the expansion of the landfill.

6. "Traffic hazards"
"Large trucks and loose debris from the facility are an on-going problem. As mentioned above, litter that makes it way beyond the facility's property line attach to automobile windshields and antennas often-endangering drivers."
"Daily, large trucks exiting the facility speed across the two westbound lanes of traffic in an effort to beat on-coming traffic as they make their way to the east bound lanes headed toward Honolulu often creating near miss traffic accidents."
"Trucks, waiting to enter the landfill facility are often forced to line-up along the westbound shoulder of Farrington Highway are documented regularly. While waiting to enter the facility, these trucks often leak and seep sludge and other toxic, odorous liquid.

Some of the impacts you describe have been mitigated or curtailed. There is an active litter management program in place that will be further discussed in the DEIS. Vehicular queuing and measures to reduce and prevent such occurrences will also be discussed in the DEIS.

Vehicles entering the landfill are required to have their loads covered and a clean out area for truck operators is provided to allow the clean out of debris before it can become windblown when vehicles leave the City's property. Vehicle operators who violate these provisions are at risk of being prohibited from using the landfill. The Department of Environmental Services (692-5358) asks that if anyone witnesses such events taking place, that they contact us or Waste Management of Hawaii (668-2985), so appropriate immediate action can be taken to prevent such occurrences.

Any vehicles using the landfill, or any public roads, which operate in an unsafe manner are also subject to sanctions. Do not hesitate to contact us, Waste Management of Hawaii, or the police, if you witness vehicle operators behaving in an unsafe manner.

Vehicles that spill their loads onto the highway and public right-of-way, whether solid or liquid, are also not tolerated. While our operator, Waste Management, regularly enforces this provision within the landfill property, the City does not have a police force that can monitor the actions of all private and commercial drivers using the public highway system. We ask that when you witness such events taking place that you report such incidences to us, Waste Management, or the police immediately for proper action.

7. "Assertion that a "NO ACTION" alternative would result in adverse island wide impacts
The City and County of Honolulu's administration; both the Mayor's office and the Department of Environmental Services continue to operate in direct contradiction to every written plan - accepted and proposed mandating that the existing landfill facility located at Waimanalo Gulch on the Leeward Coast of Oahu be closed. Postponing the solicitation and selection of alternative waste processing technologies, refusal to consider transshipment of waste off-island and the failure to complete the long over-due Solid Waste Integrated Management Plan are the short list of examples. In turn, the City and County has done little to identify and expedite the selection and implementation of any number of available alternative waste processing technologies. Resting on the notion that there is expansion potential for the current site - the City and County continues the use of land filling to meet Oahu's Refuse Disposal Requirements."

The DEIS will identify a number of activities that the City has been engaged in since 2002 regarding alternatives to reduce our dependency on landfilling. In addition, there will be further discussion of alternatives to reduce and recycle waste, including the use of transshipment.

8. "In conclusion, *The General Plan[5] for the City and County of Honolulu,* *"(the plan) is a comprehensive statement of objectives and policies which sets forth the long-range aspirations of Oahu's residents and the strategies of actions to achieve them." The plan further sets forth the following policy statement found in Chapter 5: Transportation and Utilities, Objective B (five of seven policy statements relate to solid-waste management):"*

> ***"To meet the needs of the people of Oahu for an adequate supply of water and for environmentally sound systems of waste disposal."***
>
> *"Policy 3: Encourage the development of new technology which will reduce the cost of providing water and the cost of waste disposal."*
> *"Policy 4: Encourage a lowering of the per-capita consumption of water and the per-capita production of waste."*
> *"Policy 5: Provide safe, efficient, and environmentally sensitive waste-collection and waste- disposal services."*
> *"Policy 6: Support programs to recover resources from solid-waste and recycle wastewater."*
> *"Policy 7: Require the safe disposal of hazardous waste."*
>
> *Footnote: "[5]This revised 1992 edition of the General Plan reinforces this planning concept. It supersedes all previous editions and includes all changes, which were adopted through the end of 1991. It is the focal point of a comprehensive planning process that addresses physical, social, economic and environmental concerns affecting the City and County of Honolulu. This planning process serves as the coordinative means by which the City and County government provides for the future growth of the metropolitan area of Honolulu. Since the adoption of the General plan in 1977, a number of amendments were subsequently adopted in 1979, 1982, 1985, 1987, 1989, 1990, 1991, 1992, and 2002. However, in spite of these changes, the basic themes and directions for growth remain valid, and require continued pursuit."*

The above sections of the General Plan have been forwarded to our consultant for appropriate action in the preparation of the DEIS.

> *9. "As documented in the preparation notice, when the Waimanalo Gulch Sanitary Landfill was designated in 1989, "there was limited to [sic] growth in the Ewa region."*
> *"Today, almost 20 years later, the City of Kapolei and the surrounding region known as the Ewa Plain are the most rapidly growing areas on the Island of Oahu. This region is where both city and state officials are directing the majority of future growth on the Island of Oahu, Hawaii's most populous island."*
> *"The City of Kapolei was designed as a complete master planned community with the intentions of becoming a major urban center rivaling Downtown Honolulu, providing a place to live, work, shop and enjoy recreational activities, eliminating the need to travel into the densely populated Downtown Honolulu or Waikiki areas."*
> *"Complimenting Campbell Estates' efforts is the rapid growth of the adjacent Ko Olina master planned resort area, which provides world-class resort accommodations. Championship golf and spa facilities, hotel and timeshare lodging, a yacht harbor and yacht club, beach clubs and residential resort developments are springing up at unprecedented rates. Not only has the area gained credibility from the international hospitality community, but the area has also become a favored destination by Oahu's residents as a quick get-a-way from the hustle and bustle of Downtown Honolulu."*
> *"Kapolei is strategically situated at the intersection of technologies in the Pacific. Globally connected by both fiber-optic cabling and satellite transmissions, Kapolei is well positioned to take forward-thinking businesses into the information age."*

> *"Over the past 20 years, Campbell Estates' vision has become a reality and the master planned City of Kapolei a resounding success. With no less than 20 major residential communities built, planned or under construction at this time and homes selling as fast as they can be built, Kapolei has truly come of age."*
> *"Businesses and services needed to support the rapidly growing community have been moving to the area in unmatched numbers. Recent additions have included nationally known businesses such as The Home Depot, Gannett's $85.0 million dollar newspaper plant, K-Mart, Consolidated Theaters, Ace Hardware, Starbucks, Jamba Juice, Burger King, Wendy's, Jack in the Box, Chili's, McDonald's, KFC, Safeway, Longs Drugs, Blockbuster Video, Payless Shoesource and many more. Over 425 local, regional and national businesses have chosen to make the City of Kapolei their home."*
> *"Therefore, based on the blatant and egregious counts identified in the Notice of Violations issued against the City's current landfill operator and the administration's failure to both oversee and monitor their own contractor. Moreover, because of the administration's indurate response to the Honolulu City Council's request that the SWIM plan be completed in a timely manner; it is incumbent on all permit granting agencies to be influenced by the subsequent Environmental Impact Statement and related State Special Use Permit (SUP) Amendment application to deny any further expansion of the existing Waimanalo Gulch Sanitary Landfill facility."*

Your comments regarding growth occurring in West Oahu are noted and will be discussed in the DEIS.

Please refer to our response to the DOH NVO, above.

As much as possible the preparation of the subject DEIS is being coordinated with the SWIM Plan. However, the plan is currently under draft and will be coordinated with the DOH and other appropriate parties for approval.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

Re: Waimanalo Gulch Sanitary Landfill Expansion, TMK (1) 9-2-03
Environmental Impact Statement Preparation Notice

Dear Ms. Namumnart

I would like to take the opportunity to voice my concerns about the proposed expansion of the Waimanalo Gulch Sanitary Landfill. It is interesting that the landfill is now a mountain and not a gulch anymore. This should be the first indication that we as a City and County are addressing this situation incorrectly. There are many obvious reasons why the landfill should not be expanded.

These include environmental hazards – ground water contamination, underground methane fires, potential ocean runoff, and air pollution. Other reasons include the wasting of the City and County of Honolulu natural and financial resources.

Many private entities offer recycling solutions that would not be harmful to our delicate ecosystem and also offer financially profitability. By not seriously exploring these alternative technologies, the leadership of the City and County of Honolulu will do a disservice to our community. We live in an age that we understand the harmful effects of landfills.

If nothing else, close it for monetary reasons. We have already had large fines levied – fines that to this day have not been paid. The fines that will have to be eventually paid – will be paid with our increasingly harder to come by tax dollars. The City's leadership has promised to close Waimanalo Gulch Sanitary Landfill twice.

It's time to keep that promise. The permit for expansion should not be granted.

Sincerely,

David J. Reantaso

May 12, 2008

Mr. David J. Reantaso
e-mail: davidreantaso@yahoo.com

Dear Mr. Reantaso:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 26, 2006, concerning the subject project. The following is prepared in response to your comments (your comments have been italicized for reference):

1. *"I would like to take the opportunity to voice my concerns about the proposed expansion of the Waimanalo Gulch Sanitary Landfill. It is interesting that the landfill is now a mountain and not a gulch anymore. This should be the first indication that we as a City and County are addressing this situation incorrectly. There are many obvious reasons why the landfill should not be expanded.*
These include environmental hazards - ground water contamination, underground methane fires, potential ocean runoff, and air pollution. Other reasons include the wasting of the City and County of Honolulu natural and financial resources."

Your objection to the proposed project is acknowledged. The potential for adverse environmental impacts including those you describe will be provided in the Draft EIS (DEIS). The DEIS will include the cost of the proposed project, and the relationship of the proposed project to the future waste management needs of the City & County of Honolulu.

2. *"Many private entities offer recycling solutions that would not be harmful to our delicate ecosystem and also offer financially profitability. By not seriously exploring these alternative technologies, the leadership of the City and County of Honolulu will do a disservice to our community. We live in an age that we understand the harmful effects of landfills."*

Information pertinent to the feasibility and environmental impacts associated with alternative technologies to the handling and disposal of municipal solid waste will be provided in the alternatives analysis that will be part of the DEIS.

> 3. *"If nothing else, close it for monetary reasons. We have already had large fines levied - fines that to this day have not been paid. The fines that will have to be eventually paid - will be paid with our increasingly harder to come by tax dollars. The City's leadership has promised to close Waimanalo Gulch Sanitary Landfill twice.*
> *It's time to keep that promise. The permit for expansion should not be granted."*

The immediate closure of the Waimanalo Gulch Sanitary Landfill without a feasible alternative to the disposal of all of the forms of municipal refuse that are generated on the island of Oahu is not a reasonable nor prudent course of action that can be taken.

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved. The NVO, settlement and grade modification will be discussed in the DEIS.

The Environmental Protection Agency's (EPA) Notice of Violation (NOV) concerning the landfill's gas collection system is currently under discussion amongst the EPA, the City and Waste Management. Until those negotiations are concluded, there can be no final determination as to the validity of the alleged violations. The NOV will be discussed in the DEIS.

The reason for the City's current EIS involve a number of actions that have transpired since completion of the last EIS in December 2002. Documentation of the prior commitment to close Waimanalo Gulch was provided in the EISPN, Section 1, Project Background.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

Ko Olina Fairways Association of Apartment Owners Comments on EISP Notice

Dear Director Takamura:

As President of the Ko Olina Fairways Association of Apartment Owners ("AOAO") representing 280 townhouses at Ko Olina Resort, we are responding to your notice for comments to the EIS Preparation Notice addressed in your November 8, 2006 letter. We did not receive a copy of the letter or the report from your office. We did hear about the EIS Preparation Notice through a friend and we recovered a copy from another source. Please place me on your mailing list again.

Your letter and the efforts of your department are unbelievable in that you seek a resurrection of the EIS process for the Waimanalo Gulch (located in Kapolei) as a site for a continuing landfill. Did we just waste all the money and efforts of the Draft EIS in 1999 and the Supplemental EIS of 2002?

Our community and our neighbors in abutting communities have relied on the pending closure of the Landfill. We have invested enormous time and effort since the incomplete and flawed DEIS and SEIS effort of 1999 and 2002 ended with a commitment from the City government and the Mayor to close the site to Municipal Waste in 2008. For the City to change directors in the Department of Environmental Services and then re-launch a plan to continue using the Waimanalo Dump past the closure date is an insult to our island community and an example of a government system out of control.

Yes we attended the community meeting sponsored by your department at Nanakuli High School and although you have made this resurrection attempt with consultant facilitators there was not one person supporting the City's effort! In fact, Kumu Kamaki Kanahele said it all at the meeting with the same emotion and disbelief that most of us believe in seeing the City's total disregard and disrespect of previous community input facing the flawed efforts of the past and through meetings too numerous to recall.

The best I can say is that homeowners in our association are dumbfounded by this re-assessment of the problem after (please count them) **EIGHT (8) years** [1999-2006] wherein the City does not have a solid waste alternate site but does have a plan and commitment to the community to close Waimanalo Gulch in Kapolei! When you look at the time line over the past eight (8) years the City could have located and prepared the alternate site for business well before the closure date in 2008 for Waimanalo Gulch in Kapolei.

Notwithstanding the lack of progress, now we change the players and restart the process? Isn't this baffling to you? Our community members have no tolerance for the blatant dismissal of all the efforts to get the project closed. We are opposed to this restart of the EIS preparation process for the subject site and recommend that the alternative site or alternative waste disposal methods are developed and close Waimanalo Gulch at Kapolei on time in May 2008.

We agree with the comments of Cynthia Rezentes and Senator Colleen Hanabusa and others published in the EIS Preparation report regarding the many detailed issues and comments that have not been resolved and will need to be a part of the new EIS process. We find that in the face of litigation and mismanagement of the facility that the City continues to shape the decision making process to match a predetermined objective.

Our association will be actively involved in every effort to close the Waimanalo Gulch Landfill located in Kapolei as we believe there is a conflict in land use, there are pending legal issues involving $2.8 million dollars in fines to the City that are directed at the poorly operated facility and that this location is not acceptable.

You must agree that the Waimanalo Gulch Landfill at Kapolei continues as blight on this beautiful island. The State and the City have designated Kapolei and West Oahu as growth areas with designated mass transit needs and increasing populations.

Please drive the roads and highways in Kapolei and see for yourself the litter and filth that travels here daily by truck. Most of my neighbors are in shock that we are about to head down the EIS road again.

Please call anytime.

Sincerely,
for Ko Olina Fairways

RA 08-045

Mr. Ralph F. Harris, President
Ko Olina Fairways - Association of Apartment Owners
92-1 527-H Aliinui Drive
Kapolei, Hawaii 96707

Dear Mr. Harris:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 23, 2006, concerning the subject project. We acknowledge your request to be a consulted party to the EIS process for the proposed project. The following has been prepared in response to your comments (your comments have been italicized for reference):

1. "Your letter and the efforts of your department are unbelievable in that you seek a resurrection of the EIS process for the Waimanalo Gulch (located in Kapolei) as a site for a continuing landfill. Did we just waste all the money and efforts of the Draft EIS in 1999 and the Supplemental EIS of 2002?"

"Our community and our neighbors in abutting communities have relied on the pending closure of the Landfill. We have invested enormous time and effort since the incomplete and flawed DEIS and SEIS effort of 1999 and 2002 ended with a commitment from the City government and the Mayor to close the site to Municipal Waste in 2008. For the City to change directors in the Department of Environmental Services and then re-launch a plan to continue using the Waimanalo Dump past the closure date is an insult to our island community and an example of a government system out of control."

Your comments concerning the proposed project are noted. Section 1 of the EISPN provided important information that establishes why the City must act at this time to provide a solid waste refuse facility for use by all the communities of Oahu. Further information concerning this requirement will be provided in the Draft EIS (DEIS).

2. "Yes we attended the community meeting sponsored by your department at Nanakuli High School and although you have made this resurrection attempt with consultant facilitators there was not one person supporting the City's effort! In fact, Kumu Kamaki Kanahele said it all at the meeting with the same emotion and disbelief that most of us believe in seeing the City's total disregard and disrespect of previous community input facing the flawed efforts of the past and through meetings too numerous to recall."

Several important events led to the current proposal to expand Oahu's only municipal sanitary landfill. The parties that were involved are documented in the EISPN and included the Mayor's Advisory Committee on Landfill Site Selection under a prior administration, the Honolulu City Council, and the current Administration. It is important to note that during the events outlined in the EISPN that community input was sought by the Council and ENV not only from the Leeward Coast, but islandwide based on the need for a municipal landfill serving all the communities of O'ahu.

3. "The best I can say is that homeowners in our association are dumbfounded by this re-assessment of the problem after (please count them) EIGHT (8) years [I999-2006] wherein the City does not have a solid waste alternate site but does have a plan and commitment to the community to close Waimanalo Gulch in Kapolei! When you look at the time line over the past eight (8) years the City could have located and prepared the alternate site for business well before the closure date in 2008 for Waimanalo Gulch in Kapolei."

Since completion of the 2002 Final Supplemental EIS for the Waimanalo Gulch landfill, the City has undertaken a number of actions regarding alternatives to the continued use of the landfill. A description of these actions will be provided in the forthcoming DEIS.

4. "Notwithstanding the lack of progress, now we change the players and restart the process? Isn't this baffling to you? Our community members have no tolerance for the blatant dismissal of all the efforts to get the project closed. We are opposed to this restart of the EIS preparation process for the subject site and recommend that the alternative site or alternative waste disposal methods are developed and close Waimanalo Gulch at Kapolei on time in May 2008."

Your opposition to the proposed project and your recommendation that an alternative landfill site or alternative disposal method be used are noted. A discussion of the proposed project in relation to alternative technologies and sites will be provided in the DEIS.

5. "We agree with the comments of Cynthia Rezentes and Senator Colleen Hanabusa and others published in the EIS Preparation report regarding the many detailed issues and comments that have not been resolved and will need to be a part of the new EIS process. We find that in the face of litigation and mismanagement of the facility that the City continues to shape the decision making process to match a predetermined objective."

"Our association will be actively involved in every effort to close the Waimanalo Gulch Landfill located in Kapolei as we believe there is a conflict in land use, there are pending legal issues involving $2.8 million dollars in fines to the City that are directed at the poorly operated facility and that this location is not acceptable."

Issues that are raised as part of the EIS process will be addressed as required by law. The City is proceeding with the necessary environmental review procedures for a lateral footprint expansion.

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved.

The Environmental Protection Agency's (EPA) Notice of Violation (NOV) concerning the landfill's gas collection system is currently under discussion amongst the EPA, the City and Waste Management. Until those negotiations are concluded, there can be no final determination as to the validity of the alleged violations. The NOV will be discussed in the DEIS.

> 6. *"You must agree that the Waimanalo Gulch Landfill at Kapolei continues as blight on this beautiful island. The State and the City have designated Kapolei and West Oahu as growth areas with designated mass transit needs and increasing populations."*
>
> *"Please drive the roads and highways in Kapolei and see for yourself the litter and filth that travels here daily by truck. Most of my neighbors are in shock that we are about to head down the EIS road again."*

The presence of the existing Waimanalo Gulch has made possible economic growth and development through the use of a site for the safe and efficient disposal of municipal refuse. In this regard, the landfill has supported economic growth and development of not only the Ewa region, but islandwide for all the communities of Oahu. Potential impacts concerning litter and litter control will be addressed in the DEIS.

A number of operational improvements to the landfill have also been implemented since 2002 when the last EIS was completed. A description of these efforts and planned mitigation measures to address traffic and traffic related potential impacts will be described in the DEIS.

We appreciate this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

RE: WAIMANALO GULCH SANITARY LANDFILL EXPANSION, WAIANAE

Please consider the sentiments of those that took possession of property nearby the landfill with the understanding that their ownership would not be subjected to particular operations of the landfill, let alone another expansion of it beyond May 1st, 2008.

When I think of all the broken treaties in America's past history with communities of Native American peoples subjugated to acts of ill-will and done so in bad faith, I never thought such practice would still be coddled into this century. The comparison rests in the fact that an agreement was brokered by the City with Leeward communities decades ago whereby the burden and aftermath of landfill operations in their "backyard" would terminate- not expand.

It is the duty and obligation of Legislators and the Judiciary to oversee that agreements tended to, are adhered to within their respective jurisdictions. In the capacity of being a State Representative, I urge those making the decision on the expansion to include approximately 92.5 acres be rendered inappropriate and dismissed.

Your favorable consideration to explore other means to mitigate the disposal/storage of waste is greatly appreciated. Thank you for this opportunity to provide written opposition to the proposal being advocated by the Department of Environmental Services.

Respectfully,

Dear Representative Cabanilla:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 22, 2006 concerning the subject project. We appreciate the time you have taken to share your concerns and have prepared the following in response.

Your request that the proposed expansion of the Waimanalo Gulch Sanitary Landfill be rendered inappropriate and be dismissed are noted. Unfortunately, for reasons that are cited in the EISPN, Section 1, Project Background, this option is not now available to the City.

Alternatives to the continued long-term use of the landfill that have been investigated by the City include increased recycling, waste reduction by both nonthermal and thermal processes, and transshipment. Further discussion of these items will be provided in the Draft EIS (DEIS) for this project.

We appreciate the time you have taken to review the subject document and this opportunity to respond to your comments. Please do not hesitate to direct further written comments to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

RE: Waimanalo Gulch Landfill Environmental Impact Statement Preparation Notice (EISPN); Kahe Valley, O'ahu; TMK:9-7-003:072 and 073

Dear Mr. Takamura,

The Office of Hawaiian Affairs (OHA) is in receipt of your November 8, 2006 request for comments on above referenced Environmental Impact Statement Preparation Notice (EISPN) to expand 92.5 acres of the Waimanalo Gulch landfill in leeward O'ahu. This expansion will result in noncompliance with the applicant's Amended State Special Use Permit (SUP), issued by the State Land Use Commission (LUC) on March 27, 2003, which required the Waimanalo Gulch landfill to close by May 1, 2008.

Although we appreciate that an Environmental Impact Statement (EIS) is being prepared for this project, we point out that the purpose of Hawaii's EIS law is not to justify the environmental effects of government actions after economic and technical decisions have been made. Rather, the purpose is to "ensure that environmental concerns are given appropriate consideration in decision making along with economic and technical consideration." Hawai'i Administrative Rules (HAR) § 11-200-1 (emphasis added). In line with this purpose is the requirement that "the agency shall assess at the earliest practicable time the significance of potential impacts of its actions, including the overall, cumulative impact in light of related actions in the region and further actions contemplated." HAR § 11-200-5.

This EISPN appears to address the isolated issue of expanding a landfill, and not the comprehensive issue of sustainable waste management on O'ahu. For example, the fact that the City and County's Solid Waste Integrated Management Plan is currently being updated, but will be completed after the Waimanalo Gulch Landfill EIS is underway or completed, illustrates the applicant's failure to consider "cumulative impact[s] in light of related actions in the region," as required by HAR § 11-200-5. Without guidance of a comprehensive waste management plan for the island, the cumulative impacts of a single landfill cannot be analyzed.

Further, it appears that this EIS is being prepared merely to discuss and possibly mitigate environmental effects, rather than to serve as an "informational document" to guide the County's decision-making. While there is still much value to discussion and mitigation of environmental problems, this use of the EIS process misses the point of the EIS law to encourage discussion of environmental issues before important decisions are made. We realize that O'ahu's solid waste problems will not be resolved overnight; however, rather than continuing to bury the problem by expanding landfills, the County must comprehensively analyze innovative and environmentally friendly waste disposal methods that are appropriate for our island state.

We request that the forthcoming EIS include a detailed analysis of the reasons behind the current SUP condition to close the landfill by 2008. We also request that the EIS clearly state the changed circumstances or other reasons that prevent the applicant from honoring its commitment to close Waimanalo Gulch Landfill. The EISPN at page 1-3 notes that the Mayor's Advisory Committee, which was formed in December 2003 to recommend different landfill sites, chose to consider Waimanalo Gulch, which was then ranked the highest among the choices. Please discuss the ranking criteria used, as well as the why Waimanalo Gulch was still considered, despite the goal of the Committee to recommend a different site. Please also discuss what good faith efforts were made to find other suitable landfill sites, and how the applicant attempted to comply with the LUC's purpose and intent behind conditioning the SUP on closure by 2008. For example, have the concerns of the LUC been addressed by the applicant's current proposal to expand the Waimanalo Gulch landfill?

We also request that the EIS address the various health concerns that have been raised by the Department of Health, and how these problems will be addressed and prevented in the future. In addition, please provide detailed analysis of how impacts to the surrounding community will be mitigated, including proposed benefits packages.

Thank you for your continued correspondence and the opportunity to comment. We look forward to reviewing the Draft EIS. If you have any further questions or concerns please contact Koa Kaulukukui at (808) 594-0244 or koalanik@oha.org.

Sincerely,

May 12, 2008

Mr. Clyde W. Nāmu'o, Administrator
State of Hawaii
Office of Hawaiian Affairs
711 Kapiolani Boulevard, Suite 500
Honolulu, Hawaii 96813

Dear Mr. Nāmu'o:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 21, 2006 concerning the subject project. The following is in response to your comments (your comments have been italicized for reference):

1. *"Although we appreciate that an Environmental Impact Statement (EIS) is being prepared for this project, we point out that the purpose of Hawaii's EIS law is not to justify the environmental effects of government actions after economic and technical decisions have been made. Rather, the purpose is to "ensure that environmental concerns are given appropriate consideration in decision making along with economic and technical consideration." Hawai'i Administrative Rules (HAR) § 11-200-1 (emphasis added). In line with this purpose is the requirement that "the agency shall assess at the earliest practicable time the significance of potential impacts of its actions, including the overall, cumulative impact in light of related actions in the region and further actions contemplated. "HAR § 11-200-5."*

The potential for the cumulative impacts you indicate will be discussed as part of the Draft EIS (DEIS).

> 2. *"This EISPN appears to address the isolated issue of expanding a landfill, and not the comprehensive issue of sustainable waste management on O'ahu. For example, the fact that the City and County's Solid Waste Integrated Management Plan is currently being updated, but will be completed after the Waimanalo Gulch Landfill EIS is underway or completed, illustrates the applicant's failure to consider "cumulative impact[s] in light of related actions in the region," as required by HAR § 11-200-5. Without guidance of a comprehensive waste management plan for the island, the cumulative impacts of a single landfill cannot be analyzed."*

The subject EIS is being developed in conjunction with the preparation of the Solid Waste Integrated Management (SWIM) Plan. While the SWIM Plan will provide the policy guidance and direction for the future handling of Oahu's solid waste through a number of projects and facilities that include Waimanalo Gulch, the subject EIS will discuss impacts, including the potential for cumulative impacts.

> 3. *"Further, it appears that this EIS is being prepared merely to discuss and possibly mitigate environmental effects, rather than to serve as an "informational document" to guide the County's decision-making. While there is still much value to discussion and mitigation of environmental problems, this use of the EIS process misses the point of the EIS law to encourage discussion of environmental issues before important decisions are made. We realize that O'ahu's solid waste problems will not be resolved overnight; however, rather than continuing to bury the problem by expanding landfills, the County must comprehensively analyze innovative and environmentally friendly waste disposal methods that are appropriate for our island state."*

We add to our above statement that the Department of Environmental Services has been actively involved in the exploration of alternative methods and technologies to waste reduction and disposal and will continue to do so. This information will be provided in the DEIS.

> 4. *"We request that the forthcoming EIS include a detailed analysis of the reasons behind the current SUP condition to close the landfill by 2008. We also request that the EIS clearly state the changed circumstances or other reasons that prevent the applicant from honoring its commitment to close Waimanalo Gulch Landfill. The EISPN at page 1-3 notes that the Mayor's Advisory Committee, which was formed in December 2003 to recommend different landfill sites, chose to consider Waimanalo Gulch, which was then ranked the highest among the choices. Please discuss the ranking criteria used, as well as the why Waimanalo Gulch was still considered, despite the goal of the Committee to recommend a different site. Please also discuss what good faith efforts were made to find other suitable landfill sites, and how the applicant attempted to comply with the LUC's purpose and intent behind conditioning the SUP on closure by 2008. For example, have the concerns of the LUC been addressed by the applicant's current proposal to expand the Waimanalo Gulch landfill?"*

Further information concerning these items will be provided in the DEIS. This will include a detailed description and discussion of the landfill site selection process.

> 5. *"We also request that the EIS address the various health concerns that have been raised by the Department of Health, and how these problems will be addressed and prevented in the future. In addition, please provide detailed analysis of how impacts to the surrounding community will be mitigated, including proposed benefits packages."*

While the EIS will provide information regarding the appropriate operational practices and procedures that will be employed at the landfill to maintain public health and safety, we note that the Notice of Violation and Order (NVO) that was issued by the State Department of Health (DOH) occurred after it had been self-reported by Waste Management of Hawai'i, Inc., and that the great majority of the alleged violations were addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved.

We appreciate the time you have taken to provide your comments and allowing us this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Very truly yours,

Eric S. Takamura, Ph.D., P.E.

Re: Comment on the Environmental Impact Statement (EIS) Preparation Notice for the Waimanalo Gulch Sanitary Landfill Expansion (HRS 343 EISPN)

Wilma,

Hawaiian Waste Systems, LLC (HWS) appreciates the opportunity to comment on the above-referenced EIS Preparation Notice, particularly with respect to Section 6.4 of the Alternatives Analysis, "Transshipment of Waste Off-Island."

HWS recognizes that the Hawaiian Islands face numerous unique challenges and requirements regarding its solid waste disposal, and has thus developed a system of waste densification, wrapping and shipment to export waste from Honolulu to Roosevelt Regional Landfill in Klickitat County, Washington in an environmentally secure and operationally efficient manner. The United States Department of Agriculture is the regulatory agency with authority over this export given the potential risk of introduction of non-indigenous plant pests. USDA has found that the system proposed by HWS poses an insignificant risk of infestation and has issued a Final Rule allowing the importation of waste from Hawaii under a specific handling protocol designed to contain the risk of plant-pest dissemination.

The following is some additional information regarding HWS' system and waste export in general that addresses some of the specific issues/questions discussed in Section 6.4 of the EIS preparation notice:

1) *Identification of appropriate waste; acceptable versus unacceptable waste.*

   - Because Roosevelt Landfill is a RCRA Subtitle D facility, it does not accept any hazardous or "dangerous" wastes as defined by the Resource Conservation and Recovery Act. Thus, multiple layers of protection against the inclusion of hazardous waste in Hawaiian waste bales will be in effect in HWS' process. First, the waste collection points in Honolulu will be pre-screened per industry standards and HWS' protocol; collection from industrial sites or known producers of hazardous or dangerous wastes will be directed to a facility other than HWS' for processing. Second, waste containers will be subject to visual inspection upon entry into HWS' Honolulu processing facility to ensure that only loads from approved collection points enter the facility and that loads that appear to contain an undue amount of hazardous or potentially hazardous material will be redirected. Third, loads that are tipped on the ground at the transfer station/processing facility in Honolulu will be subject to visual inspection by HWS employees. In the event that a load is found to consist of hazardous materials, that load will be physically segregated by a loader or other machine on site, then re-loaded into a roll-off container for redirection to an alternate, appropriate facility.

   - HWS' screening process will be reviewed and regulated by the State of Hawaii Department of Health, USDA and the Klickitat County Health Department, all subject to US EPA Subtitle D regulations.

2) *Locations for staging, handling and processing of waste for subsequent shipment/export.*

   - Oahu has a number of suitable locations for waste processing facilities that could be easily developed. The Industrial zoning designations in Honolulu generally permit waste transfer stations and related activities, and several locations with this designation would have adequate ingress/egress, processing space and storage space to accommodate the needs of a processing facility. HWS has identified a location for waste transshipment and is currently proceeding with its development.

3) *The range of (financial) costs associated with transshipment:*

   - It is estimated that the cost of transshipment will be dramatically less than other "new technology" alternatives that have been examined by the City of Honolulu, and competitive (considering relative capital investment) with traditional alternatives such as new landfills or incinerators.

4) *Potential environmental costs for the City and County of Honolulu:*

   - Waste transshipment will have a positive environmental impact on essential sanitary services in the City and County of Honolulu. The City and County has tried unsuccessfully to site new landfills or secure alternative technologies. Waimanalo Gulch Sanitary Landfill is no longer located in an optimal area due to urban infill. Because of these issues, Honolulu is in desperate need of disposal alternatives. HWS' export system presents an alternative that is environmentally secure over a short or long-term period. Without such an option, the City is faced with myriad environmental concerns, including but not limited to inability to site a new landfill, landfills that fail due to overburden, illegal ocean and land dumping, and human and animal health concerns related to improper disposal or solid waste handling.

5) *Potential environmental costs for the mainland U.S. facility receiving the waste:*

- Roosevelt Landfill was designed and engineered to be one of the world's most environmentally secure landfills. It is situated on 3,000 acres in the arid climate of Southeastern Washington State and its unique hydrogeological characteristics, combined with engineered features that meet or exceed all state, local and federal regulations, makes for an environmentally secure facility. The Roosevelt facility has been in service for over 15 years and currently handles over 10,000 tons per day of various waste materials from throughout the Pacific Northwest region (including Alaska). Given its excellent operational and environmental safety record and its existing infrastructure, it is uniquely suited to accept and safely dispose of waste from Hawaii. Allied Waste, the second largest solid waste company in the United States and owner/operator of Roosevelt Landfill, provides complete indemnification to its solid waste customers by taking title to all solid waste entering the facility.

6) *Transshipment leading to Oahu's dependency on resources out of its control.*

- Waste export has become such an integral part of solid waste management in the United States that Hawaii is now the only US state that does not export or import any waste. Roosevelt Landfill accepts or has accepted imported waste from municipalities in Oregon, Idaho, California, British Columbia (CA) and Alaska. These municipalities rely on long-term disposal and transportation contracts to assure continuous uninterrupted service. The case of Alaska is very similar to that of Hawaii; numerous municipalities in Southeast Alaska rely on barge shipment of waste to Washington State for disposal at Roosevelt, and they do so on the basis of long term (10+ years) transportation and disposal contracts. They are reliant on tug and barge operations and have enjoyed reliable service for many years. We encourage the EIS process to review the prevalence and commonality of regional landfilling throughout the mainland US.

7) *The receiving state will assume the long term environmental management issues and problems associated with accepting Oahu's refuse.*

- Klickitat County, host municipality of the Roosevelt Landfill, conceived of and developed the facility via a public procurement process as an economic development initiative. Roosevelt is now the County's third largest employer and, through host-County fees, is its single greatest source of municipal revenue. As such, Klickitat County welcomes new waste streams into the facility, to the extent that its Board of Commissioners often takes an active role in Landfill marketing with respect to municipal relationships. The Klickitat County Commissioners have been kept apprised of HWS' export project in Honolulu, and have sent letters to officials in Hawaii supporting the concept and inviting them to visit Roosevelt.

- Roosevelt Landfill's capacity – permitted for 5 million tons annually and 220 million tons overall, with room for expansion – is such that waste from Honolulu would not significantly impact its ability to meet current and future domestic waste disposal needs.

HWS believes that waste transshipment is a necessary and viable alternative to the proposed action that can serve as a long-term solution or as a bridge to future domestic disposal alternatives. Thank you again for the opportunity to comment on this EIS Preparation Notice. Please do not hesitate to contact me at 206.292.2929 to discuss these issues further or for additional information as you prepare the Draft EIS.

Sincerely,

James Hodge

Dear Mr. Hodge:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 20, 2006, concerning the subject project. We have prepared the following in response to your comments (your comments have been italicized for reference):

"1) Identification of appropriate waste; acceptable versus unacceptable waste.

- ○ *Because Roosevelt Landfill is a RCRA Subtitle D facility, it does not accept any hazardous or "dangerous" wastes as defined by the Resource Conservation and Recovery Act. Thus, multiple layers of protection against the inclusion of hazardous waste in Hawaiian waste bales will be in effect in HWS' process. First, the waste collection points in Honolulu will be prescreened per industry standards and HWS' protocol; collection from industrial sites or known producers of hazardous or dangerous wastes will be directed to a facility other than HWS' for processing. Second, waste containers will be subject to visual inspection upon entry into HWS' Honolulu processing facility to ensure that only loads from approved collection points enter the facility and that loads that appear to contain an undue amount of hazardous or potentially hazardous material will be redirected. Third, loads that are tipped on the ground at the transfer station/processing facility in Honolulu will be subject to visual inspection by HWS employees. In the event that a load is found to consist of hazardous materials, that load will be physically segregated by a loader or other machine on site, then re-loaded into a roll-off container for redirection to an alternate, appropriate facility.*
- ○ *HWS' screening process will be reviewed and regulated by the State of Hawaii Department of Health, USDA and the Klickitat County Health Department, all subject to US EPA Subtitle D regulations."*

Your description of the proposed handling of transshipment waste to Roosevelt Landfill, and that hazardous waste will not be accepted by the Roosevelt Landfill, are noted.

"2) Locations for staging, handling and processing of waste for subsequent shipment/export.

- ○ *Oahu has a number of suitable locations for waste processing facilities that could be easily developed. The Industrial zoning designations in Honolulu generally permit waste transfer stations and related activities, and several locations with this designation would have adequate ingress/egress, processing space and storage space to accommodate the needs of a processing facility. HWS has identified a location for waste transshipment and is currently proceeding with its development."*

Your current efforts to develop transshipment are noted. Transshipment requires special handling that will result in by-products that cannot be transshipped. We ask that you identify the materials that are unacceptable for shipping using your process, and how you plan to dispose of these unacceptable materials.

"3) The range of (financial) costs associated with transshipment:

- ○ *It is estimated that the cost of transshipment will be dramatically less than other "new technology" alternatives that have been examined by the City of Honolulu, and competitive (considering relative capital investment) with traditional alternatives such as new landfills or incinerators."*

Your point is noted. However, costs that are associated with the adoption of any alternative will require analysis of not only immediate short-term, but long-term costs as well. Multiple factors that influence cost, including the long term cost of disposing of waste that cannot now be handled by transshipment must also be understood in order to properly assess the true costs associated with transshipment.

"4) Potential environmental costs for the City and County of Honolulu:

- ○ *Waste transshipment will have a positive environmental impact on essential sanitary services in the City and County of Honolulu. The City and County has tried unsuccessfully to site new landfills or secure alternative technologies. Waimanalo Gulch Sanitary Landfill is no longer located in an optimal area due to urban infill. Because of these issues, Honolulu is in desperate need of disposal alternatives. HWS' export system presents an alternative that is environmentally secure over a short or long-term period. Without such an option, the City is faced with myriad environmental concerns, including but not limited to inability to site a new landfill, landfills that fail due to overburden, illegal ocean and land dumping, and human and animal health concerns related to improper disposal or solid waste handling."*

Your point concerning the potential environmental effect of transshipment is noted. However, it is not possible to conclude that transshipment is not without environmental risk or cost since it will require the major combustion of fossil fuel resources in order to accomplish the journey to Washington State, approximately 2,500 or more miles away. Furthermore, the proper environmental handling of transshipment refuse is also required potentially triggering the need for the filing of a Chapter 343, HRS, document as well as other environmental entitlements.

"5) *Potential environmental costs for the mainland U.S. facility receiving the waste:*

○ *Roosevelt Landfill was designed and engineered to be one of the world's most environmentally secure landfills. It is situated on 3,000 acres in the arid climate of Southeastern Washington State and its unique hydrogeological characteristics, combined with engineered features that meet or exceed all state, local and federal regulations, makes for an environmentally secure facility. The Roosevelt facility has been in service for over 15 years and currently handles over 10,000 tons per day of various waste materials from throughout the Pacific Northwest region (including Alaska). Given its excellent operational and environmental safety record and its existing infrastructure, it is uniquely suited to accept and safely dispose of waste from Hawaii. Allied Waste, the second largest solid waste company in the United States and owner/operator of Roosevelt Landfill, provides complete indemnification to its solid waste customers by taking title to all solid waste entering the facility."*

This point of information concerning the engineering and operating standards of the Roosevelt Landfill, approximately 2,500 miles or more from Honolulu, is noted.

"6) *Transshipment leading to Oahu 's dependency on resources out of its control.*

○ *Waste export has become such an integral part of solid waste management in the United States that Hawaii is now the only US state that does not export or import any waste. Roosevelt Landfill accepts or has accepted imported waste from municipalities in Oregon, Idaho, California, British Columbia (CA) and Alaska. These municipalities rely on long-term disposal and transportation contracts to assure continuous uninterrupted service. The case of Alaska is very similar to that of Hawaii; numerous municipalities in Southeast Alaska rely on barge shipment of waste to Washington State for disposal at Roosevelt, and they do so on the basis of long term (10+ years) transportation and disposal contracts. They are reliant on tug and barge operations and have enjoyed reliable service for many years. We encourage the EIS process to review the prevalence and commonality of regional landfilling throughout the mainland US."*

We note that Hawaii is also the only U.S. state that is separated from the mainland U.S. by a vast ocean. While the DEIS will examine the potential for waste transshipment, the arrangements for states other than Hawaii, are based on and benefit from the relative close proximity of shipping and waste handling infrastructure thatcan be called upon in the event of natural or man-induced interruptions or problems with waste delivery. This shipping and waste handling infrastructure will not be present along most of the ocean journey to the Roosevelt Landfill.

"7) *The receiving state will assume the long term environmental management issues and problems associated with accepting Oahu's refuse.*

○ *Klickitat County, host municipality of the Roosevelt Landfill, conceived of and developed the facility via a public procurement process as an economic development initiative. Roosevelt is now the County's third largest employer and, through host-County fees, is its single greatest source of municipal revenue. As such, Klickitat County welcomes new waste streams into the facility, to the extent that its Board of Commissioners often takes an active role in Landfill marketing with respect to municipal relationships. The Klickitat County Commissioners have been kept apprised of HWS' export project in Honolulu, and have sent letters to officials in Hawaii supporting the concept and inviting them to visit Roosevelt*

○ *Roosevelt Landfill's capacity - permitted for 5 million tons annually and 220 million tons overall, with room for expansion - is such that waste from Honolulu would not significantly impact its ability to meet current and future domestic waste disposal needs."*

The points you offer concerning Klickitat County and the Roosevelt Landfill are noted.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart ofour office.

Sincerely,

Eric S. Takamura

Attn: Wilma Namumnart

Dear Dr. Takamura:

Subject: Environmental Impact Statement (EIS) Preparation Notice
Waimanalo Gulch Sanitary Landfill Expansion

We have the following comments to offer:

Nanakuli B Landfill: Notice of the Nanakuli EISPN was published in our May 23rd, 2006 *Environmental Notice.* In the draft EIS fully discuss the relation between the currently proposed expansion of Waimanalo Gulch and Nanakuli B.

Violations of conditions: In February 2006 the State DOH issued a Notice and Finding of Violation and Order against Waste Management of Hawaii and the City & County of Honolulu for 18 alleged violations of solid waste management laws, regulations, and permit conditions at Waimanalo Gulch Landfill. When and how will these alleged violations be corrected? What assurance does the public have that these alleged violations will not occur in the expansion area?

Acronyms list: A list of acronyms and abbreviations used in the text would be helpful for the reviewer. Please include such a list in the draft EIS.

Consultation: A list of agencies and community groups to be consulted during the EIS process was not included in the EISPN. Include this list in the EIS.

Permits and approvals: In the DEIS permits list (or chart) be sure indicate the status of each.

Figure 4-6, "Land Uses": The text accompanying this figure indicates that the Kahe power plant lies to the east of the landfill, while in the figure it lies to the west. Please correct this in the draft EIS.

If you have any questions, call Nancy Heinrich at 586-4185.

Sincerely,

Genevieve Salmonson

May 12, 2008

Ms. Katherine Puana Kealoha, Director
Office of Environmental Quality Control
235 South Beretania Street, Room 702
Honolulu, Hawaii 96813-2437

Dear Ms. Kealoha:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 15, 2006, concerning the subject project. The following is prepared in response to your comments (your comments have been italicized for reference):

1. "Nanakuli B Landfill: Notice of the Nanakuli EISPN was published in our May 23rd, 2006 Environmental Notice. In the draft EIS fully discuss the relation between the currently proposed expansion of Waimanalo Gulch and Nanakuli B."

The relationship between the proposed expansion of the Nanakuli B landfill and the proposed expansion of the Waimanalo Gulch landfill will be further discussed in the Draft EIS (DEIS).

2. "Violations of conditions: In February 2006 the State DOH issued a Notice and Finding of Violation and Order against Waste Management of Hawaii and the City & County of Honolulu for 18 alleged violations of solid waste management laws, regulations, and permit conditions at Waimanalo Gulch Landfill. When and how will these alleged violations be corrected? What assurance does the public have that these alleged violations will not occur in the expansion area?"

The Notice of Violation and Order (NVO) was issued by the State Department of Health (DOH) after the alleged violations had been self-reported. The great majority of the alleged violations had been addressed before the NVO was issued. On December 7, 2007, DOH, the City and Waste Management of Hawaii, Inc., agreed to a settlement which resolved the NVO. At that time, there was only a single remaining violation that had not been resolved--the exceedance of permitted grades. On February 20, 2008, DOH issued a grade modification approval which resolved the grade exceedance issue. Thus, all alleged violations in the NVO have been resolved.

3. "Acronyms list: A list of acronyms and abbreviations used in the text would be helpful for the reviewer. Please include such a list in the draft EIS."

We have directed our consultant to prepare a list of acronyms for inclusion in the DEIS to help the reviewers of the document.

4. "Consultation: A list of agencies and community groups to be consulted during the EIS process was not included in the EISPN. Include this list in the EIS."

We will supplement our list of agencies and community members provided in Section 8, Organizations, Agencies, and Public Parties Consulted in the Preparation of the Environmental Impact Statement Preparation Notice, with a new list identifying the consultation undertaken for the EIS process.

5. "Permits and approvals: In the DEIS permits list (or chart) be sure indicate the status of each."

The DEIS will include the status of the permits and approval that may be required for the proposed project.

6. Figure 4-6, "Land Uses": The text accompanying this figure indicates that the Kahe power plant lies to the east of the landfill, while in the figure it lies to the west. Please correct this in the draft EIS."

Your point of correction is noted and appreciated. This will be corrected in the DEIS.

We thank you for this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

FROM: Deborah Kim Morikawa, Director of Community Services

SUBJECT: Waimanalo Gulch Sanitary Landfill Expansion
Environmental Impact Statement Preparation Notice

We have reviewed the subject Environmental Impact Statement Preparation Notice and have determined that the subject project will have no impact on the projects and programs of the Department of Community Services.

However, we believe it is worth noting in the Draft and Final EIS that the City and County of Honolulu will be allocating a $2 million community benefits package to offset the impact of the Waimanalo Gulch landfill. The intent is that $1 million will go to the Department of Parks and Recreation for parks improvements to the areas most directly affected by the landfill. The rest of the money will be used by the Department of Community Services to provide grants and services that will address problems or concerns identified by residents.

We appreciate the opportunity to provide these comments. Questions regarding this matter may be directed to Mr. Keith Ishida at 768-7750.

To Whom It May Concern:

Subject: Comments on the Waimanalo Gulch Sanitary Landfill Expansion Environmental Impact Statement Preparation Notice dated November 2006

Makaiwa Hills LLC ("MH LLC") is the fee owner of approximately 1,700 acres of property ("Property") located on the eastern boundary of the Waimanalo Gulch Landfill ("Waimanalo Gulch"). As part of the Environmental Impact Statement ("EIS") Public Scoping process, MH LLC submitted a letter dated August 29, 2006, which outlined concerns regarding blasting activity that had been occurring near the western portion of the Property. MH LLC expressed concern that the aforementioned blasting activity, as well as any future activity could threaten the Property's structural integrity. At this time, we would like to reiterate our position that the EIS address the following issues:

- Structural integrity of the slope along Waimanalo Gulch's eastern boundary line.
- Proposed operations near Waimanalo Gulch's eastern boundary line.
- Proposed access points for any expansion of Waimanalo Gulch near the eastern boundary.
- The eventual height of Waimanalo Gulch along its eastern boundary.
- The distance from the top of slope to the Waimanalo Gulch eastern property line.
- Blast distances from Waimanalo Gulch's eastern property line.

Thank you for the opportunity to comment on the proposed EIS.

Sincerely,

Steve Kelly, AICP

Makaiwa Hills LLC
James Campbell Building, Suite 250
1001 Kamokila Boulevard
Kapolei, Hawaii 96707

Dear Mr. Kelly:

Subject: Environmental Impact Statement Preparation Notice (EISPN) Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 13, 2006 concerning the subject project. The following is prepared in response to your comments (your comments have been italicized for reference):

1. *"Makaiwa Hills LLC ("MH LLC") is the fee owner of approximately 1,700 acres of property ("Property") located on the eastern boundary of the Waimanalo Gulch Landfill ("Waimanalo Gulch"). As part of the Environmental Impact Statement ("EIS") Public Scoping process, MH LLC submitted a letter dated August 29,2006, which outlined concerns regarding blasting activity that had been occurring near the western portion of the Property. MH LLC expressed concern that the aforementioned blasting activity, as well as any future activity could threaten the Property's structural integrity."*

The operation of the proposed project that will involve blasting will be discussed as a part of the Draft EIS (DEIS). The potential for geologic structural and related impacts and planned mitigation measures will be provided as part of the discussion.

2. *"At this time, we would like to reiterate our position that the EIS address the following issues:*

- *Structural integrity of the slope along Waimanalo Gulch's eastern boundary line.*
- *Proposed operations near Waimanalo Gulch's eastern boundary line.*
- *Proposed access points for any expansion of Waimanalo Gulch near the eastern boundary.*
- *The eventual height of Waimanalo Gulch along its eastern boundary.*
- *The distance from the top of slope to the Waimanalo Gulch eastern property line.*
- *Blast distances from Waimanalo Gulch's eastern property line."*

The specific locations and details associated with some of the items you describe will not be fully known at the time the EIS is processed. Our intention, and the intention of Waste Management of Hawaiʻi, Inc., is to closely coordinate and inform you of the work activities that are required to mitigate and minimize any potential for impacts to your project. As much as possible, the DEIS will describe the structural integrity of the site, operational practices, the use of controlled blasting, and other practices that will be used to ensure a well run and operated facility.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Subject: Environmental Impact Statement Preparation Notice (EISPN) – Waimanalo Gulch Sanitary Landfill Expansion

Dear Mr. Takamura:

The Waimanalo Gulch Landfill continues to adversely impact the surrounding areas of Ko Olina with odors, dust and a constant stream of trucks. The Association of Apartment Owners at The Coconut Plantation, whom I am representing, are very concerned with the open issues of garbage still being piled higher than a permit allows and the level of leachate - liquid seepage from garbage is not totally monitored. We have seen flying trash and plastic bags that litter the roadways, parks, nearby residences and eventually polluting our ocean.

The Coconut Plantation consists of 270 units and is located near Kai Lani within the Ko Olina Resort and near the base of the landfill. This landfill has reached its safe limit for its size and proximity to the ocean. It has previously been determined that the area between the gulch and the waterfront can only handle the load point that is now being reached.

Another concern is the run-off of storm water that comes from the landfill. This run-off is detrimental to our reefs, which are of great importance to the tourism business, here on the Leeward Coast. The artificial reef created by the warm water discharge pipe at the power station is the best snorkeling on the Leeward Coast of the Island and the life blood for numerous charter operations for both Ko Olina Marina and Waianae Harbor. All around this small section (about 500 yards to the right of the gulch), the reefs are dying as the coral heads and fish are smothered by the mud and contaminates that are allowed to flow into our ocean. To expand the landfill beyond it current limits is guaranteed to adversely effect the ocean environment here for decades.

Local government must improve management of reef resources by addressing land pollution. It has been stated that the current landfill operator is committed to implementing necessary improvements to landfill operations to address community concerns regarding visual impacts, odors, airborne waste, litter and dust control. However, it appears that inspecting and regulating the landfill falls short of what should be expected from the State and City and County of Honolulu. It is imperative to have the environmental study incorporate how compliance enforcement is to be adhere to. So far it appears we have been failed by the watch dog organizations.

These are the concerns and issues which must be addressed in the draft EIS. It is our position that the Waimanalo Landfill be closed

Sincerely,

Bob Teramoto
Board Vice President

IN REPLY REFER TO:
RA 08-078

Mr. S. B. Teramoto
92-1198-2 Olani Street
Kapolei, Hawaii 96707

Dear Mr. Teramoto:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated December 13, 2006, concerning the subject project. The following is prepared in response to your comments (your comments have been italicized for reference):

1. *"The Waimanalo Gulch Landfill continues to adversely impact the surrounding areas of Ko Olina with odors, dust and a constant stream of trucks. The Association of Apartment Owners at The Coconut Plantation, whom I am representing, are very concerned with the open issues of garbage still being piled higher than a permit allows and the level of leachate - liquid seepage from garbage is not totally monitored. We have seen flying trash and plastic bags that litter the roadways, parks, nearby residences and eventually polluting our ocean."*

The matter involving the height of the existing landfill was coordinated with the State Department of Health (DOH) through a request for a height modification submitted in February 2006. On February 20, 2008, the DOH approved the height modification request based on thorough stability analyses.

Leachate generated from the operation of the existing area of landfill is currently being monitored in accordance with DOH requirements.

Discussion of litter management at the existing and future proposed site will be provided in the DEIS including measures that will be implemented to mitigate against adverse impacts, such as those of concern to you.

Further discussion of these and other operational matters as they relate to the proposed expansion will also be provided in the Draft EIS (DEIS).

2. *"The Coconut Plantation consists of 270 units and is located near Kai Lani within the Ko Olina Resort and near the base of the landfill. This landfill has reached its safe limit for its size and proximity to the ocean. It has previously been determined that the area between the gulch and the waterfront can only handle the load point that is now being reached."*

A discussion concerning the ability of the site to support the planned lateral expansion of the landfill will be provided in the DEIS. This will include a description of the proposed area of use and its capacity. This planned area of expansion will lie entirely within the approximately 200 acre landfill property owned by the City and County of Honolulu.

3. *"Another concern is the run-off of storm water that comes from the landfill. This run-off is detrimental to our reefs, which are of great importance to the tourism business, here on the Leeward Coast. The artificial reef created by the warm water discharge pipe at the power station is the best snorkeling on the Leeward Coast of the Island and the life blood for numerous charter operations for both Ko Olina Marina and Waianae Harbor. All around this small section (about 500 yards to the right of the gulch), the reefs are dying as the coral heads and fish are smothered by the mud and contaminates that are allowed to flow into our ocean. To expand the landfill beyond it [sic] current limits is guaranteed to adversely effect the ocean environment here for decades."*

And,

"Local government must improve management of reef resources by addressing land pollution. It has been stated that the current landfill operator is committed to implementing necessary improvements to landfill operations to address community concerns regarding visual impacts, odors, airborne waste, litter and dust control. However, it appears that inspecting and regulating the landfill falls short of what should be expected from the State and City and County of Honolulu. It is imperative to have the environmental study incorporate how compliance enforcement is to be adhere [sic] to. So far it appears we have been failed by the watch dog organizations."

"These are the concerns and issues which must be addressed in the draft EIS. It is our position that the Waimanalo Landfill be closed"

Your objection to the proposed project is noted. The DEIS will describe the stormwater management controls of the existing and planned lateral landfill expansion. This will include a discussion of the potential for impacts to nearshore waters as well as mitigative measures, as appropriate, to ensure protection of the ocean coastal resources.

The DEIS will also discuss the potential for visual impacts, and odor and windblown litter and dust control.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

Attention: Ms. Wilma Namumnart
Refuse Division

Dear Dr. Takamura:

Subject: Environmental Impact Statement Preparation Notice
Waimanalo Gulch Sanitary Landfill Expansion
Waimanalo Gulch, Oahu, Hawaii

The Department of Health (DOH), Clean Water Branch (CWB), acknowledges receipt of the subject document, dated November 2006. The CWB has reviewed the limited information contained in the subject document and offers the following comments:

1. The Draft Environmental Impact Statement should address the impacts to state waters and controlling pollutants in storm water runoff in accordance with Hawaii Administrative Rules (HAR), Chapters 11-54, 11-55 and 11-58.1.

2. Construction activities related to the expansion requires National Pollutant Discharge Elimination System (NPDES) general permit coverage for storm water associated with construction activity. A Notice of Intent (NOI) form for NPDES general permit coverage should be submitted at least 30 days before the commencement of construction activities. The NOI form may be picked up at our office or downloaded from our website at: http://www.hawaii.gov/health/environmental/water/cleanwater/forms/genl-index.html.

3. Any other discharge from the project, including, but not limited to, treated effluent from leaking underground storage tank remedial activities, hydrotesting water, and construction dewatering effluent, requires separate NPDES general permit coverages. Please see Item 2 above for information regarding the submittal of NOI.

4. The existing portion of the facility currently has coverage under the NPDES general permit for discharges of storm water associated with industrial activity. This coverage expires on November 6, 2007, and a renewal NOI must be submitted before the expiration date. A reminder will be sent to you next year. When the expansion project is completed, the Storm Water Pollution Control Plan for the facility must be revised to address the expanded area and submitted to our office.

5. In accordance with HAR, Section 11-55-38, the applicant for an NPDES permit is required to either submit a copy of the new NOI or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the DOH that the project, activity, or site covered by the NOI or application has been or is being reviewed by SHPD. If applicable, please submit a copy of the request for review by SHPD or SHPD's determination letter for the project.

6. Any discharges related to project construction or operation activities, with or without a Section 401 Water Quality Certification or NPDES permit coverage, shall comply with the applicable State Water Quality Standards as specified in HAR, Chapter 11-54.

The Hawaii Revised Statutes, Subsection 342D-50(a), requires that "[n]o person, including any public body, shall discharge any water pollutants into state waters, or cause or allow any water pollutant to enter state waters except in compliance with this chapter, rules adopted pursuant to this Chapter, or a permit or variance issued by the director."

If you have any questions, please contact Mr. Alec Wong, Supervisor of the Engineering Section, CWB, at 586-4309.

Sincerely,

DENIS R. LAU, P.E., CHIEF
Clean Water Branch

IN REPLY REFER TO:
RA 08-074

Mr. Alec Wong, P.E., Chief
Clean Water Branch
State of Hawaii
Department of Health
P.O. Box 3378
Honolulu, Hawaii 96801-3378

Dear Mr. Wong:

Subject: Environmental Impact Statement Preparation Notice (EISPN)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated November 30, 2006. concerning the subject project. The following is prepared in response to your comments (your comments have been italicized for reference):

"1. *The Draft Environmental Impact Statement should address the impacts to state waters and controlling pollutants in storm water runoff in accordance with Hawaii Administrative Rules (HAR), Chapters 11-54, 11-55 and 11-58.1."*

The Draft EIS (DEIS) will describe the potential for impacts and provide mitigative measures concerning the control of pollutants in storm water runoff in accordance with HAR 11-54, 11-55, and 11-58.1.

"2. *Construction activities related to the expansion requires National Pollutant Discharge Elimination System (NPDES) general permit coverage for storm water associated with construction activity. A Notice of Intent (NOI) form for NPDES general permit coverage should be submitted at least 30 days before the commencement of construction activities. The NOI form may be picked up at our office or downloaded from our website at: http://www.hawaii.gov/healt/environment/water/ cleanwater/forms/genl index.html."*

A permit application for the NOI Form C, Construction Stormwater permit application will be prepared and filed in accordance with the regulations you have cited. The DEIS will also identify this as a requirement of the proposed project.

"3. *Any other discharge from the project, including, but not limited to, treated effluent from leaking underground storage tank remedial activities, hydrotesting water, and construction dewatering effluent, requires separate NPDES general permit coverages. Please see Item 2 above for information regarding the submittal of NOI."*

Construction activities for the proposed project that generate storm and non-stormwater discharges to state waters will be subject to the NPDES regulations. Should the proposed project be approved, the appropriate NPDES permit applications will be prepared and filed for the area of expansion. A list of the permit applications that may be required will be provided in the DEIS.

"4. *The existing portion of the facility currently has coverage under the NPDES general permit for discharges of storm water associated with industrial activity. This coverage expires on November 6, 2007, and a renewal NOI must be submitted before the expiration date. A reminder will be sent to you next year. When the expansion project is completed, the Storm Water Pollution Control Plan for the facility must be revised to address the expanded area and submitted to our office."*

Our regulatory responsibilities for the NPDES NOI Form B are noted and will be complied with. It is understood that a revised Storm Water Pollution Control Plan will be required for the proposed area of expansion.

"5. *In accordance with HAR, Section 11-55-38, the applicant for an NPDES permit is required to either submit a copy of the new NOI or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the DOH that the project, activity, or site covered by the NOI or application has been or is being reviewed by SHPD. If applicable, please submit a copy of the request for review by SHPD or SHPD's determination letter for the project."*

Information concerning compliance with SHPD regulatory requirements will be provided in the DEIS. Documents that will be submitted to the SHPD for review will include an archaeological study of the planned area of expansion, and copies of the NPDES permit applications, as applicable.

"6. *Any discharges related to project construction or operation activities, with or without a Section 401 Water Quality Certification or NPDES permit coverage, shall comply with the applicable State Water Quality Standards as specified in HAR, Chapter 11-54."*

The requirement that all project construction activities must comply with HAR, Chapter 11-54, Water Quality Standards, is noted and will be complied with should the proposed project be approved.

Closing Remark

"The Hawaii Revised Statutes, Subsection 342D-50(a), requires that "[n]o person, including any public body, shall discharge any water pollutants into state waters,or cause or allow any water pollutant to enter state waters except in compliance with this chapter, rules adopted pursuant to this Chapter, or a permit or variance issued by the director.""

This requirement is also noted and acknowledged. The City and its operator, Waste Management of Hawaii, will comply with the requirements of law.

We appreciate this opportunity to respond to your comments. Any further written comments may be directed to Ms. Wilma Namumnart of our office.

Sincerely,

Eric S. Takamura

City & County of Honolulu
Dept. of Environmental Svs.

Ref: The draft Environmental report.

The report states "no increase in traffic". Kapolei is the "2nd City" and more than 1000 new homes and businesses are scheduled here. Are you assuming that these homes & businesses will create no trash? Will there be no additional trucks taking trash to the dump? Will the streets be less torn up by the increased traffic?

I realize that the City & County has made up its mind to expand the dump, but at least be honest — "no adverse environmental impact" is definately not true or honest.

George W. Niotta

RA 08-127

Mr. George W. Niotta
92-1128 Olani Street, Apt. 2
Kapolei, Hawaii 96707

Dear Mr. Niotta:

Subject: Draft Environmental Impact Statement (DEIS)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your undated letter we received in July 2008, concerning the subject project. The following has been prepared in response to your comments (your comments have been italicized for reference):

1. *Will there be no additional trucks taking trash to the dump? Will the [Kapolei] streets be less torn up by the increased traffic?*

According to the DEIS, Section 6.1.1. Traffic Impact Report, the existing and projected "with project" conditions indicated that "The critical traffic movements at the intersection of Farrington Highway with the WGSL (Waimanalo Gulch Sanitary Landfill) access road are expected to continue operating at LOS (level of service) "B" and LOS "C" during the AM and PM peak periods, respectively. The total traffic volumes entering the intersection are expected to increase by less than one percent during both peak hours of traffic with proposed expansion. These increases in the total traffic volumes are in the range of daily volume fluctuations along Farrington Highway and represent a minimal increase in the overall traffic volumes."

The amount of increased vehicles entering the proposed landfill equate to approximately 11 southbound vehicles during the morning peak period (between 6:15 AM and 7:15 AM) and 31 southbound vehicles during the afternoon peak period (between 3:45 PM and 4:45 PM). This increase in traffic, while minimal, represents the provision of an important public service for Kapolei and all the island communities of Oahu, by making possible the collection and disposal of municipal refuse.

2. *I realize the City & County has made up its mind to expand the dump, but at least be honest--"no adverse environmental impact" is definitely not true or honest.*

The project DEIS represents major effort by the City and Waste Management of Hawaii to identify potential adverse environmental impacts and appropriate mitigation measures to reduce or otherwise minimize the effects of the proposed project. No less than eight independent special studies and several engineering studies have been commissioned and are referenced in the subject DEIS. We urge you to review these documents and the mitigation measures that have been proposed to address the potential for environmental impacts.

We appreciate this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office at 768-3406.

Sincerely,

Eric S. Takamura

City and County of Honolulu
Department of Environmental Services
1000 Uluohia Street. Suite 308
Kapolei, Hawaii 96707

Gentlepersons;

I am submitting this letter to express my opposition to expansion of the Waimanalo Gulch Landfill.

As a resident of Kapolei, I live in close proximity to Honolulu's only landfill. I am deeply concerned over the lack of effort on the part of the city to find alternate ways of reducing the volume of ash, treated human sewage waste and debris that is currently being disposed of at Waimanalo Gulch Landfill.

The proposed expansion of 92.5 acres almost doubles the size of the existing landfill, and will allow another 15 years of waste disposal. This is unacceptable.

The company that runs the Waimanalo Gulch Landfill has had serious, repeated violations and fines in the past. There is no reason to believe that these violations or more troubling violations won't occur in the future.

It is unfair and unjust to approve the expansion of Waimanalo Gulch Landfill without first implementing curbside recycling inclusive of, but not limited to, green compostable waste, glass, paper, newspaper, aluminum and cardboard. Diversion and waste to energy programs must occur prior to, or in conjunction with any expansion.

Please do not allow your family members, friends and neighbors on the Leeward side of Oahu to continue to be subjected to possible exposure of hazardous waste and contaminates.

Again, I strongly oppose the approval of the expansion of Waimanalo Gulch Landfill and urge you to explore additional options regarding waste disposal and recycling.

Respectfully,

Signed ______ Date 6/28/08

Kapolei, Hawaii 96707

Dear Mr. Imagawa:

Subject: Draft Environmental Impact Statement (DEIS)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated June 28, 2008, concerning the subject project. The following has been prepared in response to your comments (your comments have been italicized for reference):

1. *"The company that runs the Waimanalo Gulch Landfill has had serious, repeated violations and fines in the past. There is no reason to believe that these violations or more troubling violations won't occur in the future."*

It is acknowledged that prior violations involving the State Department of Health (DOH) and the Environmental Protection Agency (EPA) have occurred in the past at the Waimanalo Gulch Sanitary Landfill. On December 7, 2007, a settlement agreement was reached with the DOH which settled all issues arising from and related to the notice of violation. At the present time the City and Waste Management of Hawaii are fully cooperating and working with the EPA to address elevated underground temperatures at the landfill which are higher than anticipated, but which are not indicative of underground combustion conditions such as a fire. A detailed discussion of this item was provided in the DEIS, in Sections 2.3.2. U.S. Environmental Protection Agency and 5.7.3. Potential Impacts and Mitigation Measures (Air Quality).

It is important to note that throughout the events involving the DOH and EPA that self-reporting procedures have remained in place to notify governmental regulatory agencies of the operating practices and procedures applied at the landfill. At no time was the health and safety of the public at risk and we anticipate that based on these procedures that sufficient safeguards will continue to maintain public health and safety.

2. *"It is unfair and unjust to approve the expansion of Waimanalo Gulch Landfill without first implementing curbside recycling inclusive of, but not limited to, green compostable waste, glass, paper, newspaper, aluminum and cardboard. Diversion and waste to energy programs must occur prior to, or in conjunction with any expansion."*

The City believes that curbside recycling, waste diversion, and refuse to energy are all important programs that will contribute to reducing our islandwide dependency on landfilling. However, these programs, including a number of other alternatives cited in the project DEIS, will not by themselves completely eliminate the need for a municipal sanitary landfill. For refuse that cannot be further recycled or otherwise reused, a landfill must continue to remain a key element of the City's refuse management system even as it continues to explore, examine, and implement the waste diversion and refuse to energy systems that you identify.

We appreciate this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office at 768-3406.

Sincerely,

Eric S. Takamura

Eric S. Takamura, Ph.D., P.E., Director
Department of Environmental Services
City and County of Honolulu
1000 Uluohia Street, Suite 308
Kapolei, Hawaii 96707

Dear Dr. Takamura:

Subject: Draft Environmental Impact Statement for the Waimanalo Gulch Sanitary Landfill Lateral Expansion
Waimanalo Gulch, Oahu, Hawaii
Tax Map Key: 9-2-03: 72 and 73

We have reviewed the Draft Environmental Impact Statement (DEIS) for the proposed lateral expansion of the Waimanalo Gulch Sanitary Landfill (WGSL) and have the following comments to offer:

1) We confirm that the site of the lateral expansion of the WGSL is designated within the State Land Use Agricultural District.

2) In accordance with section 11-200-17(e), Hawaii Administrative Rules (HAR), a project description, including, among other things, a historic perspective, should be provided. We acknowledge the background of the WGSL provided in Section 2 of the DEIS, including reference to the recent action of the Land Use Commission (LUC) that extended the deadline to accept solid waste at the WGSL from May 1, 2008, to November 1, 2009. In the interest of full disclosure, please also include the appeals filed by the Ko Olina Community Association (KOCA) and Colleen Hanabusa to the decisions of the City and County of Honolulu Planning Commission (Planning Commission) and the LUC in regard to the deadline extension.

We understand that with the lateral expansion of the WGSL on the unused 92.5-acre portion of the 200-acre site, a minimum life of approximately 15 years for the landfill is projected. We further understand that prior to the closure of the expansion area, the City and County will initiate the search for the next landfill. We request that greater specification be provided regarding the municipal solid waste plans and policies of the City and County, including alternative technology and waste reduction strategies and programs, beyond the projected life of the WGSL.

235 SOUTH BERETANIA STREET ✽ SUITE 406 ✽ HONOLULU, HAWAI'I 96813 ✽ TEL (808) 587-3822 ✽ FAX (808) 587-3827✽ EMAIL: luc@dbedt.hawaii.gov
Mailing Address: P.O. Box 2359, Honolulu, Hawaii 96804

3) In accordance with section 11-200-17(f), HAR, a separate and distinct section on alternatives which could attain the objectives of the action, including alternatives requiring actions of a significantly different nature, should be provided. At the LUC's March 6 and 7, 2008, meeting on the deadline extension to accept solid waste at the WGSL, several commissioners noted that a district boundary amendment may be a more appropriate mechanism by which to seek the expansion of the WGSL rather than by an amendment to the existing special use permit (SUP). Accordingly, we request that the alternative of reclassifying the WGSL site from the Agricultural District to the Urban District be thoroughly addressed.

4) In accordance with section 11-200-17(h), HAR, the status of each identified approval should be described. Therefore, we request that to the extent possible the *projected* submittal dates (i.e., by month/year) of the various permit applications be provided.

5) In accordance with section 11-200-17(i), HAR, the probable impact of the proposed action on the environment should be included. Review of the DEIS indicates that no inventory and assessment of arthropods on the 92.5-acre expansion area was conducted. Although the location of the subject property may not require that a comprehensive arthropod study be conducted, we request that this matter be addressed in the interest of full environmental disclosure.

Additionally, a discussion on the existing civil defense conditions and potential impacts and proposed mitigation measures should be included.

6) In accordance with section 11-200-17(n), HAR, a separate and distinct section that summarizes unresolved issues should be included. To the extent that no decision has been rendered on the appeals filed by KOCA and Colleen Hanabusa to the decisions of the Planning Commission and the LUC in regard to the deadline extension, we request that they be identified as unresolved issues at this time.

7) As you know, by Findings of Fact, Conclusions of Law, and Decision and Order Adopting with Modifications, the City and County of Honolulu Planning Commission's Recommendation to Approve Amendment to Special Use Permit issued on March 14, 2008, the LUC extended the deadline to accept solid waste at the landfill from May 1, 2008, to November 1, 2009, subject to, among other things, the requirement that the Applicant report to the LUC every six months on the actions taken to alleviate the further use of the WGSL. We acknowledge that the DEIS (p. 9-36) references the expansion of the H-POWER garbage-to-energy plant that was approved by the Mayor on January 18, 2008. However, we request that this discussion provide greater specificity to include, but

not be limited to, the nature of the expansion, the capacity of the expansion, the life of the expansion, and its role in alleviating the further use of the WGSL.

We also request that the discussion on the transshipment of waste and curbside recycling be updated with the latest efforts of the City and County to implement such alternatives to refuse disposal at the WGSL.

8) Condition No. 5 of the LUC's Decision and Order Approving Amendment to Special Use Permit (D&O Approving Amendment) issued on June 9, 2003, specified that the WGSL would be operational only between the hours of 7:00 a.m. and 4:30 p.m. daily. Clarification should be provided as to whether the current operational hours of the WGSL are proposed to be changed with its expansion.

9) Condition No. 19 of the LUC's D&O Approving Amendment also specified that the City and County shall implement by executive order or ordinance measures for, among other things, wood recovery, metal recovery, gypsum recovery, and enhanced enforcement of landfill bans. Clarification should be provided as to the efforts of the City and County to comply with this condition.

10) In the DEIS, there are several references to the term *potable water*. We request that it be replaced by the term *drinking water*. We have been advised that although potable water has generally been used to mean drinking water, the Department of Health (DOH) uses the latter term specifically to indicate water for human consumption that is derived from surface water and/or groundwater and is regulated by the DOH pursuant to chapter 11-20, HAR.

11) We request that the EIS explicitly reference the applicable category of action within chapter 343, Hawaii Revised Statutes, and chapter 11-200, HAR, that triggered its preparation.

12) On page 8-12, the DEIS states that an SUP for the expansion of the WGSL must be obtained through the City and County of Honolulu. Notwithstanding the LUC's concerns about the appropriateness of an SUP in this matter, clarification should be provided as to whether the Department of Environmental Services intends to seek an amendment to the existing SUP or an entirely new SUP. Please be advised that in either case the LUC will have jurisdiction over the application in the event the Planning Commission recommends its approval. As such, Section 12 and other applicable sections within the DEIS should be revised accordingly.

Finally, as part of the SUP process, the WGSL expansion is required to meet the SUP guidelines in determining an "unusual and reasonable" use in the Agricultural District pursuant to section 15-15-95, HAR. We believe that given the purpose of the EIS, it would be appropriate to specifically address said guidelines in the document.

We have no further comments to offer at this time. Thank you for the opportunity to comment on the subject DEIS.

Should you have any questions, please feel free to call me or Bert Saruwatari of our office at 587-3822.

Sincerely,

ORLANDO DAVIDSON
Executive Officer

October 23, 2008

Mr. Orlando "Dan" Davidson
Executive Officer
Land Use Commission
State of Hawaii
P.O. Box 2359
Honolulu, Hawaii 96804

Dear Mr. Davidson:

Subject: Draft Environmental Impact Statement (DEIS)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated July 3, 2008, concerning the subject project. The following has been prepared in response to your comments (your comments have been *italicized* for reference):

1. *We confirm that the site of the lateral expansion of the WGSL is designated within the State Land Use Agricultural District.*

This comment is acknowledged.

2. *"In accordance with Section 1 1-200-1 7(e), Hawaii Administrative Rules (HAR), a project description, including, among other things, a historic perspective, should be provided. We acknowledge the background of the WGSL provided in Section 2 of the DEIS, including reference to the recent action of the Land Use Commission (LUC) that extended the deadline to accept solid waste at the WGSL from May 1,2008, to November 1,2009. In the interest of full disclosure, please also include the appeals filed by the KO Olina Community Association (KOCA) and Colleen Hanabusa to the decisions of the City and County of Honolulu Planning Commission (Planning Commission) and the LUC in regard to the deadline extension."*

   "We understand that with the lateral expansion of the WGSL on the unused 92.5-acre portion of the 200-acre site, a minimum life of approximately 15 years for the landfill is projected. We further understand that prior to the closure of the expansion area, the City and County will initiate the search for the next landfill. We request that greater specification be provided regarding the municipal solid waste plans and policies of the City and County, including alternative technology and waste reduction strategies and programs, beyond the projected life of the WGSL"

This comment is acknowledged regarding the inclusion of the appeals filed. See Section 2.5. Historical Background of the State Special Use Permit, of the Final EIS (FEIS) for this project.

The City's <u>Draft Integrated Solid Waste Management Plan</u> was completed in June 2008 after the publication of the subject DEIS. We will provide further information concerning the municipal solid waste plans and policies contained in the draft document in the forthcoming FEIS for this project. See Section 2.6. <u>City Plans Involving the Future Handling of Solid Waste</u>.

3. *"In accordance with section 1 1-200-17(f), HAR, a separate and distinct section on alternatives which could attain the objectives of the action, including alternatives requiring actions of a significantly different nature, should be provided. At the LUC's March 6 and 7,2008, meeting on the deadline extension to accept solid waste at the WGSL, several commissioners noted that a district boundary amendment may be a more appropriate mechanism by which to seek the expansion of the WGSL rather than by an amendment to the existing special use permit (SUP). Accordingly, we request that the alternative of reclassifying the WGSL site from the Agricultural District to the Urban District be thoroughly addressed.*

This comment is acknowledged and will be addressed in the FEIS by indicating that both the filing of a new SUP application and/or a Land Use District Boundary Amendment (LUDBA) application will constitute a viable means of addressing the use of the site for a municipal landfill. We add that the use of the site for landfilling purposes has been adequately and sufficiently addressed through the SUP filed for this project since 1989, when the site was opened for use.

See Section 8.3. State Land Use Law, and Section 12. Permits and Regulatory Approvals That May Be Required, in the FEIS.

4. *"In accordance with section 1 1-200- 17(h), HAR, the status of each identified approval should be described. Therefore, we request that to the extent possible the projected submittal dates (i.e., by monthlyear) of the various permit applications be provided."*

The projected submittal dates for the land use entitlements and other pending permissions for the proposed project are not known at this time due to the pending EIS process that is currently underway. We can report, however, that as soon as practicable that these applications will be prepared and filed with the appropriate governmental agencies upon the conclusion of the current EIS process.

5. *"In accordance with section 1 1-200-1 7(i), HAR, the probable impact of the proposed action on the environment should be included. Review of the DEIS indicates that no inventory and assessment of arthropods on the 92.5-acre expansion area was conducted. Although the location of the subject property may not require that a comprehensive arthropod study be conducted, we request that this matter be addressed in the interest of full environmental disclosure."*

> *"Additionally, a discussion on the existing civil defense conditions and potential impacts and proposed mitigation measures should be included."*

This comment regarding arthropods is being investigated and will be addressed in the forthcoming project's FEIS in Section 5.9.4. Invertebrates, and Section 5.9.5. Potential Impacts and Mitigation Measures.

The City Department of Emergency Management has been consulted concerning any civil defense related coordination that may be required. At this time the Department of Emergency Management has indicated no additional concerns or issues relating to the WGSL other than to note that the nearby location of the Battery Arizona site will not be used for public shelter given the condition of the facility. See attached Memorandum dated September 29, 2008.

6. *"In accordance with Section 1 1-200-1 7(n), HAR, a separate and distinct section that summarizes unresolved issues should be included. To the extent that no decision has been rendered on the appeals filed by KOCA and Colleen Hanabusa to the decisions of the Planning Commission and the LUC in regard to the deadline extension, we request that they be identified as unresolved issues at this time."*

This request is acknowledged. See Section 11. Unresolved Issues, of the FEIS which provides further information regarding this issue.

7. *"As you know, by Findings of Fact, Conclusions of Law, and Decision and Order Adopting with Modifications, the City and County of Honolulu Planning Commission's Recommendation to Approve Amendment to Special Use Permit issued on March 14, 2008, the LUC extended the deadline to accept solid waste at the landfill from May 1, 2008, to November 1,2009, subject to, among other things, the requirement that the Applicant report to the LUC every six months on the actions taken to alleviate the further use of the WGSL. We acknowledge that the DEIS (p. 9-36) references the expansion of the H-POWER garbage-to-energy plant that was approved by the Mayor on January 18, 2008. However, we request that this discussion provide greater specificity to include, but not be limited to, the nature of the expansion, the capacity of the expansion, the life of the expansion, and its role in alleviating the further use of the WGSL."*

   We also request that the discussion on the transshipment of waste and curbside recycling be updated with the latest efforts of the City and County to implement such alternatives to refuse disposal at the WGSL.

While the specific operational details of the planned H-POWER expansion project will be provided in the EIS documentation prepared for that project, we can provide information concerning the City's consideration of Waste to Energy (WTE) facilities in relation to handling the refuse needs of the Island of Oahu. This information is provided in Section 2.6.2. Waste to Energy (WTE) Capacity, in the FEIS.

Section 2.6.4. Waste Transshipment to the Mainland, in the FEIS, describes current efforts and the relationship between waste transshipment and the City's refuse management system.

The DEIS has provided information on the latest efforts of the City in promoting recycling to reduce dependency on landfilling. See Sections: 9.5.6. Expanded Recycling; 9.5.6.1. Improvements to Recycling Infrastructure; and, 9.5.6.2. Recycling to Energy.

8. *"Condition No. 5 of the LUC's Decision and Order Approving Amendment to Special Use Permit (D&O Approving Amendment) issued on June 9,2003, specified that the WGSL would be operational only between the hours of 7:00 a.m. and 4:30 p.m. daily. Clarification should be provided as to whether the current operational hours of the WGSL are proposed to be changed with its expansion."*

Except for unusual circumstances, the operational hours of 7:00 AM to 4:30 PM are not planned to be changed.

9. *"Condition No. 19 of the LUC's D&O Approving Amendment also specified that the City and County shall implement by executive order or ordinance measures for, among other things, wood recovery, metal recovery, gypsum recovery, and enhanced enforcement of landfill bans. Clarification should be provided as to the efforts of the City and County to comply with this condition."*

In order to sustain a successful material recovery operation, the amount of material available at landfill was reestablished in the 2006 Waste Composition study. The total metals in the landfill waste stream have decreased. Gypsum board has decreased to less than one percent of the total waste or approximately 1,500 tons. In the area of wood, amounts have decreased to a little over ten percent, with treated wood making up over half of the amount of wood available. While it is possible to attempt to recover metals, gypsum board, and wood, the amounts being landfilled are not sufficient to sustain a cost-effective program.

Actions that the City is currently supporting include the State Beverage Deposit law and focusing on enhanced enforcement of landfill bans. City staff are assigned intermittently to the landfill and H-POWER to ensure compliance with bans. If any vehicle is in violation of the bans, they receive a 'first warning.' If the vehicle returns with a banned material the hauling company is warned that if deliveries continue the company will not be allowed to dispose of waste at the landfill. Waste hauling companies that have been issued warnings have complied.

10. *"In the DEIS, there are several references to the term potable water. We request that it be replaced by the term drinking water. The Department of Health (DOH) uses the latter term specifically to indicate water for human consumption that is derived from surface water and/or groundwater and is regulated by the DOH pursuant to chapter 11-20, HAR."*

We acknowledge your request and will augment the use of the term potable water as "potable/drinking water" in the forthcoming FEIS.

11. *"We request that the EIS explicitly reference the applicable category of action within Chapter 343, Hawaii Revised Statutes, and Chapter 11-200, HAR, that triggered its preparation."*

We acknowledge your request. See Section 3.2. Purpose of the Draft Final Environmental Impact Statement, in the FEIS providing this information.

12. *"On page 8-12, the DEIS states that an SUP for the expansion of the WGSL must be obtained through the City and County of Honolulu. Notwithstanding the LUC's concerns about the appropriateness of an SUP in this matter, clarification should be provided as to whether the Department of Environmental Services intends to seek an amendment to the existing SUP or an entirely new SUP. Please be advised that in either case the LUC will have jurisdiction over the application in the event the Planning Commission recommends its approval. As such, Section 12 and other applicable sections within the DEIS should be revised accordingly."*

Finally, as part of the SUP process, the WGSL expansion is required to meet the SUP guidelines in determining an "unusual and reasonable" use in the Agricultural District pursuant to Section 15-15-95, HAR. We believe that given the purpose of the EIS, it would be appropriate to specifically address said guidelines in the document.

At this time the City has not yet determined if it will file a SUP or LUDBA for the proposed project. Section 12, Permits and Regulatory Approvals That May be Required, will be revised accordingly in the FEIS.

As noted, while the preparation of a SUP or LUDBA has not been determined at this time, we acknowledge that the content of an SUP application when it is filed should meet the SUP guidelines and applicable regulations of law, and do not necessarily agree that this determination should be a part of the EIS process under Chapter 343, HRS.

We appreciate this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office at 768-3406.

Sincerely,

Eric S. Takamura

DEPARTMENT OF EMERGENCY MANAGEMENT

SUBJECT: EIS REQUEST – BATTERY ARIZONA

In reference to Battery Arizona, located within the Waimanalo Gulch Sanitary Landfill proposed lateral expansion zone, the Department of Emergency Management (DEM has determined that the facility will not be used as a public shelter. Since the battery is in poor physical condition and would require extensive repairs before it could be utilized for any type of training, DEM is not able to commit to retaining this facility.

#08

City and County of Honolulu
Department of Environmental Services
1000 Uluohia Street. Suite 308
Kapolei, Hawaii 96707

Gentlepersons;

I am submitting this letter to express my opposition to expansion of the Waimanalo Gulch Landfill.

As a resident of Kapolei, I live in close proximity to Honolulu's only landfill. I am deeply concerned over the lack of effort on the part of the city to find alternate ways of reducing the volume of ash, treated human sewage waste and debris that is currently being disposed of at Waimanalo Gulch Landfill.

The proposed expansion of 92.5 acres almost doubles the size of the existing landfill, and will allow another 15 years of waste disposal. This is unacceptable.

The company that runs the Waimanalo Gulch Landfill has had serious, repeated violations and fines in the past. There is no reason to believe that these violations or more troubling violations won't occur in the future.

It is unfair and unjust to approve the expansion of Waimanalo Gulch Landfill without first implementing curbside recycling inclusive of, but not limited to, green compostable waste, glass, paper, newspaper, aluminum and cardboard. Diversion and waste to energy programs must occur prior to, or in conjunction with any expansion.

Please do not allow your family members, friends and neighbors on the Leeward side of Oahu to continue to be subjected to possible exposure of hazardous waste and contaminates.

Again, I strongly oppose the approval of the expansion of Waimanalo Gulch Landfill and urge you to explore additional options regarding waste disposal and recycling.

Respectfully,

Maribel M. Saelid
Signed

Honolulu, HI 96819

Just A Note

As a member of Hawaii's youth, I must object to the Expansion of the Waimanalo Gulch landfill. Expanding the landfill is tantamount to handing the problem of waste disposal to the upcoming generation. Please think of how expanding the landfill will affect the future generations of Hawaii before making your final decision.

Just A Note

If the landfill must be enlarged, please provide other options for waste disposal, such as curbside recycling.

Thank you for your time,
Rachel Saelid

Kapolei, Hawaii 96707

Dear Ms. Saelid:

Subject: Draft Environmental Impact Statement (DEIS)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letters dated July 4, 2008, concerning the subject project. The following has been prepared in response to your comments (your comments have been italicized for reference):

1. *The company that runs the Waimanalo Gulch Landfill has had serious, repeated violations and fines in the past. There is no reason to believe that these violations or more troubling violations won't occur in the future.*

It is acknowledged that prior violations involving the State Department of Health (DOH) and the Environmental Protection Agency (EPA) have occurred in the past at the Waimanalo Gulch Sanitary Landfill. On December 7, 2007, a settlement agreement was reached with the DOH which settled all issues arising from and related to the notice of violation. At the present time the City and Waste Management of Hawaii are fully cooperating and working with the EPA to address elevated underground temperatures at the landfill which are higher than anticipated, but which are not indicative of underground combustion conditions such as a fire. A detailed discussion of this item was provided in the DEIS, in Sections 2.3.2. U.S. Environmental Protection Agency and 5.7.3. Potential Impacts and Mitigation Measures (Air Quality).

It is important to note that throughout the events involving the DOH and EPA that self-reporting procedures have remained in place to notify governmental regulatory agencies of the operating practices and procedures applied at the landfill. At no time was the health and safety of the public at risk and we anticipate that based on these procedures that sufficient safeguards will continue to maintain public health and safety.

2. *It is unfair and unjust to approve the expansion of Waimanalo Gulch Landfill without first implementing curbside recycling inclusive of, but not limited to, green compostable waste, glass, paper, newspaper, aluminum and cardboard. Diversion and waste to energy programs must occur prior to, or in conjunction with any expansion.*

The City believes that curbside recycling, waste diversion, and refuse to energy are all important programs that will contribute to reducing our islandwide dependency on landfilling. However, these programs, including a number of other alternatives cited in the project DEIS, will not by themselves completely eliminate the need for a municipal sanitary landfill. For refuse that cannot be further recycled or otherwise reused, a landfill must continue to remain a key element of the City's refuse management system even as it continues to explore, examine, and implement the waste diversion and refuse to energy systems that you identify.

3. *(Note from Rachael Saelid). As a member of Hawai'i's youth, I must object to the expansion of the Waimanalo Gulch Landfill. Expanding the landfill is tantamount to handling the problem of waste disposal to the upcoming generation. Please think of how expanding the landfill will affect the future generations of Hawai'i before making your final decision. If the landfill must be enlarged, please provide other options for waste disposal, such as curbside recycling.*

We appreciate your comment and acknowledge your objection to the proposed project. The planned lateral expansion of the Waimanalo Gulch Sanitary Landfill is designed to address Oahu's refuse disposal needs for the present as well as future generations. In addition to this project the City has also considered and intends to implement other refuse disposal strategies that include the expansion of H-POWER, waste transshipment, and the continued use of recycling (including curbside collection). While there is no single solution that fully addresses our waste disposal requirements, we are hopeful that a combination of options will reduce our long term dependency on landfilling.

We appreciate this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office at 768-3406.

Sincerely,

Eric S Takamura

Eric S. Takamura, Ph. D., Director
City and County of Honolulu
Department of Environmental Services
1000 Uluohia Street, Suite 308
Kapolei, Hawaii 96813

Dear Dr. Takamura:

SUBJECT: Draft Environmental Impact Statement for Waimanalo Gulch Sanitary Landfill
Lateral Expansion
Waimanalo Gulch, Oahu, Hawaii
TMK: (1) 9-2-003: 072 and 073

Thank you for allowing us to review and comment on the subject application. The document was routed to the various branches of the Department of Health (DOH) Environmental Health Administration. We have the following Wastewater Branch, Clean Water Branch, Clean Air Branch, and General comments. In addition, our Solid and Hazardous Waste Branch will send you their comments separately.

Wastewater Branch

The document proposes the expansion of the area of landfill, the development of landfill associated support infrastructure (e.g. drainage, access roadways, landfill gas and leachate collection and monitoring systems, stockpile sites and other related features), a public drop off center and a landfill gas to energy (LFGTE) system.

The existing landfill facility is served by an existing on-site wastewater system which accommodates domestic flows from the administrative and service buildings of the site. As long as the existing wastewater system is adequate for the proposed project, we have no objections and offer our recommendation for approval of the landfill lateral expansion.

All wastewater plans must meet Department's Rules, HAR Chapter 11-62, "Wastewater Systems." We do reserve the right to review the detailed wastewater plans for conformance to applicable rules. If you have any questions, please contact the Planning & Design Section of the Wastewater Branch at 586-4294.

Clean Water Branch

The Department of Health, Clean Water Branch (CWB), has reviewed the subject document and offers these comments on your project. Please note that our review is based solely on the information provided in the subject document and its compliance with Hawaii Administrative Rules (HAR), Chapters 11-54 and 11-55. You may be responsible for fulfilling additional requirements related to our program. We recommend that you also read our standard comments on our website at
http://www.hawaii.gov/health/environmental/env-planning/landuse/CWB-standardcomment.pdf.

1. Any project and its potential impacts to State waters must meet the following criteria:

    a. Antidegradation policy (HAR, Section 11-54-1.1), which requires that the existing uses and the level of water quality necessary to protect the existing uses of the receiving State water be maintained and protected.

    b. Designated uses (HAR, Section 11-54-3), as determined by the classification of the receiving State waters.

    c. Water quality criteria (HAR, Sections 11-54-4 through 11-54-8).

2. You are required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for discharges of wastewater, including storm water runoff, into State surface waters (HAR, Chapter 11-55). For the following types of discharges into Class A or Class 2 State waters, you may apply for NPDES general permit coverage by submitting a Notice of Intent (NOI) form:

    a. Storm water associated with construction activities, including clearing, grading, and excavation, that result in the disturbance of equal to or greater than one (1) acre of total land area. The total land area includes a contiguous area where multiple separate and distinct construction activities may be taking place at different times on different schedules under a larger common plan of development or sale. An NPDES permit is required before the start of the construction activities.

    b. Discharge of Hydrotesting water.

    c. Discharge of dewatering effluent.

    You must submit a separate NOI form for each type of discharge at least 30 calendar days prior to the start of the discharge activity, except when applying for coverage for discharges of storm water associated with construction activity. For this type of discharge, the NOI must be submitted 30 calendar days before to the start of construction activities. The NOI forms may be picked up at our office or downloaded from our website at: http://www.hawaii.gov/health/environmental/water/cleanwater/forms/genl-index.html.

3. For types of wastewater not listed in Item 2 above or wastewater discharging into Class 1 or Class AA waters, you must obtain an NPDES individual permit. An application for an NPDES individual permit must be submitted at least 180 calendar days before the commencement of the discharge. The NPDES application forms may be picked up at our office or downloaded from our website at http://www.hawaii.gov/health/environmental/water/cleanwater/forms/indiv-index.html.

4. You must also submit a copy of the NOI or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the CWB that SHPD has or is in the process of evaluating your project. Please submit a copy of your request for review by SHPD or SHPD's determination letter for the project along with your NOI or NPDES permit application, as applicable.

5. At least 30 calendar days prior to the completion of the expansion, you must modify your NOI for storm water associated with industrial activity and Storm Water Pollution Control Plan to include the area of expansion and submit these documents to the CWB along with a $500 filing fee.

6. Please note that all discharges related to the project construction or operation activities, whether or not NPDES permit coverage and/or Section 401 Water Quality Certification are required, must comply with the State's Water Quality Standards. Noncompliance with water quality requirements contained in HAR, Chapter 11-54, and/or permitting requirements, specified in HAR, Chapter 11-55, may be subject to penalties of $25,000 per day per violation.

If you have any questions, please visit our website at http://www.hawaii.gov/health/environmental/water/cleanwater/index.html, or contact the Engineering Section, CWB, at 586-4309.

Clean Air Branch

Pursuant to current permit requirements, Waimanalo Gulch landfill must operate the collection and control system so that gas is collected from each area, cell, or group of cells in the Municipal Solid Waste Landfill (MSWLF) on which solid waste has been in place for five years or more if active, and two years or more if closed or at final grade. Therefore, expansion of the landfill does not require any revisions to the current Title V permit.

The draft EIS states that a landfill gas to energy system may be installed. If so, the installation of this system may require a modification to the existing Title V permit.

Control of Fugitive Dust

Fugitive dust emissions occur during all phases of construction and operations. Activities close to existing residences, businesses, public areas or thoroughfares can cause dust problems. For cases involving mixed land use, we strongly recommend that buffer zones be established, wherever possible, in order to alleviate potential nuisance problems. We recommend that the contractors operate under a dust control management plan. The plan does not require the Department of Health approval, however it will help with identifying and minimizing the dust problems from the proposed project.

Examples of measures that can be included in the dust control plan are:

a) Planning the different phases of construction, focusing on minimizing the amount of dust-generating materials and activities, centralizing on-site vehicular traffic routes, and locating potential dust-generating equipment in areas of the least impact;
b) Providing an adequate water resource at the site prior to start-up of construction activities;
c) Landscaping and providing rapid covering of bare areas, including slopes, starting from the initial grading phase;
d) Minimizing dust from shoulders and access roads;
e) Providing adequate dust control measures during weekends, after hours, and prior to daily start-up of construction activities; and
f) Controlling dust from debris being hauled away from the project site.

General

We strongly recommend that you review all of the Standard Comments on our website: www.hawaii.gov/health/environmental/env-planning/landuse/landuse.html. Any comments specifically applicable to this project should be adhered to.

If there are any questions about these comments please contact Jiacai Liu with the Environmental Planning Office at 586-4346.

Sincerely,

KELVIN H. SUNADA, MANAGER
Environmental Planning Office

October 23, 2008

Mr. Kevin H. Sunada, Manager
Environmental Planning Office
Department of Health
State of Hawaii
P.O. Box 3378
Kapolei, Hawaii 96707

Dear Mr. Sunada:

Subject: Draft Environmental Impact Statement (DEIS)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated July 6, 2008, concerning the subject project. The following has been prepared in response to your comments (your comments have been *italicized* for reference):

1. *"Any project and its potential impacts to State waters must meet the following criteria:…*
Antidegradation policy (HAR, Section 11-54-1.1),…
Designated uses (HAR, Section 11-54-3),…
Water quality criteria (HAR, Sections 11-54-4 through 11-54-8)."

This comment cites the water quality regulations of Hawaii Administrative Rules, Section 11-54, Water Quality Standards, that apply to all projects in the State of Hawaii.

2. *"You are required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for discharges of wastewater, including storm water runoff, into State surface waters (HAR, Chapter 11-55). For the following types of discharges into Class A or Class 2 State waters, you may apply for NPDES general permit coverage by submitting a Notice of Intent (NOI) form:*
Storm water associated with construction activities,
Discharge of Hydrotesting water,
Discharge of dewatering effluent.
You must submit a separate NOI form for each type of discharge at least 30 calendar days prior to the start of the discharge activity, except when applying for coverage for discharges of storm water associated with construction activity. For this type of discharge, the NOI must be submitted 30 calendar days before to the start of construction activities."

This comment cites Hawaii Administrative Rules, Section 11-55, Water Pollution Control, governing the requirements of the NPDES permit program in the State of Hawaii. The ocean waters off of the proposed project site are designated as Class "A." This designation will require the filing of the NOI Form C, Construction Stormwater permit application which has been identified in Section 12, Permits and Regulatory Approvals That May Be Required.

3. *"For types of wastewater not listed in Item 2 above or wastewater discharging into Class 1 or Class AA waters, you must obtain an NPDES individual permit. An application for an NPDES individual permit must be submitted at least 180 calendar days before the commencement of the discharge."*

Please refer to the comment above.

4. *"You must also submit a copy of the NOI or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the CWB that SHPD has or is in the process of evaluating your project."*

We acknowledge the requirement that the SHPD be provided with a copy of the NOI Form C permit application for the proposed project.

5. *"At least 30 calendar days prior to the completion of the expansion, you must modify your NOI for storm water associated with industrial activity and Storm Water Pollution Control Plan to include the area of expansion and submit these documents to the CWB along with a $500 filing fee."*

We acknowledge this requirement for the approved existing NPDES NOI Form B permit for the Waimanalo Gulch Sanitary Landfill.

6. *"Please note that all discharges related to the project construction or operation activities, whether or not NPDES permit coverage and/or Section 401 Water Quality Certification are required, must comply with the State's Water Quality Standards."*

We acknowledge this requirement.

7. *"The draft DEIS states that a landfill gas to energy system may be installed. If so, the installation of this system may require a modification to the existing Title V permit."*

We acknowledge this requirement.

8. *"We recommend that the contractors operate under a dust control management plan. The plan does not require the Department of Health approval, however it will help with identifying and minimizing the dust problems from the proposed project."*

We acknowledge the recommendation and note that the provision for dust control has been provided in the Operations Plan for the Waimanalo Gulch Sanitary Landfill, as submitted to the DOH.

We appreciate this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office at 768-3406.

Sincerely,

Eric S. Takamura

RE: 0779

Mr. Eric Takamura
City and County of Honolulu
Department of Environmental Services
1000 Uluohia Street, Suite 308
Kapolei, HI 96707

Dear Mr. Takamura:

Draft Environmental Impact Statement
Waimanalo Gulch Sanitary Landfill Lateral Expansion
Waimanalo Gulch, Oahu, Hawaii

The Waimanalo Gulch Sanitary Landfill is a City and County of Honolulu facility that provides municipal and solid waste disposal for communities across Oahu. Refuge that is disposed of at the WGSL includes municipal solid waste, recycling residue, and H-Power ash and residue. Landfill operations have existed at the 200-acre site since 1989. Approximately 92.5 of the property's 200 acres are unused. If utilized, the remaining 92.5 acres are estimated to extend the operational span of the landfill by a minimum of 15 years. In March 2008, the State Land Use Commission approved an extension of the State Special Use Permit from May 1, 2008 to November 1, 2009. In addition to landfill expansion efforts, the proposed project will also include the development of landfill associated support infrastructure, a public drop-off center, and a landfill gas to energy system.

This review was conducted with the assistance of Ryan Riddle, Environmental Center.

General Comments

What is missing from the contents of this draft environmental impact statement (DEIS) is a discussion of the total waste picture on Oahu. It would be useful to know how much waste is generated on Oahu, what the total amount of waste that is handled by the City and County, how much comes into the landfill from the City and County collections and how much comes from private companies. Right now statistics are scattered throughout the document. On page 3-6 for example, we learn that the Waimanalo Gulch landfill receives approximately 1400 tons per day (TPD) of solid waste and ash residual. That equals to approximately 511,000 tons of waste per

2500 Dole Street, Krauss Annex 19 Honolulu, Hawai'i 96822
Telephone: (808) 956-7361 Fax: (808) 956-3980
An Equal Opportunity/Affirmative Action Institution

year. Later in the document (p. 9-12) we find that the H-POWER plant processes approximately 600,000 TPD of solid waste, which on page 9-16 we find is equivalent to 40 percent of the municipal solid waste produced on Oahu. If we add up the figures of what goes into the landfill at present and what goes to H-POWER, we see that the fraction going to H-POWER is closer to 55 percent of all the municipal solid waste collected. Also, according to page 9-39, the H-POWER plant incinerates 90 percent of the garbage that comes to that facility. If we take the figure of 600,000 TPY taken to H-POWER of which 90 percent is incinerated that would leave approximately 60,000 TPY of ash or approximately 146 TPD. This is substantially smaller than the 600 TPD listed on page 3-6 as coming to the landfill from H-POWER.

Trying to determine the total picture of solid waste generation and disposal by looking at the various components is confusing. It doesn't seem to add up. Adding a discussion in Section 3 on the total amount of garbage collected, what goes into the landfill, what goes to H-POWER, what goes to green waste, and what is recycled would be helpful in understanding the magnitude of the problems and will aid in weighing the alternative waste strategies. We suggest that such a discussion be included in the final environmental impact statement.

In addition to our general comments, we also have several specific comments.

Environmental Compliance Violations (p. 2-11)

In this section, the DOH and EPA violation notices are listed. While the DEIS adequately discusses the measures that have been taken to address the violations, there is no discussion on why these violations occurred in the first place. Without a mention of this, the discussion of the retroactive measures taken to correct the violations seems incomplete.

Need for the Proposed Project (pp. 3-5 – 3-6)

The first full paragraph on page 3-6 contains the line "As an annual acreage, approximately 800 tons per day …. or delivered." What has acreage to do with tonnage of solid waste? Was this a mistake or is there some formula for equating amount of waste delivered with the amount of land used?

Final Cover (pp. 4-5 – 4-11)

The final line in the section of the DEIS dealing with final covering of the landfill states that the "site may request the DOH permit alternative cover in lieu of the Subtitle D prescriptive cover described above." What are other types of covering contemplated? Does the City and County have anything else in mind? If so, shouldn't they be discussed in the DEIS? Does Subtitle D allow for alternative covers for the landfill?

Materials Acceptance (p. 4-21)

We were wondering how much waste is usually excluded per day under the Unacceptable Waste Exclusion Program?

Management of Unacceptable Waste (pp. 4-25 – 4-26)

In the management of unacceptable waste, hazardous waste is stored in a temporary storage area for 90 days after the accumulation of 220 pounds or more. What happens to the hazardous waste after the 90 day period expires? Why wait 90 days after it reaches 220 pounds, why not just dispose of it then?

Groundwater and Gas Monitoring Data (p. 4-34)

What does the groundwater and gas monitoring consist of? Are they devices that are placed in the ground that detect gas and record the data on graph paper? Are they gauges that are periodically read? How is monitoring carried out?

Drainage Control System (pp. 4-36 - 4-37)

In Section 4.6.1 the DEIS mentions that the landfill stormwater management system is designed and constructed to manage runoff from a 25-year, 24-hour storm. What about a 100-year storm? How did the site fare during the January 2007 rain events?

Potential Impacts and Mitigation Measures (p. 5-53)

In the section on landfill gas temperatures, it is mentioned that WGSL has temperatures exceeding the EPA specified maximum temperature. Other approved mainland landfills with temperatures exceeding EPA limits are then listed. Absent from this discussion is a mention of the actual temperatures found at WGSL.

Potential Impacts and Mitigation Measures (p. 5-84)

The DEIS states that hydromulching has not been very successful on top of the filled areas due to dry conditions at the site. The DEIS continues by stating that landscaping and the further use of irrigation will promote vegetative growth similar to that found on the adjoining hillsides. Can you provide more details on why there has been little success with revegetation, and how new action plans will remedy this?

General Community Concerns and Issues (p. 7-11)

In this section the DEIS states "For several years, Hawai'i residents have responded to polls on the major issues facing the community by pointing to the economy and education as the most important issues for the State (Figure 7-1). Environmental issues . . . do not achieve the same salience." Figure 7-1 illustrates the relative expressed importance of the economy, education, traffic, housing, and drugs, but the issue of the environment does not appear at all. Is this because Hawai'i residents were not given the option of choosing the environment as an issue (a structured poll), or because it was mentioned so infrequently that it would not show up on the graph?

Community Involvement (p. 7-41)

The DEIS states that the value of the community benefits were identified as $2.7 million in 2007 and $2.0 million in 2008. While the specific benefits that will be distributed in the future have not yet been determined, can you provide more detail on the benefit packages provided in previous years?

Alternatives to the Proposed Action (pp. 9-1 - 9-45)

There are a number of technology driven options examined in the first half of the lengthy discussion of alternatives. Each of these is evaluated as an all or nothing choice. There is no reason why several options might be considered in tandem that could address the need for the City and County to address it solid waste situation. Some of these methods taken together could lead to the closure or at least lead to a drastic reduction in the use of the landfill. There is also incomplete information about the cost of each of these options. Could not reasonable estimates of cost be found so that the options could be compared?

Thank you for the opportunity to review this Draft EIS.

Sincerely,

Peter Rappa

Mr. Peter Rappa
Environmental Review Coordinator
University of Hawaii – Manoa
Environmental Center
2500 Dole Street, Krauss Annex 19
Honolulu, Hawaii 96822

Dear Mr. Rappa:

Subject: Draft Environmental Impact Statement (DEIS)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated July 7, 2008, concerning the subject project. The following has been prepared in response to your comments (your comments have been *italicized* for reference):

1. *"Trying to determine the total picture of solid waste generation and disposal by looking at the various components is confusing. It doesn't seem to add up. Adding a discussion in Section 3 on the total amount of garbage collected, what goes into the landfill, what goes to H-POWER, what goes to green waste, and what is recycled would be helpful in understanding the magnitude of the problems and will aid in weighing the alternative waste strategies."*

The Final EIS, Section 9.2.2. Composition of Waste Stream, will include tables to provide the information requested. The new tables will identify the amount of waste taken to Waimanalo Gulch and H-POWER, as well as an estimate of the amount of materials recycled. Tables will also be provided identifying the sector from which the waste was collected (residential and commercial), and the amount collected by the City and other waste haulers.

2. *"In [the Environmental Compliance Violations] section, the DOH and EPA violation notices are listed. While the DEIS adequately discusses the measures that have been taken to address the violations, there is no discussion on why these violations occurred in the first place. Without a mention of this, the discussion of the retroactive measures taken to correct the violations seems incomplete."*

Both the City and Waste Management of Hawaii acknowledge that the alleged violations have occurred because of delays in implementing and reporting operational activities at the landfill. All of the allegations that were brought to light based on the operator's self-reporting practices were either corrected or were in the immediate process of being corrected (e.g., addressing the atypical temperatures at the landfill with the EPA) when the notices of violations were issued in early 2006.

The primary corrective step that has been taken since that time has been to improve the timeliness of correcting and then reporting the required information to the DOH and EPA. The DEIS identifies the steps taken to help prevent a future occurrence in Section 2.3. Environmental Compliance Violations and Section 2.4. Summary of Current Status.

3. *"The first full paragraph on page 3-6 contains the line "As an annual acreage, approximately 800 tons per day….or delivered." What has acreage to do with tonnage of solid waste? Was this a mistake or is there some formula for equating amount of waste delivered with the amount of land used?"*

Thank you for pointing out this typographical error. The correct entry that will be provided in the Final EIS will read, "As an annual average, approximately 800 tons per day …."

4. *"The final line in the section of the DEIS dealing with final covering of the landfill states that the 'site may request the DOH permit alternative cover in lieu of the Subtitle D prescriptive cover described above.' What are other types of covering contemplated? Does the City and County have anything else in mind? If so, shouldn't they be discussed in the DEIS? Does Subtitle D allow for alternative covers for the landfill?"*

RCRA, Subtitle D, allows for the use of alternative cover. The alternative cover that is being considered involves a thicker soil cover to handle the root systems of the types of trees being considered at the landfill. The tree types being contemplated will be similar to those found on the surrounding terrain. Native or other trees with a long tap root will not be used. Also, boulders may be added to enhance the appearance of the site.

5. *"How much waste is usually excluded per day under the Unacceptable Waste Exclusion Program?"*

This waste amounts to less than one percent of the refuse disposed of at the landfill.

6. *"In the management of unacceptable waste, hazardous waste is stored in a temporary storage area for 90 days after the accumulation of 220 pounds or more. What happens to the hazardous waste after the 90 day period expires? Why wait 90 days after it reaches 220 pounds, why not just dispose of it then?"*

Waste identified as "hazardous" is collected for temporary holding in a specially designated site that is designed to contain the waste and prevent exposure paths to the environment. A typical hazardous waste item for example, is a car battery. The reason for the safe storage of this type of waste prior to removal to an approved disposal facility is to minimize the number of trips involving the transport of these types of materials.

7. *"What does the groundwater and gas monitoring consist of? Are they devices that are placed in the ground that detect gas and record the data on graph paper? Are they gauges that are periodically read? How is monitoring carried out?"*

The groundwater and gas monitoring systems consist of the use of subsurface wells for the collection of samples. Sampling of these wells are by trained third party personnel who collect the samples according to industry standard practices that involve chain of custody, quality assurance/quality control procedures, and other protocols that govern the length of time and conditions under which a sample is collected prior to analysis. The samples are submitted to a laboratory certified by the State DOH. The results of all analyses, including the supporting documentation establishing that the samples were collected properly are provided in a report that is submitted to the DOH.

8. *"In Section 4.6.1 the DEIS mentions that the landfill stormwater management system is designed and constructed to manage runoff from a 25-year, 24-hour storm. What about a 100-year storm? How did the site fare during the January 2007 rain events?"*

The 25-year storm was used as an industry safety standard that was compliant with the City & County of Honolulu. The handling of stormwater for a 100- year storm event would involve considerable retention and drainage system sizing requirements that are not considered feasible or reasonable for the WGSL. The performance of the WGSL during the January 2007 rain events were satisfactory and provided for the sufficient control and treatment of stormwater runoff.

9. *"In the section on landfill gas temperatures, it is mentioned that WGSL has temperatures exceeding the EPA specified maximum temperature. Other approved mainland landfills with temperatures exceeding EPA limits are then listed. Absent from this discussion is a mention of the actual temperatures found at WGSL."*

The wells with temperatures above the EPA's standard operating temperature of 131° Fahrenheit average approximately 165° F. One well has had an isolated temperature reading of 184° F, which is the highest recorded temperature of any well at the landfill. This information and the specific operational conditions associated with the decomposition of waste generating these temperatures have been submitted to the EPA.

See Section 5.7.3. Potential Impacts and Mitigation Measures, of the FEIS relating to landfill gas emissions, relating to a discussion on the LFG (landfill gas) Collection System, providing this information.

10. "The DEIS states that hydromulching has not been very successful on top of the filled areas due to dry conditions at the site. The DEIS continues by stating that landscaping and the further use of irrigation will promote vegetative growth similar to that found on the adjoining hillsides. Can you provide more details on why there has been little success with revegetation, and how new action plans will remedy this?"

The initial difficulty with vegetative growth involved the dry and low rainfall conditions of the Leeward side of Oahu. The sporadic level of rainfall received at the site was simply not conducive to growth. The new plan will address this constraint by selectively targeting smaller portions of the site with as many target planting spots as can be provided while meeting the water conservation requirements of the Board of Water Supply.

An important feature of the plan is to more efficiently use irrigation while recognizing that the contours of the landfill are subject to change as various portions of the site are filled. Landscaping will therefore follow the filling of the cells. In order to do so, the new system will employ a central trunk water line that will run across the slope of the landfill and use perforated feed lines that run from the central trunk line. We expect that this will constitute an improvement over the prior practice of using rigid perforated water hoses that were prone to breakage whenever it was necessary to move or relocate the water hoses.

11. *"In this section the DEIS states "For several years, Hawai'i residents have responded to polls on the major issues facing the community by pointing to the economy and education as the most important issues for the State (Figure 7-1). Environmental issues . . . do not achieve the same salience. Figure 7-1 illustrates the relative expressed importance of the economy, education, traffic, housing, and drugs, but the issue of then environment does not appear at all. Is this because Hawai'i residents were not given the no option of choosing the environment as an issue (a structured poll), or because it was mentioned so infrequently that it would not show up on the graph?"*

The question that was posed to those interviewed was open-ended allowing them to select the environment if they chose to do so. While SMS Research has noted that the environment is becoming of increasing concern to Hawaii residents it does not come up in numbers that exceed one to five percent of the population.

12. *"The DEIS states that the value of the community benefits were identified as $2.7 million in 2007 and $2.0 million in 2008. While the specific benefits that will be distributed in the future have not yet been determined, can you provide more detail on the benefit packages provided in previous years?"*

The community benefits initiative is a new program that was started by the current City Administration. Prior to 2007, there were no community benefits initiatives associated with the project.

13. *"There are a number of technology driven options examined in the first half of the lengthy discussion of alternatives. Each of these is evaluated as an all or nothing choice. There is no reason why several options might be considered in tandem that could address the need for the City and County to address it solid waste situation. Some of these methods taken together could lead to the closure or at least lead to a drastic reduction in the use of the landfill. There is also incomplete information about the cost of each of these options. Could not reasonable estimates of cost be found so that the options could be compared?"*

The alternative technologies to landfilling provided in the DEIS have been used in sizes smaller than noted. The size used in the DEIS was as specified by the City to define the project types that would be considered in its Invitation for Bid (IFB) for alternative technology. The Final EIS will provide discussion of the use of multiple smaller technologies. See Section 9.6. Alternative Technologies to Refuse Disposal, subsection 9.6.1. Introduction.

Concerning the cost of the technologies, many of the alternatives evaluated have not had a full scale project built. Some have. To compare the cost of these two disparate conditions would result in an inaccurate and unfair evaluation. In addition, site specific factors must be reflected in the cost of a facility and those need to be estimated based on preliminary engineering data that was unavailable for most of the technologies.

We appreciate this opportunity to respond. Any further written comments may be directed to Ms. Wilma Namumnart of our office at 768-3406.

Sincerely,

Eric S. Takamura

Eric S. Takamura, Ph.D., P.E.

July 7, 2008

Dr. Eric S. Takamura, P.E., Director
Department of Environmental Services
City and County of Honolulu
1000 Uluohia Street, Suite 308
Kapolei, HI 96707

Re: Draft Environmental Impact Statement
Waimanalo Gulch Sanitary Landfill Lateral Expansion (May 2008)

Dear Dr. Takamura:

In accordance with the provisions of Hawai`i Revised Statutes §§ 343-1 *et. seq* ("HRS 343") and Title 11 Chapter 200 of the Department of Health State of Hawai`i Environmental Impact Statement Rules ("EIS Rules" or "HAR"), I hereby respectfully submit my comments to the Draft Environmental Impact Statement for the Waimanalo Gulch Sanitary Landfill ("WGSL") Lateral Expansion (May 2008) ("DEIS").

The comments which address Section 1 Executive Summary are made in the more detailed sections of the DEIS as discussed below.

Section 2 Project Background

This section begins with the incorrect conclusion that WGSL is "essential and necessary" for the City and County of Honolulu ("City"). WGSL is deemed to be essential and necessary only because no action has been taken by the City in truly exploring alternatives to landfilling on this island. An honest discussion is lacking in the DEIS as to why the City delayed in bringing the expansion to the public. News media reports of comments by the Planning Commission of the City and County ("PC") and the

Land Use Commission ("LUC") evidence that these decision makers were also not pleased with what could be construed as a deliberate delay to request the extension. This expansion request will also be construed as leaving decision makers no alternative but to grant an extension.

Blue Ribbon Commission

Much of this DEIS is based upon the Mayor's Advisory Committee on Landfill Site Selection ("Blue Ribbon Commission"). What the DEIS fails to address is that this Blue Ribbon Commission, having been staffed by R.M. Towill provided the members with inadequate information or incorrect information to fulfill their task. Though much is made about violations of the Sunshine law, what is lacking is an honest discussion of the flawed information which was provided to the Blue Ribbon Commission. Response by the City that R.M. Towill is not expected to know what the conditions of the land is absolutely laughable. The entity which has prepared all EISs in recent history and who is well aware of the Contract entered into to extend the management contract with Waste Management Hawaii, Inc. ("WMI") for the landfill operations at WGSL, cannot argue ignorance. It is of significance that the City finally admits that one of the criteria to assess the sites was no excavation. How R.M. Towill or the City could present WGSL expansion for 20 years with no excavation is akin to bad faith. The City and R.M. Towill was definitely on notice and failed to inform the Blue Ribbon Commission of this fact. The Contract between WMI and City should be made a part of the Appendices for the Final Supplement EIS to be accurate and complete.

In addition, the Appendix which is found in Volume 3 of 3 fails to include those pages which address the criteria as well as how the alternative sites were evaluated by R.M. Towill. This should definitely be included for all to review. Under Section 4 of this letter, there will be a discussion of the costs. Cost which was a criteria for the Blue Ribbon Commission had very minimal expenses for WGSL because of the lack of excavation. This is again shown to be an incorrect statement.

DOH Violations

The so called alleged efforts of the City to address the Department of Health's Notice of Violations ("NOV") and how to prevent them in the future need more details. This is especially true in light of the subsequent allegations of mismanagement and the recent lawsuit regarding the City's rebate of tipping fees to Schnitzer steel. What is of significance is the issue of what is the City doing to monitor what is being placed in the landfill. It is also important that irrespective of whether the violations were "settled;" there is still lacking information as to how and where the asbestos was buried. This is hidden in the violations regarding the reporting to the DOH.

The exceedance of grade is a critical issue as to future monitoring and there needs to be a more detailed discussion as to how this will be avoided in the future.

EPA Violations

It is unacceptable to merely address these violations as "resolution pending." In light of this Department and the City's battles with the EPA on the sewer systems, it is important to cover in this DEIS the relationship between the two, if any.

More importantly, what is lacking is a discussion as to what the City has done in terms of contract evaluations and performance evaluations of its operator, WMI. Given the nature of their violations and the magnitude, the DEIS is required to provide this information to the public.

Section 3 Introduction

This introduction is lacking in that it fails to set forth that this is a project which was promised to be closed by the prior administration and this Mayor as well. Moreover, in that the City has chosen to address the requirements of a DEIS in this section of its document, it should be clear as to exactly what is required, such as:

> Department of Health Rules ("HAR") § 11-200-14 through 23 are the requirements in the preparation of Draft and Final Environmental Impact Statements. The "General Provisions" highlight the expectation of the EIS process.
>
> > . . . An EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self serving recitation of benefits and a rationalization of the proposed action. Agencies shall ensure that statements are prepared at the earliest opportunity in the planning and decision making process. This shall assure an early open forum for discussion of adverse effects and available alternatives, and that the decision makers will be enlightened to any environmental consequences of the proposed action.

Clearly, this DEIS is a self serving recitation and a rationalization of what the City wants to do. The Rules require that these statements be prepared at the earliest opportunity and it is evident that the City chose to wait until the last possible moment. The argument which the City will raise is the discovery of stone outcroppings. However, the City chose to file this DEIS without a determination by the EPA on the violations at WGSL. When it has been convenient, the City has chosen to act so that there is no time for any viable alternative.

Figure 3-2 in this section depicts expansion which will exceed the present SUP boundary. This means that the expansion is expected on the lower portion of WGSL nearest Farrington Highway which will make the landfill more visible to the residents. This expansion will take all of the 200 acres at WGSL minus a 100 foot barrier around the perimeter of the property boundary.

<u>Section 4 Project Description</u>

It is interesting that the City refuses to acknowledge that WGSL is located near Ko Olina. Ko Olina has a community and is marked as the Second Resort destination for the Island of Oahu. In these difficult economic times, it would be significance to know that location of the landfill to a major economic engine for the City and the State of Hawai‘i.

Given that there has been a contested case hearing recently completed on the WGSL, it is of interest that the sworn to testimony of the City officials are not included in some form or another. For example:

> Frank Doyle testified that he was Chief of the Division of Refuse when WGSL was initially selected. He confirmed that the original Environmental Impact Statement ("EIS") stated that only 59 or 60 acres was suitable for landfill use. (For ease of reference, the "Tr." refers to the transcript in the Contested Case Hearing held on December 7, 2007, followed by the page numbers Tr. 215 and 217).
>
> You, Mr. Takamura testified that to expand WGSL under the 17 year contract with WMI, 8 million cubic yards of native soil will have to be removed to create 15 million cubic yards of airspace (landfill). (Tr. 67-68).
>
> WGSL is up the side of a mountain. In the present expansion of WGSL by the 14.9 acres, WMI encountered blue rock and has been blasting to expand WGSL. (Tr. 177-178). Paul Burns, former manager of WMI for WGSL, testified that grading has been done at WGSL which is outside the permitted 14.9 acres and is where blue rock has been encountered. (Tr. 149). It is for sloping of rock faces and drainage. (Tr. 150). In the E-3, E-4 area as much as 700,000 cubic yards of blue rock was removed. (Tr. 152-153).

> At the landfill, leachate is created. Leachate is "the decomposition of organic matter . . .produces CO2; if it's anaerobic, it produces methane, and the other end product is water. There's also water in – loose water with the material we grab or dispose of, so when it decomposes and breaks down, water seeps to the bottom . . . where the liner is and it collects there. . ." (Tr. 71).
>
> Count I of the NOV is entitled "Exceedance of Permitted Grades" and is relevant to the representation of the capacity at WGSL. (*Id.* at 2). In Count I and as testified to by Burns, permitted capacity in the ash monofill area was filled and exceeded in 2004 by 100,000 tons. (Tr. 168). In addition, 129,200 cubic yards of Municipal Solid Waste ("MSW") was placed above permitted grades. This computes to about 91,000-100,000 tons. (Tr. 168-169). When the DOH learned of these violations, it had originally told WMI to re-grade the ash monofill area and remove the excess MSW to the back portion of the landfill. (Tr. 248). An alternative provided to WMI was to construct the berms to address the stability issue. (Tr. 250).
>
> A "toe berm" was constructed at the "toe" of the ash monofill when Takamura was Director to address the overall stability of the WGSL. (Tr. 56 and 58).
>
> Takamura testified that stability issues are common when you touch a slope and WGSL is up the slope of the mountainside. (Tr. 60).
>
> Burns conceded the stability concerns and described WGSL as a canyon and once the valley is filled (the gulch) then when the expansion is upward, there is an effect throughout the whole facility. It is similar to stacking on the top and the effect will be there for the lower area. (Tr.159-160).
>
> Due to the topography of WGSL, there are three stability berms. One is for the ash monofill area and called the "toe berm." The others are the E-1 berm and the West berm. (Tr. 151). The E-1 berm was constructed in late 2005 to 2006 and the West berm in 2006-2007. (Tr. 164). All three berms were constructed with blue rock from primarily the E-3 cells. (Tr. 177-178). The West berm was constructed to stabilize the landfill as the east side (E cells) are being filled. As the east side fills the

> forces push the to the west side. (Tr. 254). These berms were stability berms which were a result of WMI overfilling WGSL. (Tr. 267).

There needs to be a description of safety factors. For example the testimony has been:

> Safety factor at WGSL is calculated at 1.5; however anything above it is acceptable. (Tr. 172). The example given is that in the E-1 area the safety factor is less than 1.5; however the addition of the berm brings it up to 1.5. (Tr. 173). The safety factor affects the grades at the landfill. For example if the factor was 2.0, the grades would need to be lowered. (Tr. 185). The stability factor at the ash monofill area before the toe berm was 1.29. (Tr. 248). A related issue is that WMI had used the wrong liner in that the "textured liner" was not used and a "smooth" liner was which called into question the resistance to movement of the landfill. There were at least two cells in the middle of the landfill with smooth liners. (Tr. 134).
>
> There are two types of safety factors, static and seismic. (Tr. 257). Seismic is when movement is anticipated and is calculated into the analysis. (Tr. 258).
>
> In a report by EA Engineering, Science and Technology, Inc., the stability factor of 2 is what is proposed with the explanation that safety factors between 1.5 to 1.9 is acceptable when it does not "pose and imminent threat to human health or the environment." The proximity to Farrington Highway and Kai Lani subdivision suggest imminent threat and supports the increase to 2.0. Exhibit H at 6.

What is clearly relevant to the general public and not set forth in this DEIS is the issue of the stability of the landfill and the requirement for the berms. It is very relevant especially when viewed in light of the first EIS which said only 59-60 acres were suitable for landfill. This is also important when viewed in light of the criteria of the Blue Ribbon Commission which included the statement that they would fill to "natural grade." (Criteria No. 23). The transcript of the Contested Case Hearing should be made a part of the Final Supplemental EIS as well.

Given the concern of the stability of the landfill and the recent earthquake on the Big Island, a discussion must be had as to what can be done if such a natural disaster caused the landfill to slip onto Farrington Highway. This discussion must look to the fact that expansion will be at the steepest part of the footprint of the parcel of land and the stress it will place on the existing landfill. The people of the Waianae Coast have only one way in and one way out.

Stability of the Landfill must be analyzed in light of Figure 3-2 which shows the expansion throughout the 200 acres of land. It will be a total landfill with the exception of a 100 foot buffer.

Though mentioned earlier, the fact that City states in this section that it has a program to control the "Contaminated Materials," this is without basis. It is also without basis that the "all documentation of asbestos disposal" is present on site. In fact, that is one of violations that WMI could not determine where the asbestos was disposed of. The asbestos disposal plan may set forth a plan; however, from the NOV we know that WMI did not follow that plan. It is unacceptable to simply state a plan and have no enforcement as to whether it will be followed.

As well, statements that their storm water or water drainage are managed is incorrect. Again, the NOV is on point and the amount of leachate which had to be pumped and dumped into the Waianae Sewage Treatment plant needs to be addressed.

Figure 4.9 seems contrary to the representations made to the Ko Olina community. Assuming that the color chart sets forth the sequence of the closure, then the area in the back of the landfill will be closed before the areas closest to Farrington Highway. This means that landfill operations will be visible from Farrington throughout the extended life of the landfill.

Cost of the Landfill

Another issue which was a criteria in the Blue Ribbon Commission's consideration was costs. At Section 4.11 a discussion of costs showed $60,800,000 for the cots of the excavation and other costs for a total cost of $99,400,000 in 2008 dollars. How are these costs arrived at? In addition, the costs of the berms should be included in that these structural changes enable the City to now petition for an extension. In addition, the reference in the DEIS is to the figure $86 million as the cost. The discrepancy must be addressed. There also needs to be a discussion as to whether additional berms will be required or are anticipated at the site.

In discussing costs, the City has said it makes a profit of $4 million a year at WGSL. If this is the case, for a 15 year expansion the operational cost will increase by at least $6.63 million a year. Why is this then economical?

Section 5 Environmental Setting

Given the recent decisions by the Hawai`i Supreme Court, it is necessary to discuss the concept of public trust. This is especially true when looking at the waters of this State. What occurred with the operations of WGSL and the leachate is inexcusable and a violation of that public trust. Note that the leachate was disposed of, for most part, in the Waianae Sewage Treatment Plant.

In this light, there is inadequate discussion of the leachate. This is especially troubling given the DOH NVO. This requires a discussion as to the how the build up of the leachate affected or could affect the integrity of liner and the stability of the landfill. It must also be addressed in light of the expansion and the stress it will have upon the liner and the stability of the landfill.

Geology

According to Figure 5.2, the proposed expansion will be primarily in the rRK soil type. This means rock over a large percentage of the surface. In addition, the description of the soil associated with rRK is "sticky and very plastic." This means that there will be a "high shrink-swell potential when moisture laden." The impact of this type of soil must be discussed when stability of the landfill will be an issue as it goes up the slope.

There must be a more detailed discussion as to the slope differential for WGSL in the proposed expansion area. It is admitted to that the upper portion of WGSL where the expansion will take place will be steep with the rRK type soil. How will excavation be safely accomplished in that region must be discussed along with the storage or removal of the excavated "native soil."

The rights to the native soil (rock, etc.) must also be addressed. It is believed that with the present operation, the contractor who does the excavation is permitted to sell the rock and soil and keep the funds. If this is the case, the practice must change and the benefit should be to the taxpayers. If the "sale" of the rock is part of the contract with WMI, these amounts must be calculated.

The DEIS concludes that "adverse impacts are not anticipated" as a result of the lateral expansion. There needs to be a definition of "adverse impacts" and how the DEIS concludes that such impacts are "not anticipated." Clearly the City and its operator have stated these similar conclusions in prior EISs and the NOV has shown to the contrary. For example how else will height violations be noted other than a "fly by." What type of monitoring device will be utilized to establish that the landfill is stable other than mathematical computations performed by WMI's experts? Part of the costs of the operation of the landfill should include a fund which the DOH utilizes to hire its own experts to monitor the landfill activities.

Regional Hydrology

This discussion in the DEIS is of interest in that it is in direct contradiction to the UIC line which is what is relied upon in the siting of the landfill. Discussion is necessary as to how the UIC line has been arrived at when it is clear that WGSL does sit over and is a part of the "Makaiwa Aquifer System." Given the past mismanagement of WGSL by WMI, it is critical that we understand the assumptions which have been made in the past, in particular the UIC line and landfill operations over an aquifer. There is an EPA map on the water systems which differs from that of the DOH. There needs to be a discussion as to difference and how the UIC lines have conveniently been drawn around existing landfill areas throughout the State.

Read in conjunction with the discussion in Section 7 as to the natural springs and water sources in the area, there should be an analysis done as to why the UIC line carves out WGSL; and more importantly the long term impact of the landfill over an aquifer.

Air Quality

There needs to a discussion in Air Quality of the EPA violations against the WGSL. Though the matter has not been resolved, for the DEIS to be accurate, the violations should be set forth as well as the anticipated remedy for the problems. Also, to the extent that the EPA violations overlap with the NOV, that discussion should also be found in the EIS.

Under this section, a passing discussion is made of the impact of the "sludge" and how it is no longer being disposed of at WGSL. The accuracy of the statement is challenged as to when it was "no longer being disposed of at WGSL." How much sludge is or has been disposed of at WGSL must be discussed. In addition, it is unclear as to whether the pellets have been authorized for sale. If not, then are these pellets being disposed of in WGSL? It is believed that the statement is incorrect as to whether the sludge is no longer at WGSL.

Methane Gas

Part of the NOV was a violation as to methane gas. The concern is whether the methane gas is smoldering or burning at WGSL. There needs to be a discussion as to how this is monitored and also that methane gas fires are found in landfill operations and WGSL should be no different. If in fact there is such a fire smoldering, what is the anticipated impact on the community and the stability of the landfill. Though there is an attempt to say that landfill permitted temperatures are higher in other states, the issue is the impact on this landfill which is located so very close to a resort and homes.

Blasting

As expected, due to the soil type in the expansion, excavation must occur with the assistance of blasting of the rocks. It is significant that the blasting is anticipated to be no more than one per day and no more than one to three times per week. If this is the average, then over a 15 year period these are a significant number of blasting activity. The discussions surround the noise and not as to the stability or structural impact on the landfill and the surrounding area. Related is the discussion on the culturally significant outcroppings which the City claims cannot safely remain in place. If the concern is over the impact of the blasting, then the blasting must have impact throughout the existing landfill. There needs to a discussion as to this fact, along with what impact it will have upon the structural berms presently built.

Pueo and Other Birds and/or Animals

It is unfortunate that the DEIS simply dispenses with these animals and birds due to the lack of sighting on a "survey." There needs to be a clear description as to how many surveys were taken and when. I have personally seen the Pueo on many occasions fly from WGSL to the area near Lanikuhonua and Kai Lani. It is questioned as to how thorough this survey is. There is a reference to a survey in 1999 and it must be clarified if the DEIS is relying upon this older study. The area is also designated as a habitat for the Elepaio. It appears that the DEIS is disagreeing with this designation. An explanation is needed as to this conclusion.

Aesthetics

As a person who has lived both at Kai Lani and now the Ko Olina Kai, I have no idea as to how the City can say that the lower portions of the landfill have a "naturalized" look. It is not natural at all and neither is the view of trucks going up and down the landfill.

The visual impact of WGSL has not been adequately addressed especially with the construction of the rock berm wall. How is this area going to be restored to its original state with a rock berm wall.

Section 6 Public Services, Potential Impacts And Mitigation Measures

Traffic

The DEIS is deficient in that it does not present the numbers of vehicles which travel to WGSL clearly in the body of its statement. It concludes by saying it is not anticipated to add more to the existing pattern. However, what is needed is a discussion as to what is the load and the description of the types of vehicles which will be used to dispose of the MSW or Ash at the WGSL. With the anticipated growth in the not only the second city of Kapolei but at Ko Olina, this discussion must address the actual numbers and the anticipated impact with the increase number of vehicles due to the growth in the area.

Wastewater System

There needs to be discussion as how the existing system will be adequate when it clearly was not adequate for the limited expansion as noted in the NOV. The City must honestly discuss the shortcomings of WMI, the operator, who has failed to operate WGSL in a professional manner.

Odors and Windblown Trash

The fact that those who live by WGSL continue to experience the odors is not adequately addressed by the DEIS. Like the "surveys" mentioned above, there needs to be a discussion as to how the odors are being monitored. Testimony has been received by people who are on the golf course and those who live in Ko Olina as to odors and windblown trash of the landfill. It is important to note that Counts in the NOV addressed the windblown trash and odor issues. Given the fact that violations have been found, the City must ensure that these violations do not occur again, given that it continues to have the same operator.

Section 7 Socioeconomic and Related Environment, Potential Impacts and Mitigation Measures

NIMBYism

As expected, the Kailua Neighborhood Board has always been adverse to the closure of the WGSL. This is due to the fact that Ameron Quarry has been viewed as a successor. It is unfortunate that the communities are forced to take positions such as they have. If the City clearly looked at alternatives and did not deal in "fear" and in its delay tactics, there could have been a long term resolution. It is not acceptable that the City's position is, "where do you want to put it?" The City is the governmental agency tasked with this obligation and it cannot simply wait, as it has, with the hopes that other agencies will buy in to its mantra that there will be rubbish on the streets if an extension or expansion is not approved.

Economic Considerations

The role that Ko Olina plays as it relates to the economic growth for West Oahu is significant. While no one would consider placement of a landfill near Waikiki, the City does not hesitate to continue a landfill operations directly across the street from Ko Olina.

Discussion on the Landfill impacts on jobs, etc. would exist wherever the landfill is sited. The discussion is lacking as to what could happen if WGSL is expanded as to the development of the Resort.

Fairness Issues

There is a discussion as to how some residents believe that Waianae is the dumping ground for the City; and the expansion of WGSL continues to dump on and places the burden on the Waianae Coast. There needs to be a discussion of the concept of environmental justice and how this discussion required under NEPA should be better explored in the DEIS.

Community Benefits Package

There needs to be an honest discussion on the benefits package. Remember that the Waianae Coast takes more than the City's rubbish. There is always the issue of "catch up" for the Waianae Coast because it appears that it is last to receive anything. When the concept of a "community benefits package" is discussed, there needs to be an analysis as to what the community would be entitled to as all others would and what is received in addition to that. The benefit must be in "addition to" not merely a replacement of.

Historic and Archaeological Findings

Prior EISs have not acknowledged the cultural significance of the Waimanalo Gulch. The DEIS recognized what is described as "Three upright boulders potentially utilized as trail or boundary markers."

It was agreed to that the stones were significant and likely used by traditional Native Hawaiian practitioners in the past. The consultants believed these stones should be preserved in place; however, the City has deemed this to be "not an option" and will move the structures. Though the cultural practitioners also expressed a concern as to the appearance of the landfill after it was completed and the boulders returned, it remains the position of the City to ignore these concerns and continue with the construction of the landfill. The DEIS must address whether the landfill expansion is at any cost and the cultural significance should be ignored.

The DEIS must address the sentiments of OHA as stated:

> OHA has made a field visit to the project site and we noted three significant cultural features that were still intact in the project area. We are also aware of the probable existence of others yet to be discovered in the project area. OHA is further saddened that the larger setting that this project sits in is one that has been highly developed and degraded. Therefore, what TCPs [Traditional Cultural Properties] that remain must be protected.
>
> The Department of Planning and Permitting, as a county agency, is mandated by Hawai`i Const. Article XII, section 7, "to preserve and protect customary and traditional practices of Native Hawaiians." Ka Pa`akai O Ka`Aina v. Land Use Comm'n, 94 Haw. 31, 45 (2000). . . . OHA urges that nothing more be done with this project until full cultural assessment has been made of the project area.

(OHA letter of September 21, 2007). At the very minimum, to address OHA's concern, there needs to be a clear statement as to how and what has been done for a "full cultural assessment" of the project area. In that much of this land has been degraded, it does not give the City the right to continue in its degradation.

Though he has passed, a respected Kumu Hula of the area, John Kaimikaua, told the story of the role of Palehua and its relationship to WGSL. There is a video of his tale and it should be included in the discussion of the cultural significance of WGSL.

The stories of the strange events in the initial construction of WGSL are rich. Yet, the DEIS continues in its predetermined conclusion that the landfill should be expanded.

Section 8 Relationship to Land Use Plans, Policies and Controls of the Potentially Affected Area

The concepts of the State General Plan have been revisited by the Legislature for the past 3 years. The Legislature has funded the Task Force on Sustainability for the year 2050. The Task Force has adopted it Sustainability Plans for the year 2050. In addition, what is now Act 183, SB 2646 CD1 of the 2008 Session, addresses the concepts of Important Agricultural Lands. The DEIS must engage in the discussion as to what is "important Ag lands" and recognize that it is no longer tied to land classification such as A, B, etc. In this light, does it impact the continued use of WGSL.

The discussion of the Land Use Policies of the area cannot be made without a discussion of the LUC's D&O on the SUP, as amended. The D&O now states that no later than November 1, 2009, the area shall be "restricted from accepting any additional waste material and be closed in accordance with an approved closure plan." This is the controlling LUC Order on the site of the proposed expansion. In addition, the City is to provide the LUC with updated status every 6 months. As someone who participated in the LUC hearing, it is clear that the LUC has sent a clear message to the City that it will not be caught in the untenable position that there is no alternative in the time remaining.

There is also a need to discuss whether the SUP process under HRS 205-6 is the proper mechanism by which to seek this expansion. The DEIS must consider whether a boundary amendment must be sought for this further expansion.

Section 9 Alternatives to the Proposed Action

This discussion in the FSEIS (most recent EIS on the property) and other documents has been inadequate in addressing alternatives. After all these years, the City must have a better response on alternative technologies, transshipment and other sites than what is provided. Again, it appears that it is simply easier to continue to have the existing landfill; and therefore all attempts to address alternatives in good faith will never be a reality.

The City has failed to timely develop its Solid Waste Management Plan. In that this is not a reality, documents such as this DEIS is not being judged by the appropriate measure.

An RFP for transshipment was solicited by the City. It is believed that the company who has been working on transshipping has had its bid challenged. If the City agrees that the bid is too low, then transshipment will not become a reality. The City does not prefer to transship because of the loss of revenue for the City. The DEIS must do a proper analysis of the loss of revenue and recall that cost is not a limiting factor in the discussion of alternatives.

What is also of concern is the discussion on Plasma Arc and how this technology does not meet the City's requirements. The DEIS does not recognize the technology which is successfully operating in Japan and the GeoPlasma facility to be operational in St. Lucie, Florida. What is just as troubling is the absence of recognition that on May 7, 2008 SB 1720 HD2 was enrolled with the Governor and on May 23, 2008 it was signed into law as Act 104 (2008 Session). This Act relates to the Special Purpose Revenue Bond to Assist Jacoby Development, Inc., a Processing Enterprise. Jacoby Development Inc.-Geoplasma LLC is authorized to issue a SPRB to build a similar facility as Florida's in Hawai'i which will not cost the taxpayers anything. Instead of welcoming such a technology, the City, instead, finds that the technology is not adequate.

Discussion of alternative landfill sites are also premised on the Blue Ribbon Commission's findings. As stated earlier, the assumptions upon which the Commission made its recommendations are incorrect and must be re done. The landfill capacities and costs are especially problematic given the obvious misinformation provided by R.M. Towill. Look at Table 9-13 to demonstrate the difference in what is presented and what is the reality. This DEIS is placing the costs of WGSL expansion at $86-99 million.

It will always be the position of the people of the Waianae Coast that there should be no more landfills on our community. We have borne the burden for not only the landfills, MSW and construction, but also the power generation facilities, live fire exercises, the homeless, etc. There is a need to look at these alternatives in terms of what is fair and in the context of environmental justice.

What is evident is that the City is not being honest in its discussion on Maili Quarry. This DEIS fails to note that the LUC denied that SUP permit of Sphere to operate a Construction and Demolition Landfill on the site. It is just as improbable that the LUC will grant a MSW landfill on the site. The proximity of this site to Maili Elementary School and its low water table is problematic. In addition, this site did accept AES's ash without a proper permit and without lining its landfill operations. In addition, traffic and access is a major concern. This landfill site is located off of a private road, Paakea which has been the site of major accidents due to the "dip" in the road. The question is whether the City will compute into its costs for the Quarry, the cost of the road and of access.

Nanakuli B is the site of a proposed private landfill. Nanakuli B will cause major traffic problems for the people of the Waianae Coast. The community will fight Nanakuli B because it is the expansion site of PVT Landfill, the only Construction and Demolition Landfill on this island. It cannot be the intent of the City to place two landfills across the street from each other and cause this community to bear this burden for a measly pay off. This DEIS must look into this inequity. The people of the Coast also want PVT closed.

Ameron Quarry is dispensed with because of costs. When the true costs of the expansion of WGSL is computed, the costs of WGSL exceeds that of Ameron.

What is lacking in this DEIS is the fact that in a few years, the status of H Power will also be an issue. If the City decides to re purchase H Power, then that cost must be made known and its impact on the cost of solid waste disposal. The expansion to a third boiler will have major cost implications.

Underlying all of this is the discussion on "flow control" of the MSW. This DEIS is inadequate in that until the necessary "flow control" is defined, the alternatives as it may be available by other vendors will not become a reality and what will remain is only the expansion alternative.

Notwithstanding, what is truly lacking in the DEIS is a combination of alternatives. To discuss these choices as a "zero sum" game does not make this DEIS a true document upon which the decision makers can rely upon.

Section 10 Irreversible and Irretrievable Commitment

Again, the DEIS is a document with a predetermined outcome. It is simpler for the City to expand WGSL than to truly explore alternatives. Promises of how the landfill will operate better and mitigation will be enforced are empty promises in light of the past performances and present performances. The recent lawsuit against Schnitzer Steel shows how there is no monitoring by the WGSL or the City before millions are given for a rebate which allegedly should not have been given. The DEIS is without basis to make such a representation or conclusory statement to the public.

Section 11 Unresolved Issues

Missing in this section is the EPA violations. In addition, it is disconcerting that the DEIS will have as an unresolved issue; the stone uprights. Given that these issues are "unresolved," this DEIS could have been made public sooner. This is all part of the plan to go before the governmental agencies with no time left and to ask for yet another extension or the expansion.

Section 12 Permits and Regulatory Approvals that May be Required

The DEIS fails to recognize the State Land Use Commission is a State agency not within the City & County of Honolulu's process. In fact, HRS § 205-6 is the State Land Use Commission statute. This DEIS should address whether a boundary amendment will be required and not a SUP.

Section 13 Organizations, Agencies and Public Parties Consulted In the Preparation of the Environmental Impact Statement Preparation Notice

No Comment.

Section 14 Significance Criteria

The DEIS provides its analysis of the significance criteria as set forth in §11-200-12 of the EIS Rules. The Rules provide:

A. In considering the significance of potential environmental effects, agencies shall consider the sum of effects on the quality of the environment, and shall evaluate the overall and cumulative effects of an action.

B. In determining whether an action may have a significant effect on the environment, the agency shall consider every phase of a proposed action, the expected consequences, both primary and secondary, and the cumulative as well as the short-term and long-term effects of the action. In most instances, an action shall be determined to have a significant effect on the environment if it:

1. Involves an irrevocable commitment to loss or destruction of any natural or cultural resource;
2. Curtails the range of beneficial uses of the environment;
3. Conflicts with the state's long-term environmental policies or goals and guidelines as expressed in chapter 344, HRS, and any revisions thereof and amendments thereto, court decisions, or executive orders;
4. Substantially affects the economic welfare, social welfare, and cultural practices of the community or State;
5. Substantially affects public health;
6. Involves substantial secondary impacts, such as population changes or effects on public facilities;
7. Involves a substantial degradation of environmental quality;
8. Is individually limited but cumulatively has considerable effect upon the environment or involves a commitment for larger actions;
9. Substantially affects a rare, threatened, or endangered species, or its habitat;
10. Detrimentally affects air or water quality or ambient noise levels;
11. Affects or is likely to suffer damage by being located in an environmentally sensitive area such as a flood plain, tsunami zone, beach, erosion-prone area, geologically hazardous land, estuary, fresh water, or coastal waters;

12. Substantially affects scenic vistas and viewplanes identified in county or state plans or studies; or,
13. Requires substantial energy consumption.

The DEIS answers each and every criteria in the negative. This provision of the EIS Rules is not applicable in that this section is relevant if there is to be a determination of no impact and therefore an EIS or an Environmental Assessment ("EA") will not be required. Specifically:

> §11-200-9 Assessment of Agency Actions and Applicant Actions
>
> A. For agency actions, except those actions exempt from the preparation of an environmental assessment pursuant to section 343-5, HRS, or section 11-200-8, the proposing agency shall:
>
> . . .
>
> 4. Determine, after reviewing the environmental assessment described in paragraph (3), and considering the significance criteria in section 11-200-12, whether the proposed action warrants an anticipated negative declaration or an environmental impact statement preparation notice, provided that for an environmental impact statement preparation notice, the proposing agency shall inform the accepting authority of the proposed action;

However, what is missing is paragraph I of the Contents of a Draft EIS:

> § 11-200-17 provides at:
>
> I. The draft EIS shall include a statement of the probable impact of the proposed act on the environment, and impacts of the natural or human environment on the project, which shall include consideration of all phases of the action and consideration of all consequences on the environment; direct and indirect effects shall be included. The interrelationships and cumulative environmental impacts of the proposed action and other related projects shall be discussed in the draft EIS. <u>It should be realized that several actions, in particular those that involve the construction of public facilities or structures</u> (e.g., highways, airports, sewer systems, water resource projects, etc.) <u>may well stimulate or induce secondary effects.</u> These secondary effects may be equally important as, or more important than, primary effects, and shall be thoroughly discussed to fully describe the probable impact of the proposed action on the environment. The population and growth impacts of an action shall be estimated if expected to be significant, and an evaluation made of the effects of any possible change in population patterns or growth upon the resource base, including but not limited to land use, water, and public services, of the area in question. Also, if the proposed action constitutes a direct or indirect source of pollution as determined by any governmental agency, necessary data shall be incorporated into the EIS. The significance of the impacts shall be discussed in terms of subsections (j), (k), (l), and (m). [Emphasis added.]

The section of the EIS rules which applies to the DEIS, has it own definition of "significant impact" as defined above. What the DEIS is clearly lacking is the discussion of secondary impacts. The recent Supreme Court decision in ***Sierra Club v. DOT,*** *105 Haw. 299, 167 P.3d 292 (2007)* is on point. This case is also known as the **"Superferry Case"** and it clearly has redefined the concept of secondary impacts. It is presumed under the EIS Rules that there is a secondary impact. This DEIS is void of any such discussion.

The DEIS has incorrectly concluded there is no significant impact under the EIS Rules. Clearly the DEIS has not met its burden to overcome the assumption of significant impacts for a public works project such as this.

<u>*Hawai'i Law*</u>

There will be finding of significant impacts because in order for an EIS to stand the test under Hawai'i law, it must be, 1) compiled in good faith; 2) met statutory requirements; and 3) provided sufficient information for the decision maker to make an "environmentally-informed choice."

1. <u>The EIS Was Not Compiled In Good Faith.</u>

The supplemental EIS's contents must comply with the requirements of an EIS. HAR § 11-200-14. An EIS is "meaningless" if it is self serving and rationalizes an outcome.

The Ninth Circuit has identified this concern as "timing." ***Idaho Sporting Congress, Inc. v. Alexander,*** 222 F.3d 562, 568 (9th Cir. 2000). In ***Idaho***, the ninth Circuit reversed the district court's denial of an injunction and discussed the timing of the agency's action and the fact that the process shall not be used to rationalize or justify decisions already made. In ***Metcalf v. Daley***, 214 F.3dc 1135, 1143 (9th Cir. 2000), the Ninth Circuit found another violation of the timing requirement and looked to the fact that the EIS process had begun after the agency had signed an agreement making the process one that rationalized the decision. This is exactly what has occurred here.

There are three specific examples of the bad faith. One is the contract of 1999 which has been entered into by WMI and the City. The DEIS should have included this document in that it is critical in understanding how this outcome has been manipulated. The contract is incorporated by reference herein. The second example is the reliance on the Blue Ribbon Commission and the flawed assumptions. This is especially true when R.M. Towill has been the consultant on almost all of the EISs and the consultant for the Blue Ribbon Commission. An excuse that they are unaware of the topography is absurd. The third is the contents of the NOV.

2. <u>The Statutory Procedural Requirements Were Not Met.</u>

The EIS process is governed by HRS § 343. An EIS is:

> § 343-2 Definitions. As used in this chapter unless the context otherwise requires: . . .
>
> "Environmental impact statement" or "statement" means an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects.

The statute also sets forth what the Rules must contain, at minimum. HRS § 343-6. The legal effects of administrative rules are well settled in this jurisdiction. Administrative Rules are to be followed and given the full effect of law. ***Williams v. Hawaii Medical Service Association,*** 71 Haw. 545, 549, 7984 P.2d 442, 444 (1990). The Supreme Court has clearly stated that arbitrary and capricious application of the Rules will not be tolerated. ***Windward Marine Resorts v. Sullivan,*** 86 Haw. 171, 948 P.2d 592 (ICA 1997).

HAR § 11-200-14 through 23 are the requirements in the preparation of Draft and Final Environmental Impact Statements. The "General Provisions" highlight the expectation of the EIS process.

> . . . An EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self serving recitation of benefits and a rationalization of the proposed action. Agencies shall ensure that statements are prepared at the earliest

> opportunity in the planning and decision making process. This shall assure an early open forum for discussion of adverse effects and available alternatives, and that the decision makers will be enlightened to any environmental consequences of the proposed action.

HAR § 11-200-14.

Title 11, Chapter 200, contain the "Environmental Impact Statement Rules" and the following are examples of Rules which were not met.

a. Full consultation did not occur with the DEIS.

HAR § 11-200-15 A sets forth the following requirements to satisfy the consultation process.

> In the preparation of a draft EIS, proposing agencies and applicants shall consult all appropriate agencies noted in section 11-200-10 (10) and other citizen groups, and concerned individuals as noted in sections 11-200-9 and 11-200-9.1. To this end, agencies and applicants shall endeavor to develop a fully acceptable EIS prior to the time the EIS is filed with the office, through a full and complete consultation process, and shall not rely solely upon the review process to expose environmental concerns.

This provision is to be read with the foregoing General Provisions and the requirements of HAR § 11-200-22 A, which further emphasize meaningful public participation as follows:

> Public review shall not substitute for early and open discussion with interested persons and agencies, concerning the environmental impacts of a proposed action. Review of the EIS shall serve to provide the public and other agencies an opportunity to discover the extent to which a proposing agency or applicant has examined environmental concerns and available alternatives. . .

These requirements are clear and unambiguous. Hawai`i case law has consistently held that when statutes or rules are clear and unambiguous, they are to be given effect in accordance with their plain and ordinary meaning. ***IBEW v. Hawaiian Tel.,*** 68 Haw. 316, 323, 713 P.2d 943, 950 (1986); ***RGIS Inventory v. Hawai`i Civil Rights Comm.,*** 104 Haw. 158, 160, 86 P.2d 449, 451 (2004). Under the Rules, the consultation process should have been implemented as soon as possible to engage the appropriate agencies and the public and not rely solely upon the review process.

When the issue of the expansion was brought to the communities, the Mayor prohibited the participation of the elected officials in his meeting. This can hardly be deemed as compliance with the consultation process. In addition, there was no sense that the decision to expand was open for discussion. The discussion was simply, if you don't expand WGSL, then the landfill will go to Nanakuli. This is not a consultation process which is open to the public.

Moreover, the concerns of the NOV and the acts complained of therein should give rise to major environmental concerns and require thorough discussions. The DEIS merely dismisses it with the fact that a settlement has been reached. The violation and the fines were the largest in the Nation at that time.

b. The FEIS failed to comply with the requirement to address alternatives.

HRS § 343-2 defines an EIS as one that discloses, among other items, the "alternatives to the action and their environmental effects."

HAR §11-200-17, which sets forth the Contents requirement of a Draft EIS, addresses the requirement as to alternatives as follows:

> F. The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks. Examples of alternatives include: . . (Emphasis added.)

HAR § 11-200-17 F. 5 states that "For any agency actions, the discussion of alternatives shall include, where relevant, those alternatives not within the existing authority of the agency." In ***Westlands Water District v. U.S. Dept. of Interior,*** 376 F.3d 853, 866 (9th Cir. 2004), the Ninth Circuit reaffirmed that alternatives must be rigorously explored and that "reasonable alternatives" include those not within the jurisdiction of the lead agency. ***Westlands, supra,*** at 868. The Ninth Circuit went on to say that "[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate." ***Id.***. citing to ***Morongo Band of Mission Indians v. FAA,*** 161 F.3d 569, 575 (9th Cir. 1998).

The alternatives discussed by the City assumed the City would operate the landfill and therefore required the purchase of each site. No consideration was given to private landfills and its ability to operate as an alternative landfill location, or alternatively, a private/public partnership. The DEIS fails to address the how much money the City makes on landfill operations and the need to control "flow" of MSW.

The DEIS also fails to adequately address the delay in the Solid Waste Management Plan and the City Ordinance which states that by the year 2000, at least 75 percent of the solid waste generated shall be recycled, reused, composted, or otherwise diverted from incineration or placement in the landfill.

Moreover as discussed above, there is no discussion of secondary impacts which is necessary in order for an DEIS to be adequate.

c. The purpose and need section limits discussion.

HAR § 11-200-17 D requires the Draft EIS to "contain a separate and distinct section that includes a statement of purpose and need for a proposed action." It is a similar provision under NEPA, which is looked upon to guide the discussion on alternatives. ***Westlands, supra,*** at 866. In ***Westlands,*** the Ninth Circuit looked to whether the preparers had "arbitrarily and capriciously" narrowed the scope of the statement, thereby affecting the discussion on the alternative.

Section 15 Comments and Responses to the EISPN

No Comment.

In the preparation of the Draft Supplemental EIS for this proposed expansion, it is critical that the decision maker and the general pubic are made to understand why the promises of government need not be kept. There should also be an explanation as to why the City prepares this DEIS and the Final EIS will be accepted by another City agency. This is especially true when the accepting agency has attached to it, the Planning Commission which is expected to be called upon the make the decision as to whether an SUP should be recommended to the LUC or whether the process requires a boundary amendment.

I trust that these comments and concerns will be addressed fairly and completely in the Final Supplemental EIS.

If you have any questions or comments, please do not hesitate to contact me.

IN REPLY REFER TO:
RA 08-125

The Honorable Colleen Hanabusa
President of the Senate
21st District
State of Hawaii
State Capitol, Room 409
415 South Beretania Street
Honolulu, Hawaii 96813

Dear Senator Hanabusa:

Subject: Draft Environmental Impact Statement (DEIS)
Waimanalo Gulch Sanitary Landfill Expansion

Thank you for your letter dated July 7, 2008, concerning the subject project. The following has been prepared in response to your comments (your comments have been italicized for reference):

1. *"Section 2 Project Background–This section begins with the incorrect conclusion that WGSL is 'essential and necessary' for the City and County of Honolulu ('City'). WGSL is deemed to be essential and necessary only because no action has been taken by the City in truly exploring alternatives to landfilling on this island."*

The City is responsible for providing for the disposal of waste materials. Currently the primary disposal methods in use are recycling, landfilling and incineration. As explained in the DEIS, WGSL is the only currently permitted municipal solid waste ("MSW") landfill on Oahu. Any alternative landfill location other than Waimanalo Gulch will take time to select, acquire and permit. H–POWER handles the majority of the MSW that is disposed on the island. Waimanalo Gulch provides disposal capacity for the ash and residue from H–POWER and is a permitting requirement for H–POWER to operate. Since the Waimanalo Gulch is the only currently permitted MSW landfill and since H–POWER is required to take ash and residue to a permitted landfill, the Waimanalo Gulch Sanitary Landfill ("WGSL") is "essential and necessary."

2. *"An honest discussion is lacking in the DEIS as to why the City delayed in bringing the expansion to the public. News media reports of comments by the Planning Commission of the City and County ('PC') and the Land Use Commission ('LUC') evidence that these decision makers were also not pleased with what could be construed as a deliberate delay to request the extension. This expansion request will also be construed as leaving decision makers no alternative but to grant an extension."*

On June 9, 2003, the LUC issued its Decision and Order Approving Amendment to Special Use Permit ("2003 LUC Decision"). The City was ordered by the LUC to select a new site by June 1, 2004. The Mayor's Advisory Committee on Landfill Siting ("Mayor's Advisory Committee") was formed in June 2003 by Mayor Harris to make a recommendation to the City Council as to a new site for the landfill. The Committee issued a list of four sites for City Council consideration on December 1, 2003, in accordance with Condition No. 1 of the 2003 LUC Decision.

The City Council conducted an independent evaluation of the selection process used by the Committee, and determined that it was unable to make a decision by the LUC's June 1, 2004 deadline. The City was granted a 6-month extension, to December 1, 2004, to make a decision on a new landfill site.

The City also sought the LUC's clarification as to whether Waimanalo Gulch could be considered by the City Council as the future landfill site. The LUC stated that such a decision was not within its jurisdiction. Accordingly, Waimanalo Gulch was then considered as a potential landfill site by the City Council. The City Council selected Waimanalo Gulch as the future landfill site on December 1, 2004.

The current City administration took office in January 2005 and immediately began a review of the options for MSW disposal. This process took about a year to conclude. By early 2006, the City decided to proceed with the environmental review process for the future use of Waimanalo Gulch. In February 2006, the City Council passed Council Bill 37 (2005), CD2, which would have closed WGSL by May 1, 2008. Bill 37 was vetoed and the environmental review process for expansion of WGSL began in 2006. The EIS Preparation Notice was published in The Environmental Notice in November 2006.

Stone uprights were identified in the proposed expansion area in the Spring of 2007. Due to a staff shortage at SHPD, the evaluation of the cultural significance of the stones was delayed. Because a cultural impact assessment is required in an EIS, completion of the EIS was delayed. Additionally, the City has been in the process of seeking to increase waste-to-energy capacity as an alternative to landfilling and to transship refuse to be landfilled on the mainland. In both cases, the results to date have been reflected in the DEIS.

Because it was clear that given the delays related to evaluation of the stone uprights the City would be unable to complete the EIS and receive the proper permits before the May 1, 2008 deadline for cessation of waste acceptance at WGSL, the City sought a 2-year extension based on the fact that there was additional unused capacity. Ultimately, an 18-month extension was granted.

3. *"Blue Ribbon Commission - Much of this DEIS is based upon the Mayor's Advisory Committee on Landfill Site Selection ('Blue Ribbon Commission'). What the DEIS fails to address is that this Blue Ribbon Commission, having been staffed by R.M. Towill provided the members with inadequate information or incorrect information to fulfill their task."*

The process followed by the Mayor's Advisory Committee is detailed in the EIS. The Mayor's Advisory Committee's recommendations were made based on its own selection of criteria it considered important to the selection of an alternative landfill site. R. M. Towill supported by Pacific Waste Consulting Group, SMS Research, Cultural Surveys Hawaii, and the City gathered the information requested of it by the Committee. Site specific information was sought in a number of instances, but access to some of the potential sites was either denied or delayed (until late in the LUC timetable) by the landowners of four of the five sites. As a result assumptions that were shared with the Committee were made to enable a reasonable comparative analysis. Although there was significant technical data about WGSL available, in order to put all of the sites on an equal level for comparison, the "no excavation" assumption and other assumptions were used for the evaluation. These assumptions were documented in the data sheets that were provided to the Committee.

4. *"Though much is made about violations of the Sunshine law, what is lacking is an honest discussion of the flawed information which was provided to the Blue Ribbon Commission. Response by the City that R.M. Towill is not expected to know what the conditions of the land* [sic] *is absolutely laughable. The entity which has prepared all EISs in recent history and who is well aware of the Contract entered into to extend the management contract with Waste Management Hawaii, Inc. ('WMI') for the landfill operations at WGSL, cannot argue ignorance. It is of significance that the City finally admits that one of the criteria to assess the sites was no excavation. How R.M. Towill or the City could present WGSL expansion for 20 years with no excavation is akin to bad faith. The City and R.M. Towill was definitely on notice and failed to inform the Blue Ribbon Commission of this fact."*

This comment regarding the City's contract with Waste Management of Hawaii, Inc. ("Waste Management"), and the comment regarding "no excavation," are similar to comments made in earlier letters from you dated August 30, 2006 and December 26, 2006. We offer the following response, which is consistent with earlier responses:

> The contract amendment dated May 1, 1999, provided for the expansion of the Waimanalo Gulch site. Subsequently, the prior administration decided on a five-year limit for the use of the site. The contract was not amended to a shorter term because the exact date of termination could not have been determined. Although the contract was not amended, the City retains control of the contract and can terminate it at any time when it is in the best interest of the City. As provided in Contract Special Provision 29, the contract can be terminated,"… in whole or in part, whenever the Director shall determine that termination of the contract, in whole or in part, is in the best interest of the City." (Letter to Colleen Hanabusa from ENV, May 12, 2008)

Waste Management, consultants, and the City all understand this provision. The contract is a publicly available document.

Regarding "no excavation":

The no excavation remark that you cite comes from the Waimanalo Gulch Expansion, Potential Landfill Site Data Sheets, prepared for the Mayor's Advisory Committee on Landfill Siting, October 2003. The specific reference is to information provided for Criteria No. 23, Landfill Capacity or Site Life. According to the data sheet, "The volume was calculated assuming a 100 foot buffer around the site boundary, 30 acres for infrastructure facilities, no excavation, and filling to the natural grade." The rationale for not incorporating excavation as a factor involved the following:

A. It was not in the consultant's scope of work to do field studies including drilling borings to obtain subsurface information. This is typically the case when doing preliminary siting studies due to difficulty in gaining access to the property, the extensive time required for such studies, and the high cost of doing field studies. Without these studies, it is not possible to determine excavation depths or difficulty with any degree of certainty. Therefore, it is typical to assume minimal or no excavation in order to compare site capacities;

B. Criteria No. 23, therefore, was established to provide an estimate of capacity only based on: an area adjusted with an approximately 100 foot buffer around the perimeter of the site; the use of 30 acres for infrastructure to operate the facility; no detailed engineering calculations incorporating soils conditions to produce information on excavation; and filling of the site to the natural grade of the terrain of the finished site. It is incorrect to conclude or imply on the basis of information from the data sheet alone that in the course of developing a landfill site that no excavation would be required.

<u>See</u> Letter to Colleen Hanabusa from ENV, May 12, 2008.

5. *"The Contract between WMI and City should be made a part of the Appendices for the Final Supplement EIS to be accurate and complete."*

The contract between the City and Waste Management is a matter of public record and is publicly available for those who may wish to view it. The absence of the contract in the Appendices will not affect the accuracy, nor completeness, of the EIS.

6. *"In addition, the Appendix which is found in Volume 3 of 3 fails to include those pages which address the criteria as well as how the alternative sites were evaluated by R.M. Towill. This should definitely be included for all to review."*

The full Report of the Mayor's Advisory Committee (Blue Ribbon Committee) on Landfill Site Selection dated December 1, 2003, which addressed the 31 criteria used by the Mayor's Advisory Committee as well as how alternative sites were evaluated, is attached as an exhibit to Appendix K of the DEIS, and located on the City's website at <u>http://www.opala.org/solid_waste/archive/Mayor%27s_Advisory_Committee_on_Landfill_Siting.html</u>. Additionally, a description of the criteria and evaluation process is located on pages 9-51 to 9-73 of the DEIS.

7. *"Under Section 4 of this letter, there will be a discussion of the costs. Cost which was a criteria for the Blue Ribbon Commission had very minimal expenses for WGSL because of the lack of excavation. This is again shown to be an incorrect statement."*

Costs are addressed below in responses to comments 35 and 36.

8. *"DOH Violations - The so called alleged efforts of the City to address the Department of Health's Notice of Violations ('NOV') and how to prevent them in the future need more details. This is especially true in light of the subsequent allegations of mismanagement and the recent lawsuit regarding the City's rebate of tipping fees to Schnitzer steel. What is of significance is the issue of what is the City doing to monitor what is being placed in the landfill. It is also important that irrespective of whether the violations were 'settled;' there is still lacking information as to how and where the asbestos was buried. This is hidden in the violations regarding the reporting to the DOH."*

As a result of the NOV, and new regulations and requirements, additional provisions were included in the revised landfill operating permit. Furthermore, the Department of Health, State of Hawaii ("DOH"), has greatly increased the frequency of its site inspections and review of the required operating documents. Finally, City staff is in constant contact with Waste Management and addresses issues that may arise on a daily basis. City staff does an initial screening of what is being placed in the landfill when the delivery vehicle is at the scale house. Waste Management does further screening as the waste is disposed of at the working face of the landfill. The City co-authors or receives copies of all reports submitted to DOH.

The allegations in the Schnitzer Steel lawsuit – to which the City is not a party – have yet to be proven, and in any event, Schnitzer Steel provides annual certification that the recycling residue in question meets all legal requirements for landfill disposal.

Asbestos is handled in accordance with Part II, Section C, of the operating permit dated February 20, 2008, which is publicly available.

9. *"The exceedance of grade is a critical issue as to future monitoring and there needs to be a more detailed discussion as to how this will be avoided in the future."*

After extensive review and a stability analysis, DOH approved the grade modification to WGSL. A ground survey is performed on a bi-monthly basis to compare existing grades with approved grades. DOH is responsible for enforcement at the site and determines the frequency of its inspections.

See also Section 2.3.1, State Department of Health of the FEIS, for further discussion.

10. *"EPA Violations - It is unacceptable to merely address these violations as "resolution pending. "In light of this Department and the City's battles with the EPA on the sewer systems, it is important to cover in this DEIS the relationship between the two, if any."*

The primary violation in the EPA Finding and Notice of Violation ("EPA NOV") was the late installation of the gas collection system, which was self-reported. It was installed and operational by November 2005. Subsequently, the EPA issued its NOV in April 2006. Thus, what led to the initial violation was corrected.

In addition, EPA alleged that the WGSL continues to operate in violation of EPA regulations because the WGSL's wellhead gas temperatures exceed 131°F in some of the landfill gas wells. Waste Management continues to monitor and evaluate the potential causes of the elevated gas temperatures and has provided documentation to EPA and DOH to demonstrate that the Landfill can be safely operated at these higher temperatures. Waste Management will continue to coordinate appropriate measures to maintain compliance with all regulations as required by law.

There is no relationship between this EPA NOV and the City's sewer systems.

See also Section 2.3.2. U.S. Environmental Protection Agency, of the FEIS.

11. *"More importantly, what is lacking is a discussion as to what the City has done in terms of contract evaluations and performance evaluations of its operator, WMI. Given the nature of their violations and the magnitude, the DEIS is required to provide this information to the public."*

To evaluate operations performance, the City hired a third-party engineering consultant to evaluate landfill operations. They concluded that Waste Management was performing at a satisfactory level. Waste Management also contracted with another third-party engineering consultant to evaluate the effect landfill operations may have on neighboring areas and has shared data with the City. The City's staff meets weekly with Waste Management's staff to discuss landfill operations. In addition, the City's Refuse Disposal Engineer is in daily contact with Waste Management's General Manager regarding operations at WGSL.

See also Section 2.4. Summary of Current Status, of the FEIS.

12. *"Section 3 Introduction - This introduction is lacking in that it fails to set forth that this is a project which was promised to be closed by the prior administration and this Mayor as well."*

The City acknowledges that prior commitments were made by previous administration officials to close WGSL by 2008. See also pages 2-2 and 2-3 of the DEIS. This position was overridden by the subsequent City Council selection of WGSL as the location of the City's future landfill as described in section 2 of the DEIS. The City is unaware of any commitment by the current administration to close WGSL.

13. *"Moreover, in that the City has chosen to address the requirements of a DEIS in this section of its document, it should be clear as to exactly what is required, such as:*

> *Department of Health Rules ('HAR') § 11-200-14 through 23 are the requirements in the preparation of Draft and Final Environmental Impact Statements. The 'General Provisions' highlight the expectation of the EIS process.*
>
> > *. . . An EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self serving recitation of benefits and a rationalization of the proposed action. Agencies shall ensure that statements are prepared at the earliest opportunity in the planning and decision making process. This shall assure an early open forum for discussion of adverse effects and available alternatives, and that the decision makers will be enlightened to any environmental consequences of the proposed action."*

The DEIS was prepared in accordance with Hawaii Revised Statutes ("HRS") Chapter 343 and Title 11, Chapter 200, of the Hawaii Administrative Rules ("HAR"). The environmental review process allows for public input, such as your letter, which benefits the integrity of the review.

14. *"Clearly, this DEIS is a self serving recitation and a rationalization of what the City wants to do. The Rules require that these statements be prepared at the earliest opportunity and it is evident that the City chose to wait until the last possible moment. The argument which the City will raise is the discovery of stone outcroppings. However, the City chose to file this DEIS without a determination by the EPA on the violations at WGSL. When it has been convenient, the City has chosen to act so that there is no time for any viable alternative."*

See the response at pages 1-2 of this letter regarding the EIS process and timeline. A cultural impact assessment is a necessary component of an EIS in accordance with Hawaii law. This assessment could not be completed until the cultural stone uprights were evaluated. This evaluation and the cultural impact assessment have been completed, however, the final preservation plan for the stone uprights is currently being developed, and has therefore, been identified as an unresolved issue in Section 11 of the DEIS. The City, Waste Management and SHPD will work to ensure that an appropriate preservation plan is put into place.

Resolution of the EPA NOV is not required to complete this DEIS. The EIS is an informational document and provides the current status of the EPA NOV. It cannot predict the resolution of the EPA NOV. The City did not wait for completion of the negotiations with EPA to complete the EIS as doing so would have further compressed the schedule. The EPA operates on its own schedule.

15. *"Figure 3-2 in this section depicts expansion which will exceed the present SUP boundary. This means that the expansion is expected on the lower portion of WGSL nearest Farrington Highway which will make the landfill more visible to the residents. This expansion will take all of the 200 acres at WGSL minus a 100 foot barrier around the perimeter of the property boundary."*

The extent of proposed landfill expansion area is shown in Figure 3-2, Figure 4-6, Figure 5-1 and Figure 5-3 of the DEIS, and these figures show that expansion will occur mauka and northeast of the currently permitted area. The area south of Ash Cells 1 and 8, which you referred to as the "lower portion of WGSL nearest Farrington Highway," is currently permitted for facilities, but not for landfilling. That area is already a part of the permitted footprint and is expected to continue to be used for facilities.

The lower portions of the expansion area, as depicted on Figure 3-2 will be used for accessory uses, not landfilling. <u>See also</u> Figure 4-6 (Approximate Final Grading Plan and Proposed Stockpile Location). Surface treatments including landscaping will be done to improve the appearance of the site.

16. *"Section 4 Project Description - It is interesting that the City refuses to acknowledge that WGSL is located near Ko Olina. Ko Olina has a community and is marked as the Second Resort destination for the Island of Oahu. In these difficult economic times, it would be significance [sic] to know that location of the landfill to a major economic engine for the City and the State of Hawai`i."*

The DEIS clearly shows the location of Ko Olina and its proximity to WGSL in Figures 7-3, 7-4, and 7-5. Section 7.2., <u>Land Use and Ownership</u>, clearly acknowledges the presence and importance of Ko Olina as one of several regional land uses in proximity to WGSL.

17. *"Given that there has been a contested case hearing recently completed on the WGSL, it is of interest that the sworn to testimony of the City officials are not included in some form or another."*

The transcript of the Contested Case Hearing is a publicly available document. It is not necessary to recite or attach the transcript to the EIS. However, where your comment misstates testimony, the corrections are noted below.

18. *"For example: Frank Doyle testified that he was Chief of the Division of Refuse when WGSL was initially selected. He confirmed that the original Environmental Impact Statement ('EIS') stated that only 59 or 60 acres was suitable for landfill use. (For ease of reference, the "Tr." refers to the transcript in the Contested Case Hearing held on December 7, 2007, followed by the page numbers Tr. 215 and 217)."*

Mr. Doyle testified that the first EIS contained a reference that WGSL contained "59, 60 [acres], somewhere in that area" of land good for landfilling. <u>See</u> Transcript at 217. Please also refer to comment 29 below.

19. *"You, [sic] Mr. Takamura testified that to expand WGSL under the 17 year contract with WMI, eight million cubic yards of native soil will have to be removed to create 15 million cubic yards of airspace (landfill). (Tr. 67-68)."*

Dr. Takamura testified that it sounded familiar that eight million cubic yards of native soil will have to be removed to create 15 million cubic yards of airspace. <u>See</u> Transcript at 68.

20. *"WGSL is up the side of a mountain. In the present expansion of WGSL by the 14.9 acres, WMI encountered blue rock and has been blasting to expand WGSL. (Tr. 177-178). Paul Burns, former manager of WMI for WGSL, testified that grading has been done at WGSL which is outside the permitted 14.9 acres and is where blue rock has been encountered. (Tr. 149). It is for sloping of rock faces and drainage. (Tr. 150). In the E-3, E-4 area as much as 700,000 cubic yards of blue rock was removed. (Tr. 152-153)."*

Mr. Burns testified that drainage, grading and sloping of rock faces for safety reasons has occurred outside of the 14.9 acre expansion area designated for landfilling. <u>See</u> Transcript at 150. Mr. Burns also testified that rock "probably in the 700,000 cubic yard range" was removed from Cells E-3 and E-4. <u>See</u> <u>id.</u> at 152-53.

21. *"At the landfill, leachate is created. Leachate is 'the decomposition of organic matter . . .produces CO2; if it's anaerobic, it produces methane, and the other end product is water. There's also water in--loose water with the material we grab or dispose of, so when it decomposes and breaks down, water seeps to the bottom . . . where the liner is and it collects there. . .' (Tr. 71)."*

Dr. Takamura testified as follows:

> In the decomposition of organic matter, I guess the biological activity produces CO2; if it's anaerobic it produces methane; and the other end product is water. There's also water in--loose water with the material we grab or dispose of, so when it decomposes and breaks down, water seeps to the bottom of the--where the liner is and it collects there and it goes to the low point, and that's what we term "leachate."

<u>See</u> Transcript at 70-71.

22. *"Count I of the NOV is entitled 'Exceedance of Permitted Grades' and is relevant to the representation of the capacity at WGSL. (Id. at 2). In Count I and as testified to by Burns, permitted capacity in the ash monofill area was filled and exceeded in 2004 by 100,000 tons. (Tr. 168). In addition, 129,200 cubic yards of Municipal Solid Waste ('MSW') was placed above permitted grades. This computes to about 91,000-100,000 tons. (Tr. 168-169). When the DOH learned of these violations, it had originally told WMI to re-grade the ash monofill area and remove the excess MSW to the back portion of the landfill. (Tr. 248). An alternative provided to WMI was to construct the berms to address the stability issue. (Tr. 250)."*

Paragraph 9 of Count I of the DOH Notice and Finding of Violation (NOV) provides, "In a letter dated February 3, 2005, Waste Management states 'approximately 100,000 tons of ash delivered from the H-POWER facility has been placed above the current permitted grades of the ash monofill'. The February 3, 2005, letter further states that the placement of ash occurred during 2004."

Mr. Burns testified that he was unable to answer whether 100,000 tons of ash had been placed above current permitted grades in the ash monofill because that was before he arrived in Hawaii. See Transcript at 167-68.

Paragraph 11 of Count I of the DOH NOV provides, "With a submission dated February 22, 2005, showing 2005 topography and master plan final grades, Waste Management noted that 139,485 cubic yards of ash and 129,240 cubic yards of MSW were placed beyond the permitted grades."

As to paragraph 11 of Count I of the DOH NOV, Mr. Burns testified that 130,000 cubic yards was "about 91,000 tons, about there, 90-something thousand?". See Transcript at 168-169.

Gary Siu of DOH testified that DOH asked Waste Management and/or the City to regrade the ash on the Waianae side, and to remove the overfilled area in the MSW area and take it to areas with capacity. See Transcript at 248. Regarding the berm, Gary Siu testified, "The construction of the ash--the berm to stabilize the ash was done--because when they told us that they overfilled it, I believe there's a letter signed by Larry Lau putting some options in front of them, and the option they chose was to build a stability berm." See Transcript at 250.

> 23. *"A 'toe berm' was constructed at the 'toe' of the ash monofill when Takamura was Director to address the overall stability of the WGSL. (Tr. 56 and 58)."*

Dr. Takamura stated that Colleen Hanabusa should ask the engineers about the purpose of the toe berm. See Transcript at 56. He testified that he understood that his approval was needed for the construction of the toe berm because "[i]t's part of the operations of the Waimanalo Gulch landfill." See id. at 57. Dr. Takamura further testified that the toe berm was already being constructed prior to a meeting with DOH regarding the NOV. See id. at 58. He believed that there had been discussions about stability prior to his meeting with DOH. See id.

> 24. *"Takamura testified that stability issues are common when you touch a slope and WGSL is up the slope of the mountainside. (Tr. 60).*
>
> *Burns conceded the stability concerns and described WGSL as a canyon and once the valley is filled (the gulch) then when the expansion is upward, there is an effect throughout the whole facility. It is similar to stacking on the top and the effect will be there for the lower area. (Tr.159- 160)."*

It is unclear what "Burns conceded the stability concerns" means. Specifically, Mr. Burns testified, "As you mentioned earlier, we've got a canyon fill or a valley fill, and that valley, it's a 'V' shape, in very simplistic terms a 'V'-shaped gulch and it's not flat, it kind of points uphill; so, whatever you do on the upper reaches has an effect, pretty much through the whole facility..." See Transcript at 158-59.

In response to the question "[B]ecause of what I consider the stacking--just a layman person's perspective--stacking of the MSW and the landfill that you--that the decision was made that at the ash monofill, the bottom area, that the height should be reduced for stability?," Mr. Burns testified, "They all kind of go together." See id. at 159.

> 25. *"Due to the topography of WGSL, there are three stability berms. One is for the ash monofill area and called the 'toe berm.' The others are the E-1 berm and the West berm. (Tr. 151). The E-1 berm was constructed in late 2005 to 2006 and the West berm in 2006-2007. (Tr. 164). All three berms were constructed with blue rock from primarily the E-3 cells. (Tr. 177-178). The West berm was constructed to stabilize the landfill as the east side (E cells) are being filled. As the east side fills the forces push the to [sic] the west side. (Tr. 254). These berms were stability berms which were a result of WMI overfilling WGSL. (Tr. 267)."*

Mr. Burns testified that he believed the E-1 berm was built in late 2005, maybe into 2006. See Transcript at 164. Mr. Burns also testified that the western berm was constructed with blue rock, that the toe berm was constructed with blue rock which primarily came out of Cell E-3, and that he was unsure where the material to construct the E-1 berm came from. See Transcript at 177-78.

Mr. Siu testified, "As you fill the east side, the force is pushing on the west side." See id. at 254. In response to the question, "So, the stability berm is the ones that came in 2005?," Mr. Siu stated, "That's correct. And they're not a part of a permit application; they're part of a response to overfilling the landfill and potentially making a site unstable, which is what their analysis showed." See id. at 267.

Regarding Mr. Siu's comment, the City clarifies that only the ash toe berm was added to address an isolated low factor of safety in some portions of the ash monofill caused by overfill. The E-1 berm and West berm were a part of the initial design for the 14.9-acre expansion of WGSL, and were not added at a later date to address an unanticipated low factor of safety.

It should also be noted that Mr. Siu testified that he was not an expert on stability analysis and did not conduct his own stability analysis of WGSL. See id. at 260-261.

26. *"There needs to be a description of safety factors. For example the testimony has been: Safety factor at WGSL is calculated at 1.5; however anything above it is acceptable. (Tr. 172). The example given is that in the E-1 area the safety factor is less than 1.5; however the addition of the berm brings it up to 1.5. (Tr. 173). The safety factor affects the grades at the landfill. For example if the factor was 2.0, the grades would need to be lowered. (Tr. 185). The stability factor at the ash monofill area before the toe berm was 1.29. (Tr. 248). A related issue is that WMI had used the wrong liner in that the 'textured liner' was not used and a 'smooth' liner was which called into question the resistance to movement of the landfill. There were at least two cells in the middle of the landfill with smooth liners. (Tr. 134)."*

Mr. Burns testified that Hawaii has a minimum safety factor of 1.5, and that anything above 1.5 is acceptable. See Transcript at 171-77. Mr. Burns provided a hypothetical example, "So, if we do a design without, say--for example, without a stability berm, in the E-1 area we may have a factor of safety below 1.5; it could be 1.4. You add that stability berm in place, it--you know, it boosts your factor of safety to the 1.5. It just gives you that extra level of insurance." Id. at 173.

Mr. Burns testified that if 2.0 was the factor of safety, it may affect WGSL's final grades or future designs. Id. at 185. He testified, "They would need to be lower, probably," and "There's some areas it would have no effect on; other areas it may have some effect." Id. at 185-86.

Mr. Siu testified that he thought the factor of safety was 1.29 with the overfill in the ash area. Id. at 247-48.

As to the liner issue, Mr. Burns testified as follows:

> So, during--in 2001, while we were doing the design of the 14.9 acre expansion, we realized there were some cells constructed in the middle that were done with a different lining system. They were specified to be a--what we call a "textured liner"; it's a real course, rough thing with a high-friction surface on it. There were a couple of cells that were built with smooth. Why? I can't answer; I wasn't there at the time. But the due diligence of that analysis brought that to light. So, what that means is, instead of having a real course friction angle in some of these cells, it's smooth, so it's not quite as resistant to movement. However, looking at it in the light of the whole project, I want to make sure that everybody knows the landfill was stable, there was no--ever any sense or--that the facility was going to slide. So, I want to make sure everybody is clear. Even though that friction value was lower in some areas, the whole site was stable and there was never any problems from that perspective.

Id. at 134.

27. *"There are two types of safety factors, static and seismic. (Tr. 257). Seismic is when movement is anticipated and is calculated into the analysis. (Tr. 258)."*

Mr. Siu testified that the seismic safety factor is different from the static safety factor. See Transcript at 257. As to the seismic safety factor, Mr. Siu testified, "There's a number of ways to do seismic. You can do it by using what they call a pseudostatic; and that is, you try to analyze in such a way that there would be no movement, and then you would, again, have a factor of safety. The other way, which this facility is using is, they're using a deformation type of analysis, and there's a determination made as to how much deformation you will--is appropriate to accept." Id. at 257-58.

28. *"In a report by EA Engineering, Science and Technology, Inc., the stability factor of 2 is what is proposed with the explanation that safety factors between 1.5 to 1.9 is acceptable when it does not 'pose and [sic] imminent threat to human health or the environment.' The proximity to Farrington Highway and Kai Lani subdivision suggest imminent threat and supports the increase to 2.0. Exhibit H at 6."*

The EA Engineering Science and Technology, Inc. ("EA") Report introduced at the Contested Case Hearing was never authenticated by EA and was not signed by a licensed professional.

Licensed and qualified professionals at DOH and experts retained to assist it will evaluate details of the landfill design. The safety factors, and other analytical approaches used by Waste Management to design the expansion, will be subject to extensive scrutiny to ensure the analysis is appropriate considering all conditions at this site.

29. *"What is clearly relevant to the general public and not set forth in this DEIS is the issue of the stability of the landfill and the requirement for the berms. It is very relevant especially when viewed in light of the first EIS which said only 59-60 acres were suitable for landfill. This is also important when viewed in light of the criteria of the Blue Ribbon Commission which included the statement that they would fill to "natural grade." (Criteria No. 23). The transcript of the Contested Case Hearing should be made a part of the Final Supplemental EIS as well."*

The Revised Environmental Impact Statement accepted by the Director of Land Utilization on October 17, 1985 (the "first" EIS), stated that WGSL contained about 80± acres of usable land. See Revised Environmental Impact Statement dated May 7, 1984, at S-5, S-7. The usable area was estimated based on the engineering knowledge, operational processes and regulatory environment at that time, all of which have changed since 1984. The usable area for a landfill is subject to continuing evaluation and change over time, as the science and engineering of landfills evolve. WGSL is an example. The preliminary design of the usable footprint is disclosed in Section 4 of the DEIS.

The first EIS also mentioned that 57± acres will be used for the landfill. See id. at 2-1.

One part of one of the 31 criteria used by the Mayor's Advisory Committee to provide a basis for comparative analysis of the sites was filling to natural grade. The Committee never assumed that any of the four sites, or an expansion at WGSL, would be designed as a landfill to the "natural grade." The final design of the selected site would consider the site specific conditions and would have to be approved by DOH.

Regarding your suggestion that the transcript of the Contested Case Hearing should be made a part of the Final EIS ("FEIS"), please refer to the response to comment 17 above.

> 30. *"Given the concern of the stability of the landfill and the recent earthquake on the Big Island, a discussion must be had as to what can be done if such a natural disaster caused the landfill to slip onto Farrington Highway. This discussion must look to the fact that expansion will be at the steepest part of the footprint of the parcel of land and the stress it will place on the existing landfill. The people of the Waianae Coast have only one way in and one way out."*

The design of the Waimanalo Gulch expansion considers the seismic and other factors appropriate to the island and to the area of the site. Detailed stability analyses were completed during the project design. The design of the current SUP area and the proposed area of expansion will meet the EPA Subtitle D (40 CFR Part 258) standard for stability. The design of the expansion will be subject to review by appropriate City and State agencies when they evaluate the permit documents.

See also Section 5.6.5., Potential Impacts and Mitigation Measures, pertaining to Seismic Activity (Earthquakes), of the FEIS.

> 31. *"Stability of the Landfill must be analyzed in light of Figure 3-2 which shows the expansion throughout the 200 acres of land. It will be a total landfill with the exception of a 100 foot buffer."*

As noted in the DEIS, the areas that will be used for MSW and ash cells do not encompass the entire 200 acres. Comments related to stability were responded to earlier in this letter.

> 32. *"Though mentioned earlier, the fact that City states in this section that it has a program to control the 'Contaminated Materials,' this is without basis. It is also without basis that the 'all documentation of asbestos disposal' is present on site. In fact, that is one of violations that WMI could not determine where the asbestos was disposed of. The asbestos disposal plan may set forth a plan; however, from the NOV we know that WMI did not follow that plan. It is unacceptable to simply state a plan and have no enforcement as to whether it will be followed."*

Any waste that is not MSW is considered "special waste," subject to profiling as described in the Operations Plan, which is publicly available at WGSL. The description of the Operations Plan in the EIS, including the Asbestos Acceptance Plan, was developed to address proper waste practices and procedures. The Operations Plan addresses all safety regulations including those in the NOV. Accordingly, the policies and practices outlined in the EIS and detailed in the Operations Plans are more than adequate because they address the issues identified in the NOV. Moreover, the Operations Plan was reviewed by DOH during its evaluation of the grade modification permit application. This permit was approved on February 20, 2008. DOH has been actively reviewing and inspecting landfill operations. Questions now and in the future about the documentation of asbestos disposal will be handled as outlined in the Operations Plan.

> 33. *"As well, statements that their storm water or water drainage are managed is incorrect. Again, the NOV is on point and the amount of leachate which had to be pumped and dumped into the Waianae Sewage Treatment plant needs to be addressed."*

Leachate is not allowed to co-mingle with stormwater runoff. Stormwater runoff is managed pursuant to the Surface Water Plan, and is unrelated to leachate management. While Count XV of the NOV related to a failure to submit the annual surface water (stormwater) plan, the leachate management issues are wholly separate from surface water and stormwater management issues. Again, the Operations Plan was developed to address proper waste handling practices and procedures, and includes extensive stormwater monitoring and surface water management. Leachate level issues related to pump and equipment failures were corrected as part of the NOV resolution.

The leachate that is accepted by the operator of the Waianae Wastewater Treatment Plant was, and continues to be, handled in accordance with regulatory requirements to ensure public health and safety. Leachate is collected at the site, analyzed regularly through independent laboratory tests, and taken to the Waianae Sewage Treatment Plan where it is properly treated. The amount of leachate varies and the need to pump and dispose of it is monitored regularly. The monitoring reports are part of the documentation reviewed by the DOH inspectors and are publicly available. Pumping the leachate from the site and disposing of it at the Waianae Wastewater Treatment Plant are DOH-approved waste disposal practices.

As noted in a memorandum to ENV from the operators of the Waianae Wastewater Treatment Plant, the leachate accepted by the plant for processing has had very little or no impact on the wastewater effluent quality that is being discharged to the ocean outfall. See October 2, 2007 memorandum from the Division of Environmental Quality to Frank Doyle, which was included as a part of section 15 of the DEIS. Leachate management and monitoring will be a part of the Solid Waste Operating Permit application.

> 34. *"Figure 4.9 seems contrary to the representations made to the Ko Olina community. Assuming that the color chart sets forth the sequence of the closure, then the area in the back of the landfill will be closed before the areas closest to Farrington Highway. This means that landfill operations will be visible from Farrington throughout the extended life of the landfill."*

It is unclear what representations are being referred to regarding visibility of the landfill. The closure sequence depicted in Figure 4.9 does not reflect the cessation of actual landfilling operations, but rather the anticipated final cover of those areas. Final cover or closure cannot be installed until the landfill operations associated with the expansion area in the back of WGSL have been completed.

The present plan is to continue filling along the west side of the landfill as the final phase of filling. These operations will start at the west stability berm and continue to the area of the ash monofill. It is important to recognize that the face of the ash disposal area has largely been covered with an interim soil cover, and portions have been planted with natural vegetation. As that vegetation matures and becomes fully established, and as the operator places rocks on the face to emulate the nearby undisturbed ground, even the ash monofill will be much less distinguishable from the surrounding land. Additional landscaping to the front area of WGSL is planned.

See also Section 4.10. Closure of Lateral Expansion Area, of the FEIS.

35. *"Cost of the Landfill - Another issue which was a criteria in the Blue Ribbon Commission's consideration was costs. At Section 4.11 a discussion of costs showed $60,800,000 for the cots* [sic] *of the excavation and other costs for a total cost of $99,400,000 in 2008 dollars. How are these costs arrived at?"*

Engineers did a design cost analysis for the WGSL and calculated costs for anticipated excavation, grading, landfill liners, access roads, a leachate collection system, a drainage system, and other accessory requirements.

36. *"In addition, the costs of the berms should be included in that these structural changes enable the City to now petition for an extension."*

The cost of the existing toe berm is not a part of the anticipated future costs of the expansion project, which are described in Section 4.11. As noted above in response to comment 25, the existing E-1 berm and West berm were a part of the initial design of WGSL and were not included in the estimated costs of future improvements. However, as noted in the response to No. 38, below, the cost of extending a portion of the west berm up the canyon is included in the proposed expansion project.

37. *"In addition, the reference in the DEIS is to the figure $86 million as the cost. The discrepancy must be addressed."*

The estimated figure of $86 million dollars was identified on Page 7-30 of the DEIS by SMS Research through consultation with Waste Management, as costs associated with the construction of the site over a 10-year period. The estimated figure of $99.4 million dollars, also prepared by Waste Management, is provided in the DEIS in Section 4.11, <u>Project Schedule and Cost</u>, and represents operating and construction costs that would be incurred over a 15-year period. Thus, the two figures represent two different periods of time and different activities, and are not comparable.

38. *"There also needs to be a discussion as to whether additional berms will be required or are anticipated at the site."*

At this time, while additional berms are not anticipated, the proposed expansion design includes extending the west berm up the canyon. The final design, however, will be determined during permitting after completion of the EIS process.

See also Section 11.2. Final Engineering and Construction Details, of the DEIS.

39. *"In discussing costs, the City has said it makes a profit of $4 million a year at WGSL. If this is the case, for a 15 year expansion the operational cost will increase by at least $6.63 million a year. Why is this then economical?"*

The EIS does not address the City's profit at the landfill. It is unclear what representations are being referred to regarding $4 million annual profit. The City is responsible for providing safe and adequate waste disposal, and these costs will exist at any landfill site, regardless of the amount of income it receives because of landfill operations.

40. *"Section 5 Environmental Setting - Given the recent decisions by the Hawaii Supreme Court, it is necessary to discuss the concept of public trust. This is especially true when looking at the waters of this State. What occurred with the operations of WGSL and the leachate is inexcusable and a violation of that public trust. Note that the leachate was disposed of, for most part, in the Waianae Sewage Treatment Plant."*

There has been no violation of the public trust. Pursuant to the public trust doctrine, the state holds certain resources in trust for the benefit of its citizens, establishing the right of the public to fully enjoy them for commerce, navigation, fishing, bathing, and related activities. It is unclear, however, how the principles of the public trust doctrine are applicable to operations of WGSL and the disposal of leachate at the Waianae Wastewater Treatment Plant. Leachate from the landfill is disposed of and processed through secondary treatment at the Waianae Wastewater Treatment Plant, consistent with all regulatory requirements. The content of the leachate is sampled and analyzed regularly through independent laboratory tests. Monitoring data show that the leachate has not changed the water quality near the outfall. <u>See</u> October 2, 2007 memorandum from the Division of Environmental Quality to Frank Doyle, which was included as a part of section 15 of the DEIS. Any suggestion that the disposal of leachate at the Waianae Wastewater Treatment Plant is harming the waters of the State is without basis.

41. *"In this light, there is inadequate discussion of the leachate. This is especially troubling given the DOH NVO. This requires a discussion as to the how the build up of the leachate affected or could affect the integrity of liner and the stability of the landfill. It must also be addressed in light of the expansion and the stress it will have upon the liner and the stability of the landfill."*

The amount of leachate the landfill is expected to produce is based on rainfall and operating experience. The methods used to collect and transport it to the points from which it is extracted and the ultimate disposal of the material are all part of the landfill design and the Operations Plan approved by DOH. The impact of the leachate on liner integrity and landfill stability are design considerations. As noted earlier, the design of the landfill will be subjected to DOH scrutiny to ensure they are consistent with conditions at this site, and with current practice and applicable regulations. The amount of detail in the EIS is adequate as the details of the leachate and site operations will be evaluated with the permit documents by DOH.

The depth of leachate is not necessarily related to the integrity of the liner. The impact of various leachate levels on stability was evaluated and reported to DOH. The design and overall factor of safety includes all anticipated operating conditions, including level of leachate.

> 42. *"Geology - According to Figure 5.2, the proposed expansion will be primarily in the rRK soil type. This means rock over a large percentage of the surface. In addition, the description of the soil associated with rRK is 'sticky and very plastic.' This means that there will be a 'high shrink-swell potential when moisture laden.' The impact of this type of soil must be discussed when stability of the landfill will be an issue as it goes up the slope."*

Soils and geotechnical analyses were performed to meet safety and regulatory requirements. The various factors affecting stability have been and will be taken into account as stability issues are reviewed and analyzed. In addition, DOH and any retained experts will review the analysis.

See also Section 5.3.3. Potential Impacts and Mitigation Measures, of the FEIS, relating to soils, which addresses this issue.

> 43. *"There must be a more detailed discussion as to the slope differential for WGSL in the proposed expansion area. It is admitted to that the upper portion of WGSL where the expansion will take place will be steep with the rRK type soil. How will excavation be safely accomplished in that region must be discussed along with the storage or removal of the excavated 'native soil.'"*

The stability of all cut slopes has been analyzed and will be reviewed by registered professionals during construction. All slopes will be excavated to meet required factors of safety and work will be done in accordance with all OSHA requirements. The DOH engineers and staff are expected to review all aspects of the construction during the permit review and while construction is in progress.

See also Section 5.3.3. Potential Impacts and Mitigation Measures, of the FEIS, relating to soils which addresses this issue.

> 44. *"The rights to the native soil (rock, etc.) must also be addressed. It is believed that with the present operation, the contractor who does the excavation is permitted to sell the rock and soil and keep the funds. If this is the case, the practice must change and the benefit should be to the taxpayers. If the 'sale' of the rock is part of the contract with WMI, these amounts must be calculated."*

The City retains the ownership rights to the excavated materials. On May 30, 1991, the City received bids for the material excavated, processed, and removed from Waimanalo Gulch Sanitary Landfill. Since August 1, 1991, the City has received royalties for any excavated and processed material removed from WGSL. Until the final design has been approved, it is difficult to determine the volume of excess materials that could be removed from the site.

> 45. *"The DEIS concludes that 'adverse impacts are not anticipated' as a result of the lateral expansion. There needs to be a definition of 'adverse impacts' and how the DEIS concludes that such impacts are 'not anticipated.' Clearly the City and its operator have stated these similar conclusions in prior EISs and the NOV has shown to the contrary. For example how else will height violations be noted other than a 'fly by.' What type of monitoring device will be utilized to establish that the landfill is stable other than mathematical computations performed by WMI's experts? Part of the costs of the operation of the landfill should include a fund which the DOH utilizes to hire its own experts to monitor the landfill activities."*

Adverse impacts to topography, geology, or soils are not anticipated with appropriate mitigation measures. Adverse impacts are detrimental impacts, and include adverse ecological effects, aesthetic effects, historic effects, cultural effects, economic effects, social effects, health effects, whether primary, secondary or cumulative. See HAR § 11-200-2. The height violation, while it exceeded the DOH permit, did not result in an adverse impact to stability. The landfill was stable at all times even when the grade exceedance occurred. The earlier permitted grades were lowered causing in part the grade exceedance. The issue was more complicated than just exceeding a permitted grade height, as the comment portrays. The exceedance was self-reported, since it was known at the time that the grade height was lowered as a precaution.

A ground survey is performed by a licensed professional surveyor on a bi-monthly basis to compare existing grades with approved grades.

The current operating permit requires seismic monitoring. Inclinometers are being considered for WGSL to aid in identifying movement should it occur. While there is no device that would determine whether a landfill is stable or not, the stability analyses are based on "state of practice," and they, along with the selected factor of safety, are based on experience with similar slopes and extensive analysis of both stable and unstable slopes by the U.S. Army Corps of Engineers and the U.S. Bureau of Land Reclamation. In the case of WGSL, Waste Management has undertaken steps beyond standard practice, and outside experts have reviewed the work performed by its consultants. Additionally, DOH has reviewed the stability analyses and consulted with outside experts.

Every ton that goes into the landfill is assessed a fee which is paid to the State to assist with funding their administrative and enforcement activities. DOH already employs inspectors who visit the landfill at frequent intervals.

> 46. *"Regional Hydrology - This discussion in the DEIS is of interest in that it is in direct contradiction to the UIC line which is what is relied upon in the siting of the landfill. Discussion is necessary as to how the UIC line has been arrived at when it is clear that WGSL does sit over and is a part of the 'Makaiwa Aquifer System.' Given the past mismanagement of WGSL by WMI, it is critical that we understand the assumptions which have been made in the past, in particular the UIC line and landfill operations over an aquifer. There is an EPA map on the water systems which differs from that of the DOH. There needs to be a discussion as to difference and how the UIC lines have conveniently been drawn around existing landfill areas throughout the State.*

> *Read in conjunction with the discussion in Section 7 as to the natural springs and water sources in the area, there should be an analysis done as to why the UIC line carves out WGSL; and more importantly the long term impact of the landfill over an aquifer."*

The UIC line designations are handled by DOH and other state agencies. Neither ENV nor Waste Management were involved in the determination of the UIC line at WGSL. If location or validity of such lines are in question, it is an issue that must be addressed pursuant to applicable federal or state law and procedure. The UIC line was determined pursuant to state and local law and jurisdiction. The City accepts current laws and regulations as validly enacted and promulgated. The location of the UIC line is one example.

We are not aware of the EPA map to which you refer, and cannot prepare a response to a vague reference to an EPA map.

47. *"Air Quality - There needs to a discussion in Air Quality of the EPA violations against the WGSL. Though the matter has not been resolved, for the DEIS to be accurate, the violations should be set forth as well as the anticipated remedy for the problems. Also, to the extent that the EPA violations overlap with the NOV, that discussion should also be found in the EIS."*

The matter involving the installation of the gas collection system has been addressed. A gas monitoring and collection system was installed in 2005, and has been operating successfully. It is regulated through the terms of WGSL's air permit.

The DOH NOV does not overlap with the EPA violations.

48. *"Under this section, a passing discussion is made of the impact of the 'sludge' and how it is no longer being disposed of at WGSL. The accuracy of the statement is challenged as to when it was 'no longer being disposed of at WGSL.' How much sludge is or has been disposed of at WGSL must be discussed. In addition, it is unclear as to whether the pellets have been authorized for sale. If not, then are these pellets being disposed of in WGSL? It is believed that the statement is incorrect as to whether the sludge is no longer at WGSL."*

The DEIS does not state that sludge is no longer being disposed of at WGSL. The DEIS emphasizes a change in processing sludge from the Sand Island Wastewater Treatment Plant ("SIWWTP") and the reduction of sludge disposed of at WGSL from the SIWWTP due to this change in processing. The sludge from the SIWWTP previously disposed of at WGSL is currently undergoing treatment in a waste digester at the SIWWTP where the sludge is turned into fertilizer pellets. The process of drying sludge into fertilizer pellets began in March 2007.

In June 2007, due to a fire, operations at SIWWTP pelletizing facility ceased until September 2007. During that time 763 tons of de-watered sludge from SIWWTP were landfilled at WGSL. For the entire 2007 year, approximately 3,122 tons of stabilized, de-watered sludge (pelletized and nonpelletized) from the SIWWTP were disposed of at WGSL. At present, all of the de-watered sludge from SIWWTP is turned into fertilizer pellets, and on average, 85% of the pellets is being used for golf course construction and soil manufacturing. The remaining amount of pellets, approximately 15% on average, is disposed at WGSL. All regulatory requirements have been met to allow beneficial use of the pellets. As the process matures and marketability increases, we anticipate a decrease in the amount of pellets that are landfilled at WGSL. Due to unforeseen circumstances, however, such as the June 2007 fire at the pelletizing facility at SIWWTP, there may times when stabilized, de-watered sludge from SIWWTP will need to be landfilled at WGSL.

Besides some of the fertilizer pellets from the SIWWTP, stabilized, de-watered sludge from the Honouliuli, Waianae, Kailua Regional, and Kahuku Wastewater Treatment Plants, as well as sludge from private (non-City) sources is still being landfilled at WGSL. For the entire 2007 year, the following approximate amounts of stabilized, de-watered sludge were disposed of at WGSL from the following City waste water treatment plants ("WWTP"): Honouliuli WWTP - 4,192 tons; Kailua Regional - 766 tons; Waianae WWTP - 277 tons; and Kahuku WWTP - 1 ton. Besides the significant reduction of sludge from the SIWWTP being landfilled, the City is in the process of seeking beneficial uses for the stabilized, de-watered sludge from the Honouliuli Wastewater Treatment Plant.

See also Section 4.2. Facility Operations, 4.2.1. Waste Accepted at Landfill, of the FEIS.

49. *"Methane Gas - Part of the NOV was a violation as to methane gas. The concern is whether the methane gas is smoldering or burning at WGSL. There needs to be a discussion as to how this is monitored and also that methane gas fires are found in landfill operations and WGSL should be no different. If in fact there is such a fire smoldering, what is the anticipated impact on the community and the stability of the landfill. Though there is an attempt to say that landfill permitted temperatures are higher in other states, the issue is the impact on this landfill which is located so very close to a resort and homes."*

Extensive studies at WGSL have shown that there is no subsurface fire occurring now or in the past at the landfill. Information demonstrating that there is no fire has been sent to the EPA and DOH.

See also the following sections already provided as a part of the DEIS: Section 4.6.1. Explosive Gas, for monitoring requirements related to explosive gases such as methane; and Section 5.7.3. Potential Impacts and Mitigation Measures, relating to air quality addressing the monitoring practices, procedures, and regulations that are in place to mitigate against any potential for impacts associated with the atypical elevated temperatures at WGSL.

> 50. *"Blasting - As expected, due to the soil type in the expansion, excavation must occur with the assistance of blasting of the rocks. It is significant that the blasting is anticipated to be no more than one per day and no more than one to three times per week. If this is the average, then over a 15 year period these are a significant number of blasting activity. The discussions surround the noise and not as to the stability or structural impact on the landfill and the surrounding area. Related is the discussion on the culturally significant outcroppings which the City claims cannot safely remain in place. If the concern is over the impact of the blasting, then the blasting must have impact throughout the existing landfill. There needs to a discussion as to this fact, along with what impact it will have upon the structural berms presently built."*

Controlled blasting will not be required for the entire anticipated life of the landfill, and is required only until the construction of the final cell. Controlled blasting does not impact the stability of the WGSL or any of its berms as it will be used only for loosening the rock from the slope. The energy output from controlled blasting is designed to be well below that produced by the design earthquake considered in the stability analysis performed to evaluate the safety of the landfill.

See also Section 5.8.2. Potential Impacts and Mitigation Measures, of the FEIS, relating to acoustic characteristics.

With respect to the cultural stone uprights, the City has proposed relocation prior to any excavation or controlled blasting at the proposed new expansion area for landfill cells as described on pages 7-81 through 7-87 of the DEIS (Section 7.3.8. Potential Impacts and Mitigation Measures, relating to historic and archaeological resources). The City, Waste Management and SHPD will work to ensure that an appropriate preservation plan is put in place.

> 51. *"Pueo and Other Birds and/or Animals - It is unfortunate that the DEIS simply dispenses with these animals and birds due to the lack of sighting on a 'survey.' There needs to be a clear description as to how many surveys were taken and when. I have personally seen the Pueo on many occasions fly from WGSL to the area near Lanikuhonua and Kai Lani. It is questioned as to how thorough this survey is. There is a reference to a survey in 1999 and it must be clarified if the DEIS is relying upon this older study. The area is also designated as a habitat for the Elepaio. It appears that the DEIS is disagreeing with this designation. An explanation is needed as to this conclusion."*

The DEIS, Section 5.9.3., <u>Fauna</u>, clearly indicated that two separate surveys were performed:

> In 2006, Phil Bruner, Ph.D., prepared the report, Survey of the Avifauna and Feral Mammals for the Proposed Waimanalo Gulch Landfill Expansion Project, Oahu (Appendix F). The purpose was to provide the findings of a bird and mammal field survey. The same area of the site was previously surveyed in 1999 (Bruner, 1999) and data from this earlier survey is provided in the current study for comparison purposes. References to literature and unpublished reports since 1999 are included.

According to the 2006 Report, the Pueo or Hawaiian Owl may forage in the area which is consistent with your observation. The area designated as critical habitat for the Elepaio by the U.S. Fish and Wildlife Services is located approximately 2 miles from the WGSL. No impacts to the habitat of the Elepaio are anticipated.

> 52. *"Aesthetics - As a person who has lived both at Kai Lani and now the Ko Olina Kai, I have no idea as to how the City can say that the lower portions of the landfill have a 'naturalized' look. It is not natural at all and neither is the view of trucks going up and down the landfill."*

As parts of the landfill are closed, surface treatments including landscaping will be done to change the appearance of the site so that it blends in with the surrounding terrain. The excavation plan includes stockpiling of rocks with a "natural" look. The rocks will be placed on the surface after closing of the landfill. The trucks are a part of the operation and the view of trucks cannot be completely mitigated. We have included additional landscaping along the Kahe Point side of the landfill in order to mitigate views from the Waianae side of the landfill. Just as the view of a natural coastline cannot be mitigated or naturalized once hotel or resort development has occurred, the view of a natural gulch or ravine will be impacted by the presence of a landfill. Nevertheless, efforts to mitigate the impact will be ongoing.

> 53. *"The visual impact of WGSL has not been adequately addressed especially with the construction of the rock berm wall. How is this area going to be restored to its original state with a rock berm wall."*

The view of the rock berms will be mitigated by the planting of trees. As they mature, the appearance of the berms will be mitigated by the vegetation. However, given the nature of the use of the site involving landfilling, it will not be possible to return the site to its original condition. The landscaping plans are included in the DEIS as Figures 5-19 through 5-21.

> 54. *"Section 6 Public Services, Potential Impacts And Mitigation Measures - Traffic - The DEIS is deficient in that it does not present the numbers of vehicles which travel to WGSL clearly in the body of its statement. It concludes by saying it is not anticipated to add more to the existing pattern. However, what is needed is a discussion as to what is the load and the description of the types of vehicles which will be used to dispose of the MSW or Ash at the WGSL. With the anticipated growth in the not only the second city of Kapolei but at Ko Olina, this discussion must address the actual numbers and the anticipated impact with the increase number of vehicles due to the growth in the area."*

A traffic study, which includes vehicle counts, is directly cited in the body of the DEIS. As indicated in Section 6.1.1. Traffic Impact Report,

"At the intersection with the existing landfill access road, Farrington Highway carries 2,046 vehicles eastbound and 859 vehicles westbound during the AM peak period. During the PM peak period, the overall traffic volume is higher with 1,131 vehicles traveling eastbound and 2,079 vehicles traveling westbound. The critical movement on the Farrington Highway approaches of the intersection is the eastbound left-turn traffic movement which operates at LOS "B" during both peak periods."

"The WGSL access road approach of the intersection carries 11 vehicles southbound during the AM peak hour of traffic. During the PM peak hour of traffic, the traffic volume is slightly higher with 31 vehicles traveling southbound. The access road approach of the intersection operates at LOS "C" during both peak periods. Traffic queues occasionally formed on this approach of the intersection with average queue lengths of 2-3 vehicles observed during both peak periods."

The entirety of the report is attached as Appendix I to the DEIS. In general, with the construction of the third boiler at H-POWER, the number of vehicles delivering MSW to WGSL is expected to decrease, and the number of vehicles delivering ash and residue from H-POWER will increase. The overall result will be fewer vehicles arriving and departing from WGSL.

> *55. "Wastewater System - There needs to be discussion as how the existing system will be adequate when it clearly was not adequate for the limited expansion as noted in the NOV. The City must honestly discuss the shortcomings of WMI, the operator, who has failed to operate WGSL in a professional manner."*

Wastewater facilities on page 6-10 of the DEIS refers to the toilets and other facilities for the workers at the landfill. Those facilities are currently in place and adequate. The need will not change with the expansion. No violations regarding the wastewater facilities were included in the NOV.

> *56. "Odors and Windblown Trash - The fact that those who live by WGSL continue to experience the odors is not adequately addressed by the DEIS. Like the 'surveys' mentioned above, there needs to be a discussion as to how the odors are being monitored. Testimony has been received by people who are on the golf course and those who live in Ko Olina as to odors and windblown trash of the landfill. It is important to note that Counts in the NOV addressed the windblown trash and odor issues. Given the fact that violations have been found, the City must ensure that these violations do not occur again, given that it continues to have the same operator."*

Odor was not a part of the NOV. Waste Management responds to odor complaints and maintains an odor complaint log. Air quality and odor, as well as mitigative measures, are discussed on pages 5-37 though 5-59 of the DEIS.

The wind-blown litter issue has been addressed through litter fences and permanent litter patrol. Litter, as well as mitigative measures, are discussed on page 4-18 of the DEIS.

According to Waste Management, less than 5 complaints were received about odor and/or litter within the last 12 months. Not all of those complaints were verified.

> *57. "Section 7 Socioeconomic and Related Environment, Potential Impacts and Mitigation Measures - NIMBYism - As expected, the Kailua Neighborhood Board has always been adverse to the closure of the WGSL. This is due to the fact that Ameron Quarry has been viewed as a successor. It is unfortunate that the communities are forced to take positions such as they have. If the City clearly looked at alternatives and did not deal in 'fear' and in its delay tactics, there could have been a long term resolution. It is not acceptable that the City's position is, 'where do you want to put it?' The City is the governmental agency tasked with this obligation and it cannot simply wait, as it has, with the hopes that other agencies will buy in to its mantra that there will be rubbish on the streets if an extension or expansion is not approved."*

The City is tasked with the obligation to provide environmentally sound disposal services for solid waste. There is a need for a landfill on Oahu. The City must select the location of its landfill based on objectively established criteria. In accordance with this obligation, and as stated in the DEIS, the City selected WGSL.

Other areas of the island have had landfills including, but not limited to, Ala Moana, Kakaako, Kailua, Kalihi, Laie, Kaneohe, Pearl City, Wahiawa and Waipahu. See also http://www.opala.org/solid_waste/archive/History%20_Garbage_in_paradise.html. Landfills, freeways, prisons and wastewater treatment plants are an unfortunate necessity of modern civilization. The suggestion that politics, policy and fear play a role in landfill selection is undocumented. Politics and policy, however, have a role in timing of decisions. It is always important that decision makers provide the public with opportunities for input, even if such opportunities for input cause decisions to be delayed. However, it is a part of the process expected by the public. WGSL has been selected as the landfill for the benefit of the entire island and was approved by the City Council.

> *58. "Economic Considerations - The role that Ko Olina plays as it relates to the economic growth for West Oahu is significant. While no one would consider placement of a landfill near Waikiki, the City does not hesitate to continue a landfill operations directly across the street from Ko Olina."*

The City does not discount the importance of economic growth wherever it is occurring on the island of Oahu. While there are no viable landfill sites near Waikiki, places such as Ala Moana Park and the Kakaako Waterfront Park once served as landfills. Various parts of Windward Oahu also supported landfills.

As represented in the DEIS, the City remains committed to the proper operation of the WGSL and to appropriate mitigation of potential adverse impacts.

> *59. "Discussion on the Landfill impacts on jobs, etc. would exist wherever the landfill is sited. The discussion is lacking as to what could happen if WGSL is expanded as to the development of the Resort."*

The DEIS provided a discussion of the economic conditions of the proposed landfill. Further information concerning the potential for adverse effects to surrounding land uses such as the Ko Olina Resort, will be addressed in the FEIS.

See also Section 7.1.5. Addendum to Socioeconomic Impacts, of the FEIS, which provides additional information on the potential for effects on property values in the surrounding region.

60. "Fairness Issues - There is a discussion as to how some residents believe that Waianae is the dumping ground for the City; and the expansion of WGSL continues to dump on and places the burden on the Waianae Coast. There needs to be a discussion of the concept of environmental justice and how this discussion required under NEPA should be better explored in the DEIS."

Environmental injustice is addressed on pages 7-28 and 7-29 of the DEIS. In summary, the median household income in the immediate areas near WGSL exceeds the island average. The City is required to complete the EIS process pursuant to HRS Chapter 343, which does not require an analysis under NEPA.

61. "Community Benefits Package - There needs to be an honest discussion on the benefits package. Remember that the Waianae Coast takes more than the City's rubbish. There is always the issue of 'catch up' for the Waianae Coast because it appears that it is last to receive anything. When the concept of a 'community benefits package' is discussed, there needs to be an analysis as to what the community would be entitled to as all others would and what is received in addition to that. The benefit must be in 'addition to' not merely a replacement of."

Basic City services are provided to all areas of the island as funded by the City Council, which must approve the City budget each fiscal year. The suggestion that programs and projects for the Leeward Coast communities are not as well funded as those for other parts of the island is undocumented. The current City administration has recognized that WGSL has a potential impact on the neighboring communities and implemented the community benefits program to provide those communities with funding for programs beyond those provided in the regular operating and capital budgets. This administration was the first to recognize the need for such a benefits program.

A Committee comprised of representatives of Leeward Coast communities was established by the Mayor to review funding applications from nonprofit community groups and identify capital projects in their communities, and determine how funds will be utilized. The Committee is diligent is assuring that any program or project they fund will provide services and benefits that are in addition to, and not in lieu of, any provided through the normal City budget process.

---

62. "Historic and Archaeological Findings - Prior EISs have not acknowledged the cultural significance of the Waimanalo Gulch. The DEIS recognized what is described as 'Three upright boulders potentially utilized as trail or boundary markers.'

It was agreed to that the stones were significant and likely used by traditional Native Hawaiian practitioners in the past. The consultants believed these stones should be preserved in place; however, the City has deemed this to be "not an option" and will move the structures. Though the cultural practitioners also expressed a concern as to the appearance of the landfill after it was completed and the boulders returned, it remains the position of the City to ignore these concerns and continue with the construction of the landfill. The DEIS must address whether the landfill expansion is at any cost and the cultural significance should be ignored."

The City has an obligation to protect public safety and health by providing waste management services. While City has proposed to preserve the stones by relocating them, the final preservation plan has not yet been determined. Relocation and preservation of the stones are currently options under consideration. The plan would be determined based on further consultation with cultural consultants, SHPD, ENV and Waste Management. The option of relocating the stones back to near their original resting places will be considered.

63. "The DEIS must address the sentiments of OHA as stated:

OHA has made a field visit to the project site and we noted three significant cultural features that were still intact in the project area. We are also aware of the probable existence of others yet to be discovered in the project area. OHA is further saddened that the larger setting that this project sits in is one that has been highly developed and degraded. Therefore, what TCPs [Traditional Cultural Properties] that remain must be protected.

The Department of Planning and Permitting, as a county agency, is mandated by Hawai'i Const. Article XII, section 7, "to preserve and protect customary and traditional practices of Native Hawaiians." Ka Pa'akai O Ka'Aina v. Land Use Comm'n, 94 Haw. 31, 45 (2000). . . . OHA urges that nothing more be done with this project until full cultural assessment has been made of the project area.

(OHA letter of September 21, 2007). At the very minimum, to address OHA's concern, there needs to be a clear statement as to how and what has been done for a 'full cultural assessment' of the project area. In that much of this land has been degraded, it does not give the City the right to continue in its degradation."

A full cultural impact assessment of the area and archaeological inventory survey were performed, attached to the DEIS as Appendices G and H and summarized in section 7 of the DEIS. A discussion of traditional cultural practices is included in the cultural impact assessment.

No action will be taken at the site until concurrence with SHPD is obtained.

64. *"Though he has passed, a respected Kumu Hula of the area, John Kaimikaua, told the story of the role of Palehua and its relationship to WGSL. There is a video of his tale and it should be included in the discussion of the cultural significance of WGSL."*

We have instructed our cultural and archaeological consultant to further investigate this item. If it is applicable, further information on the cultural significance of the content of the video will be referenced in the FEIS.

65. *"The stories of the strange events in the initial construction of WGSL are rich. Yet, the DEIS continues in its predeteimined* [sic] *conclusion that the landfill should be expanded."*

The stories are documented in the cultural impact assessment. At the same time, the City is pursuing development of the site because there is a need for a landfill to benefit all areas of Oahu.

66. *"Section 8 Relationship to Land Use Plans, Policies and Controls of the Potentially Affected Area - The concepts of the State General Plan have been revisited by the Legislature for the past 3 years. The Legislature has funded the Task Force on Sustainability for the year 2050. The Task Force has adopted it* [sic] *Sustainability Plans for the year 2050. In addition, what is now Act 183, SB 2646 CD1 of the 2008* [sic] *Session, addresses the concepts of Important Agricultural Lands. The DEIS must engage in the discussion as to what is "important Ag lands" and recognize that it is no longer tied to land classification such as A, B, etc. In this light, does it impact the continued use of WGSL."*

The sustainability of our island State is important. The use of WGSL promotes sustainability through the use of an on-island facility that has remaining but unused capacity. Without Waimanalo Gulch, new land, a precious resource, would need to be prematurely used when there is remaining capacity at this existing public facility.

The DEIS addresses the proposed project's impacts on Important Agricultural Lands in Section 8.3. The DEIS notes that the proposed project is located within the State Agricultural District, however, the subject site is not classified as one of the three types of agricultural land (i.e., prime, unique, or other important agricultural lands) according to the Agricultural Lands of Importance to the State of Hawaii ("ALISH") system. The subject site is not currently used for agricultural production; is not associated with traditional native Hawaiian agricultural uses; has mostly rocky soil, has a relatively dry climate; and is not near support infrastructure conducive to agricultural productivity.

67. *"The discussion of the Land Use Policies of the area cannot be made without a discussion of the LUC's D&O on the SUP, as amended. The D&O now states that no later than November 1, 2009, the area shall be 'restricted from accepting any additional waste material and be closed in accordance with an approved closure plan.' This is the controlling LUC Order on the site of the proposed expansion. In addition, the City is to provide the LUC with updated status every 6 months. As someone who participated in the LUC hearing, it is clear that the LUC has sent a clear message to the City that it will not be caught in the untenable position that there is no alternative in the time remaining."*

The EIS process will continue to fairly and accurately describe the events leading to the decision to select WGSL as the City's preferred alternative. Further information regarding this past history of events, including the current order of the LUC, will be provided in the FEIS in Section 2, <u>Project Background</u>.

68. *"There is also a need to discuss whether the SUP process under HRS 205-6 is the proper mechanism by which to seek this expansion. The DEIS must consider whether a boundary amendment must be sought for this further expansion."*

Because the subject property is located within the State Agricultural District, a State Special Use Permit ("SUP") must be obtained. HRS § 205-6 provides that the county Planning Commission "may permit certain unusual and reasonable uses within agricultural and rural districts other than those for which the district is classified." Because the SUP will be for land greater than 15 acres, the approval by the LUC is necessary. In the past, the LUC has granted SUP approvals for landfills, including WGSL. For purposes of the expansion addressed herein, the City may pursue either an SUP or a boundary amendment. This procedural decision does not impact the analysis contained in the EIS.

69. *"Section 9 Alternatives to the Proposed Action - This discussion in the FSEIS (most recent EIS on the property) and other documents has been inadequate in addressing alternatives. After all these years, the City must have a better response on alternative technologies, transshipment and other sites than what is provided. Again, it appears that it is simply easier to continue to have the existing landfill; and therefore all attempts to address alternatives in good faith will never be a reality."*

The City has in good faith pursued alternative technologies that are reliable, cost efficient and scalable, and issued an RFP for alternative technologies. In response to the RFP, the only qualified proposals were for existing mass burn technologies. The City is currently pursuing mass burn technology through the expansion of H-POWER. As noted in the DEIS, no alternative can completely eliminate the need for a landfill. WGSL is a strategic component of the City's solid waste management system and the final destination for certain solid wastes including MSW, recycling residue, and H-POWER generated ash, residue and unacceptable waste that cannot be further combusted, shipped, recycled or reused.

70. *"The City has failed to timely develop its Solid Waste Management Plan. In that this is not a reality, documents such as this DEIS is not being judged by the appropriate measure."*

The City has an Integrated Solid Waste Management Plan, and an update of that plan was adopted by the City Council in December 1994 through Resolution 94-306, CD1. A new draft update to the City's Integrated Solid Waste Management Plan was sent to DOH on July 1, 2008, for review. The DOH will determine its appropriateness prior to consideration by the City Council.

The words "judged by the appropriate measure," are undefined and unclear. The DEIS as well as the FEIS are prepared according to the standards set forth in HRS Chapter 343, as well as Hawaii Administrative Rules, Title 11, Chapter 200.

See also Section 2.6. City Plans Involving the Future Handling of Solid Waste, of the FEIS, relating to the Integrated Solid Waste Management Plan.
